L.21.e.17.

CYCLOPÆDIA:

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS AND SCIENCES;

CONTAINING
AN EXPLICATION OF THE TERMS, AND AN ACCOUNT OF
THE THINGS SIGNIFIED THEREBY,

IN THE

SEVERAL ARTS, BOTH LIBERAL AND MECHANICAL;

AND THE

SEVERAL SCIENCES, HUMAN AND DIVINE:

The Figures, Kinds, Properties, Productions, Preparations, and Uſes of Things
NATURAL AND ARTIFICIAL:

The Riſe, Progreſs, and State of Things

ECCLESIASTICAL, CIVIL, MILITARY, AND COMMERCIAL:

With the ſeveral Syſtems, Sects, Opinions, &c. among

PHILOSOPHERS, | PHYSICIANS,
DIVINES, | ANTIQUARIES,
MATHEMATICIANS, | CRITICS, &c.

The whole intended as a Courſe of antient and modern Learning.

Extracted from the beſt Authors, Dictionaries, Journals, Memoirs, Tranſactions,
Ephemerides, &c. in ſeveral Languages.

By E. CHAMBERS, F. R. S.

Floriferis ut apes in ſaltibus omnia libant,
Omnia nos ———————————— LUCRET.

THE FIFTH EDITION.

IN TWO VOLUMES.

VOL. II.

CYCLOPÆDIA:

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS AND SCIENCES.

L, El, a ſemi-vowel, or liquid; making the eleventh letter of the alphabet. See **Letter**, and **Alphabet**.

The *l* has a ſweet ſound, and is pronounced by applying the tongue to the palate.

Paſſerat obſerves, that *l* was frequently uſed among the ancients for *b*; as in *cillibæ* for *cibillæ*: for *d*; as, *alipe* for *adipe*: for *c*; as, *mutila* for *mutica*: for *n*; as, *arvilla* for *arvina*, *belle* for *bene*, *colligo* for *conligo*: for *r*; as *fratellus* of *frater*, *balatrones* for *baratrones*: for *ſ*; as *ancile*. of am and *cæſum*, *equilia* for *equiſia*: for *t*, as *equiſelis* for *equiſetis*, *Thelis* for *Thetis*, See B, T, *&c.*

The double *ll* is a modern contrivance, and was never uſed among ancient Roman authors: they wrote *alium* not *allium*, *macelum* not *macellum*, *polucere* not *pollucere*.

The double *l* of the Greeks was ſometimes changed by the Romans into *li*, as in ἀλλομαι, *ſalio*; ἀλλος, *alius*; φυλλον, *folium*: *r* has alſo been turned into two *ll*; as *hira*, *hilla*; *ſarare*, *ſatullare*, &c. and *l* into *x* or *xill*; as, *ala*, *axilla*, *mala*, *maxilla*; *velum*, *vexillum*: *d* was alſo uſed for *l*; *n* for two *ll*, and *r* for one *l*. See R, *&c.*

L is alſo frequently uſed inſtead of *d*, as in *Ulyſſes*, from the Greek οδυσσευς, in the Æolic dialect υδυσσευς. Thus alſo for *dautia*, we ſay *lautia*; for *dacrumæ*, *lacrymæ*, &c. See D.

There are ſeveral people, for inſtance, the Chineſe in Aſia, the Ilinois in America, *&c.* who cannot pronounce the *r*, but always change it into *l*. Thus when any of them have been baptized by the name of *Petrus*, *Franciſcus*, &c. they always pronouce it, *Petlus*, *Flanciſcus*, &c. See R.

The Spaniards and Welſh uſually double the *l* at the beginning of a word, which ſounds nearly the ſame with our *hl* or *fl*.

The figure of our *l* we borrowed from the Latins, they from the Greeks, and they again from the Hebrews, whoſe *lamed* is much like our *l*, excepting that the angle is ſomewhat more acute.

L was alſo a numeral letter among the ancients, and is ſtill ſo in the Roman ciphering, ſignifying *fifty*; according to the verſe,

> *Quinquies* L *denos numero deſignat habendos.*

When a daſh was added at top L̄, it ſtood for *fifty thouſand*.

L was uſed for fifty, as being half a C, which ſignified a hundred, and was formerly written thus Ŀ, which, according to Paſquier, makes two L L, the one upright, the other inverted.

The French louis d'ors have a croſs on them, conſiſting of eight L's interwoven, and diſpoſed in form of a croſs. See **Louis**.

The epocha's on Greek medals are uſually written with the ancient *lamda*, L; which, according to the tradition of the antiquaries, ſtands for Λυκοβαντος, a poetical word, unknown in common ſpeech, ſignifying *anno*, and which, it is probable, was more uſed in Egypt than Greece.

LABARUM, the banner, or ſtandard born before the Roman emperors in the wars. See **Ensign**, and **Standard**.

The *labarum* conſiſted of a long lance, with a ſtaff atop, croſſing it at right angles; from which hung a rich ſtreamer, of a purple colour, adorned with precious ſtones.

Till the time of Conſtantine it had an eagle painted on it, but that emperor, in lieu thereof, added a croſs with a cipher expreſſing the name of Jeſus.

Conſtantine choſe fifty of the braveſt men in his guards to bear it on their ſhoulders, each in his turn.—Euſebius tells us, that in the battle againſt Maxentius, the perſon who bore it being fatigued, gave it to another, and that he had no ſooner parted with it, but he was killed; all the ſtrokes he received while the *labarum* was in his charge, not being able to wound him.—The author adds, he had this miracle from the emperor's mouth.

This ſtandard the Romans took from the Germans, Dacæ, Sarmatæ, Pannonians, *&s.* whom they had overcome.

The name *labarum* * was not known before the time of Conſtantine; but the ſtandard itſelf, in the form we have deſcribed it, abating the ſymbols of Chriſtianity, was uſed by all the preceding emperors. See **Eagle**.

The *labarum* has afforded ample matter for criticiſm, and has been diſcourſed of by Fuller, Alciatus, Cujas, Gyraldus, Lipſius, Meurſius, Voſſius, Hoffman, Valois, Du Cange, *&c.*

LABEL, a long, thin braſs ruler, with a ſmall ſight at one end, and a centre hole at the other; commonly uſed with a tangent line on the edge of a circumferentor, to take altitudes. &c. See **Circumferentor**.

Label, in law, is a narrow ſlip of paper, or parchment, affixed to a deed or writing, in order to hold the appending ſeal.—Any paper annexed by way of addition, or explication, to any will or teſtament, is alſo called a *label*, or codicil. See **Codicil**.

Label, in heraldry, a kind of addition to the arms of a younger brother, eſpecially a ſecond to diſtinguiſh him from the firſt or eldeſt. See **Difference**.

The *label* is eſteemed the moſt honourable of all differences; and is formed by a fillet uſually placed in the middle, and along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief.

It is adorned with pendants ſomewhat like the drops under the trigliphs in the Doric freeze.—When there are above three pendants, the number muſt be ſpecified in blazoning.—There are ſometimes ſix.

LABIA, in anatomy. See the article **Lips**.

Depreſſor **Labiorum**. } See the article { **Depressor**.
Elevator **Labiorum**. } See the article { **Elevator**.

LABIAL, a term in the French law, uſed in the ſame ſenſe with *oral*. See **Oral**.

Labial *Letters*, among grammarians, are thoſe whoſe pronunciation is chiefly effected by the motion of the lips. See **Letter**.

By which they ſtand contradiſtinguiſhed from *palatal*, *dental*, *guttural*, &c. letters. See **Palatal**, **Guttural**, *&c.*

---

* Some derive the word from *labor*, as if this finiſhed their labours; ſome from ευλαβεια, reverence, piety; others from λαμβανειν, to take; and others from λαφυρα, ſpoils.

LABIAL *Offers*, are ſuch as are only made by word of mouth, or even by writing, where there is no valuable conſideration: In courts of equity theſe are not regarded.

LABIATE *Flowers*, from the word *labium*, a lip, is a term applied by herbaliſts to ſuch flowers as have one or two lips, ſome of which repreſent a kind of helmet or monk's hood. See FLOWER.

LABORATORY, or ELABORATORY, the chymiſts workhouſe; or the place where they perform their operations; where their furnaces are built, their veſſels kept, *&c.*

In general, the term *laboratory* is applied to any place, where phyſical experiments, and operations in pharmacy, chymiſtry, pyrotechnia, *&c.* are performed.

LABORATORY of an hoſpital, is a place where the chymical, *&c.* remedies are made up.

LABORATORY, in a camp, is the tent where the fireworkers and bombardeers prepare their works, drive their fuſees, fix their ſhells, and carcaſſes, make quick match, *&c.*

LABYRINTH, Λαβυρινθος, among the ancients, was a large intricate edifice cut out into various iſles, and meanders, running into each other, ſo as to render it difficult to get out of it.

There is mention made of four celebrated *labyrinths* among the ancients, ranked by Pliny in the number of the wonders of the world; *viz.* the *Cretan*, *Egyptian*, *Lemnian*, and *Italian.*

That of Crete is the moſt famed; it was built by Dædalus; and it was hence that Theſeus made his eſcape by means of Ariadne's clue.

That of Egypt, according to Pliny, was the oldeſt of all, and was ſubſiſting in his time, after having ſtood 3600 years. He ſays it was built by king Peteſucus, or Tithoes, but Herodotus makes it the work of ſeveral kings: It ſtood on the banks of the lake Myris, and conſiſted of twelve palaces, and 1500 apartments: Mela ſays, *ter mille domos.*

That of Lemnos was ſupported by columns of wonderful beauty, there were ſome remains of it at the time when Pliny wrote.—That of Italy, was built by Porſenna king of Hetruria, for his tomb.

LABYRINTH, in anatomy, denotes the ſecond cavity of the internal ear, which is formed or excavated out of the os petroſum, and is thus called, as having ſeveral windings in it. See EAR.

This cavity is divided into three parts; the firſt called the *veſtibulum* of the *labyrinth*, becauſe it leads into the other two. The ſecond comprehends three canals bent ſemicircularly, and thence called *ſemicircular canals*, placed on one ſide of the veſtibulum, towards the back of the head. The third called the *cochlea*, is ſituate on the other ſide. See COCHLEA, VESTIBULUM, *&c.*

Dr. Vieuſſens obſerves, that the bone out of which the *labyrinth* is dug, is white, hard, and very compact; that the ethereal matter of ſounds laden with impreſſions ſtriking againſt its ſide, may loſe little or nothing of its motion, but communicate it entire to the nerves of the ear. See HEARING, SOUND, *&c.*

LAC *Lunæ.* See the article MINERAL AGARIC.

LACCA, or LAKE, a ſort of gum, or rather wax, hard, red, brittle, clear and tranſparent, brought from Malabar, Bengal, and Pegu, and uſed in dying ſcarlet, painting, *&c.*

Authors differ as to the production of this curious drug. F. Tachard, who was on the ſpot, tells us, that a kind of little ants fixing themſelves on the branches of ſeveral trees, leave behind them a reddiſh moiſture, which lying expoſed to the air and ſun, hardens in five or ſix days time, and becomes *lacca.*—Some imagine this is not the production of the ants, but a juice which they draw out of the tree, by making little inciſions in it; and in effect, the trees where the *lacca* is found, do yield a gum; but then it is of a very different nature from the *lacca.*

The ants act here in quality of bees, and the *lacca* is their honey. They work at it eight months in the year, and the reſt of the time lie by, becauſe of the rains.

Lemery having examined the gum *lacca* chymically, judges it to be a mean mixture between a gum and a reſin, more abundant in ſalt than oil. See GUM, *&c.*

To prepare the *lacca* for uſe, they firſt ſeparate it from the branches to which it adheres, pound it in a mortar, and throw it into boiling water; and when the water is well dyed, they pour on freſh, till ſuch time as it will tinge no more. Part of the water thus tinged is evaporated in the ſun; after which the thickened tincture is ſtrained through a linnen cloth.

M. Geoffroy, examining the gum *lacca*, found it to be a kind of comb, ſuch as the bees, and ſome other inſects, are accuſtomed to make. Upon breaking it into pieces, it appears divided into a great number of alveoli, or little cells of an uniform figure, and which plainly ſhew that it never ouzed from trees. Theſe cells are not mere excrements, as ſome imagine, but are intended for ſomething to be depoſited in them. And accordingly are found to contain little bodies, which the firſt obſervers took for the wings or other parts of the inſects that produced the *lacca.*—Theſe little bodies are of a beautiful red colour; and when broke, make a powder as fine as cochineel. It is moſt probable, theſe cells are deſtined to lodge the young brood, as thoſe of the bees, and that theſe little carcaſſes are the embryo's of inſects, or perhaps their skins.

There are ſeveral ſorts of *lacca*; that mentioned in the laſt paragraph is the natural; when it is prepared, as in the former, thoſe kinds of dry cells are not ſeen.—M. Geoffroy reckons ſix or ſeven different kinds; beſides which, there are ſeveral paſtes uſed by the painters, that go by this name, or that of *laque.* This gum boiled in water with acids, makes a beautiful red dye. See RED, COLOUR, and DYING.

Artificial LACCA, or LAQUE, is alſo a name given to a coloured ſubſtance, drawn from ſeveral flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet.

The tinctures of theſe flowers are expreſſed by diſtilling them ſeveral times in aqua vitæ, or by boiling them over a ſtove-fire in a lixivium of pot-aſhes and alum.

Artificial lacca is alſo made of Brazile wood boiled in a lixivium of the branches of the vine, adding a little cochineel, terramerita, calcined alum, and arſenic incorporated with the bones of the cuttle-fiſh pulverized, made up into little cakes, and dried.

If it be to be very red, they add the juice of citron to it; to make it brown, they add oil of tartar.

Dove-coloured or columbine *lacca*, is made with brazile of Fernambuc ſteeped in diſtilled vinegar for the ſpace of a month, mixed with alum incorporated in cuttle-fiſh bone.

LACERNA, a thick coarſe ſort of military garment worn by the ancients.

The *lacerna* was a kind of cloke of woollen, only uſed by the men; who wore it over the toga, and when that was not on, over the tunica.—It was at firſt very ſhort, but growing popular in the Roman army, was ſoon lengthened.

The *lacerna* was ſcarce known in Rome till the time of the civil wars and the triumvirate; then indeed it came into faſhion; for the ſoldiers being then frequently in the city, or at the city-gates, the ſight became familiar to the citizens, and they fell into the uſe of it; inſomuch that it became the common dreſs of the knights and ſenators, till the time of Valentinian and Theodoſius, when the ſenators were prohibited the wearing of it in the city.

The *lacerna* appears to have been much the ſame with the *chlamys* and *birrus.* See CHLAMYS, *&c.*

Martial mentions *lacernæ* of ten thouſand ſeſterces price.

LACHRYMAL, or LACRYMAL *Gland*, in anatomy, a ſmall oblong gland ſituate above the eye, near the little canthus, whence proceed two or three ſmall ducts, which opening on the inward ſurface of the eye-lid, filtrate a ſeroſity ſerving to moiſten the ball of the eye, and facilitate its motion. See EYE.

Near the larger angle is alſo a little eminence, in form of a caruncle, which ſome have taken for another *glandula lachrymalis*, but by miſtake; this being no more than the duplicature of the inner membrane of the eye-lids. See CARUNCULA.

On the ſame ſide, near the leſſer angle, are two little perforations, called *puncta lachrymalia.* See LACHRYMALIA *Puncta.*

On the ſame ſide is alſo a ſmall bone, one of thoſe of the upper jaw, ſometimes called *os lachrymale*, but more uſually *os unguis.* See UNGUIS.

Fiſtula LACHRYMALIS, is a fiſtula in the larger angle of the eye. See FISTULA.

It uſually happens after an abſceſs formed in the ſacculus lachrymalis, by means of the ſeroſity lodged there; which being retained too long, becomes acrimonious, and occaſions an ulcer, which frequently degenerates into a fiſtula.

Sacculus LACHRYMALIS. See SACCULUS, and LACHRYMALIA.

LACHRYMALIA, or LACRYMALIA *Puncta*, in anatomy, two little apertures in the great angle of each eye, into which an aqueo-ſaline pellucid humour, ſecreted from the blood by the glandula lachrymalis, is conveyed, and thence carried off by the lachrymal canals into a little bag called *ſacculus lachrymalis*, in the canal of the noſe; whence, by a pipe always open, it is carried into the cavity of the noſe immediately under the lower os ſpongioſum. See DUCTUS, and SACCULUS.

Hence appears the reaſon why people, in crying, run at the noſe.

This humour, ſeparated by the glandula lachrymalis, ſerves to moiſten and lubricate the ball of the eye, and prevent any hurtful attrition: when it is ſecreted in any great quantity, ſo as to overflow the eye-lids, it is called *tears.* See TEARS.

LACHRYMATORIES, or LACRYMATORIES, were anciently ſmall glaſs or earthen veſſels, wherein the tears of the weeping friends that ſurvived were repoſited, and buried with the aſhes and urns of the dead. See ASHES, FUNERAL, *&c.*

Some of theſe are ſtill ſeen in the cabinets of the curious.

LAC *Lunæ*, or *Milk of the Moon.* See the article MILK.

BRITISH MUSEUM 15 JUN 65

LACONIC *Style.* } See the article { **Style.**
Laconica *Scytala.* } See the article { **Scytala.**

LACONISM, Λακωνισμος, a ſhort, pithy, ſententious ſpeech, in the manner of the Lacedæmonians, who were remarkable for the cloſeneſs and conciſeneſs of their way of delivering themſelves.

LACRYMAL. See the article **Lachrymal.**

LACTATION, the act of giving ſuck.

The word is alſo applied to the time during which the mother doth that office to her young. See **Ablactation.**

LACTEALS, or **Lacteal** *Veins*, a kind of long ſlender tubes, for the conveyance of the chyle from the inteſtines to the common reſervatory. See **Chyle.**

They appear to have been known to Hippocrates, Eraſiſtratus, and Galen; but were firſt duly deſcribed and publiſhed by Aſellius, an Italian phyſician in 1622, and called *lacteal*, from the liquor they contain, which reſembles milk. Vid. *Dougl. Bibl. Anat.* p. 236. Ed. 1734. Their coats are ſo thin as to be inviſible, except when diſtended with chyle, or lympha. —They ariſe from all the parts of the ſmall guts, and as they run from the ſides of the guts to the glands in the meſentery, unite and form larger branches, called *venæ lacteæ primi generis.* —The mouths of theſe *lacteals*, which are open into the cavity of the guts, from whence they receive the chyle, are ſo ſmall, as not to be ſeen by the beſt microſcope. It was neceſſary they ſhould be ſmaller than the fineſt arteries in the body, that nothing might enter to ſtop the circulation of the blood.

The ſame extremity of the *lacteals* has likewiſe communication with the capillary arteries of the guts, by which they receive a lympha that dilutes, and propels the chyle forwards, and waſhes the *lacteals* and glands, that they might not fur, and be obſtructed by the chyle's ſtaying in them upon faſting.

The other extremity of the *lacteals* diſcharges the chyle into the veſicular cells of the glands diſperſed up and down the meſentery: And from thoſe ariſe other *lacteals* of a larger ſize, which carry the chyle immediately into the receptaculum chyli, and theſe are called *lacteæ ſecundi generis.*

The *lacteal veins* have valves at proper diſtances, which hinder the chyle from returning back into the inteſtines. See **Valve.**

It is ſtill doubted, whether or no the inteſtina craſſa have any *lacteals* or not? The impoſſibility of human diſſection proper for ſuch an enquiry, gives no room either to affirm or deny. But the contents of the thick inteſtines ſeem not likely to afford much chyle, and therefore if there be any *lacteals*, it is probable they are very few.

In brutes, if diſſected at a reaſonable time after feeding, as two or three hours, the *lacteals* appear very tumid and white; and if wounded, the chyle flows plentifully from them. But if inſpected when the ſtomach of the animal has lain ſome time empty, they appear like lymphatics, viſible indeed, but filled with a tranſparent liquor.

That the *lacteals* have a communication with the cavities of the inteſtines, is demonſtrated by their contents, the chyle; but how their pores are diſpoſed to receive it, has not yet been diſcovered; nor is there any way known whereby to fill the *lacteals* from the cavities of the guts after death. It is probable then, their entrance into the gut is oblique, ſince neither wind nor liquors can paſs from thence. As it is found theſe pores can only receive any thing in their living ſtate, we may be allowed to imagine, that it is the periſtaltic motion of the guts which diſpoſes them in that ſtate to receive the chyle. And this may be done by means of the circular and longitudinal fibres of the inteſtines ſtill applying the internal coats of the guts to their contents, by which means its pores abſorb the chyle from the excrementitious part.

LACTARY *Column.* See the article **Column.**

LACTEA *Via*, the milky way. See the article **Galaxy.**

LACTIFERI *Tubuli.* See the article **Tubuli.**

LACUNÆ, among anatomiſts, certain excretory canals in the genital parts of women.—See *Tab. Anat, (Splanch) fig.* 11. *litt. II.*

Between the fleſhy fibres of the ureters, and the membrane of the vagina, is found a whitiſh glandulous body, about a finger thick, running round the neck of the bladder, having a great number of excretory ducts, which de Graef calls *lacunæ*, and which terminate in the lower part of the orifice of the womb; conveying thither a ſlimy matter, that mixes with the ſeed of the male. See **Generation, Conception, Seed,** &c.

LACUNAR, in architecture, an arched roof, or cieling; more eſpecially the planking, or flooring over portico's, or piazza's. See **Arch, Vault, Roof, Ceiling,** &c.

LADANUM, or **Labdanum**, in pharmacy, a gummous, or a reſinous matter, ouzing out of the leaves of a ſhrub called *ciſtus ladanifera*, which is very common in the hot countries of the Levant, and whereof there are various kinds.

Dioſcorides ſays, they gather the *ladanum* by means of goats, which brouzing on the leaves of this ſhrub, return to the ſtable with their beards loaded with a fat ſubſtance, which the peaſants take off, with a kind of combs made for that purpoſe. This matter they thus collect into lumps, and, as it is mixed with the goats hair, and other impurities, call it *ladanum in the beard*, or *natural ladanum.*—Others are ſaid to draw cords over the leaves, and other parts of the ſhrub; and ſcraping off what had ſtuck to the cords, make up the *ladanum* into little balls.

Tournefort aſſures us, that the common way of gathering the *ladanum* is, by bruſhing off the leaves with a ſort of whip, compoſed of many laſhes, or ſtraps: after it is ſcraped off the ſtraps, they make it into cakes of different ſizes.

Ladanum is uſed in phyſic, to ſoften, digeſt, deterge, attenuate, and reſolve. That which is brittle, of an aſh colour, ſweet ſcented, &c. is the beſt.

Pietro della Valle tells us, he was informed by the Indians, that *ladanum* is formed like dew, and falls from heaven like manna; that it is gathered on the leaves of a plant a palm and a half high; that, after gathering, they boil it, by which means it becomes ſoft, like wax. See **Dew,** and **Manna.**

Liquid **Ladanum**, more properly called *clear*, or *purified ladanum*, is a preparation of the natural *ladanum*, by melting and purifying it from the hairs, &c.

This is ſometimes ſold for a ſort of black amber.

LADING. See the article **Bill** *of Lading.*

LADY *of the Thiſtle.* } See { **Thistle.**
Preſentation of our **Lady.** } See { **Presentation.**

LAGAN *, or **Lagon**, in our ancient ſea laws, ſhipwrecked goods, left by the ſea, lying on the ſand, either aſhore, or out at ſea. See **Wreck.**

* The word ſeems formed from the Saxon leȝan, or luȝan, *jacere*, to lie.—Though others deduce it from the Latin *ligare*, to bind; and ſuppoſe it to denote goods tied together with a buoy, or the like, to hinder their ſinking to the bottom, that they may be found again.

Lagan, is uſually joined with *jetſon*, and *flotſon.* See **Jetson,** and **Flotson.**

LAGOPHTHALMIA *, Λαγοφθαλμια, a diſeaſe of the eyelids, when the upper lid is ſo contracted, that the eye cannot be quite ſhut, but remains open even in the time of ſleep. See **Palpebræ.**

* The word comes from the Greek λαγως, hare, and οφθαλμος, eye: this being the property of the eyes of hares.

LAICA *Vi removenda.* See the article **Vi.**

LAID *under Metal.* See the article **Metal.**

LAIR, or **Layer**, in gardening. See the article **Layer.**

Lair, Layr, or **Layer**, among ſportſmen, denotes a place where deer harbour by day. See **Harbour.**

Lair, or **Layr** *of a Deer*, is the impreſſion which the beaſt has made on the graſs, and ground, where he has lain down, or repoſed. See **Hunting.**

Lair, among huſbandmen, alſo denotes a place, where cattle uſually reſt, under ſome ſhelter; the ground being enriched by their dung.

LAKE, a collection of ſtanding water, incloſed in the cavity of ſome inland place, of a conſiderable extent, and depth.

According to ſome authors, thoſe only are properly called *lakes*, which receive and emit rivers. See **River.**

Lakes, however, may be divided into four kinds; 1°. Such as neither emit nor receive rivers. 2°. Such as emit rivers, without receiving any. 3°. Such as receive, without emitting any. 4°. Such as both receive, and emit rivers.

Of the firſt kind, ſome are perennial, others temporary: the temporary owe their origin, moſt of them, to rain, and to the cavity, or depreſſion of the place where they are lodged. See **Rain.**

In the Indies they make artificial *lakes*, which they wall about, to catch the rain in wet ſeaſons, and preſerve it for their uſe in the dry ones.—There are ſeveral of this kind of *lakes*, formed by the inundations of the ſea and rivers, particularly the Nile, and Niger; which, when they retire within their banks, leave floods of water, which the inhabitants take care to incloſe, to ſerve as a magazine for the enſuing months.

The generation of perennial *lakes* may be alſo referred to rain, where the cavity is ſo deep as to receive a quantity in winter, more than the heat of the ſun will exhale in ſummer; though it is probable many of theſe *lakes* have their ſprings at bottom, by which they are continually ſupplied.—To this claſs may be referred the turloughs, i. e. *terreus lacus*, or land-*lakes*, in Ireland, which are *lakes* one part of the year, and the reſt ſmooth fields: At the bottom of theſe turloughs are found holes, through which the water ſprings in winter, and ſinks towards ſummer.

The ſecond ſpecies of *lakes*, which emit, without receiving rivers, is very numerous; they owe their origin to ſprings, the cavities where the ſpring is found not being able to contain all the waters it yields. See **Spring.**

The third kind, *viz.* thoſe which receive rivers without emitting any, apparently owe their origin to thoſe rivers which in their progreſs from their ſource falling into ſome ample cavity, are collected together, and form a *lake* of ſuch dimenſions, as may loſe as much by exhalation as it continually receives from its ſprings; or to a river's flowing on a ſoft ſpongy ſoil, which imbibes the water, and tranſmits it to the neighbouring grounds.—The number of theſe is but ſmall.

Of the fourth ſpecies, which both receive and emit rivers, we reckon three kinds; as the quantity of water they emit is greater, equal, or leſs than that they receive. If the quantity they emit be greater, it is plain they muſt have a ſpring at the bottom; if leſs, there muſt be ſome ſubterraneous ducts, or canals, or elſe the earth muſt be ſpongy; if it be equal, we gather, that they have neither any hidden ſprings, nor canals.—Of theſe *lakes* we have a great number, and thoſe very conſiderable ones.

The generality of *lakes* conſiſt of freſh waters, as moſt of thoſe which are ſupplied either from ſome ſpring, far from the ſea, or a river, or from the rain: ſome few of ſalt water, as thoſe produced by the inundation of the ſea, or by its immiſſion through ſome duct of the earth, or that have ſalt ſprings at bottom. See UNDER-CURRENT.

Dr. Halley is of opinion, that all great perennial *lakes* are ſaline, either in a greater or leſs degree; and that this ſaltneſs increaſes with time; and on this foundation, propoſes a method for determining the age of the world. See AGE, and SALTNESS.

The large *lakes*, wherewith the northern regions abound, ſerve for very good purpoſes, inaſmuch as the warm vapours ariſing from them, ſerve for a defenſative againſt the pinching cold of thoſe climates.—To this it is owing, that Ireland, Scotland, *&c.* are leſs affected with froſts than much warmer countries. See COLD, FROST, VAPOUR, *&c.*

LAKE, among painters, *&c.* See the article LACCA.

LAMA, or LAMAS, the title of an order of prieſts among the weſtern Tartars, on the frontiers of China; who are held in great veneration.

They have a grand *lama*, who is their high-prieſt, and who is the ſecond perſon in the kingdom, being the next in authority to the king. He receives homage, and adoration, not only from the people, but from the neighbouring kings; none of whom are ever inthroned, without ſending ambaſſadors to him to obtain his benediction.

The *lama's* are extremely ſuperſtitious, and are remarkably given to magic.

LAMB. See the article PASCAL *Lamb*.

LAMBATIVES, or rather LAMBITIVES, a form of medicine to be licked off the end of a liquorice-ſtick.

Lambatives amount to the ſame with *linctus's*, *lohocks*, and *eclegma's*. See LINCTUS, ECLEGMA, *&c.*

LAMBDOIDES, Λαμβδοειδης, in anatomy, an epithet applied to the third proper ſuture of the cranium, in regard it reſembles the form of a Greek λ, *lambda*. See SUTURE.

For the ſame reaſon it is ſometimes called *ypſiloides*, as bearing ſome reſemblance to a Greek Υ, *ypſilon*. See YPSILOIDES.

LAMELLÆ *, little, thin plates, or laminæ, whereof the ſcales, and ſhells of fiſhes, *&c.* are compoſed.

* The word is a derivative of *lamina*; and ſignifies as much as *little laminæ*. See LAMINA.

LAMIÆ, Λαμιαι, among the antients, a kind of dæmons, or evil ſpirits, who, under the form of beautiful women are ſaid to have devoured children, See DÆMON.

Horace makes mention of them in his *Art of Poetry*.—Some authors call them *laniæ*, *à laniando*.—Philoſtratus ſays, they are alſo called *larvæ*, or *lemures*, as if they were all the ſame thing.—Bochart will have the word to be Phœnician, and derives it from לחם to devour; alledging, the fable of the *lamiæ* came from Libya. See LEMURES.

LAMINÆ, in phyſiology, thin plates, or tables, whereof any thing conſiſts; particularly the human ſkull, which are two, the one laid over the other. See CRANIUM, and BONE.

LAMMAS-DAY, the firſt of Auguſt; ſo called, as ſome will have it, becauſe lambs then grow out of ſeaſon, as being too big. Others derive it from a Saxon word, ſignifying *loaf-maſs*, becauſe on that day our fore-fathers made an offering of bread made with new wheat.

On this day, the tenants who formerly held lands of the cathedral church in York, were bound by their tenure to bring a lamb alive into the church at high-maſs.

LAMP, Λαμπας, a ſort of luminary, conſiſting of oil diſpoſed with a wick in a proper veſſel for burning.

The uſe of lighted *lamps* in churches, and places of devotion, is very antient.—In the city of Fez is a moſque, wherein are nine hundred brazen *lamps* burning every night.—In Turkey, all the illuminations are made with *lamps*.—Polydore Virgil aſcribes the firſt invention of *lamps* to the Egyptians; and Herodotus deſcribes a feaſt of *lamps* held annually in Egypt.

Kircher ſhews the manner of preparing *lamps*, which ſhall diffuſe a light ſo diſpoſed, as to make the faces of thoſe preſent appear black, blue, red, or of any other colour.

There has been a great diſpute among the learned, about the ſepulchral *lamps* of the antients: ſome maintain, they had the ſecret of making *lamps* that were inextinguiſhable, alledging ſeveral that had been found burning, at the opening of tombs, fifteen or ſixteen hundred years old. But others treat theſe relations as fables; and others think that the *lamps* which before were extinguiſhed, took light afreſh upon the admiſſion of freſh air.

Dr. Plott, however, is of opinion, ſuch perpetual *lamps* are things practicable, and has himſelf made ſome propoſals of this kind. The linum asbeſtinum, he thinks, may do pretty well for the wick, and that naphta, or liquid bitumen, conſtantly ſpringing into ſome of the coal mines, will anſwer for the oil. See ASBESTOS, and NAPHTA.

If the asbeſtos will not make a perperual wick, he thinks there is no matter in the world that will; and argues, that the tradition of ſuch *lamps* muſt be fabulous, or that they made them without wicks.

Such a *lamp* he thinks it poſſible to make of the bitumen ſpringing into the coal mines at Pitchford in Shropſhire; which, he ſays, like other liquid bitumens, will burn without a wick.

Thoſe *lamps* that kindle on the immiſſion of freſh air, the ſame author thinks might be imitated by incloſing ſome of the liquid phoſphorus in the recipient of an air-pump; which, under thoſe circumſtances, will not ſhine at all; but on letting in the air into the recipient, there will poſſibly, ſays he, appear as good a perpetual *lamp*, as ſome that have been found in the ſepulchres of the antients. See PHOSPHORUS.

Cardan's LAMP, is a contrivance of the author of that name, which furniſhes itſelf with its own oil.

It conſiſts of a litle column of braſs, tin, or the like, well cloſed every where, excepting a ſmall aperture at bottom, in the middle of a little gullet, or canal, where the wick is placed.

Here the oil cannot get out, but in proportion as it ſpends, and ſo opens the paſſage of that little apertute.

This kind of *lamp* was in much uſe ſome years ago; but it has ſeveral inconveniences; as that the air gets into it by ſtarts and gluts; and that when the air in the cavity comes to be much rarefied by heat, it drives out too much oil, ſo as ſometimes to extinguiſh the *lamp*.

Dr. Hook, and Mr. Boyle, have invented other *lamps*, that have all the conveniences of Cardan's, without the inconveniences.—See ſome improvements in the doctrine of *lamps*, under MIRROR.

LAMP *Black*.	See the article	BLACK.
Cul de LAMP.		CUL.
Enamelling by LAMP.		ENAMELLING.
Fire of a LAMP.		FIRE.

LAMPADARY, LAMPADARIUS, an officer in the antient church of Conſtantinople; whoſe buſineſs was to ſee the church well lighted, and to bear a taper before the emperor, the empreſs, and the patriarch, when they went to church, or in proceſſion. See TAPER.

The taper born by the *lampadary* before the emperor, was incompaſſed with diverſe circles of gold, in manner of crowns; thoſe held before the empreſs, and patriarch, had but one.—It ſeems they were of emblematical uſe, and were intended to keep thoſe great perſons in mind, that their light was to illumine thoſe underneath them.

There were alſo *lampadaries* in the emperor's palaces; and others in the houſes of the grandees: at firſt, the privilege of having a *lampadary*, or torch-bearer, was only granted to the great officers of the crown, and the chief magiſtrates; but afterwards the emperor allowed it to other inferior officers, as queſtors, treaſurers, *&c.*

Together with the taper, they bore before the magiſtrates the emperor's image, *&c.* And it is very probable, it was on account of this image, that they were firſt permitted to have a *lampadary*.

LAMPAS, a kind of fiery meteor, reſembling a burning lamp, hence alſo denominated *fax ardens*. See METEOR.

LAMPAS, or LAMPERS, a kind of ſwelling in the palate of a horſe; ſo called, becauſe it is cured by burning with a lamp, or an hot iron.

The *lampas* is an inflammation, or tumor, in the roof of a horſe's mouth, behind the nippers of the upper jaw.—It ariſes from abundance of blood reſorting to the firſt furrow of the mouth, near the fore teeth, which cauſes that furrow to ſwell as high as his gatherers: it hinders the beaſt's feeding, and makes him let his meat fall, half chewed, out of his mouth again.

The *lampas* is a natural infirmity, which every horſe has, firſt or laſt, and every ſmith can cure.

LAMPETIANS, LAMPETIANI, a ſect of antient heretics, who fell in with ſome of the opinions of the Aerians. See AERIAN.

Their founder, Lampetius, is ſaid to have been one of the chiefs of the Marcionites. They condemned all kind of vows, particularly that of obedience, as inconſiſtent with the liberty of the ſons of God.

LAMPROPHORUS, an appellation antiently given to the Neophytes, during the ſeven days that ſucceeded their baptiſm.

In the ceremony of baptiſm, the new Chriſtian was clothed with a white robe, which he wore for the week following; and was thence called *lamprophorus*, which ſignifies a *perſon wearing a ſhining garment*; from λαμπρος, ſhining, and φερω, I carry.

The Greeks alſo gave this name to the day of the reſurrection, in regard their houſes were adorned and illuminated on that day with an infinite number of torches, as a ſymbol of the light which that myſtery diffuſed in the world.

LANÆ *Petra*. See the article PETRA.

LANCE, LANCEA, a ſpear; an offenſive weapon bore by the antient cavaliers, in form of a half pike.

The *lance* conſiſted of three parts, the ſhaft, or handle, the wings, and the dart.—Pliny attributes the invention of *lances* to the Ætolians. Varro, and Aulus Gellius ſay, the word *lance* is Spaniſh; whence others conclude the uſe of this weapon was borrowed by the people of Italy from the Spaniards. — Diodorus Siculus derives it from the Gauliſh, and Feſtus from the Greek, λογχη, which ſignifies the ſame.

LANCETI, a name given by the antient laws of England to a kind of vaſſals, who were obliged to work for the lord one day in a week, from Michaelmas to Autumn, either with fork, ſpade, or flail, at the option of the lord.

LANCETTE, a fine, ſmall, chirurgeon's knife; ſtreight-pointed, and two edged; uſed in opening veins, &c. See PHLEBOTOMY.

LAND, in a general ſenſe. See the articles SOIL, EARTH, &c.

LANDAN, in phyſiology. See the article SAGO.

LAND-CHEAP, an antient cuſtomary fine, paid either in cattle, or money, upon the alienating or ſelling of *land* in certain manors, or within the liberty of certain boroughs.

At Malden in Eſſex, a payment is ſtill made of 13*d.* in every mark of the purchaſe-money, for lands and houſes ſold in that town; which is called *land-cheap*.

LAND-FALL, is a ſea term, ſignifying to fall in with the land.

Good LAND-FALL, is when a ſhip makes, or ſees the *land* as ſhe expected according to her reckoning.—The contrary is called a *bad land-fall*.

LAND-GABLE, an antient term for a tax, or rent iſſuing out of *land*; anſwering to what we now call *ground rent*.

LAND-LOCKED, a ſhip is ſaid to ride *land-locked*, when ſhe is ſurrounded with land, that is, is at anchor in a place where there is no point open to the ſea, ſo that ſhe is ſafe from the violence of winds, and tides.

LANDSKIP, or LANDSCHAPE, the view, or proſpect of a country, extended as far as the eye will carry.

LANDSKIPS, in painting, are pieces repreſenting ſome champaign, or rural ſubject, as hills, vales, rivers, country houſes, where human figures are only introduced as accidents, or circumſtances.

Landskip painting is eſteemed one of the loweſt branches of painting. See PAINTING.

LANGREL SHOT, is a ſort of ſhot ſometimes uſed at ſea, made of two bars of iron, with a joint, or ſhackle, in the middle; by which means it can be ſhortned, and ſo put the better into the gun; and at each end there is a half bullet, either of lead, or iron.

This ſhot, when diſcharged, flies out at length, and ſo does more execution among the enemies rigging, &c.

LANGUAGE, a ſet of words which any people have agreed upon, whereby to communicate their thoughts to each other. See WORD.

The firſt principles of all *languages*, F. Buffier obſerves, may be reduced to expreſſions, ſignifying, firſt, The ſubject ſpoke of. Secondly, The thing affirmed of it. Thirdly, The circumſtances of the one and the other. But as each *language* has its particular ways of denoting each of theſe, a *language* is only to be looked on as an aſſemblage of expreſſions, which chance or caprice has eſtabliſhed among a certain people; juſt as we look on the mode of dreſſing. &c.—It is uſage and cuſtom is the rule of a *language*; and theſe hold their empire independant of reaſon, or any other cauſe: nor has reaſon any thing to do in *language*, unleſs to ſtudy or teach it, ſuch as it is: Here then commences grammar; a juſt plan of which, ſuppoſes a *language* already introduced by uſe; and without pretending to alter or amend a tittle, only furniſhes reflections, called *rules*, to which the manners of ſpeaking uſed in that *language* may be reduced; which aſſemblage of reflections, is what we call the *grammar of that language*.—This remark may obviate an abuſe introduced among grammarians, who are ever crying out, ' Uſage is, in this point, oppoſite to ' grammar; or the *language* here frees itſelf from the rules of ' grammar, &c. See GRAMMAR.

It is chance then to which we owe uſage, and uſage that makes the rules and meaſures of a *language*. Uſage, indeed, is ſomewhat dubious, and may be divided into *good* and *bad*: If it be asked, Wherein the difference between theſe lies? it is in this; that the one is better eſtabliſhed, or authorized, than the other: and if it be asked, Wherein that difference of authority conſiſts? it is anſwered, That in dead *languages*, that which makes the good uſage is the writings of the beſt authors in that *language*: and if it be further queſtioned, Which are the beſt? thoſe are allowed ſuch, who wrote when that ſtate was in its greateſt glory. Thus the age of Auguſtus, being the moſt diſtinguiſhed by great men, who then flouriſhed, we call that *good Latin* which is conformable to the manners of ſpeaking uſed by authors who wrote fifty years before, and fifty after the reign of that emperor.—As to living *languages*, the good uſage, or mode, is that which obtains among the moſt eminent perſons, whether as to quality, and authority, or as to learning, and the reputation of writing well.

With this view, M. Vaugelas defines uſage of a *language*, the manner of ſpeaking uſed by the ſoundeſt or beſt part of the court, conformably to the manner of writing among the beſt part of the authors of the time.—But this definition, how judicious ſoever, may occaſion infinite doubt; for which is to be deemed the beſt part of the court, and of the writers? Each party, doubtleſs, thinks itſelf the beſt.—F. Buffier, therefore, very juſtly, inſtead of the beſt part, ſubſtitutes the greateſt part, which brings the matter nearer to a certainty; the moſt numerous part being ſomething fixed, and palpable, whereas the moſt ſound part may be inſenſible, or arbitrary. There is found a conſtant reſemblance between the genius or natural complexion of each people, and the *language* they ſpeak.—Thus the Greeks, a polite, but voluptuous nation, had a *language* perfectly ſuitable, full of delicacy and ſweetneſs.—The Romans, who ſeemed only born to command, had a *language* noble, nervous, and auguſt; and their deſcendants, the Italians, are ſunk into ſoftneſs, and effeminacy, which is as viſibly in their *language*, as their manners.—The *language* of the Spaniards is full of that gravity, and haughtineſs of air, which make the diſtinguiſhing character of that people.—The French, who have a world of vivacity, have a *language* that runs extremely brisk and lively.—And the Engliſh, who are naturally blunt, thoughtful, and of few words, have a *language* exceedingly ſhort, conciſe, and ſententious.

The diverſity of LANGUAGES is generally allowed to have taken its riſe from the confuſion of Babel, both by Jews, Chriſtians, and Mahometans: but the manner in which this diverſity was effected, is ſtill in diſpute among the learned.—The queſtion is, Whether God only expunged the remembrance of the ſignification of terms in thoſe who built the tower? or, Whether he immediately inſpired them with new words? Scaliger holds, that they only forgot the meaning of the words, and named one thing inſtead of another; though all indifferently ſpoke the Hebrew tongue. — Nor does Caſaubon allow, that they immediately ſpoke different *languages*: the confuſion of tongues, he thinks, might be very well effected, without introducing a multiplicity of *languages*. See Ziegra *de confuſione Linguarum Babylonica ad Geneſ. XI.*

As to the point of antiquity, and priority among *languages*, that too has been extremely controverted.—Herodotus tells us, that in the diſpute between the Egyptians and Phrygians, about the antiquity of their *languages*, Pſammeticus, king of Egypt, ordered two children to be brought up, with expreſs prohibition not to have one word pronounced before them, but to leave nature to ſpeak of herſelf; and the firſt word they ſpoke happened to be *beccos*, which, in the Phrygian *language*, ſignifies *bread*. The Egyptians, however, were not convinced with this proof.—The Arabs diſpute the point of antiquity with the Hebrews: but the Jews, jealous, even to exceſs, of the honour of their nation, poſitively inſiſt on it, that the Hebrew tongue, ſuch as it is found in the holy ſcriptures, is the primitive *language*, and that ſpoken by the firſt man.

Others maintain, that the *language* ſpoken by Adam is loſt, and that the Hebrew, Chaldee, and Arabic, are only dialects of that original tongue. So far are they from giving the priority to the Hebrew, that they maintain Abraham ſpoke Chaldee before he paſſed the Euphrates; and that he firſt learned the Hebrew in the land of Canaan: ſo that this was not a ſpecial *language* conſecrated to the people of God, but was originally the *language* of the Canaanites.

M. le Clerc is of opinion, the Hebrew is far inferior to the Greek, both in copiouſneſs, elegancy, and perſpicuity; it is dry and deſtitute of ornaments, inſomuch that wanting expreſſions to vary the phraſe, the ſame periods are perpetually returning. — The Rabbins ſay, it is ſo pure and chaſte, that it has no proper names for the parts of generation, nor for thoſe by which the excrements are diſcharged. See HEBREW.

The Arabic is held the moſt copious of all *languages*; being ſaid to have 300 different words to expreſs a lion, and no leſs than 1200 for a ſword.

LANGUAGES are divided into,—*original*, or *mother tongues*; as the Hebrew, and Arabic, in the Eaſt, the Teutonic, and Sclavonic in the Weſt. See SCLAVONIC, and TEUTONIC.

Secondary, or *derivative* LANGUAGES, which are thoſe formed out of a mixture of ſeveral others, as Latin, French, *&c.*

Kircher will have the Cophtic a mother tongue, independant of all others. See COPHTIC.

Du Jon maintains the Gothic a primitive *language*, and the mother of all the Teutonic tongues; that is, of all thoſe ſpoke in the North. See RUNIC.

Some add the Baſque, or Biſcayan, and Bas Briton, to the number of mother tongues, imagining them to have been thoſe of the antient Celtæ, or Gauls.

Learned, or *dead* LANGUAGES, are thoſe which only ſubſiſt in books, and which muſt be learned by the rules of grammar; as the Greek, Hebrew, Syriac, and Chaldee. See the articles HEBREW, GREEK, *&c.*

Raymond Lully ſolicited the eſtabliſhment of the ſtudy of the learned *languages* a long time, in the thirteenth and fourteenth Centuries. At length, in the year 1312, pope Clement, and the council of Vienne, appointed, that in the court of Rome, and in the univerſities of Paris, Oxford, Bologna, and Salamanca, there ſhould be inſtituted profeſſors of each, who ſhould have ſalaries from the reſpective courts.—The monks, however, vigorouſly oppoſed the ſpreading of theſe ſtudies; and with ſo much ſucceſs, that Eraſmus tells us, in his time *Græce noſſe ſuſpectum, Hebraice prope hæreticum.*

Living LANGUAGES, are thoſe ſtill ſpoke in ſome country, or other; and which may be learned by converſation.—The moſt popular among theſe are the French, Italian, Spaniſh, and Engliſh: which ſee under their reſpective names, ENGLISH, FRENCH, ITALIAN, *&c.*

The Spaniards ſeem to place the nobleneſs, and gravity of their language, in the number of ſyllables, and the ſwelling of words; and ſpeak leſs to be underſtood, than to be admired. Their terms are big, and ſonorous, their expreſſions haughty, and boiſterous, and pomp and oſtentation run through all they ſay: their *language* cannot paint a thought to the life; it always magnifies it, frequently diſtorts it; and does nothing, if it do not exceed nature.

The Italian tongue does not ſwell up things to that degree, but it adorns, and embeliſhes them more; yet theſe ornaments, and embeliſhments, are not real beauties.—The Italian expreſſions, thus rich and brilliant, are like thoſe faces covered with patch and paint, which make a fine ſhow; but the finery is all deceit. See ITALIAN.

The French *language* (as ſome of their authors expreſs themſelves) is ſimple, without lowneſs; bold without indecency; elegant and florid, without affectation; harmonious, without ſwelling; majeſtic, without pride; delicate, without ſoftneſs; and ſtrong, without roughneſs.—Though, as to the points of ſtrength, and majeſty, the French muſt give way to the Engliſh; which, in theſe, as well as in copiouſneſs, exceeds moſt of the living *languages*; as far as it comes behind ſome of them in ſmoothneſs, and delicacy.

Of all the modern *languages*, the French is allowed to be the moſt clear and fit for philoſophical and critical ſubjects; the chaſteſt and moſt reſerved in its diction; the moſt judicious and ſevere in its ornaments.—Of all others, the Engliſh is ſaid to be the moſt honeſt, open, and undeſigning; it will not bear double meanings, nor can it palliate, or hide nonſenſe: bad ſenſe, and good Engliſh, being things inconſiſtent. With all its ſublimity, it is gay and pleaſant on occaſion; but its gaiety is ſtill moderated, and reſtrained by good ſenſe; it hates exceſſive ornaments; and, for the greater ſimplicity, would almoſt chuſe, as ſome ſay of the French, to go naked: it never dreſſes more than decorum and neceſſity requires.

The Spaniſh reſembles thoſe rivers whoſe waters are always ſwelling, and always muddy, and turbulent; that never keep long within their channel, but are ever overflowing, and their overflowings ever noiſy, and precipitate.—The Italian is like thoſe pleaſing rivulets that purl agreeably among the ſtones, and glide in meanders through meadows full of flowers.—The French reſembles one of thoſe beautiful ſtreams that always run briskly; but, at the ſame time, ſmoothly, and equally; without much noiſe, or much depth.—The Engliſh, like the Nile, preſerves a majeſty even in its abundance: its waters roll rapidly, notwithſtanding their depth; it never roars, but when its banks are too narrow; nor overflows, without enriching the ſoil.

The Latin is the common mother of the three former; but the daughters have very different genius's, and inclinations.—The Spaniſh, a haughty dame, that piques herſelf on her quality, and loves exceſs, and extravagancy in every thing. The Italian, a coquette, full of fine airs; always appearing dreſs'd, and taking all occaſions of ſhewing her finery: to be admired being all ſhe aims at. The French, an eaſy prude, that has her ſhare of modeſty, and diſcretion; but, on occaſion, can lay them both aſide.—The Engliſh is of a more maſculine temperament: it is not only of a different family from the others, but appears of a different ſex too: its virtues are thoſe of a man: indeed, it is the product of a colder climate, and a rougher people; and its features may be ſomewhat coarſer than thoſe of its neighbours, but its faculties are more extenſive, its conduct more ingenuous, and its views more noble. See ENGLISH, *&c.*

Ennius, and Cecrops, are celebrated for their knowledge of many *languages*. Mithridates, king of Pontus, underſtood twenty two tongues, which was the number of different people over whom he commanded; and thoſe *languages* he knew ſo well, that he was able to harangue each of his people in their own tongue. It was a ſaying of Charles the fifth, 'That ſo many *languages* as a man underſtands, 'ſo many times he is man.' Sultan Soliman's interpreter ſpoke perfectly well ſeventeen different *languages*. But among the moderns, none have been more remarkable in this way, than Poſtellus; who, beſides a perfect knowledge of all the dead *languages*, was ſo well acquainted with the living, that it is ſaid he could have made the tour of the globe, without the uſe of an interpreter.

Bibliander has written of the analogy, and proportion of *languages* and letters, *De ratione communi linguarum*, in 1518. Geſner, of the difference of *languages*, in 1572. Lazius publiſhed an *Introduction to the learning of the politer languages, in a common method*, in 1548. Megiſſier, a ſcheme of forty different *languages*, and different dialects, ſpecimens of each whereof he gives in the Lord's-prayer, in 1593. De Recoles, in his *addition to the world of Daviti*, has publiſhed the Pater-noſter in all the *languages* ſpoken among Chriſtians; and Mr. Chamberlayne has lately propoſed to do the ſame in 100 *languages*, a ſpecimen of which has been already publiſhed. Albericus Gentilis wrote of the mixture of *languages*, in 1603. And father Reinier's diſcourſe on etymologies, is a work of the ſame kind. In 1613, Duret publiſhed a treaſure of the hiſtory of all the *languages* in the univerſe: Guichart has a treatiſe of the etymological harmony of *languages*, publiſhed in 1619. Brerewood has given us curious enquiries into the diverſities of *languages*, and religions, publiſhed in 1635.

LANGUAGE, is alſo uſed in the order of Malta, for *nation*.

The knights of Malta are divided into eight *languages*; three whereof are for France, *viz.* the *language* of Provence, of Auvergne, and of France; two for Spain, thoſe of Caſtile, and Arragon; the other three are the *languages* of Italy, England, and Germany.

Each of theſe *languages* has its chiefs, who preſides in aſſemblies of the *language* to which he belongs. See MALTA.

Frank LANGUAGE. } See the article { FRANK.
Helleniſtic LANGUAGE. } See the article { HELLENISTIC.

LANGUED, LANGUE', in heraldry, is applied to ſuch animals whoſe tongues appear out of their mouths; being of a colour different from that of the body of the animal.

LANGUOR ſignifies a *faintneſs*, or relaxation of the members, ariſing either from a want, or decay of ſpirits, through indigeſtion, or too much exerciſe; or from an additional weight of fluids, cauſed by a diminution of the excretion by the common diſcharges. See LASSITUDE.

LANIGEROUS, any thing that bears wool. See WOOL.—Hence,

LANIGEROUS, or LANUGINOUS *Trees*, among herbaliſts, are thoſe trees that bear a woolly, downy ſubſtance; as, the black, white, and trembling poplars, oſiers, and willows of all ſorts. See LANUGO, and TREE.

LANTERN *, or LANTHORN, a cover for a luminary, made of ſome tranſparent matter; ſerving to tranſmit the light, and, at the ſame time, to ſkreen it from the wind, and weather. See LIGHT, *&c.*

Epictetus's *lantern* is ſaid to have been ſold for 3000 drachms. That of Diogenes was held in great veneration

---

* The word is derived from the French *lanterne*, and that from the Latin *laterna*, of *lateo*, I am hidden; *eo quod lucem habeat interius clauſam*, in regard the light is hidden within, ſay Iſidore, and Lambin. But according to Pezron, *laterna* comes from the Celtic *latern*; and according to Salmaſius, *lantern* comes from *lato*, of *fero*, in regard it bears a lamp, or a light.

among the antients; and that of Judas is ſtill preſerved in the treaſury of S. Denys, as a very curious piece of antiquity.

Lanterns are made of glaſs, horn, paper, &c. formerly, they were made of the horn of a wild bull, called *urus*; which when cut into thin laminæ, Pliny tells us, was very tranſparent.

Dark LANTERN, is a *lantern* with only one opening, or light, which, too, may be cloſed up, when the light is to be entirely hid; and may be preſented to the perſon one would ſee, without being perceived one's ſelf.

The antients had their dark *lanterns*, but they differed from ours; they were covered with four ſkins, one on each ſide, or light, three whereof were black, and only the fourth tranſparent.—Caſaubon, who gives us the deſcription, took it from a manuſcript of Julius Frontinus.

Theſe were principally uſed in their armies, when they were to march privately off from their enemies in the night-time.

Feaſt of LANTERNS, in China, is a celebrated feaſt held on the fifteenth day of the firſt month; ſo called from the infinite number of *lanterns* hung out of the houſes, and ſtreets; which, it is ſaid, is not leſs than two hundred millions: inſomuch, that it rather appears a fit of madneſs, than of feaſting. On this day are expoſed *lanterns* of all prices, whereof ſome are ſaid to coſt 2000 crowns.—Some of their grandees retrench ſomewhat every day, out of their table, out of their dreſs, equipage, &c. to appear the more magnificent in *lanterns*. They are adorned with gilding, ſculpture, painting, japanning, &c. and as to their ſize, it is extravagant; ſome are from 25 to 30 foot diameter: they repreſent halls, and chambers, and two or three ſuch machines together would make handſome houſes; ſo that in China they are able to eat, lodge, receive viſits, have balls, and act plays in a *lantern*.

To illumine them, they ſhould have bonfires; but as that would be inconvenient, they content themſelves with lighting up in them an infinite number of torches, or lamps; which, at a diſtance, have a beautiful effect.—In theſe they exhibit various kinds of ſhews to divert the people.

Beſides theſe enormous *lanterns*, there is a multitude of other ſmaller: theſe uſually conſiſt of ſix faces or lights, each about four feet high, and one and a half broad, framed in wood finely gilt and adorned; over theſe they ſtretch a fine tranſparent ſilk, curiouſly painted with flowers, trees, and ſometimes human figures: the painting is very extraordinary, and the colours extremely bright; and when the torches are lighted, they appear highly beautiful, and ſurprizing.

LANTERN, in architecture, a kind of little dome raiſed over a large one, or over the roof of a building, to give light, and to ſerve for an acroter to finiſh the building. See CUPOLA.

LANTERN is alſo uſed for a ſquare cage of timber, with glaſs in it, placed over the ridge of a corridor, or a gallery between two rows of ſhops, to illuminate them; as that in the Royal-Exchange, London.

Magic LANTERN, in optics, the name of a machine, which in the dark repreſents various images, and ſpectres on a wall, or other white ſurface, ſo odd and ſurprizing, that thoſe who are not in the ſecret, think them the effects of magic. See MAGIC.

LANUGINOUS. See the article LANIGEROUS.

LANUGO, in botany, *down*; that ſoft, hairy, or woolly covering, which grows on the leaves, ſtalks, or fruit of divers plants. See LANIGEROUS.

Such is that found on the leaves of the roſe campion, and on the fruit of the peach-tree.

LAPIDARY, LAPIDARIUS, an artificer who cuts precious ſtones. See GEM, and PRECIOUS *Stone*.

The art of cutting precious ſtones is very antient; but, like other arts, its original was very imperfect: the French have ſucceeded in it the beſt; and the *lapidaries* of Paris, who have been a corporation ſince the year 1290, have carried it, eſpecially cutting of diamonds called *brilliants*, to its laſt perfection.

There are various machines uſed in the cutting of precious ſtones, according to the quality of the matter to be cut: the diamond, which is extremely hard, is cut and formed on a wheel of ſoft ſteel, turned by a kind of mill, with diamond duſt tempered in oil of olives; and this ſerves to poliſh them, as well as to cut them. See DIAMOND.

Oriental rubies, ſapphires, and topazes, are cut and formed on a copper wheel, with oil of olives, and diamond duſt: they are poliſhed on another copper wheel, with tripoly and water. See RUBY, &c.

Emeralds, hyacinths, amethyſts, garnets, agats, and other ſtones leſs hard, are cut on a leaden wheel, with ſmalt and water, and poliſhed on a tin wheel with tripoly. See EMERALD, &c.

Turquois, of the old and new rock, lapis, giraſol, and opal, are cut and poliſhed on a wooden wheel with tripoly. See TURQUOIS, &c.

LAPIDARY is alſo uſed for a virtuoſo ſkilled in the nature, kinds, &c. of precious ſtones; or a merchant who deals in them. In which ſenſe, the preſent great mogul is ſaid to be one of the greateſt *lapidaries* in the world.

LAPIDARY *Style*, denotes the ſtyle proper for inſcriptions. See STYLE, and INSCRIPTION.

This is a kind of medium between proſe and verſe; the jejune and the brilliant are here equally to be avoided. Cicero has preſcribed the rules of it: *Accedat oportet oratio varia, vehemens, plena ſpiritus. Omnium ſententiarum gravitate, omnium verborum ponderibus eſt utendum.*

The *lapidary ſtyle*, which was loſt with the antient monuments, has been retrieved, at the beginning of this age, by count Emanuel Teſoro: It is now uſed various ways at the beginning of books; and even epiſtles dedicatory are compoſed in it, whereof we have no example among the antients.

LAPIDESCENT, any thing which has the faculty of petrifying, or turning bodies to a ſtony nature. See STONE.

Naturaliſts ſpeak of a *lapideſcent* principle, a *lapideſcent* ſpirit, *lapideſcent* juice, &c.

LAPIDESCENT *Waters* or *Springs*, are ſuch as having ſtony particles diſſolved, and ſwimming in them, do depoſite the ſame on wood, leaves, and other bodies immerged therein; which being incruſted herewith, are commonly conſidered as petrifactions. See SPRING, and PETRIFACTION.

LAPIDIFICATION, in chemiſtry, an operation whereby any ſubſtance is converted into ſtone. See PETRIFACTION.

This is done by diſſolving a metal, for inſtance, in a corroſive ſpirit or menſtruum, and afterwards baking that diſſolution into the conſiſtence of a ſtone.

Lapidification is practiſed in metals, fixed ſalts, and ſalts of plants.

The term is alſo uſed for the making of artificial ſtones.

LAPIS, in the general ſenſe. See the article STONE.

LAPIS *Asbeſtos*. } See the article { ASBESTOS.
LAPIS *Calaminaris*. } See the article { CALAMINE.
LAPIS *Dentalis*. } See the article { DENTALIS.

LAPIS *Infernalis*, a cauſtic ſtone prepared various ways; ſometimes of ſtrong ſoap-lees evaporated to a drineſs, and the remainder kept in a glaſs well ſtopt from the air.

Sometimes it is made of calcined vitriol, tartar, and ſal armoniac, and boiled in quick-lime water to a ſtrong lixivium; then ſtrained and evaporated till dry. See CAUSTIC.

LAPIS *Judaicus*. See the article JUDAICUS.

LAPIS *Lazuli*. See the article LAZULI.

LAPIS *Medicamentoſus*, or the medicinal ſtone; is a compoſition of roch alum, litharge, colcothar of vitriol, Armenian bole, and vinegar; boiled to the conſiſtence of a hard ſtone.—It is uſed to faſten the teeth, preſerve the gums, heal and dry up ulcers and wounds, and is uſed in injections, and in compoſitions for ſore eyes.

LAPIS *Specularis*. See the article SPECULARIS.

LAPSARII. See INFRALAPSARII, SUBLAPSARII, and SUPRALAPSARII.

LAPSE, a ſlip, or omiſſion of a patron to preſent a clerk to a benefice within ſix months of its being void; in which caſe the benefice is ſaid to be in *lapſe*, or *lapſed*, and the right of preſentation devolved to the ordinary. See PRESENTATION.

LAQUEARIUS *, a kind of athleta among the antients, who in one hand held a *laqueus*, i. e. a ſort of ſnare, wherewith to embaraſs and intangle his antagoniſt, and in the other a poinard to ſtab him. See ATHLETA.

* The word comes from the Latin *laqueus*, a ſnare, or nooze.

LAQUEUS, in ſurgery, a *nooze* or *ſnare*; or a kind of ligature ſo contrived, that when ſtretched by any weight, or the like, it draws up cloſe.

Its uſe is to extend broken or disjointed bones, to keep them in their places, when they are ſet, and to bind the parts cloſe together.

LAR-BOARD, the left-hand ſide of a ſhip when you ſtand with your face toward the head. See STARBOARD.

LARCENY *, in law, is a theft of perſonal goods, or chattels, in the owner's abſence. See THEFT.

* The word comes from the French *larcin*, and that from the Latin *latrocinium*, theft.

In reſpect of the things ſtolen, *larceny* is either *great*, or *ſmall*.

Great LARCENY, is when the things ſtolen, though ſeverally, exceed the value of 12*d*.

Petty LARCENY, is when the goods ſtolen, exceed not the value of 12*d*.

Civilians define *larceny*, a fraudulent ſubtraction of another man's property, with deſign to appropriate it without the owner's leave.

When it is done by force, it is called a *robbery*. See ROBBERY.

By the Roman law, the penalty of *ſimple* and *ſecret larceny* was the returning it twofold; and of *manifeſt larceny*, fourfold: *manifeſt larceny*, was where the criminal was taken in the fact; *ſimple*, where he was not. The Lacedæmonians never puniſhed *larceny*, provided the perſon was not caught in the fact; but, on the contrary, it was applauded as a mark of dexterity and addreſs.—The Circaſſians are ſaid to honour it at this day; inſomuch that at their public feaſts their youth are not ſuffered to drink, if they have not performed ſomething remarkable in that way.—Solinus tells us, that in Sardinia there was a fountain that had the virtue of diſcovering a perſon that had committed *larceny*.

LARENTINALIA, in antiquity, a feaſt held among the Romans on the 23d day of September; by ſome ſuppoſed to have been in honour of the Lares, but by others, with more probability, in honour of Acca Laurentia; and to have been the ſame with *laurentalia*. See LAURENTALIA.

LARES, among the antients, a kind of domeſtic genii, or divinities, worſhipped in houſes, and eſteemed the guardians and protectors of families; ſuppoſed to reſide more immediately in the chimney-corner. See GOD.

Plutarch diſtinguiſhes good and evil *lares*, as he had before done good and evil genii. See GENIUS.

There were alſo ſome public, others private *lares*.

Apuleius tells us, the domeſtic *lares* were no more than the ſouls of departed perſons, who had lived well, and diſcharged the duties of their ſtation; whereas thoſe who had done otherwiſe, were vagabonds, wandering about and frightening people, called *larvæ* and *lemures*. See LEMURES.

The *lares* were alſo called *penates*, and were worſhipped under the figures of little marmouſets, or images of wax, ſilver, or earthen ware. See PENATES.

The public *lares* were alſo called *compitales*, from *compitum*, a croſs-way; and *viales*, from *via*, a way, or public road; as being placed at the meetings of roads, and in the highways, and eſteemed the patrons and protectors of travellers. See VIALES.

Their private *lares* took care of particular houſes and families: theſe they alſo called *præſtites*, from præſto;

> *Quod præſtant oculis omnia tuta ſuis.* Ovid. Faſt.

They gave the name *urbani*, i. e. *lares* of cities, to thoſe who had cities under their care; and *hoſtilii*, to thoſe who were to keep their enemies off.—There were alſo *lares* of the country, called *rurales*, as appears by ſeveral antique inſcriptions.

The *lares* were alſo genial gods, and were ſuppoſed to take care of children from their birth. It is for this reaſon, that when Macrobius tells us the Egyptians had four gods who preſided over the births of children, *viz.* the *genius*, *fortune*, *love*, and *neceſſity*, called *præſtites*; ſome interpret him as if he had ſaid the Egyptians had *lares*; but there was a world of difference between the *lares* of the Romans, and the præſtites of the Egyptians.

The antients differ extremely about the origin of the *lares*. Varro and Macrobius ſay they were the children of Mania; Ovid makes them the iſſue of Mercius, and the naiad Lara, whom Lactantius and Auſonius call *Larunda*; Apuleius aſſures us, they were the poſterity of the Lemures; Nigridius, according to Arnobius, made them ſometimes the guardians and protectors of houſes, and ſometimes the ſame with the *Curetes* of Samothracia, which the Greeks call *Idæi dactyli*. Nor was Varro more conſiſtent in his opinion of theſe gods; ſometimes making them the names of heroes, and ſometimes gods of the air.

T. Tatius, king of the Sabines, was the firſt who built a temple to the *lares*. The chimney and fire-place in the houſe were particularly conſecrated to them.

Tertullian tells us, the cuſtom of worſhipping the *lares* aroſe from this, that they antiently interred their dead in their houſes; whence the credulous people took occaſion to imagine their ſouls continued there alſo, and proceeded to pay them divine honours.—To this it may be added, that the cuſtom being afterwards introduced of burying in the highways, they might hence take occaſion to regard them as gods of the highways. See COMPITALITIA.

The victim offered to the *lares*, in the public ſacrifices, was a hog: In private, they offered them wine, incenſe, a crown of wool, and a little of what was left at the table.—They alſo crowned them with flowers, particularly the violet, myrtle, and roſemary. Their ſymbol was a dog, which was uſually repreſented by their ſide, on account of its fidelity, and the ſervice it does to man, in watching his houſe. They were ſometimes alſo repreſented as clothed in a dog's ſkin. See PENATES.

See further on the *lares*, in Arnobius, Lactantius, Auguſtin *De Civit.* Natalis Comes, Lambin on *Plaut*. *Aulul.* and on *Hor.* Caſaubon on *Sueton.* &c.

The pantheons, or images repreſenting ſeveral gods at once, were alſo called *lares*.—Harpocrates was one of theſe. See PANTHEON.

LARGE, a ſea-term. See the article VEERING.

LARGE *Minion*. See the article MINION.

LARMIER, in architecture, a flat, ſquare, maſſive member of the cornice, between the cymatium and the ovolo; ſo called from its uſe, which is to diſperſe the water, and cauſe it to fall at a diſtance from the wall, drop by drop, or as it were, by tears; *larme*, in French, ſignifying a *tear*.—*See Tab. Architect. fig. 9. fig. 24. lit. d. fig. 28. lit. f.*

The *larmier* is alſo called *corona*; and in Engliſh, the *drip*. See CORONA, and CORNICHE.

LARYNGOTOMIA *, an inciſion in the trachea, or windpipe between two of its annuli, or rings, in order to give paſſage for the breath, when there is danger of ſuffocation from a ſquinancy, or the like. See ANGINA, and QUINZY.

* The word is Greek, Λαρυγγοτομια, formed of λαρυγξ, and τεμνω, *ſeco*, I cut.

Laryngotomy is the ſame with what is otherwiſe called *bronchotomy*. See BRONCHOTOMY.

Dr. Muſgrave obſerves, that in all medicine there is not one method that works ſo great a change, for the better, in ſo ſhort a time. However, it is ſeldom practiſed, in regard that gap which appears on the cutting a throat, (the divided parts being then drawn towards their more fixed ends) together with the great efflux of blood, when the jugulars and carotid arteries are alſo wounded, create in moſt men a dread of the operation, and make many believe all wounds of the trachea mortal. The ſame author makes no ſcruple, however, to ſay, it ought to be practiſed in quinzies, and other dangers of ſuffocation from cauſes of a like nature with them: from an extraordinary cure which he himſelf had wrought in this way.

LARYNX, Λαρυγξ, in anatomy, the upper part, or head of the trachea, lying below the root of the tongue, and before the pharynx. See TRACHEA.

The *larynx* is one of the organs of reſpiration, and the principal inſtrument of voice. See RESPIRATION, *&c.*

Its body is almoſt wholly cartilaginous, and it is to be conſtantly open to give room for the air to paſs and repaſs. Its figure is circular, though it jets out a little before, and is a little flatted behind, leſt it ſhould incommode the œſophagus, whereon it is placed.

The *larynx* is of different diameters, according to the different ages; in young people it is narrow; whence their voice comes to be acute; in thoſe more advanced in years, it is more ample, which occaſions their voice to be ſtronger and deeper. In men it is bigger than in women, for which reaſon mens voice is more grave than that of women.

It appears the leſs in women, in regard the glands ſituate at the bottom of the *larynx*, are bigger in women than in men. See VOICE.

The *larynx* moves at the time of deglutiiton; when the œſophagus is lowered for the reception of the food, the *larynx* raiſes itſelf to compreſs it, and facilitate its deſcent. See DEGLUTITION.

There are five kinds of parts belonging to the *larynx*, viz. *cartilages*, *muſcles*, *membranes*, *nerves*, and *glands*.—Its cartilages are the thyroides, cricoides, arytænoides, glottis, and epiglottis, by means of which it can eaſily dilate and contract, ſhut and open itſelf. Theſe form the whole body of the *larynx*, and grow dry and harden, in proportion as the perſon grows old, when the *larynx* ſometimes appears as if it were bony.

The biggeſt of theſe is the *thyroides* or *ſcutiformis*, this guards the forepart, and has its name from ſome ſuppoſed reſemblance it bears to a ſhield. It is of a concavo-convex ſquare figure, the hollow part being inward, and the gibbous outward, having a little prominence in the middle called *pomum Adami*, as if ſome of the forbidden fruit had ſtuck in Adam's throat, and occaſioned that ſwelling.

The ſecond is called *cricoides*, or *annularis*, from its reſemblance to a ring which the Turks put on their thumb for the drawing of their bows. The fore part of this is very narrow, coming under the other cartilage, but behind it is broad, thick, and ſtrong, being, as it were, the baſis of all the others.

The third and fourth are called *arytænoides*, or *guttales*, from the figure of an ewer, which theſe two together ſomewhat reſemble. At the juncture of theſe there is a little cleft, or chink, in form of a little tongue, and for that reaſon called *glottis*, or *lingula*. Through this chink the air deſcends into the lungs, and the pituitous matter ejected by coughing, in catarrhs, is let out. It ſerves alſo for modulating the voice, and is imitated in flutes and the pipes of organs. See GLOTTIS.

Over the glottis lies a fifth cartilage called the *epiglottis*, which is very thin and ſoft, and in non-adults almoſt membranous, concave on the under ſide, and convex on the upper: It defends the entrance of the *larynx*, and hinders the liquids, which in drinking ſlip over it into the œſophagus, from falling into the trachea. See EPIGLOTTIS.

The *larynx* has ſeven pair of muſcles, which ſerve to move its ſeveral cartilages, and to contract or dilate them at pleaſure; two pair of them are common, the other five proper: the proper are thoſe which have both their origination and inſertion in the *larynx*; the common have only their inſertion there.

Of the former kind are the cricothyroides, which moves the ſcutiform cartilage; the crico-arytænoides poſticum, which ſerves, by its contraction, to draw the arytænoides cartilage, and to open the rima. The third is the arytænoides; which ſerves to bring the two cartilages of that name together, and to ſhut the rima. The fourth is the crico-arytænoides laterale, and the fifth the thyreo-arytænoides, which ſhuts the *larynx*.

The common muſcles are the ſternothyroides, which ſerve to draw down the thyroide cartilage, and the hyothyroides, which lift up that cartilage.

The *larynx* has but two membranes, the one *external*, which is a continuation of that which covers the trachea; the other *internal*, which is the ſame that lines the whole mouth.

It receives two branches of nerves from the recurrents, and is moiſtned by four large glands, two ſituate above, called *tonſils*; and two underneath, called *thyroidæ*. See TONSIL, *&c.*

The *larynx* is of very conſiderable uſe, not only in forming and modulating the voice, by the different apertures of its rima, or chink, but alſo in compreſſing the lungs to a greater or leſs degree, by the air: for if the internal diameter of the *larynx* had been equal to that of the trachea, the lungs could have undergone little or no compreſſion at all; nor, conſequently, without the *larynx* could we have reaped any advantage from breathing, in regard the air would not have reſiſted that force wherewith it is driven out in expiration, nor, conſequently, could the compreſſion have been made in the lungs, which is found neceſſary for the comminution of the globules of the blood, and the mixing of the two fluids, air and blood, together. See RESPIRATION.

For the action of the *larynx* in ſound, ſee GLOTTIS, and SOUND; ſee alſo EPIGLOTTIS, TRACHEA, *&c.*

LASH, or LACE, in the ſea language, ſignifies *to bind*, or *make faſt*.

Laſhing is chiefly uſed for binding up to the ſhip's ſide, muſkets, butts of water or beer, or pieces of timber to make ſpare top-maſts.

LASHERS, are properly thoſe ropes only which bind faſt the tackles, and the breeches of the ordnance, when they are haled, or made faſt within board.

LASKING, a ſea term, for going large, or veering. See VEERING.

LASSITUDE, among phyſicians, expreſſes that wearineſs, or heavineſs of members, that proceeds from a diſtempered ſtate of body, and not from exerciſe; either from an increaſe of bulk, a diminution of proper evacuation, or too great a conſumption of that fluid which is neceſſary to maintain the force and ſpring of the ſolids, as in fevers and convulſions; or from a vitiated ſecretion of that juice, whereby the fibres are not ſupplied either in due quantity or quality.

The remedy, in the firſt caſe, is evacuation: in the latter proper diet, or ſuch alterative medicines as influences ſuch a ſecretion.

LAST, or LEST, in general, ſignifies the burden or load of a ſhip. See BURTHEN.

LAST, is alſo uſed for a certain weight and meaſure, which is various in ſeveral countries; though in the general, the *laſt* is eſtimated at four thouſand pounds weight. See WEIGHT.

A *laſt* of cod-fiſh, white herrings, meal, and aſhes for ſoap, is twelve barrels: Of corn, or rape-ſeed, ten quarters: Of gunpowder, twenty four barrels, or 2400 pounds weight: Of red herrings, twenty cades: Of hides, twelve dozen: Of leather, twenty dickers: Of pitch, or tar, fourteen barrels: Of wool, twelve ſacks: Of ſtock-fiſh, a thouſand: Of flax, or feathers, 1700 pounds weight.

LAST *Heir*, is he to whom lands come by eſcheat, for want of lawful heirs; which, in many caſes, is the lord whereof they are held, but in others the king. See HEIR, and ESCHEAT.

LAST *Will.* } See the article { WILL.
Port-LAST. } { PORT-*Laſt*.

LASTAGE, or LESTAGE, according to Raſtal, is a duty exacted in ſome fairs and markets, for carrying things bought where one will.

LASTAGE, according to another author, is properly that cuſtom which is paid for wares ſold by the *laſt*. See LAST.

In a law of Ric. II. *laſtage* is taken for the ballaſt or lading of a ſhip. See BALLAST, *&c.*

LASTAGE is ſometimes alſo uſed for garbage, rubbiſh, or ſuch filth.

LATE *Flowers*. See the article FLOWERS.

LATENT *Acids*. See the article ACID.

LATERAL. See COLLATERAL, MULTILATERAL, and QUADRILATERAL.

LATERAL *Equation*, in algebra, denotes a ſimple equation; or an equation whoſe root is only of one dimenſion. See EQUATION.

LATERAL *Palſy*. } See the article { PALSY.
LATERAL *Operation*. } { LITHOTOMY.

LATERALIS *Rectus Capitis*. See the article RECTUS.

LATERAN, was originally the proper name of a man, whence it deſcended to an ancient palace in Rome, and to the buildings ſince erected in its place; particularly a church called *S. John of Lateran*, which is the principal ſee of the popedom. See POPE.

Councils of the LATERAN, are thoſe held in the baſilica of the *Lateran*: Of theſe there have been five, held in 1123, 1139, 1179, 1215, and 1513. See COUNCIL.

Canons Regular of the Congregation of the LATERAN, is a congregation of regular canons, whereof that church is the principal place, or ſeat.

It is pretended, there has been an uninterrupted ſucceſſion of clerks, living in community from the time of the apoſtles; and that a number of theſe were eſtabliſhed in the *Lateran* in the time of Conſtantine. But the canons were not introduced till the time of Leo I. and theſe held the church 800 years, till the reign of Boniface, who took it from them, and placed ſecular canons in their room: 150 years after, the regulars were reinſtated. See CANON.

A LATERE, a Latin term, uſed to denote the qualification of cardinals whom the pope ſends as legates into foreign courts; who are called cardinals *à latere*, as being his holineſs's counſellors in ordinary, and aſſiſtants. See LEGATE.

The guards of princes were heretofore called *laterones*, becauſe always attending at their ſides, *à latere*.

Du Cange, in his *Gloſſary*, ſays, there were antiently counts *à latere*, and monitors *à latere*.

LATH *, in building, a long, thin, narrow ſlip of wood, nailed on the rafters of a roof, to ſuſtain the covering.

Laths are divided into three kinds, with regard to the different woods they are made of, viz. *heart of oak laths*, *ſap laths*, and *deal laths*: The two laſt uſed only for ceiling and partitioning, and the firſt only for tyling. — *Laths* are alſo diſtinguiſhed, with regard to their length, into *five* foot, *four* foot, and *three* foot *laths*: though the ſtatute allows but of two lengths, *viz.* thoſe of five foot and of three, each of which are to be an inch and half in breadth, and half an inch in thickneſs.

LATHE, or LEATHE, a very uſeful engine for the turning of wood, ivory, metals, and other materials. See TURNING.

The invention of the *lathe* is very ancient: Diodorus Siculus ſays, the firſt who uſed it was a grandſon of Dædalus, named Talus. Pliny aſcribes it to Theodore of Samos, and mentions one Thericles, who rendered himſelf very famous by his dexterity in managing the *lathe*.

With this inſtrument the antients turned all kinds of vaſes, many whereof they enriched with figures and ornaments in baſſo relievo. Thus Virgil:

Lenta quibus torno facili ſuperaddita vitis.

The Greek and Latin authors make frequent mention of the *lathe*; and Cicero calls the workmen who uſed it, *vaſcularii*.

It was a proverb among the antients, to ſay a thing was formed in the *lathe*, to expreſs its delicacy and juſtneſs.

The *lathe* is compoſed of two wooden cheeks, or ſides, parallel to the horizon, having a groove or opening between; perpendicular to theſe, are two other pieces, called *puppets*, made to ſlide between the cheeks, and to be fixed down at any point at pleaſure. See CHEEK.

Theſe have two points, between which the piece to be turned is ſuſtained; the piece is turned round, backwards and forwards, by means of a ſtring put round it, and faſtned above to the end of a pliable pole, and underneath to a tredle or board moved with the foot. There is alſo a reſt which bears up the tool, and keeps it ſteady.

As it is the uſe and application of this inſtrument that makes the greateſt part of the art of turning, we refer the particular deſcription thereof, as well as the manner of applying it in various works, to that head. See TURNING.

LATHE, in law. See the article LETH.

LATIAR,* a feaſt or ceremony inſtituted by Tarquinius Superbus, in honour of Jupiter Latiaris, or Latialis.

Tarquin, having made a treaty of alliance with the Latins, propoſed, in order for perpetuating it, to erect a common temple, where all the allies, the Romans, Latins, Hernici, Volſci *&c.* ſhould aſſemble themſelves every year, hold a kind of fair, exchange merchandizes, feaſt, ſacrifice, and make merry together.—Such was the inſtitution of the *latiar*.

The founder only appointed one day for this feaſt; the firſt conſuls added another to it, upon concluding the peace with the Latins; a third was added, after the people who had retired to the Mons Sacer were returned to Rome, and a fourth after appeaſing the ſedition raiſed on occaſion of the conſulate, in which the people would needs have a ſhare.

Theſe four days were called the *Latin feriæ*, and every thing done during the courſe of theſe feriæ, as feaſts, ſacrifices, offerings, *&c.* were called *latiares*. See FERIÆ.

LATICLAVIUM, or LATUS-CLAVUS, a garment of diſtinction and dignity among the Romans; contradiſtinguiſhed from the *anguſticlavium*. See ANGUSTICLAVIUM.

The *laticlavium* was a kind of tunic, or long coat, faced with one, or two ſlips of purple, applied lengthwiſe to the two ſides of the tunic.

In the *latus-clavus* theſe ſlips were pretty broad, and in the anguſtus-clavus narrower; though there is nothing about which the learned differ more, than the difference between thoſe two habits.

There were buttons ſet on the *latus-clavus*, which appeared like the heads of large nails; whence ſome think it took its name.

The ſenators, prætors, and the chief magiſtrates of colonies and municipal cities, had a right to wear it. The robe called *prætexta*, was worn over the *latus-clavus*. When the prætor pronounced ſentence of death, he put off the prætexta, but retained the *latus-clavus*. See PRETEXTA.

---

* Theſe are what Feſtus calls *ambrices*; in other Latin writers they are denominated *templa*; and by Gregory of Tours, *ligaturæ*.

LATIN, a dead language, firſt ſpoken in Latium, and afterwards at Rome; and ſtill uſed in the Romiſh church, and among men of letters. See LANGUAGE.

Some authors rank the *Latin* among the number of original languages, but by miſtake: it is formed principally from the Greek, and particularly the Æolic dialect of that tongue; though it has a great number of words which it borrowed from the languages of the Etruſci, Oſci, and other antient people of Italy; and foreign commerce and wars, in courſe of time, added a great many more.

The *Latin* is a ſtrong, robuſt language, perfectly ſuitable to the character of the people who ſpoke it. We have, ſtill, works of every kind, admirably well written in *Latin*, though there are an infinite number loſt. The *Latin* is more figurative than the Engliſh, leſs pliant than the French, leſs copious than the Greek, leſs pompous than the Spaniſh, leſs delicate than the Italian, but cloſer and more nervous than any of them.

For a while, the *Latin* tongue was confined almoſt wholly within the walls of Rome; nor would the Romans allow the common uſe of it to their neighbours, or to the nations they ſubdued.—Cicero obſerved, that, even in his time, Greek was uſed almoſt among every people, but the *Latin* only confined to a very narrow compaſs; *Græca leguntur in omnibus ferè gentibus, Latina ſuis finibus exiguis ſanè continentur*. By degrees they were brought to grant the uſe of it as a favour; and in time became ſenſible of the neceſſity there was of its being generally underſtood, for the conveniency of commerce; and accordingly uſed their utmoſt endeavours, that all the nations ſubject to their empire, ſhould be united by one common language: ſo that at length they impoſed that as a law, which they had before granted as a favour.

After the tranſlation of the ſeat of the empire from Rome to Conſtantinople, the emperors of the eaſt, being always deſirous of retaining the title of Roman emperors, appointed the *Latin* to be ſtill retained in uſe, both in their reſcripts and edicts, as appears by the conſtitutions of the eaſtern emperors, collected in the Theodoſian Code: But at length the emperors neglecting the empire of the weſt, abandoned all care of the *Latin* tongue, and allowed their judges to paſs ſentence in Greek; and accordingly, we find the emperor Juſtinian's *Novels* compoſed in Greek.

Charlemagne coming to the empire of the weſt, appointed the law proceedings in ſovereign courts to be in *Latin*; and the notaries were to draw their acts and inſtruments in the ſame tongue: This practice continued a long time through a great part of Europe, but at length it gave way, and the French took place of the *Latin*, not only in France, but in ſome meaſure in England too; and the reaſon given for it was, that abundance of difficulties aroſe about the underſtanding of *Latin* terms.

The *Latin*, however, was prodigiouſly degenerated and corrupted, ere it came to be laid aſide. The incurſions of the Goths and Vandals into Italy, brought an inundation of foreign words and phraſes into it; inſomuch that Valla and Naude call Boethius the laſt *Latin* author. But that was not all; when it once got into the courts of juſtice, it was ſtill worſe handled; till at laſt being introduced amongſt the monks, and become the common language of miſſals and breviaries, it was debauched to that degree, that it was almoſt become ſcandalous to uſe it.

In this condition it was found at the time of the Reformation; when Vives, Eraſmus, &c. began to open the way for its recovery; ſince which time, monkiſh latinity has been declining, and all endeavours have been uſed to retrieve the pure language of the Auguſtan age.

It was ſaid of cardinal Bembo, that he would never read the Breviary, for fear of corrupting his fine *Latin*.

LATIN *Church*, is a term uſed for the Romiſh or weſtern church, by way of oppoſition to the Greek church. See CHURCH, GREEK, &c.

LATIN *Bibles*. } See the article { BIBLE.
LATIN *Character*. } See the article { CHARACTER.

LATISSIMUS *Dorſi*, in anatomy, a muſcle ſo called from its ſhape, covering almoſt the whole back.

It has a thin, broad, tendinous beginning, which comes from the poſterior part of the ſpine of the ilium, from the ſuperior ſpines of the os ſacrum, from all the ſpines of the vertebræ of the loins, and from the ſeven lower of the thorax; it paſſes by the inferior angle of the ſcapula, from which ſome of its fleſhy fibres ſometimes ariſe, and is inſerted with the teres major, by a ſtrong and broad tendon, with which it pulls the arm downwards.

It is alſo called *ani ſcalptor*, becauſe it carries the arm to the anus.—*See Tab. Anat. (Myol.) fig.* 6. *n.* 28.

LATITAT *, a writ, whereby all men in perſonal actions are called originally to the King's Bench.

* It has this name, as ſuppoſing the defendant lurks, lies hid, and cannot be found in the county of Middleſex, to be taken by bill; but is gone to ſome other county, to the ſheriff whereof this writ is directed.

LATITUDE, LATITUDO, in geography, the diſtance of a place from the equator; or an arch of the meridian intercepted between the zenith of the place and the equator.—Hence, *latitude* is either *northern* or *ſouthern*, according as the place whoſe *latitude* is ſpoke of, is on this, or that ſide, of the equator.—Thus, London is ſaid to be in 51 degrees, 32 minutes, northern *latitude*.

Circles parallel to the equator are called *parallels of latitude*, becauſe they ſhew the *latitudes* of places by their interſection with the meridian. See PARALLEL.

If through the poles of the world we conceive innumerable great circles drawn, theſe are called *ſecondaries* of the equator; and by their help, the poſition of every point, either on earth, or in the heavens, with regard to the equinoctial (that is, the *latitude* of any point) is determined. See SECONDARY.

One of theſe ſecondaries paſſing through any place on the earth's ſurface, is called the *meridian* of that place, and on it the *latitude* of that place is meaſured. See MERIDIAN.

The *latitude* of a place, and the elevation of the pole of that place above the horizon, are terms uſed indifferently for each other, in regard the *latitude* and the elevation of the pole are always equal. See POLE, and ELEVATION.

This will appear from *Tab. Geography, fig.* 5.—where the circle HZQ repreſents the meridian, HO the horizon, ÆCQ the equator, Z the zenith, and P the pole.

Here, the *latitude* of the place, or its diſtance from the equator, is the arch ZÆ, and the elevation of the pole, or its diſtance from the horizon, the arch PO.—Now the arch PÆ between the pole and the equator, is a quadrant of a circle, and the arch ZO, from the zenith to the horizon, is likewiſe a quadrant. Therefore the two arches, PÆ and ZO, muſt be equal; and taking away the arch ZP, which is common to both, there will remain the arch ZÆ, equal to the arch PO; that is, the *latitude* of the place equal to the pole above the horizon.

Hence we have a method of meaſuring the circumference of the earth, or of determining the quantity of a degree on its ſurface; for by going directly northward or ſouthward, till the pole be elevated one degree more or leſs, and then meaſuring that interval accurately, we ſhall have the number of miles in a degree of a great circle of the earth's globe. See DEGREE.

The knowledge of the *latitude* of the place is of the utmoſt conſequence, both in geography, navigation, and aſtronomy: The methods of determining it, both at ſea and land, are as follow:

The altitude of the pole, it has been already ſhewn, is always equal to the *latitude*; for which reaſon the *latitude* might be beſt found by obſerving the pole's heighth: But in regard the pole is only a mathematical point, and no ways to be obſerved by our ſenſes, its heighth cannot be determined in the ſame manner as that of the ſun and ſtars, &c. for which reaſon, another manner has been contrived.

In order to this, a meridian line is firſt drawn; the method of doing which, ſee under the word MERIDIAN.

Place a quadrant on this line, ſo as its plane may be in the plane of the meridian; then take ſome ſtar near the pole, *v. gr.* the pole ſtar, which never ſets, and obſerve both its greateſt and leaſt altitude. See QUADRANT.

Let the greateſt, *v. gr.* be SO, (*Tab. Geography, fig.* 5.) and the leaſt *s*O; the half of which PS or P*s*, deducted from the greateſt altitude SO, or added to the leaſt *s*O, will give PO, the altitude of the pole above the horizon, which is equal to the *latitude* of the place.

The *latitude* may alſo be found, by having the ſun's, or a ſtar's declination, and meridian altitude, taken with a quadrant or aſtrolabe.—The method is this:

Obſerve the meridian diſtance of the ſun from the vertex or zenith, which is always the complement of his meridian altitude: and add to this the ſun's declination, when the ſun and the place are on the ſame ſide the equator, or ſubtract the declination when they are on different ſides: the ſum, in the former caſe, and the difference in the latter, will be the *latitude* required. But when the declination of the ſun is greater than the *latitude* of the place, which is known from the ſun's being nearer to the elevated pole than the vertex of the place is, as it frequently happens in the torrid zone; then the difference between the ſun's declination, and his zenith diſtance, is the *latitude* of the place.

If the ſun, or ſtar, have no declination, but move in the equinoctial that day, then the elevation of the equator will be equal to his meridian altitude, and conſequently his meridian altitude is the complement of the *latitude* to 90.

This latter method is beſt accommodated to the uſes of navigation, as being practicable at ſea; but the former method preferable at land.

LATITUDE, in aſtronomy, is the diſtance of a ſtar or planet from the ecliptic.

Or, it is an arch of a great circle, TS (*Tab. Aſtron. fig.* 14. *n.* 2.) intercepted between the centre of the ſtar S, and the ecliptic EL; and perpendicular thereto.

Through the poles of the ecliptic are ſuppoſed to paſs an indefinite number of great circles, cutting the ecliptic at right angles, called *circles of latitude*, or ſecondaries of the ecliptic: By means of which, every ſtar and point of the heavens is reduced to the ecliptic, and has its place in regard thereto determined; the *latitude* of a ſtar being an arch of one of theſe ſecondaries, intercepted between that ſtar and the point where it interſects the ecliptic.

In which the *latitude* differs from the *declination*, which is the diſtance of a ſtar from the equator towards one of the poles of the world. See DECLINATION.

So that the geographical *latitude* is the ſame thing with the aſtronomical declination, and the aſtronomical *latitude* a quite different thing.

The *latitude* of a planet is an angle, as PTR, (*Tab. Aſtronomy, fig.* 26.) under which a planet's diſtance from the ecliptic PR is ſeen on the earth.

The ſun never has any *latitude*, but the planets have: for which reaſon, in the common ſphere the zodiac has ſome breadth.—The ancients only allowed ſix degrees on each ſide the ecliptic, but the moderns have extended it to nine.

According to the obſervation of ſome of the modern aſtronomers, the greateſt *latitude* of the planets is not always the ſame; but Venus never exceeds 9 degrees northern *latitude*; Mercury 5 degrees; the Moon in her quadrant with the Sun 5 degrees; Saturn 2 degrees, 50 minutes; Jupiter one degree, 50 minutes; Mars 7 degrees, 31 minutes.

When they have no *latitude*, they are ſaid to be in the *nodes* of the ecliptic, or in the interſection of their orbit with that of the ſun; and in this ſituation it is that they eclipſe, or are eclipſed by the ſun. See NODE, and ECLIPSE.

Circle of **LATITUDE**, is a great circle, MST *m*, paſſing through the poles of the ecliptic. See CIRCLE.

North aſcending **LATITUDE** of the moon, is when ſhe proceeds from the aſcending node towards her northern limit, or greateſt elongation. See MOON, &c.

North deſcending **LATITUDE**, is when the moon returns from her northern limit to the aſcending node.

South deſcending **LATITUDE**, is when ſhe prooeeds from the deſcending node to her ſouthern limit.

South aſcending **LATITUDE**, is when ſhe returns from her ſouthern limit to her aſcending node.

And the ſame holds good of the other planets. See ASCENDING, and DESCENDING.

Heliocentric **LATITUDE** of a planet, is its diſtance from the ecliptic, ſuch as it is ſeen from the ſun.

This, when the planet comes to the ſame point of its orbit, is always the ſame, and unchangeable.

Geocentric **LATITUDE** of a planet, is the diſtance of the planet from the ecliptic, as it is ſeen from the earth.

This, though the planet be in the ſame point of its orbit, yet is not conſtantly the ſame, but alters according to the poſition of the earth, in reſpect to the planet. See HELIOCENTRIC, and GEOCENTRIC.

Dr. Halley has ſome conſiderations in the *Philoſophical Tranſactions*, which make it probable, the *latitudes* of ſome of the principal fixed ſtars, particularly Palilicium, Sirius, and Arcturus, alter in time; whence it may be argued, the reſt likewiſe alter, though the variation may be leſs conſpicuous in theſe, by reaſon they are ſuppoſed at a greater diſtance from us. See STAR.

Parallax of **LATITUDE**. } See the article { PARALLAX.
Refraction of **LATITUDE**. } { REFRACTION.

LATITUDINARIAN, among divines, ſignifies a *moderate perſon*, not over-cloſely tied to any religious opinions, but who thinks there is a breadth, or latitude, in the road to heaven; which may admit people of different perſuaſions. See ADIAPHORIST, TOLERATION, &c.

LATOMIA *, Λατομια, properly ſignifies a *quarry*, or place whence ſtones are dug. See QUARRY.

* The word comes from the Greek λας, ſtone, and τεμνω, I cut.

Theſe were anciently uſed as goals for criminals.—Dionyſius had a place of this kind dug in a rock near Syracuſe, where an infinite number of people were ſhut up. Cicero reproaches Verres with impriſoning Roman citizens in *latomiæ*; ſo that *latomia* became a general name for a priſon, and the priſoners incloſed in them were called *latomarii*.

LATRIA, Λατρεια in theology, a religious worſhip due only to God. See WORSHIP, ADORATION, &c.

The Romaniſts ſay, 'They honour God with the worſhip 'of *latria*; and the ſaints with the worſhip of *dulia*:' but the terms, however diſtinct, are uſually confounded. See SAINT, RELIC, &c.

The worſhip of *latria*, beſides its inner characters, has its external marks to diſtinguiſh it; the principal whereof is ſacrifice, which cannot be offered to any other but God himſelf, as being a ſolemn acknowledgment, or recognition of the ſovereignty of God, and our dependance on him. See SACRIFICE.

M. Daille ſeems to own, that ſome of the fathers of the fourth century allowed the diſtinction between *latria* and *dulia*.

LATUS *rectum*, in conics, the ſame with *parameter*. See PARAMETER.

LATUS *tranſverſum* of the hyperbola, is a right line intercepted between the vertices of the two oppoſite ſections; or that part of the common axis, which is between the vertices of the upper and lower cone.

Such is the line ED, (*Tab. Conics, fig.* 1.) where alſo D *d*, and E *e*, may be the parameters, or *latus rectums*, belonging to the two oppoſite ſections, DLRO, and OEOR.

To this *latus tranſverſum* anſwers the longeſt diameter in the ellipſis; which Apollonius calls the *tranſverſe axis*, or *diameter*. See TRANSVERSE.

LATUS *primarium*, is a right line belonging to a conic ſection, drawn through the vertex of the ſection of the cone, and within it; as the line EE, or DD, in the figure above referred to.

LAVATORY, or **LAVADERO**, a name given to certain places in Chili, and Peru, where gold is got out of earth by waſhing. See GOLD.

M. Frezier gives us the following deſcription of the *lavatories* of Chili: they dig deep into the earth, in ſuch places as they have reaſon to expect gold in; and in order to facilitate this digging, turn a ſtream of water upon the ſpot, looſening the earth as much as poſſible all the time, that the current may have the greater effect, and tear up the earth more ſtrongly. When they are got to the earth they want, they turn off the ſtream, and dig dry.

The earth that they now get, is carried on mules, and diſcharged into a baſon, made ſomewhat in the manner of a ſmith's bellows; into which a little rivulet of water runs with a great deal of rapidity, diſſolving the parts of the earth, and carrying every thing away with it, excepting the particles of gold, which, by their great weight, precipitate to the bottom of the baſon, and mix with a fine black ſand, where they are almoſt as much hidden, as they were before in the earth.

Sometimes, they find very conſiderable pieces in *lavatories*, particularly pieces of twenty four ounces each.—There are ſeveral *lavatories*, where they find pepitas, or pieces of virgin gold, of a prodigious ſize. Among others, they tell of one that weighed 512 ounces, bought by the count de la Moncloa, viceroy of Peru.

Nine or ten leagues to the eaſt of Coquimbo, are the *lavatories* of Andacoll, the gold whereof is twenty three carats fine.—Their work, here, always turn to great profit, excepting when the water fails them.—The natives maintain that the earth is creative, (*creatrix*) that is, it produces gold continually; becauſe, after having been waſhed ſixty or eighty years, they find it impregnated afreſh, and draw almoſt as much out of it as at firſt.

LAUDANUM, a name given by the chymiſts to certain preparations, chiefly extracts, of opium; by reaſon of their excellent qualities: as who ſhould ſay, *laudandum*, from *laudare*, to praiſe. See OPIUM.

We have divers kinds of *laudanum*; as Sydenham's *liquid laudanum, tartarized liquid laudanum*, &c.

LAUDS, **LAUDES**, the ſecond part of the ordinary office of the Breviary, ſaid after mattins; though heretofore it ended the office of the night. See MATTINS, and BREVIARY.

The *laudes* conſiſt principally of pſalms, hymns, &c. whence they took their name: from *laus, laudis*, praiſe.

LAUGHTER, an action, or paſſion peculiar to man. See RISIBILITY.

Authors attribute *laughter* to the fifth pair of nerves, which ſending branches to the eye, ear, lips, tongue, palate, and muſcles of the cheek, parts of the mouth, præcordia, &c. there hence ariſes a ſympathy, or conſent, between all theſe parts; ſo that when one of them is acted upon, the others are proportionably affected. See CONSENT.

Hence a ſavoury thing ſeen, or ſmelt, affects the glands, and parts of the mouth; a thing ſeen, or heard, that is ſhameful, affects the cheeks with bluſhes: on the contrary, if it pleaſe and tickle the fancy, it affects the præcordia, and muſcles of the mouth and face with *laughter*; if it cauſe ſadneſs and melancholy, it likewiſe affects the præcordia, and demonſtrates itſelf by cauſing the glands of the eyes to emit tears.

Dr. Willis accounts for the pleaſure of kiſſing from the ſame cauſe, the branches of this fifth pair being ſpread to the lips, the præcordia, and the genital parts; whence ariſes a ſympathy between thoſe parts.

LAUNCH, in the ſea phraſe, is *to put out*: thus they ſay, *launch the ſhip*; that is, put her out of the dock, or out of the key, &c.

LAURA *, a name given to the reſidences of the ancient monks. See MONK.

* The word is originally Greek λαυρα, where it primarily ſignifies *village, ſtreet*, or *hamlet*.

Authors cannot agree about the difference between a *laura* and a monaſtery: ſome pretend, that a *laura* was a monaſtery wherein there lived, at leaſt, a thouſand monks; but this is in no wiſe credible. The more natural opinion is, that the ancient monaſteries were the ſame with the modern, conſiſting

ing of large buildings, divided into halls, chapels, and cells poſſeſſed by the monks, each of whom had his apartment; but the *lauræ* were a kind of villages, whereof each ſeveral houſe was inhabited by one or two ſeveral monks at the moſt: ſo that the houſes of the chartreux ſeem, in ſome meaſure, to repreſent the ancient *lauræ*, and thoſe of the other monks, proper monaſteries. See MONASTERY, CARTHUSIAN, *&c.*

The term *laura* was only underſtood of the religious places in Egypt, and the Eaſt, where their houſes ſtood apart from each other, and were not joined by any common cloiſter, the monks that inhabited them only meeting in public once a week. See HERMIT, ANACHORET, *&c.*

LAUREATION, a term in the Scottiſh univerſities uſed for the act of taking up the degree of a maſter of arts, to which the ſtudents are admitted after four years ſtudy in the univerſity. See MASTER.

LAURENCE.—*Canons of S. Laurence*, an order of regular canons, ſo called from the monaſtery of S. Laurence d'Oulx in Dauphine. See CANON.

This congregation is ſaid to have been founded by S. Benedict. It was deſtroyed by the Vandals, and continued uninhabited till the middle of the eleventh century. In 1057, Odo, count of Savoy, gave it to one Gerard, and his Canons. This donation was confirmed in 1065, by Cunibert, biſhop of Turin, who added to it above forty other churches. By which means a very conſiderable congregation was formed, to whom the ſucceeding popes, and counts of Savoy, granted a great many privileges.

It had thirty priories; the chief, who is the prior of the congregation, bears the title of provoſt, and exerciſes a ſpiritual juriſdiction throughout his provoſtſhip.

LAURENTALIA*, or LARENTALIA, called alſo *larentinalia*, *laurentales*, and *larentales*; feaſts celebrated among the Romans on the tenth of the calends of January, or twenty third of December, in memory of Acca Laurentia, wife of the ſhepherd Fauſtulus, and nurſe of Romulus and Remus.

* Acca Laurentia, from whom the ſolemnity took its name, is repreſented as no leſs remarkable for the beauty of her perſon, than her laſciviouſneſs: on account of which, ſhe was nicknamed by her neighbours, *lupa*, ſhe wolf; which is ſaid to have given riſe to the tradition of Romulus and Remus being ſuckled by a wolf.—She afterwards married a very rich man, who brought her great wealth; which, at her death, ſhe left to the Roman people; in conſideration whereof they performed her theſe honours: thongh others repreſent the feaſt as held in honour of Jupiter Latiaris.

LAW*, a command, or precept, coming from ſome ſuperior authority, which an inferior is obliged to obey; or, more properly, a command, or mandate of ſome perſon, or power, whoſe precept carries with it the reaſon of obedience.

* The word is formed from the Saxon lah, laȝa, which ſignifies the ſame.

Thus, the commands of God, with reſpect to men, of a city, with reſpect to the citizens, and univerſally of all powerful beings, in reſpect to thoſe who cannot reſiſt, are called their *laws*.

The nature of a *law* will be moſt clearly diſcovered, by ſhewing wherein it differs from *covenant*, *counſel*, and *right* or *equity*; with all which it is frequently confounded. The difference between a council and a *law*, will be beſt determined from the difference between counſel and command. A counſel is a precept, wherein the reaſon of obedience is taken from the thing itſelf preſcribed; a command is a precept, wherein the reaſon of obedience depends on the will of the preſcriber; for we cannot properly ſay, *ſic volo, ſic jubeo*, unleſs *ſtet pro ratione voluntas.* But ſince in *laws* we do not obey for the ſake of the thing itſelf, but for the ſake of the perſon who preſcribes it, a *law* is not properly a counſel, but a command. A *law* comes from a perſon who has a power over thoſe whom he commands; a counſel, from him who has no ſuch power. To do what is enjoined by a *law*, is an act of duty; what by a counſel, an act of choice, or free-will. A counſel is directed to his advantage who receives it, a *law* to his who gives it. A counſel only takes effect over thoſe who are willing; a *law*, over thoſe that are unwilling. Laſtly, the authority of the counſellor is taken away at the diſcretion of him to whom the counſel is given; but the authority of the legiſlator is not taken away at the diſcretion of him on whom the *law* is impoſed.

Law is always confounded with covenant, by thoſe who take *laws* to be nothing elſe but ὁμολογηματα, or forms of living determined by the conſent of mankind: among whom is Ariſtotle, who defines a *law*, 'A declaration determined by the 'common conſent of a city, ſhewing in what manner things 'are to be done;' which is not ſo much the definition of a *law*, as of a *civil law*: nor yet properly of a civil *law*; for this common conſent is no more than a mutual covenant, which does not oblige any perſon, and conſequently is not any *law*, till ſome ſupreme power be conſtituted with a power to compel, and to make it penal to tranſgreſs it. Here then the covenant is confounded with the *law*, which leads into abſurdities; for a covenant is a promiſe; a *law*, a command. In a covenant it is ſaid, *I will do*; in a *law*, *do.* By a covenant we are obliged, (that is, we muſt perform according to our promiſe) by a *law* we are preſerved under that obligation, (that is, we are forced to perform, for fear of the puniſhment awarded by it;) a covenant obliges by itſelf, a *law* preſerves the obligation by force. In a covenant, therefore, we conſider what is to be done ere we be obliged to do it; in a *law* we are obliged to do, in the firſt place, and what is to be done is determined afterwards.

Law is confounded with right or equity, by thoſe who perſiſt in doing what is permitted by the *divine law*, though prohibited by the *laws* of the country. What is prohibited by the *divine law*, cannot be permitted by the *civil law*; nor what is commanded by the *divine law*, be prohibited by the *civil law*; but what is permitted by the *divine law*, may, notwithſtanding, be prohibited by the *civil law*: for the inferior *laws* have a power of reſtraining the liberty left the ſuperior *laws*, though they cannot enlarge it. Now right or equity is a natural liberty, not conſtituted by *laws*, but free of them; for take away *laws*, and liberty is compleat. This liberty is firſt reſtrained by the *natural* and the *divine law*, the reſt reſtrained by the *civil laws*; and what remains unreſtrained by the *civil law*, may be again reſtrained by the conſtitutions of particular cities, and ſocieties. There is a great difference, therefore, between *law* and right, *lex & jus*; for *law* is a chain, but right, a liberty; and they differ as two contraries. See RIGHT.

Law may be divided, with reſpect to its different authors, into *divine*, and *human*.

Divine LAW may be conſidered as twofold, with reſpect to the two different manners in which God notifies his will to man, viz. *natural*, (or *moral)* and *poſitive*.

Natural LAW, is that which he has made known to all mankind, by that innate light, called *natural reaſon.*

Poſitive LAW, is that which he has revealed by his prophets; as thoſe *laws* delivered to the Jews, relating to the divine worſhip, and polity, which may be called *divino-civil laws*, as being peculiarly directed to that people.—Again,

Natural law may be divided into that *natural law* of men, which, in a peculiar ſenſe, is called *the* LAW *of nature:* and the *natural law* of countries, commonly called *the* LAW *of nations.*—The precepts are the ſame in both: but becauſe, when ſocieties are once inſtituted, certain perſonal properties become veſted in men; that *law*, which, when we ſpeak of the duties of men ſeverally, we call *the natural law*; when transferred to cities, or countries, we call *the law of nations.*

M. Regis ſays, that the *laws* of nature are the dictates of right reaſon, which teach every man how he is to uſe his natural right; and the *laws* of nations, the dictates, in like manner, of right reaſon, which teach every ſtate how to act and behave themſelves towards others.

Human LAWS are all civil. See the article CIVIL.

For, according to Hobbes, the ſtate of man, out of ſociety, is a ſtate of war; wherein, no one being ſubject to another, there can be no other *law* beſides the dictates of natural reaſon, which is the *divine law.*

Civil LAWS may be divided, with regard to the difference of their ſubject matter, into *ſacred*, and *ſecular.*

Sacred LAWS, are thoſe that relate to religion; that is, to the ceremonies and worſhip of the Deity, and which are not preſcribed by any poſitive divine *law.*

Secular LAWS, are thoſe that relate to property, *&c.* commonly called by the name *civil.*—Further,

Civil laws, conſidered with regard to the two offices of the legiſlator, *viz.* to judge, and to compel, may be divided into two branches; the one *diſtributive*, the other *vindictive*, and *penal.*

Diſtributive LAW, is that by which every man has his right; or, it is that which conſtitutes the rules and meaſures of things, whereby we know what belongs to us, and what to others; ſo as we may not diſturb or interrupt others in the enjoyment of their own, nor be interrupted by them; and what each man may lawfully do, or not do.

Vindictive LAW, is that branch by which the puniſhments to be inflicted on thoſe who violate the *laws*, are determined.

The diſtributive, and vindictive, are not two ſpecies of *laws*, but two parts of the ſame *law*. For if a *law* ſay no more than 'Whatever you catch in your net, in the ſea, ſhall be 'yours,' it is in vain; for though another take from you what you have caught, it is ſtill yours; in regard, in the ſtate of nature, where all things are common, yours, and another's are the ſame thing. So that what the *law* defines to be yours, was yours before that *law*, and will be yours after it, though poſſeſſed by another.—A *law*, therefore, is but an empty ſound, unleſs it determine the thing to be yours in ſuch a ſenſe, as to forbid every body elſe from diſturbing you in the poſſeſſion of it. But ſuch prohibition will be vain, unleſs there be a penalty annexed to it—A *law*, therefore, muſt contain both theſe parts, that which prohibits, and that which puniſhes. The firſt whereof, which is called *diſtributive*, is prohibitory, and ſpeaks to all: the latter, called *vindictive*, or *penal*, is mandatory, and ſpeaks only to the public officers. Whence it follows, that to all *civil laws* there is annexed a penalty, either implicitly, or explicitly: and where that puniſhment is not aſcertained, either by writing, or by example, it is ſuppoſed to be arbitrary, and to depend on the pleaſure of the legiſlator; for that is no *law* which may be violated impunè.

Civil laws, conſidered with regard to the different manners of promulgating them, are of two kinds; *ſcriptæ*, and *non-ſcriptæ*, or *written*, and *unwritten*.

Written LAWS, are thoſe which require either the voice, or ſome other ſign of the legiſlator's will, to become *laws*.

Unwritten LAWS, are ſuch as need no other promulgation beſides the voice of nature, or natural reaſon; of which kind are all natural *laws*.

Hence it appears, that though the natural *laws* be deſcribed in the writings of philoſophers, they are not therefore to be called *written laws*. Nor are the writings of lawyers, *laws*, for want of the ſupreme authority: nor the *reſponſam prudentum*, or opinions of judges, *laws*, excepting ſo far as they are allowed by the ſupreme power to paſs into uſe; and then they are called *leges ſcriptæ*, written laws; not becauſe of their uſe, but becauſe of the will of the ſupreme power, which is argued from their paſſing into uſe.

The firſt principle, or *law* of nature, according to Hobbes, is ſelf-preſervation.—Thomaſius will have it to be our own happineſs, which falls in at laſt with the ſentiment of Hobbes. Puffendorf maintains it to be ſociality.—Valentine Alberti, the belief that we are the image of God.—Henry and Samuel Cocceius, the will of God.—Grotius, right reaſon. —Velthemius, the intrinſic decency, or turpitude of actions. —Strimeſius and Janus, that we are to love God, ourſelves, and our neighbour.

LAW is alſo applied to the ſeveral policies of ſtates and people, or the maxims and rules they have agreed upon, or received from their magiſtrates, whereby to live in peace and mutual ſociety.

The *laws* of the twelve tables, were the antient *laws* of the Romans, for which the Decemviri were ſent into Greece, and which ſerved them for the ground-work of all their juriſprudence. See TABLE, and ROMAN.

The celebrated *laws* of the more modern days, are thoſe of the Angli, the Werini, or Thuringi; of the Boii, or Bavarians; thoſe of the Burgundi, Germans, Danes, and Norwegians; of the Franks, the Friſons, the Lumbards, the Gothic *laws*, the Martian, or Mercian *law*; the *laws* of the Saxons, Scots, Sicilians, Viſigoths; the *laws* of Oleron, the Molmutin *law*, and the Salic *law*. See SALIC, SUMPTUARY, &c.

LAW, *Lex*, among the firſt Romans, properly ſignified an ordinance of the people, made at the requeſt of a magiſtrate, particularly a conſul.

Theſe ordinances differed from the plebiſcita, and ſenatusconſulta, and even from other ordinances made at the requeſt of any other magiſtrate beſide a conſul, though thoſe too bore the names of *laws*.

Thus, though Aquilius and Falcidius were only tribunes when they made their requeſt, yet we ſtill ſay, the *Aquilian law*, the *Falcidian law*, &c.

The ſeveral *laws* of the Romans are diſtinguiſhed, 1°. By the name of him at whoſe requeſt they were paſſed; as the *Cornelian law*, the *Julian law*, &c.—2°, By the matter or ſubject of the *law*; and hence came the terms *Teſtamentary laws*, *Judiciary laws*, *Agrarian laws*, &c. See AGRARIAN, &c.

3°. Sometimes, by the crimes againſt which they were made; for inſtance, the *laws* touching *poiſoning*, *parricides*, &c. the *laws* of *concuſſion*, *peculate*, &c.

The *Codex*, and *Authenticæ*, are the laws, and conſtitutions of the Roman emperors: the *Digeſt* is a compilation, made by the emperor Juſtinian's order, of the ſeveral opinions, and judgments of the moſt learned in the Roman *law*; to which he gave the ſanction of *laws*, as appears by the epiſtle prefixed to the work: and it is this that properly conſtitutes the Roman *law*. See CODE, DIGEST, CIVIL *Law*, &c.

The *lex talionis*, or *law of like for like*, is the moſt antient, and equitable *law* in the world. It was obſerved by the Hebrews.

LAW *of England*, conſiſts of three parts: 1°. The common *law*, which is the moſt antient, and general *law* of the realm. See COMMON.

2°. Statutes, or acts of parliament.—3°. Particular cuſtoms. See STATUTE, CUSTOM, &c.

The common *law* of England, is derived from the Engliſh, Saxons, and Danes, and was antiently divided into three parts, *viz.* the *Mercian law*, the *Weſt-Saxon law*, and the *Daniſh law*.

Thoſe called *Mercian laws*, are commonly ſaid to have been compoſed by Martia, queen of the Britons, from whom there was a province called *provincia Merciorum*.—Many *laws* were alſo publiſhed by Ethelred, king of Kent, by king Ina, and Offa: but Alfred, who ſubdued the whole kingdom, having reviſed all the *laws* of his predeceſſors, retained thoſe which he thought proper, and aboliſhed the reſt; whence he is called *Anglicarum legum conditor*; and theſe *laws* were called *Weſtſexenelaga*.

But the kingdom being afterwards ſubdued by the Danes, they introduced another *law*, called *Danelaga*, by which their people were governed: And they being afterwards deſtroyed, Edward the confeſſor, out of the former *laws*, compoſed that which we now call the *common law*; for which reaſon he is called by our hiſtorians, *Anglicarum legum reſtitutor*.

Theſe *laws* were only general cuſtoms obſerved through the nation, and for that reaſon were called *common*; and perhaps, alſo, becauſe *leges omnibus in commune reddidit*, to be obſerved by all, with ſuch amendments as were afterwards to be made.

William the conqueror did not enact many new *laws*, but confirmed the old, *viz.* S. Edward's *laws*, and abrogated none that any way concerned compoſitions, or mulcts of delinquents.

The *common law* is alſo called *lex non ſcripta* (not but that we have moſt of them written in the old Norman dialect, but) becauſe it cannot be made by charter, or parliament; for thoſe are always matters of record, whereas cuſtoms are only matters of fact, and are no where but in the memory of the people, and of all *laws* muſt be the beſt for the Engliſh: for the written *laws*, made by king and parliament, are impoſed upon the ſubjects before any probation, or trial whether they are beneficial to the nation, or agreeable to the nature of the people, except where they are firſt made temporary, and for their experienced uſefulneſs afterwards made perpetual; but cuſtoms bind not till they have been tried and approved time out of mind.

Beſides the *common law* of England in general, there are in ſeveral parts of it certain cuſtoms and common uſages, which have the force of *common law* among thoſe people to whoſe property they belong; as, *borough Engliſh*, a cuſtom ſo called as not being in uſe out of England; where the youngeſt ſon, or, for want of ſons, the youngeſt brother, is to inherit; the eldeſt being ſuppoſed to have learnt the father's trade, and the youngeſt the leaſt able to ſhift for himſelf. See BOROUGH ENGLISH, GAVELKIND, &c.

Where the *common law* is ſilent, there we have *ſtatute laws*, made by the ſeveral kings of England, with the advice and conſent of both houſes of parliament. See STATUTE.

Beſides theſe, we make uſe of the *civil* and *canon laws* in eccleſiaſtical courts. See CIVIL, and CANON.

We have alſo *military* or *martial law*, in uſe among the ſoldiery in time of war; and *foreſt law*, for the regulation of foreſts. See MARTIAL, FOREST, &c.

LAW has alſo a more ſpecial ſignification, wherein it is taken for that which is lawful with us, and not elſewhere; as, 'Tenant by the courteſy of England.'

Thus, we alſo ſay, to *wage law (vadiare legem)* and to *make* or *do law (facere legem)*. See WAGE, and MAKE.

When an action of debt is brought againſt one upon ſome ſecret agreement or contract, the defendant may wage his *law* if he pleaſes; that is, ſwear, and certain perſons with him, that he owes the plaintiff nothing: but this is only allowed in caſe of the plaintiff's want of evidence, and when he cannot prove his ſurmiſe by any deed, or open act.

When one wages his *law*, he ſhall bring with him ſo many of his neighbours as the court ſhall aſſign, (Sir Edward Coke ſays, *eleven*) to ſwear with him, that they believe, in their conſciences, he hath ſworn truly; and theſe, in our *law*, are called *compurgators*; by the feudiſts, *ſacramentales*.

The officer, to make oath, is called the *wager of law*; and when it is accompliſhed, it is called the *making* or *doing of law*. This cuſtom is ſaid to have obtained, formerly, among the Egyptians.

LAWS *of the Stage.*		STAGE.

LAW *of Arms*, is that *law* which gives precepts how rightly to proclaim war, to make and obſerve leagues, to attack the enemy, and to puniſh offenders in the camp. See WAR, ARMS, MARTIAL, &c.

LAW *of Marque*, a *law* by which thoſe who are driven to make uſe of it, take the goods, or ſhipping of the party that has done them wrong, and of whom they cannot get ordinary juſtice, whenever they can take them within their own bounds, or precincts. See REPRISALS.

LAWS *of Molmutius.*	See the article	MOLMUTIN *Laws.*
LAWS *of Oleron.*		OLERON.

LAW *of the Staple*, the ſame with LAW *Merchant*.

LAW *Merchant*, a ſummary ſort of *law*, originally differing from the *common law*, though now adopted and become a part of the laws of the kingdom; one point of it conſiſts in this, that if there be two joint merchants of wares, and one of them dies, his executor ſhall have the moiety: which is not allowed in the caſe of others, not merchants.

LAW *Spiritual*, is the eccleſiaſtical or canon *law*, allowed and authorized in this realm; ſo far as it is not againſt the common *law*, nor againſt the ſtatutes and cuſtoms of the kingdom. And according to ſuch eccleſiaſtical *laws*, the ordinary and other eccleſiaſtical judges do proceed in caſes within their cognizance. See CANON *Law*.

LAW is alſo uſed figuratively, in ſpeaking of the rules, or order wherein any thing is performed.

Thus we ſay, the *laws* of motion, the laws of mechanics, the *laws* of fluids, the *laws* of chance, of a game, *&c.* See MOTION, FLUID, GAME, *&c.* — *Laws* of friction, of reſiſtance, of deſcent of bodies, *&c.* See FRICTION, RESISTANCE, DESCENT, *&c.* — *Laws* of elaſticity, rarefaction, reflection, refraction, *&c.* See ELASTICITY, RAREFACTION, REFLECTION, REFRACTION, *&c.*

LAWFUL. See the article UNLAWFUL.

LAWFUL *Naam.* See the article NAAM.

LAWING *of Dogs*, a phraſe uſed in our antient law-writers. Thus, maſtiffs muſt be *lawed* every three years; *Crompton Juriſd.* fol. 163. that is, three claws of the fore foot ſhall be cut off by the ſkin, or the ball of the fore foot cut out. See EXPEDITATING.

LAWLESS *Court*, a court held on King's-hill, at Rochford in Eſſex, every Wedneſday morning next after Michaelmas-day, at cock-crowing; at which court they whiſper, and have no candle, nor any pen and ink, but a coal: he that owes ſuit or ſervice there, forfeits double his rent every hour he is miſſing.

This court is called *lawleſs*, becauſe held at an unlawful hour, or, perhaps, *quia dicta ſine lege*, becauſe opened without any form. It is mentioned by Camden, who ſays, this ſervile attendance was impoſed on the tenants, for conſpiring at the like unſeaſonable time to raiſe a commotion.

LAWLESS *Man*, *Exlex.* See the article OUTLAW.

LAXATIVE, in medicine, is uſed to ſignify a looſe ſtate, or diſpoſition of the body; ſo as to go frequently to ſtool.

LAXATIVES, or LAXATIVE *Medicines*, are ſuch as promote that diſpoſition, which they do by ſome ſmooth, ſoftening quality, taking away the tenſity of the fibres, and facilitating the paſſage of the contents of the inteſtinal tube, through it; for which reaſon all oily ſubſtances come under this claſs. See PURGATIVES.

LAXIOR *Toga.* See the article TOGA.

LAY, the name of a kind of antient poeſy, or poem among the French; conſiſting of very ſhort verſes.

There were two ſorts of *lays*, the *great*, and the *little*.

Greater LAY, was a poem conſiſting of twelve couplets of verſes, of different meaſures.

Little LAY, was a poem conſiſting of ſixteen or twenty verſes, divided into four couplets.

Theſe *lays* were the lyric poetry of the old French poets, who were imitated by ſome among the Engliſh. They were principally uſed on melancholy ſubjects, and are ſaid to have been formed on the model of the trochaic verſes of the Greek and Latin tragedies.

Father Mourgues gives us an extraordinary inſtance of one of theſe antient *lays*, in his treatiſe of French poetry.

Sur l' appui du monde
Que faut il qu'on fonde
D' eſpoir?
Cette mer profonde,
En debris feconde
Fait voir
Calme au matin, l' onde
Et l' orage y gronde
Le ſoir.

LAY *the Land*, a ſea phraſe, uſed for ſailing out of ſight of land. In ſuch caſes they ſay, *they have laid the land:* and if another point of land exclude the ſight of the former, they ſay, *they have ſhut the firſt land in.*

LAY-*Land*, in huſbandry, denotes fallow ground, which lies untilled. See FALLOW, and PLOUGHING.

LAY-*Brother*, among the Romaniſts, a pious, but illiterate perſon, who devotes himſelf, in ſome convent, to the ſervice of the religious. See BROTHER.

The *lay-brother* wears a habit different from that of the religious, nor ever enters into the choir, or the chapter. He is not in any orders, nor does he make any vow, excepting of conſtancy and obedience.

LAY-*Brother* is alſo uſed for an illiterate religious, who takes care of ſome of the temporal concerns of the convent, as the kitchin, the gate, *&c.*

Theſe *lay-brothers* make the three vows of religion.

In the nunneries are alſo *lay-ſiſters*, who never enter the choir, *&c.* and who are only retained for the ſervice of the convent.

The inſtitution of *lay-brothers* began in the eleventh century. The perſons on whom this title was conferred, were ſuch as were too ignorant to become clerks, and who therefore applied themſelves wholly to bodily labour. It ſeems to have taken its riſe from hence, that the laity in thoſe days had not, for the generality, the leaſt tincture of learning; whence alſo thoſe came to be called *clerks*, by way of diſtinction, who had ſtudied a little, and were able to read. See CLERK.

LAYER, in huſbandry, and gardening, a young tender ſhoot or twig of a plant, not far from the ground, which is bent down, and ſeveral joints or knots of it buried three or four inches under ground: the other part ſtill remaining united with the parent tree; till having ſtruck root below, it is cut and ſeparated from the reſt, and produces a new plant.

LAYMAN, a perſon not engaged in any order of eccleſiaſtics. See CLERGY, SECULAR, *&c.*

LAYMAN, among painters, a little ſtatue or model, either of wax or wood, whoſe joints are ſo made, that it may be put into any attitude, or poſture: its chief uſe is for the caſting, and adjuſting draperies, for the clothing of figures.

Some call it, after the French, *manequin*, *q. d.* a little man.

LAZARETTO, or LAZAR-HOUSE, a public building in manner of an hoſpital, for the reception of poor ſick. See HOSPITAL, *&c.*

LAZARETTO, in ſome countries, is an edifice appointed for perſons coming from places ſuſpected of the plague, to perform quarantain in.

This is uſually a large building, at a diſtance from any city, whoſe apartments ſtand detached from each other, *&c.* where ſhips are unladen, and their crew is laid up for forty days, more or leſs, according to the time and place of departure. See QUARANTAIN.

S. LAZARUS, or LAZARO, a military order, inſtituted at Jeruſalem by the Chriſtians of the Weſt, when they became maſters of the holy land, whoſe buſineſs was to receive pilgrims under their care, guard them on the roads, and defend them from the inſults of the Mahometans.

Some ſay, this order was inſtituted in 1119. Pope Alexander IV. confirmed it by a bull in 1255, giving it the rule of S. Auguſtine.

The knights of this order being driven out of the holy land, part of them retired into France, and were eſtabliſhed there under Louis III. who beſtowed on them the country of Boigny near Orleans. Innocent VIII. ſuppreſſed the order of *S. Lazaro* in Italy in 1490, or rather united it to that of Malta. Leo X. re-eſtabliſhed it in Italy in the beginning of the ſixteenth century. In 1572, Gregory XIII. united it in Savoy to that of S. Maurice, juſt inſtituted by duke Emanuel Philibert.

In France, this order was united to that of N. D. of Mount Carmel in 1608, and had ſome new advantages conferred on it by the late king Louis XIV. The knights of *S. Lazarus* are allowed to marry, and yet have penſions upon benefices.

Fathers of S. LAZARUS, called alſo LAZARITES, a name given to certain regular clerks of a congregation inſtituted in France, in the ſeventeenth century, by M. Vincent.

They take the denomination from a houſe in the Fauxbourg of Paris. They have a ſeminary in Paris, called, *The ſeminary des bons enfans.* The vows they make are ſimple, and on occaſion may be diſpenſed withal.

LAZULI.—*Lapis* LAZULI, a ſort of precious ſtone, of a blue colour, veined and ſpotted with white, and yellow. See STONE.

This is the ſame with what is otherwiſe called *azure* ſtone, by the antients *cyaneus*, and *cæruleum*; by Meſue, the *ſtarry* ſtone; by Pliny, as Dr. Woodward imagines, *ſapphirus.* See AZURE, SAPPHIRE, *&c.*

Of the *lapis lazuli* is prepared the fine pigment called *ultra marine.* See ULTRAMARINE.

To be good, it ſhould be able to reſiſt fire and ſmoke; and come out of them with new luſtre.—It is found in mines of gold, ſilver, and copper, as alſo in pits of marble; which laſt is that generally in uſe.

Naturaliſts diſtinguiſh three kinds of *lapis*: The firſt called *old rock*, which is pure, ſmooth, a fine blue, with beautiful yellow ſtreaks like veins of gold, which yet are frequently no more than veins of pyrites.—The ſecond, called the *new rock*, is ſtuffed with common ſtones; its colour is weaker, and its price lower: theſe two kinds are brought from Perſia and Siam.—The third kind is brought from the mountains of Auvergne. This is mixed with the common rock whence it is dug; it is of a pale blue, and is ſprinkled with greeniſh ſpots, with veins of pyrites. This, when ſufficiently charged with ſpots of green, is ſold for the Armenian ſtone. See ARMENIAN.

The *lapis* is of ſome uſe in medicine; they prepare it by calcining and waſhing it ſeveral times; which done, it makes an ingredient in the famous confection of alkermes. Sometimes, in ſpite of all its lotions, it continues to be purgative, by reaſon of the vitriolic matter it contains.

LE *Roy le veut.* } See the article LE ROY.
LE *Roy ſ'adviſera.* }

LEAD, a coarſe, heavy, impure metal, of all others the ſofteſt and moſt fuſible, when purified; called by the chymiſts *ſaturn*. See METAL.

Thoſe who have made an analyſis of *lead*, find it to contain a little mercury, ſome ſulphur, and a great deal of bituminous earth.

Lead is found in various countries, but abounds particularly in England. It is found, too, in ſeveral kinds of ſoils, and ſtones, ſome whereof, beſides, contain gold, ſome ſilver, others tin, *&c.*

It is melted in a furnace provided for that purpoſe, with a ſtrong coal-fire upon it; as it melts, it runs through a canal on one ſide; leaving the earth, ſtone, and ſcoria, with the aſhes of the coals.

It is purified by ſkimming it ere cold, and throwing ſuet and other fat bodies into it.

Lead is found of a lighter, or deeper colour, according as it is more or leſs purified; though ſome make a difference in the colour of the ore, always eſteeming that moſt which is the whiteſt.

Some very able naturaliſts obſerve, that the weight of *lead* increaſes, either in the open air, or under ground.—Mr. Boyle obſerves this particularly of the *lead* of churches, which, he ſays, frequently grows both in bulk and weight, ſo as to become too ponderous for the timber that before ſuſtained it; which ſome account for from the impurity, heterogeneity, and looſe texture of its parts, by means whereof the particles of the air getting admiſſion within its pores, are attracted, and eaſily aſſimilated to it. But others, who rely wholly on experience, abſolutely deny the fact, as alſo that it is reproduced in mines before exhauſted, by letting them lie long open to the air; which others aſſert.

Lead is a metal of much uſe; it eaſily melts, and mixes with gold, ſilver, and copper, and communicates, as they talk, its humidity to them; but not being able to endure the violence of the fire which they undergo, it retires, and carries with it all that was heterogeneous in them; ſo as neither gold nor ſilver are refined without *lead*. See REFINING.

To which it may be added, that the coarſer kind of precious ſtones, boiled in *lead*, are thereby rendered much more brilliant.

Lead is much uſed in building, particularly for covering, gutters, pipes, and in glaſs-windows. For which uſes, it is either caſt into ſheets in a mold, or milled; which laſt, ſome have pretended, is the leaſt ſerviceable, not only on account of its thinneſs, but alſo becauſe it is ſo exceedingly ſtretched in milling; that when it comes to lie in the hot ſun, it is apt to ſhrink and crack, and conſequently will not keep out the water: But this appears to be a ſuggeſtion without grounds. *Vid.* Bayl. *Build. Dict.* Suppl. in voc.

The *lead* uſed by glaziers is firſt caſt into ſlender rods, twelve or fourteen inches long, called *cames*; which being afterwards drawn through their vice, comes to have a groove on either ſide for the panes of glaſs; and this they call *turned lead.*

The method of paleing or ſoldering *lead* for fitting on of imboſſed figures, *&c.* is by placing the part whereon the figure is to be paled, horizontal, and ſtrewing on it ſome pulveriſed roſin; under this they place a chafing-diſh of coals, till ſuch time as the roſin becomes reddiſh, and riſes in pimples; then apply the figure, and rub ſome ſoft ſolder into the joining: when this is done, the figure will be paled on, and as firm as if it had been caſt on it.

Borrichius aſſerts, that *lead* reverberated into minium, converted into glaſs, reduced into ceruſs, and burnt into litharge, immediately reſumes its original figure, upon the dexterous application of a lixivial ſalt.

LEAD-*works*.—Mr. Glanville obſerves, that the ſmoke of the *lead-works* at Mendip in Somerſetſhire is a prodigious annoyance, and ſubjects both the workmen, and the cattle that graze about them, to a mortal diſeaſe. The trees that grow near them have their tops burnt, and their leaves and outſides diſcoloured and ſcorched.

When the *lead* ore is dug out, they beat it ſmall, then waſh it clean in a running ſtream, and ſift it in iron rudders. Their hearth or furnace is made of the clay or fire-ſtone; this they ſet in the ground, and on it build their fire, which they light with charcoal, continuing it with young oaken gads, blown with bellows, by mens treading on them. After the fire is lighted, and the fire-place hot, they throw their *lead* ore on the wood, which melts down into the furnace, and then with an iron ladle they take it out, and upon ſand caſt it into what form they pleaſe.

The mine-men ſometimes find the vein run up into the roots of trees, and yet do not obſerve any difference between thoſe and other trees. When the mine is near the ſurface, the graſs is ſometimes found yellow. They make no account of the virgula divinatoria; yet ſay, that when a mine is open, they may gueſs by it how far the vein will lead. The ore runs ſometimes in a vein, ſometimes diſperſed in banks; it lies many times between rocks; ſome of it is harder, others milder; ſometimes they have branched ore in the ſpar; about the ore is ſpar and caulk; and another ſubſtance, which they call *crootes*.

For the manufacture of LEAD, ſee the article PLUMBERY.

There are various preparations of *lead*, ſerving for various purpoſes:

LEAD *Duſt*, is a preparation uſed by the potters; made by throwing charcoal duſt into melted *lead*, and ſtirring them a long time together; to ſeparate the coal again, they only waſh it in water, and dry it afreſh.—Its uſe is to give a varniſh and gloſs to their works.

Burnt LEAD, *plumbum uſtum*, is a chymical preparation uſed in medicine, made of plates of *lead* melted in a pot with ſulphur, and reduced by fire into a brown powder.

White LEAD, uſed by painters, is only thin plates of *lead* diſſolved with vinegar. See WHITE *Lead*, and CERUSS.

Litharge of gold or ſilver, is only the *lead* uſed in purifying copper. See LITHARGE.

Red LEAD, a preparation of mineral *lead* calcined, and rubified; uſed by painters, potters, and phyſicians. See MINIUM.

By help of chymiſtry, there are alſo drawn from *lead*, ſalts, balſams, oils, vinegar, a magiſtery, *&c.* diſguiſed under the name of *ſaturn*, to amuſe the ignorant.

Salt, or *Sugar of* LEAD, *Saccharum ſaturni*, is an eſſential ſalt of vinegar, incorporated with the proper ſubſtance of *lead*, or ceruſs diſſolved in ſpirit of vinegar.

Balm of LEAD, or *Saturn*, is an oil drawn from the ſalt of *lead* by diſtillation, after having diſſolved it in ſpirit of turpentine.

Magiſtery of LEAD, is the calx of *lead* purified and ſubtilized. It is made of *lead* diſſolved in aqua fortis, pouring a filtrated ſalt water into it; whence reſults a magiſtery extremely white, which, when ſoftened by ſeveral lotions, is mixed with pomatums for the face and complexion. See MAGISTERY.

Black LEAD, is a kind of mineral ſtone, of a black colour, but ſilvered, and ſhining, found chiefly in *lead* mines, and appearing to be nothing elſe but *lead* not yet arrived at maturity; much uſed for pencils, or crayons for deſigning.—It is melted like the common *lead*.

Eſſay of LEAD. } See the article { ESSAY.
Refining of LEAD. } See the article { REFINING.
Caſting of LEAD *on Cloth*. } See the article { CASTING.

LEAD *Nails*. See the article NAILS.

LEADEN *Bullet Moulds*. See the article MOULDS.

LEAF, a part of a plant, ordinarily very thin and flat, growing in the ſpring, and falling off in autumn. See PLANT.

There are ſome plants without *leaves*, as truffles and muſhrooms. See TRUFFLE, and MUSHROOM.

As to the ſtructure of *leaves*, Dr. Grew obſerves, that their fibres never ſtand on the ſtalk in an even line, but always in an angular circular poſture, and their vaſcular fibres or threads are 3, 5, or 7. The reaſon of which poſition is for their more erect growth, and the greater ſtrength of the *leaf*.

Another obſervable in the fibres of *leaves*, is their orderly poſition; ſo as in ſome to take in an eighth part of a circle, as in mallows; in ſome a tenth, but in moſt a twelfth.

The ſame author obſerves ſix ſeveral parts intended by nature for the preſervation of gems; *viz. leaves*, ſurſoils, interſoils, ſtalks of *leaves*, hoods, and mantlings that cover them.

The ſkin or coat of the *leaves* is no more than that of the branches extended, as gold, by beating, is reduced into leaves.—In the gem, the *leaves* are folded, ſometimes in two, and ſometimes in ſeveral plaits, ſomewhat after the manner of a fan. If the leaves be too thick to plait commodiouſly in two, and to be ranged againſt each other; or if they be in too ſmall a number, and their fibres too delicate, inſtead of being plaited, they are rolled up, and form either a ſingle roll, as the *leaves* of the mountain cowſlip, which are thick; or two rolls, which begin at each extremity of the *leaf*, and meet in the middle.—There are alſo ſome plants whoſe *leaves* form three rolls, as fern; ſeveral *leaves* are covered with hair of ſeveral figures, thoſe of lavender and olive-tree have hair reſembling ſtars. See LANUGO.

Botaniſts conſider the *leaves* of plants, with regard to their ſtructure, ſurface, figure, conſiſtence, edges, ſituation and ſize.—With regard to their ſtructure, *leaves* are either *ſingle*, as thoſe of the apple-tree, pear-tree, *&c.* or *double*, as thoſe of angelica, parſley, *&c.*

With regard to their ſurface, *leaves* are either *flat*, as the nummularia, aſarum, origany, androſæmum, brionia canadenſis, *&c.* or *hollow*, as thoſe of the onion and aſphodel; or *in bunches*, as ſeveral kinds of kali, and houſe-leeks.

With regard to their conſiſtence, *leaves* are either *thin* and fine, as thoſe of S. John's-wort, and dog's graſs; or *thick* and groſs, as thoſe of portulaca; or *fleſhy*, as thoſe of ſeveral kinds of houſe-leeks; or *woolly*, as thoſe of the wool-blade.

With regard to their verge, or edges, *leaves* are either *cut ſlightly*, as ſome ſpecies of geum, and cannabis lutea; or *deep*, as trefoil, &c. See DENTED *Verge*.

With regard to their ſituation, *leaves* are either *alternate*, that is, ranged alternately, as the philyca; or oppoſite to each other, as the phillyrea, and ſome ſpecies of the rubia.

With regard to their ſize, *leaves* are either very *big*, as thoſe of the colocaſia, and ſphondylium; *moderate*, as thoſe of the biſtort, the fig-tre; *ſmall*, as thoſe of the apple-tree, pear-tree, peach-tree; or *very ſmall*, as thoſe of mille-pertuis, or S. John's-wort.

Annual LEAVES.	See the article	ANNUAL.

Vernal LEAVES.		VERNAL.

LEAF, is alſo applied to the fineſt and moſt beautiful parts of flowers. See FLOWER.

It is true, all flowers have not *leaves*, and it is ſometimes difficult to determine which is to be called the *leaves*, and which the calyx of the ſame flower. See CALYX.

To prevent confounding the *leaves* of the flower with thoſe of the reſt of the plant; the former are called by botaniſts *petala*, the latter *folia*. See PETALA.

LEAVES, in architecture, are an ornament of the Corinthian capital, and thence borrowed into the Compoſite; conſiſting in the repreſentation of a double row of *leaves* covering the vaſe, tympanum, or neck of the column. See CAPITAL.

Theſe *leaves* are uſually formed in imitation of thoſe of the acanthus; ſometimes of thoſe of olive, and ſometimes of laurel. See ACANTHUS.

The *leaves* are divided; each making three ranges of leſſer, and are bent, atop, one third of their heighth.—*See Tab. Archit. fig.* 39. *lit. CC.*

LEAF-*Silver*. See the article SILVER.

LEAGUE *, an extent of ground, conſidered lengthwiſe; ſerving to meaſure the diſtances of one place from another; and containing more or leſs geometrical paces, according to the different uſages and cuſtoms of countries.

* The word comes from *leuca*, or *leuga*, an ancient Gauliſh word, for an itinerary meaſure, and adopted in that ſenſe by the Romans.—Some derive the word *leuca* from λευκος, white; in regard the Gauls, in imitation of the Romans, marked the ſpaces and diſtances of their roads with white ſtones.

A *ſea league* is uſually reckoned 3000 geometrical paces, or three Engliſh miles: the large *leagues* of France, are uſually 3000, and in ſome places 3500 paces; the mean or common *league* is 2400 paces, and the little *league* 2000. Chorior obſerves, that the ancient Gauliſh *leagues* were but 1500 paces.

The Spaniſh *leagues* are larger than the French, 17 Spaniſh *leagues* make a degree, or 20 French *leagues*, or 69 ½ Engliſh ſtatute miles. The *leagues* of Germany and Holland contain four geographical miles each.

The Perſian *leagues* are nearly the ſame with the Spaniſh; that is, they are equivalent to four Italian miles; which comes pretty near to what Herodotus mentions of the paraſanga, an ancient meaſure among the Perſians, containing thirty ſtadia; eight whereof, according to Strabo, make a mile. See PARASANG.

The Perſians mark their *leagues* by trees, as the ancient Romans did by ſtones, *lapides*; for which reaſon they are alſo called *agag*, a Turkiſh word ſignifying *tree*.—In Japan, the *league* conſiſts of 1800 fathoms.—Theſe are all diſtinguiſhed by little hillocks, raiſed on purpoſe by the road ſide. See the *leagues* of moſt countries, reduced to the Roman foot, under the word MILE.

LEAGUE * alſo denotes an alliance, or confederacy between princes, and ſtates, for their mutual aid, either in attacking ſome common enemy, or in defending themſelves. See ALLIANCE.

* The word comes from *liga*; which, in the corrupt Latin, was uſed for a *confederacy:* Qua quis cum alio ligatur.

There have been ſeveral holy *leagues* entered into by the Chriſtians againſt the Saracens and infidels; called alſo *cruſado's*, or *croiſades*. See CROISADE.

The LEAGUE, by way of eminence, denotes that famous one on foot in France, from the year 1576, to 1593. Its intent was to prevent the ſucceſſion of Henry IV. who was of the Reformed religion, to the crown; and it ended with his abjuration of that faith.

The *leaguers*, or confederates, were of three kinds: the *zealous leaguers* aimed at the utter deſtruction, not only of the Huguenots, but alſo of the miniſtry. The *Spaniſh leaguers* had principally in view the transferring the crown of France to the king of Spain, or the infanta his daughter. The *moderate leaguers* aimed only at the extirpation of Calviniſm, without any alteration of the government.

LEAKAGE, the ſtate of a veſſel that *leaks*; that is, lets water, or other liquid ouze in or out.

LEAKAGE alſo denotes an allowance of 12 per cent. to merchants importing wine, out of the cuſtoms thereof; and of 2 barrels in 22 of ale to brewers, &c. out of the exciſe.

LEAP, and STEP. See the article STEP.

LEAP-YEAR *, the ſame with *biſſextile*. See BISSEXTILE.

* It is thus called, by reaſon, in the common year, any fixed day of the month changes ſucceſſively the day of the week; but in the *leap-year*, it skips or *leaps* over one day.

The common year hath 365 days in it, but the *leap-year* 366 days; and in this caſe February hath 29 days; which, in the common year, hath but 28.

To find the *leap-year*, the rule is,

Divide by 4, *what's left ſhall be,*
For leap-year 0, *for paſt*, 1, 2, or 3.

For example; Is the year 1720 a *leap-year*, or a common year?

4) 1720 (430

There is 0 remainder, ſo that it is *leap-year*.

LEASE, in law, a demiſe, or letting of lands, tenements, or hereditaments unto another for life, term of years, or at will, for a rent reſerved. See RENT.

A *leaſe* is either written, called an *indenture*, *deed poll*, or *leaſe* in writing; or by word of mouth, called *leaſe parol*. See PAROL.

The party who lets a *leaſe*, is called the *leſſor*; and the party to whom it is let, the *leſſee*.

LEASH, or LEASE, among ſportſmen, denotes three creatures of any kind; but chiefly greyhounds, foxes, bucks, and hares.

We ſay, a *leaſh* of greyhounds, a couple and a half of hounds.

LEATHER-*Mills*.	See the article	MILL.
LEATHER-*Money*.		COIN, and MONEY.

LEAVE *and take*. See the article TAKE.

LEAVEN *, any thing that will make a body ſwell, and ferment. See FERMENT, and FERMENTATION.

* The word is formed from the French *levain*, which ſignifies the ſame, of the verb *lever*, or Latin, *levare*, to riſe.

Beer, ale, wine, and cyder, only work by means of the *leaven* in them.—Sour paſte, barm, rennet, &c. are *leavens* uſed in baking bread, brewing beer, making cheeſe, &c. See YEST, RENNET, BAKING, &c.

LEAVER. See the article LEVER.

LECTICARIUS, an officer in the Greek church, whoſe buſineſs it was to bear off the bodies of thoſe who died, and to bury them.—Theſe were otherwiſe denominated *decani* and *copiatæ*. See DEAN, and COPIATÆ.

The Romans had two kinds of *lecticarii*, different from thoſe of the Greeks, and who anſwered nearly to the office of our chairmen. See LITTER.

LECTISTERNIUM, a religious ceremony among the ancient Romans; being a feſtival prepared, and ſolemnly ſerved up in a temple. See FEAST.

And becauſe, according to the cuſtoms of thoſe times, they placed beds around the tables, and ſet the ſtatues of the gods on thoſe beds, in the ſame manner as men ſat at meals; they called the ſolemnity *lectiſternium*, from *lectus*, bed, and *ſternere*, of *ſterno*, to ſpread, prepare.

In this ceremony the Epulones preſided. See EPULO.

Caſaubon has obſerved from a paſſage in the ſcholiaſt of Pindar, that the Greeks had alſo a ſort of *lectiſternium* in uſe.

Livy obſerves, that the firſt *lectiſternium* ſeen in Rome, was that which held for eight days ſucceſſively, in honour of Apollo, Latona, Diana, Hercules, Mercury, and Neptune; on occaſion of a contagious diſeaſe which killed all their cattle, in the year of Rome 354; though Valerius Maximus mentions one before that.

LECTURES. See the article BOYLE's *Lectures*.

LEDGER. See the article BOOK.

LEE, a term variouſly uſed at ſea; though its general uſe be to ſignify the part towards, or oppoſite to the wind.—Thus the

LEE-*Shore*, is that on which the wind blows; ſo that to be under the *lee* of the ſhore, is to be cloſe under the weather-ſhore, or under wind.

A LEE *the Helm*, ſignifies, put the helm to the lee-ward ſide of the ſhip.

Take care of the LEE *Hatch*, is a word of command to the man at the helm, to take care that the ſhip do not go to the leeward of her courſe.

Lee-*ward Ship*, is one that is not faſt by the wind, or which doth not ſail ſo near the wind, nor make ſo good way as ſhe ſhould.

To lay a Ship by the LEE, or *to come up by the* LEE, is to bring her ſo, that all her ſails may lie flat againſt her maſts and ſhrouds, and that the wind may come right upon her broadſide.

LEE-*way*, or LEE-*ward-way of a Ship*, is the angle made by the line on which the ſhip ſhould run according to her courſe; or the point of the compaſs ſteered upon, and the real line of the ſhip's way.

All ſhips are apt to make ſome *lee-way*; ſo that in caſting up the log-board, ſomething muſt be allowed for *lee-way.* The ordinary rules are theſe:

1°. If the ſhip be upon a wind, allow one point for *lee-way.*

2°. If the wind blow hard, ſo that you are forced to take in one top-ſail, allow two points for *lee-way.* 3°. If it blow ſo hard, that both top-ſails muſt be taken in, and the ſea runs high, allow three points for *lee-way.* 4°. If her fore-ſail being furled, ſhe try under a main-ſail, or mizzen, ſhe will make her way four points before the beam. 5°. If ſhe try with a main-ſail only, ſhe will make her way near three points before the beam. But, 6°. If under a mizzen only, ſhe will make her way about two points before the beam. 7°. If ſhe lie a hull, with all her ſails furled, ſhe will make her way one point before the beam.

LEER *Furnace.* See the article Furnace.

LEES*, the groſſeſt and thickeſt parts of wine, oil, and other liquors; or the ſediment found at the bottom of the veſſel.

* The word comes from the French, *lie,* and that either from *limus,* mud, or from *Lyeus,* one of the ſurnames of Bacchus; or according to Du Cange, from *lia,* a corrupt Latin word, ſignifying the ſame.

A kind of gravelly ſand is made with the *lees* of wine burnt, and prepared, uſed by dyers, *&c.* which ought to ſtand as a caution to people troubled with the ſtone, *&c.*

The vinegar-makers make a great trade of the *lees* of wine dried, and made into cakes, after having ſqueezed out the remains of the liquor in preſſes. See Wine, and Capital.

LEET, Leta, a court held by the lord of a manor; though, in reality, it is the king's court, in whoſe manor ſoever it is held; by reaſon the authority thereof belongs originally to the crown, and is derived thence to other perſons.

A *court-leet,* is a court of record, and inquires of all offences under high-treaſon; though it cannot puniſh many, but muſt certify them to the juſtice of aſſize. See Court.

LEFT *Hand.* See the article Hand.

LEG, *Crus.* See the article Legs.

LEGACY, Legatum, in the civil law, a donation by teſtament; anſwering to what in common law is called a *demiſe.* See Donation, Testament, Demise, *&c.*

Legacy is uſually defined ſome particular thing given by a laſt will, and teſtament; for that if a man thus diſpoſe, or transfer his whole eſtate on another, it is called *hæreditas*; and he to whom it is given, is called *hæres.* Though, in common law, the diſtinction is this; that he to whom all a man's lands, and hereditaments deſcend by right of blood, is *hæres natus*; the other, to whom it is bequeathed, is called *hæres factus.* See Heir.

Legacy, in an eccleſiaſtical ſenſe, was a ſoul-ſeat, a bequeſt to the church, or accuſtomed mortuary: which was to hold good, even though the teſtament itſelf were declared null, and invalid. See Mortuary.

LEGAL *Column.* ⎫ See the article ⎧ Column.
Legal *Oeconomy.* ⎬ See the article ⎨ Oeconomy.
Legal *Subrogation.* ⎬ See the article ⎨ Subrogation.
Legal *Tutorage.* ⎭ See the article ⎩ Tutorage.

LEGALIS *Homo,* in law, a perſon who ſtands rectus in curia, not out-lawed, nor excommunicated, nor defamed.

And in this ſenſe are thoſe words ſo often uſed *probi, & legalis homines.*

Hence all *legality* is taken for the condition of ſuch a man.

LEGATE, a prelate, whom the pope ſends as ambaſſador to any ſovereign prince. See Embassador, and Vice-Legate.

* The term *legate* comes from that of *legatus,* which Varro derives from *legere,* to chuſe; and others from *legare, delegare,* to ſend, delegate. *Wicquefort.*

There are three kinds of *legates,* viz. *legates à latere, legates de latere,* and *legates* by office, or *legati nati.*

Of theſe, the moſt conſiderable are the *legates à latere*; ſuch are thoſe whom the pope commiſſions to take his place in councils; who are thus called, in regard the pope never gives this office to any but his greateſt favorites, and confidents, who are always at his ſide, *à latere*; that is, to the cardinals. See Latere.

A *legate à latere,* may confer benefices without mandate, legitimate baſtards to hold offices, and has a croſs carried before him, as the enſign of his authority.

The *legates de latere,* are thoſe who are not cardinals, but are yet intruſted with an apoſtolical legation.

Legates by office, *legati nati,* are thoſe who have not any particular legation given them; but who, by virtue of their dignity, and place in the church, become *legates.* Such are the archbiſhops of Rheims and Arles.—But the authority of theſe *legates,* is much inferior to that of the *legates à latere.*

The power of a *legate* is ſometimes alſo given without the title: ſome of the nuntio's are inveſted with it. See Nuntio.

Court of the Legate. See the article Court.

LEGATIS *Tenementis.* See the article Tenementis.

LEGATORY, or Legatary, a term uſed in ſpeaking of the government of the antient Romans: Auguſtus divided the provinces of the empire into conſular, *legatory,* and preſidial.

Legatory *Provinces* were thoſe whereof the emperor himſelf was governor, but where he did not reſide, but adminiſtred affairs by his lieutenant, or *legatus.* See Legatus.

LEGATUS, among the Romans, a military officer, who commanded as deputy of the chief general.

Of theſe there were divers kinds, *viz.* a *legatus* in the army under the imperator, or general, anſwering to our lieutenant-general; and a *legatus* in the provinces, under the proconſul, or governor.

When any conſiderable perſon, among the Roman citizens, had occaſion to paſs through any of the provinces, the ſenate gave him the title of *legatus*; that is, of envoy from the ſenate, to the end he might be received with the greater reſpect; and that the cities and towns, through which he travelled, might defray his expences.—This they call a *free legation,* libera legatio; in regard the perſon was not incumbered with any truſt, and might lay it aſide as ſoon as he pleaſed.

LEGEND, Legenda, was originally a book uſed in the old Romiſh churches, containing the leſſons that were to be read in divine ſervice.

Hence alſo the lives of ſaints, and martyrs came to be called *legends*; becauſe chapters were read out of them at mattins, and in the refectories of the religious houſes. See Saint.

Golden Legend, is a collection of the lives of the ſaints, compiled by James de Varaſe, better known by his Latin name of *J. de Voragine,* vicar-general of the Dominicans, and afterwards archbiſhop of Genoa, who died in 1298.

It was received into the church with a world of applauſe, which it maintained for 200 years; but, in effect, is ſo full of ridiculous and romantic accounts, that the Romaniſts themſelves are now generally aſhamed of it.—The word *legend* itſelf is, on that account, come into diſrepute.

Legend is alſo uſed to ſignify the words, or letters engraven about the margins, *&c.* of coins. See Coin.

Thus the *legend* of a French crown is, *Sit nomen domini benedictum*; that of a moidore, *In hoc ſigno vinces*; on thoſe of the laſt emperors of Conſtantinople, we find *Jeſus Chriſtus Baſileus Baſileon,* IHS XPS NIKA, *Jeſus Chriſtus vincit.*

Legend is alſo applied to the inſcriptions of medals, which ſerve to explain the figures, or deviſes thereof. See Medal, Devise, *&c.*

In ſtrictneſs, the *legend* differs from the *inſcription*; this laſt properly ſignifying words placed on the reverſe of a medal, in lieu of figures.

It ſeems as if the antients had intended their medals ſhould ſerve both as images, and as emblems; the one for the common people, and the other for perſons of taſte, and parts: the images to repreſent the faces of princes; and emblems to repreſent their virtues, and great actions: ſo that the *legend* is to be looked on as the ſoul of the medal, and the figures as the body.

Every medal has two *legends*; that on the front, and that on the reverſe. The firſt, for the generality, ſerves only to diſtinguiſh the perſon by his name, titles, offices, *&c.* the latter is intended to expreſs his noble and virtuous ſentiments, his good deeds, and the advantages the publick has reaped by him.—This, however, does not hold univerſally; for ſometimes we find the titles ſhared betwen both ſides, and ſometimes alſo the *legend.*

In the medals of cities, and provinces, as the head is uſually the genius of the place, or at leaſt ſome deity adored there; the *legend* is the name of the city, province, or deity, or of both together; and the reverſe, ſome ſymbol of the city, *&c.* frequently without a *legend*; ſometimes, with that of one of its magiſtrates.

The ordinary ſubjects of *legends,* are the virtues of princes, the honours they have received, conſecrations, ſignal events, public monuments, deities, public vows, privileges, *&c.*

Legends, and inſcriptions of medals, are either in Latin, or Greek.—The Greek character, conſiſting of majuſcule, or capital letters, appears uniform on all the medals: no change, or alteration being found in confronting the ſeveral characters; though, it is certain, there was in the ordinary uſe, and pronunciation.—All we obſerve on medals, is ſometimes a mixture of Greek and Latin letters.—The character was preſerved in all its beauty, till the time of Gallienus.

From the time of Conſtantine, and for the ſpace of 500 years, the Latin tongue was alone uſed in the *legends* of medals, even in thoſe ſtruck at Conſtantinople.—Michael begun the firſt, whoſe *legend* was in Greek; and from his time the language, as well as the characters, began to alter for the worſe. See Character.

LEGION*, a kind of regiment, or body of forces, of a number whereof the Roman armies were chiefly compoſed.

* The word comes from the Latin, *legere,* to chuſe; becauſe, when the *legions* were raiſed, they made choice of ſuch of their youth, as were the moſt proper to bear arms.

The number of ſoldiers, and officers, whereof the *legion* conſiſted, was different at different times: but it is impoſſible to determine the preciſe time, and manner of their alteration. —In the time of Romulus, each *legion* contained 3000 foot, and 300 equites, or horſe: theſe were divided into three bodies, which made as many orders of battle.—Each body conſiſted of ten companies, or manipules, ranged at ſome diſtance from each other, though in the ſame front.—Each body had two general officers to command it, called *tribunes*; and each manipule, two centurions.

Under the conſuls, the *legion* conſiſted of 4000 men, who made four bodies, commanded by a conſul, or one of his lieutenants; and each legion had its ſhare of cavalry, which was from two to three hundred horſe.

Afterwards, in the time of Marius, theſe four diviſions of the *legion* were united into one, and augmented; and cohorts were appointed from five to ſix hundred men, each under the command of a tribune.—Each cohort conſiſted of three companies, or manipules, each manipule of two centuries, and the *legion* was divided into ten cohorts, who made as many diſtinct battalions, diſpoſed in three lines; ſo that the *legion*, then, conſiſted of five or ſix thouſand men.

Iſidore tells us, that the *legion* conſiſted of ſix thouſand men, divided into ſixty centuries, thirty manipules, twelve cohorts, and two hundred troops.—According to the French academy, the *legion* conſiſted of ſix thouſand foot, and ſeven hundred twenty five horſe.

The *legions* were, by far, the moſt conſiderable part of the Roman army; their number, in the time of Auguſtus, was thirty three; they were compoſed wholly of Roman citizens. —The allies formed a body of auxiliary forces.

The ſtandard bore by the *legions* was various: at firſt, a wolf, in honour of that which ſuckled Romulus; afterwards a hog, by reaſon, ſays Feſtus, war is only undertaken with a view to peace, which was concluded by ſacrificing a hog. Sometimes, they bore the minotaur, to remind their general that their deſigns were to be kept ſecret, and inacceſſible as the minotaur in the labyrinth.—They alſo bore a horſe, a boar, *&c.*—Pliny tells us, that Marius was the firſt who changed all theſe ſtandards into eagles. See EAGLE.

Square LEGION, *Legio quadrata*, was a legion conſiſting of 4000 men. See QUADRATA.

Domeſticus LEGIONUM. } See { DOMESTICUS.
Thundering LEGION. } See { THUNDERING.

LEGISLATOR, *Law-giver*; he who frames the laws of a kingdom, or ſtate founded by him. See LAW.

The principal antient *legiſlators* are,—Moſes, *legiſlator* of the Hebrews; Mercurius Triſmegiſtus, and Bocchyris, of the Egyptians; Italus, of the Oenotrians; Theſeus, Draco, and Solon, of the Athenians; Zoroaſter, of the Bactrians; Charondas, of the Cappadocians; and Charondas, or Phaleas, of the Carthaginians; Androdamas, of the Chalcidians; Eudoxus of the Cnidians; Phido, of the Corinthians; Minos, of the Cretans; Pythagoras, of the Crotoniates, and moſt of the cities of Græcia Major; Parmenides, and Zeno, of Elea in Lucania; Zamolxis, of the Getæ; Phoroneus, of the Greeks; Bacchus, of the Indians; Saturn, of Italy; Macarius, of the iſle of Lesbos; Zaleucus, of the Locrians; Nicodorus Athleta, of the city of Mutina; Hippodamia, of Miletus; Charondas, of Rheggio; Lycurgus, of the Lacedæmonians; Archytas, of Tarentum; Philolaus, of the Thebans.

At Rome, the people were in great meaſure their own *legiſlators*; though Solon may be ſaid, in ſome ſenſe, to have been their *legiſlator*, in regard the Decemviri, who were created for the making of laws, borrowed a great number from thoſe of Solon. See DECEMVIRI, and TABLES.

LEGITIMATE *Delivery*. } See { DELIVERY.
LEGITIMATE *Tertian*. } See { FEVER.

LEGITIMATION, an act by which natural, or illegitimate children are rendered legitimate. See BASTARD, *&c.*

By the French law, the father and mother, by marrying, render their children, begotten before marriage, legitimate; and this is called *legitimatio per ſubſequens matrimonium.*

The right of *legitimation*, was a thing unknown to princes till the time of Conſtantine; but, ſince his time, has been exerciſed by moſt of them. The Greek emperors invented ſeveral kinds of *legitimation*.

Anaſtaſius put it in the power of the father to *legitimate* his natural children, by a bare adoption, provided he had no legitimate children.—But Juſtin, by his conſtitution, and Juſtinian, by his *Novel* 74, aboliſhed this *legitimation*, as fearing the too eaſy acceſs to *legitimation* ſhould encourage concubinage.

In lieu of this, he eſtabliſhed a way of *legitimation* by the emperor's letters.—This rendered baſtards capable of attaining to honours, and even of ſucceeding to inheritances, provided the perſons were *legitimated* with the conſent of their father and mother; which is agreeable to the canon law.

LEGS, the lower extremes of the bodies of moſt animals, ſerving them for ſupport and motion. See ANIMAL, and EXTREME.

Some anatomiſts divide the foot of man into three parts, *viz.* the thigh, the *leg*, and the leſſer foot. See FOOT.

In the *leg*, there are two conſiderable bones; the one called the *great focile*, or *tibia*; the other the *little focile*, or *fibula.* See TIBIA, and FIBULA.

The *legs* and feet of the ſeveral animals, Mr. Derham obſerves, are exactly conformable to the poſture, make, nay, to the motion and exerciſes of thoſe animals. In ſome they are made for ſtrength only, in others for agility and ſwiftneſs; in ſome, for walking and running, in others for ſwimming, in others for digging, and in others for flying. In ſome more lax, and weak, for traverſing the plain land; in others ſtiff, and rigid, for ice and precipices. In ſome, ſhod with tough and hard hoofs, ſome whole, ſome cleft. In ſome the feet are compoſed of toes, ſome ſhort, for only going, others long, to ſupply the place of hands; ſome are armed with talons, to catch and tear their prey; ſome with ſhort nails, to confirm their ſteps in running and walking. See NAIL, *&c.*

In birds, the *legs* are curved, for their eaſy perching, rooſting, and reſt, as alſo to help them on the wing in taking their flight, and to be therein commodiouſly tucked up to the body, ſo as not to obſtruct their flight. In ſome, long, for wading, *&c.* See BIRD.

LEGS *of a Triangle.*—When one ſide of a triangle is taken as a baſe, the other two are called *legs.* See TRIANGLE.

Arched LEGS. } See the article { ARCHED.
Hyperbolic LEGS. } See the article { HYPERBOLIC.
Compaſſes of three LEGS. } See the article { COMPASSES.

LEGUMEN, LEGUME, is applied, by botaniſts, to beans, peas, vetches, &c. otherwiſe called *pulſe.* See PULSE, and LEGUMINOUS.

Some will have them thus called, in regard they are gathered with the hand; by which they are diſtinguiſhed from corn, &c. which are mowed, or reaped: *eo quod manu legatur, & non ſecatur.*

Yet the antient writers on huſbandry conſider corn, and even turneps, and all grains, and roots for family uſe, as *legumina.*

LEGUMINOUS, an appellation given to thoſe plants which yield legumes, or pulſe. See LEGUMEN.

Of this kind are moſt plants which grow in pods, as beans, peas, &c.

Ray ranks all plants as *leguminous*, which have a papilionaceous or butter-fly-like flower. See PLANT.

LEGUMINOUS *Flowers.* See the article FLOWER.

LEMMA, ΛΗΜΜΑ, in mathematics, denotes a previous propoſition, laid down in order to clear the way for ſome following demonſtration; and prefixed either to theorems, in order to render their demonſtration leſs perplexed, and intricate; or to problems, to make their reſolution more eaſy, and ſhort.

Thus, to prove a pyramid one third of a priſm, or parallelepipid of the ſame baſe and heighth with it; the demonſtration whereof in the ordinary way, is difficult, and troubleſome; this *lemma* may be premiſed, which is proved in the rules of progreſſion; that the ſum of the ſeries of the ſquares, in numbers in arithmetical progreſſion, beginning from 0, and going on 1, 4, 9, 16, 25, 36, &c. is always ſubtriple of the ſum of as many terms equal to the greateſt; or is always one third of the greateſt term multiplyed by the number of terms.

Thus, to find the inflection of a curve line, this *lemma* is firſt premiſed; that a tangent may be drawn to the given curve, in a given point.

So, in phyſics, to the demonſtration of moſt propoſitions, ſuch *lemmata* as theſe are neceſſary firſt to be allowed; that there is no penetration of dimenſions; that all matter is diviſible; and the like.—As alſo in the theory of medicine, that where the blood circulates, there is life, *&c.*

LEMNIAN *Earth*, *Terra* LEMNIA, a medicinal, aſtringent, ſort of earth, of a fatty conſiſtence, and reddiſh colour; uſed in the ſame caſes as bole. See BOLE.

It has its name from the iſland of *Lemnos*, whence it is chiefly brought.

Many form it into round cakes, and impreſs a ſeal upon it; whence it is alſo called, *terra ſigillata.* See SIGILLATA.

LEMONADE, a drink prepared of water, ſugar, and citron, or lemon juice.

This factitious liquor is ſo popular in Paris, that it has given its name to a new eſtabliſhed company, called *lemonadiers.*

LEMURES, in antiquity, *ſprites* or *hobgoblins*; reſtleſs ghoſts of departed perſons, who return to terrify and torment the living. See MANES.

Theſe are the ſame with *larvæ*, which the antients imagined to wander round the world, to frighten good people, and plague the bad.—For which reaſon, at Rome they had *lemuria*, or feaſts inſtituted to appeaſe the manes of the defunct.

Apuleius explains the antient notion of manes thus: The ſouls of men releaſed from the bands of the body, and freed from performing their bodily functions, become a kind of dæmons, or genii, formerly called *lemures.*—Of theſe *lemures*, thoſe that were kind to their families, were called *lares familiares*; but thoſe who, for their crimes, were condemned to wander continually, without meeting with any place of reſt, and terrified good men, and hurt the bad, are vulgarly called *larvæ*. See Lares.

An ancient commentator on Horace mentions, that the Romans wrote *lemures* for *remures*; which laſt word was formed from Remus, who was killed by his brother Romulus, and who returned to earth to torment him. See Lemuria.

But Apuleius obſerves, that in the ancient Latin tongue *lemures* ſignifies the ſoul of a man ſeparated from the body by death.

LEMURIA, or Lemuralia, a feaſt ſolemnized at Rome on the ninth of May, to pacify the manes of the dead, or in honour of the lemures. See Lemures.

The inſtitution of this feaſt is aſcribed to Romulus, who, to rid himſelf of the phantom of his brother Remus (whom he had ordered to be murdered) appearing always before him, ordained a feaſt called after his name *remuria*, or *lemuria*.

In the *lemuria*, they offered ſacrifices for three nights together; during which time all the temples of the gods were ſhut up, nor any marriages permitted.—There were a world of ceremonies in this feaſt, chiefly intended to exorciſe the *lemures*, and prevent their appearing, or giving any diſturbance to the living.

LENIS *Spiritus*, in proſody. See the article Spirit.

LENITIVE, in phyſic, ſometimes denotes a ſoftening, reſolutive remedy, that moiſtens the parts diſeaſed, and diſſipates any ſharp humour collected there.

Lenitive, is more frequently uſed for *laxative*. See Laxative.

Lenitive *Electuary*, is more peculiarly uſed for a gentle ſort of electuary, compoſed of Sena, polypody, *&c.* ſo called, in regard it purges eaſily, and by reſolving. See Electuary.

LENS, in dioptrics, properly ſignifies a ſmall, oblong glaſs, of the figure of a *lentil*; but is extended to any optic glaſs, not very thick, which either collects the rays of light into a point, in their paſſage through it, or diſperſes them farther apart, according to the laws of refraction. See Glass, Light, Rays, *&c.*

Lens's have various figures; that is, are terminated by various ſurfaces, from which they acquire various names. Some are plane on one ſide, and convex on the other; others convex on both ſides; both which are ordinarily called *convex lens's*: though when we ſpeak accurately, the former are called *plano-convex*.—Again, ſome are plane on one ſide, and concave on the other; and others are concave on both ſides, which are both uſually ranked among the concave *lens's*; though, when diſtinguiſhed, the former is called a *plano-concave*.—Others, again, are concave on both ſides; others are concave on one ſide, and convex on the other; which are called *convexo-concave*, or *concavo-convex lens's*, according as the one or the other ſurface is more curve, or a portion of a leſs ſphere. See Convex, Concave, *&c.*

It is to be here obſerved, that in every *lens* terminated in any of the forementioned manners, a right line perpendicular to the two ſurfaces is called the *axis* of the *lens*.—Which axis, when both ſurfaces are ſpherical, paſſes through both their centres; but if one of them be plane, it falls perpendicularly upon that, and goes through the centre of the other. See Axis.

A *lens*, one of whoſe ſurfaces is convex, and the other concave, is called a *meniſcus*; the properties of which, ſee under Meniscus.

See alſo the *Theory of* Lens's *demonſtrated* under Refraction; and the application thereof, under Microscope, Telescope, Burning-Glass, Focus, *&c.*

Some confine *lens's* within the diameter of five or ſix lines, and will have ſuch as exceed that diameter called *lenticular glaſſes*.

Lens's are diſtinguiſhed, with regard to the manner of their preparation, into *ground*, and *blown*.

Blown Lens's, are little globules of glaſs, melted in the flame of a lamp, or taper. See Microscope.

But the figure of theſe is ſeldom exact; beſides, that the ſmoke of the lamp cleaves to the ſurface in melting: on both which accounts, they come ſhort of the clearneſs of thoſe that are ground, or turned and poliſhed in the lathe, in little copper baſons, or diſhes.—The ſecret is now found of making theſe exquiſitely ſmall, ſo as ſome of them do not exceed, in diameter, the ſixth part of a line, which are found to magnify objects ſeveral millions of times.

Manner of grinding Lens's.—A little piece of copper is cemented to the end of the arbor of a lathe, and turned, till it form a diſh, or baſon of the diameter of the *lens* required.—Then a piece of clear glaſs is cemented on one of its flat ſides, to the end of a little maundrel, with black Spaniſh wax; and thus ground, on the ſide not cemented, on a grindſtone, with water, till it have nearly acquired a concave figure.—It is finiſhed in the lathe, by turning it in the baſon, with fine wet ſand, or gritt-ſtone. The gritt muſt be often repeated freſh, till the *lens* appear very round; when it is come to that point, they ceaſe to take any freſh ſtone, but continue to turn it in the baſon, till the remains of the ſand be become ſo fine as to have poliſhed it.—This they perceive, when, upon wiping it, the image of the window of the place is ſeen painted on its ſurface; if it does not, it is wetted in water without any ſand, and turned till it have got a poliſh.—The baſon is then covered, within ſide, with two or three folds of linen, and the poliſh finiſhed with putty, or tripoly of Venice ſteeped in water.—It is known to be perfectly poliſhed, when, viewing it with a magnifier, there appear no ſcratches of the ſand.—The cement is then broke off, and the ſide poliſhed cemented, to work and grind the other, as before, till the edges of the *lens* be become ſharp, and it be perfectly poliſhed on either ſide.—When finiſhed, it is waſhed in ſpirit of wine, to take off all remains of the wax.

For convex Lens's, the laws of their refraction, and their effects depending thereon, are as follow.—1°. A ray of light, EG, near the axis, (*Tab. Optics*, *fig.* 1.) and parallel thereto, ſtriking on the plane ſurface of a plano-convex *lens*, directly oppoſite to the luminous body, after refraction concurs with the axis in the point F: and if C be the centre of the convexity, CF will be to FL, that is, the diſtance of the centre from the point of concourſe, or focus, will be to the diſtance of the centre in the convex ſurface, in the ratio of the refraction. See Refraction.

For the plane ſurface being directly oppoſed to the luminous body, the ray EG is perpendicular to AB, and therefore will paſs unrefracted to H: thus it ſtrikes on AHB, ſtill parallel to the axis; and therefore coming out of a denſer medium into a rarer, will meet with the axis of the *lens* in F; and ſo, as that CF will be to FL in the ratio of the ſine of the refracted angle to the ſine of the angle of inclination: as will be demonſtrated under the head Refraction.

If then the refraction be out of a glaſs *lens* into air $CF : EL :: 3 : 2$, and therefore $FL = 2 CL$. That is, parallel rays, near the axis, will concur with it at the diſtance of the diameter. — Again, if the refraction were out of a water *lens*, *i. e.* out of a plano-convex *lens* filled with water, $CF : EL :: 4 : 3$, and therefore $FL = 3 CL$; *i. e.* parallel rays, near the axis, will concur with it at the diſtance of half the diameter. So that if a lighted candle be placed in the focus of a plano-convex *lens*, that is, in the point F, diſtant from the ſurface of the *lens* ALB, by the length of the diameter; and from the ſurface of the water *lens*, by half the diameter, its rays, after refraction, will become parallel. See Refraction.

2°. If the ray KI, (*Tab. Optics*, *fig.* 2.) near the axis of a plano-convex *lens*, and parallel thereto, ſtrike on its convex ſurface AHB, after a double refraction, it will meet the axis in F; ſo as that HG will be to GC, and GF to FH, in the ratio of the refraction.

For the ray KI, parallel to the axis EG, by virtue of the firſt refraction in I, will tend to the point G, ſo as GH will be to GC in the ratio of the ſine of the angle of inclination to the ſine of the refracted angles: therefore, by virtue of the ſecond refraction in L, it will concur with the axis in F; ſo as GD will be to FD in the ratio of the ſine of the refracted angle, to the ſine of the angle of inclination. See Refraction.

So that the ſemidiameter, and thickneſs of the plano-convex *lens*, with the ratio of refraction being given, hence ariſes a method of determining the focus of parallel rays ſtriking on the convex ſurface. For,

Hence, if the *lens* be glaſs, $FD = 2 CH - \frac{2}{3} HD$. So that if two thirds of the thickneſs of the *lens* be inconſiderable (as in practice it uſually happens) parallel rays meet with the axis at the diſtance of the diameter from the *lens*, even when they ſtrike on the convex ſurface.

So that as to the place of the focus, it is the ſame thing whether the plane ſurface, or the convex one be turned to a luminary of parallel rays; though it appears, both from experience, and trigonometrical calculations, that there are more rays united in a leſs ſpace, if the convex ſurface, than if the plane one be turned towards the ſun.

If the *lens* were full of water, $FD = 3 CH - \frac{3}{4} HD$. Wherefore if $\frac{3}{4}$ HD be inconſiderable, $FD = 3 CH$, or if $\frac{1}{4}$ HD be inconſiderable, $FH = 3 CH$. Parallel, and near rays, therefore, are united at the diſtance of half the diameter, if the refraction be in water, even when the convex ſurface is oppoſed to the luminous body. Hence, alſo, ariſes a method of determining the focus of parallel rays ſtriking on a *lens* convex on both ſides, the two ſemidiameters, and the thickneſs of the *lens*, being given.

On theſe principles is founded the ſtructure of refracting burning glaſſes, the ſun's light, and heat, being exceedingly augmented in the focus of a *lens*, whether convex or plano-convex; ſince the rays falling parallel to the axis of the *lens*, are reduced into a much narrower compaſs; ſo that it is no wonder they burn ſome bodies, melt others, and produce other extraordinary phænomena. See Burning-Glass.

3°. If a luminous body be placed in a focus behind a *lens*, whether plano-convex, or convex on both ſides; or whether equally, or unequally, the rays, after refraction, become parallel.

Hence, by means of a convex *lens*, or a little glaſs bubble full of water, a very intenſe light may be projected to a vaſt diſtance. See MIRROUR.

And this furniſhes us with the ſtructure of a lamp, or lantern, to project an intenſe light to an immenſe diſtance: for a *lens*, convex on both ſides, being placed oppoſite to a concave mirror, if in the common focus of both be placed a lighted candle, or wick, the rays reflected back from the mirror to the *lens* will be parallel to each other; and after refraction will converge, till they concur to the diſtance of the ſemidiameter, after which they will again diverge.—But the candle being likewiſe in the focus of the *lens*, the rays it throws on the *lens* will be parallel: and therefore a very intenſe light meeting with another equally intenſe, at the diſtance of the diameter from the *lens*, the light will be ſurprizing: and though it afterwards decreaſe, yet the parallel and diverging rays going a long way together, it will be very great at a very great diſtance. Lanterns of this kind are of conſiderable ſervice in the night-time to diſcover remote objects, and are uſed, with ſucceſs, by fowlers and fiſhermen, to gather their prey together, in order to take them.

If it be required to have the light, at the ſame time, tranſmitted to ſeveral places, as through ſeveral ſtreets, &c. the number of *lens's* and mirrors is to be encreaſed.

If the luminous body, placed in the focus, be of a larger extent, the rays flowing from points ſenſibly diſtant from each other, canot be parallel; but will conſtitute ſeveral trains, or parcels of rays, parallel to each other.

3°. The images of objects, oppoſed in any manner to a convex *lens*, are exhibited, invertedly, in its focus.

Hence, if a paper be applied to a convex *lens*, (eſpecially in a dark room) at the diſtance of its focus, the images of objects ſhining upon it, will be repreſented diſtinctly, and in their natural colours, thereon: nor is the focus of the ſun's rays any thing elſe, in effect, but the image of the ſun.—Hence, in ſolar eclipſes, the ſun's image, eclipſed as it is, may be burnt by a large *lens*, on a board, &c. a very entertaining phænomenon!

Hence alſo, if a convex *lens*, of any kind, be expoſed both to nearer and remoter objects, and a paper at the ſame time be applied, ſo as to receive the images of objects diſtinctly, the diſtance of the focus from the *lens*, and thence the diameter of the convexity, may be determined.

4°. If a concave mirror be ſo placed, as that an inverted image, formed by refraction through a *lens*, be found between the centre and the focus, or even beyond the centre, it will again be inverted by reflection, and ſo appear erect in the firſt caſe beyond the centre; and in the latter, between the centre and the focus. On theſe principles is built the camera obſcura. See CAMERA *obſcura*.

5°. The diameter of the image of an object delineated beyond a convex *lens*, is to the object itſelf in the ratio of the diſtance of the image to that of the object.

Since then the image of a remoter object is leſs diſtant from the *lens* than that of the nearer, the image of the more remote will be leſs than that of the nearer. And becauſe the diſtance of the image from the *lens* is greater, if the *lens* be a ſegment of a greater ſphere than of a leſs; hence the image will be greater in the former caſe than in the latter. The image therefore will be of ſuch a magnitude, as it would be of, were the object to ſhine into a dark room through a little hole upon a wall, at the ſame diſtance from the hole, at which the focus is from the *lens*.—When an object is leſs diſtant from a *lens* than the focus of parallel rays, the diſtance of the image is greater than that of the object, otherwiſe, the diſtance of the image is leſs than that of the object; in the former caſe, therefore, the image is greater than the object, in the latter, leſs.

If the images be made greater than the objects, they will not appear diſtinctly; becauſe in that caſe there are fewer rays which meet after refraction in the ſame point; whence it happens, that rays proceeding from different points of an object, terminate in the ſame point of an image, which is the cauſe of confuſion.—Hence it appears, that the ſame aperture of a *lens* may not be admitted in every caſe, if we would keep off the rays which produce confuſion. However, though the image is then more diſtinct, when no rays are admitted but thoſe near the axis, yet for want of rays the image is apt to be dim. See APERTURE.

6°. If the eye be placed in the focus of a convex *lens*, an object viewed through it appears erect, and enlarged in the ratio of the diſtance of the object from the eye, to that of the eye from the *lens*, if it be near; but infinitely, if remote. See MICROSCOPE; ſee alſo PRISM.

For Concave LENS's, *their laws* are as follow.—1°. If parallel rays ſtrike on a plano-concave *lens* KL, and FC be to FB in the ratio of refraction, the rays will diverge from the axis, and the point of divergency, or diſperſion, called the *virtual focus*, will be F. *See Tab. Optics, fig.* 3.

For the ray HI, parallel to the axis, is perpendicular to KL, and will therefore paſs unrefracted to E. Wherefore FC being to FB in the ratio of refraction, F will be the virtual focus. See REFRACTION.

If then the *lens* be glaſs, FB=2BC; *i. e.* the virtual focus E will be diſtant from the *lens* KL by the ſpace of the diameter 2 BC.

If the refraction be in water, FB=3 BC; *i. e.* the virtual focus F will be diſtant from the *lens* KL a diameter and a half 3 BC.

2°. If the ray AE, parallel to the axis FP, ſtrike on a *lens* concave on both ſides; and both FC be to FB, and IP to PH in the ratio of refraction; and FP : PH : : FB : BG; G will be the point of diſperſion, or the virtual focus. See *Tab. Optics, fig.* 4.

If therefore the refraction be in a glaſs *lens*, the ſums of the ſemi-diameters CB and HI, will be to the diameter of the concavity of either, 2 HI, as the ſemidiameter of the other CB, to the diſtance of the virtual focus from the *lens* BG.

Hence the ſun's rays ſtriking on a concave *lens*, their light, after refraction, will be conſiderably weakened; ſo that the effect of concave *lens's* is oppoſite to that of convex ones.

3°. An object viewed through a concave *lens*, appears erect, and diminiſhed in a ratio compounded of the ratio's of the ſpace in the axis, between the point of incidence, and the point to which an oblique ray would paſs without refraction, to the ſpace in the axis between the eye and the middle of the object; and the ſpace in the ſame axis between the eye and the point of incidence, to the ſpace between the middle of the object and the point the oblique ray would paſs to without refraction.

Though the properties of *lens's* have been here conſidered principally with regard to rays falling near the axis, and parallel thereto; yet the reaſoning will be eaſily transferred to rays remoter from the axis, and falling in any direction.—Thus we may ſay univerſally, that in a convex *lens*, all parallel rays become converging, and concur in a focus; that diverging rays either become leſs diverging, or run parallel, or converge; and that converging rays converge the more: All which alterations are more ſenſible in oblique rays, than in perpendicular ones, by reaſon the angles of incidence in that caſe are greater.

In concave *lens's* all parallel rays become diverging; diverging rays diverge more; converging rays either converge leſs, or become parallel, or go out diverging: all which things hold of oblique as well as direct rays, but more ſenſibly in the firſt.

LENS, or LENTICULA, was alſo the name of a kind of weight among the Romans; being the hundred and eighth part of a drachm; equal to a grain and a half. See DRACHM, and GRAIN.

LENT, *Quadrageſima*, a time of mortification, during the ſpace of forty days, wherein Chriſtians are enjoined to faſt, in commemoration of our Saviour's miraculous faſting ſo long in the deſart, and by way of preparation for the feaſt of Eaſter. See FAST.

In the ancient Latin church, *Lent* only conſiſted of thirty-ſix days. In the ninth century, to come ſomewhat nearer to the miracle, ſeveral took upon them to add four days more; which in time, became a general practice; though the church of Milan is ſaid ſtill to take up with the ancient thirty-ſix.

According to S. Jerom, S. Leo, S. Auguſtine, and others, *Lent* muſt have been inſtituted by the apoſtles.—Their way of reaſoning is thus: Whatever is generally received throughout the whole church, and whoſe inſtitution we do not find in any council, muſt be eſteemed to have been eſtabliſhed by the apoſtles.—Now ſuch, they ſay, is the faſt of *Lent*. Its inſtitution is not ſpoke of in any council; but many of the ancient councils, particularly that of Nice, that of Laodicea, &c. and ſome of the oldeſt fathers, particularly Tertullian, ſpeak of it as a thing of ſome ſtanding

The Reformed, generally, hold *Lent* to be a ſuperſtitious inſtitution, ſet on foot by ſome vain enthuſiaſts, who durſt undertake to ape the miracle of Jeſus Chriſt; as, in effect, it appears to have been from a paſſage of Irenæus, quoted by Euſebius.

Some will have it to have been firſt inſtituted by pope Teleſphorus, in the ſecond century: others, who own that there was a kind of abſtinence obſerved in the ancient church before Eaſter, yet contend that it was voluntary, and was never enjoined by any law, till the third century.

There was ſome difference between the practice of the Greek and Latin churches as to the buſineſs of *Lent*; the Greeks beginning it a week ſooner, but at the ſame time allowing more days of intermiſſion than the Latins: thoſe who held it ſeven weeks, did not faſt on Saturdays, as thoſe who obſerved it but ſix did.

The ancient Latin monks had three *Lents*; the grand *Lent* before Eaſter; another before Chriſtmas, called the *Lent of S. Martin*; and a third after Whitſunday, called the *Lent of S. John Baptiſt*: each of which conſiſted of forty days.

The Greeks, beſides that before Eaſter, obſerved four others; that of the *Apoſtles*, of the *Aſſumption*, of *Chriſtmas*, and of the *Transfiguration*: but they reduced each of them to the ſpace of ſeven days.—The Jacobites added a fifth, which they call the *repentance of Nineveh*; and the Maronites a ſixth, called the *exaltation of the holy croſs*.

By the ninth canon of the eighth council of Toledo it is ordained, ‘ That if any perſons, without evident neceſſity, eat fleſh in *Lent*, ‘ they ſhall be deprived the uſe of it all the reſt of the year.

The forty days in *Lent*, ſay ſome, are obſerved in remembrance of the forty days wherein the world was drowned; or, as others ſay, of the forty years wherein the Jews wandered in the deſart; others, of the forty days allowed Nineveh for repentance; others, of the forty ſtripes by which malefactors were to be corrected; or, the forty days faſted by Moſes at the receiving of the law; or, the forty days faſted by Elias; or, the forty days faſted by our Saviour.

LENTIGO, a cutaneous diſorder, popularly called *freckles*. See FRECKLES.

LENTIGO, is alſo uſed by Dr. Quincy for a freckly, or ſcurfy eruption upon the ſkin; ſuch, eſpecially, as is common to women in the time of child-bearing.

LENTISCUS, the wood of an evergreen tree of the ſame name, of ſome uſe in phyſic; it is aſtringent and fortifying, and much uſed for tooth-picks.

It contains a kind of gum, or reſin, much like maſtic, or rather the maſtic itſelf, or incenſe of Perſia, ſo highly commended by Strabo. See MASTIC.

The *lentiſcus* has nearly the ſame properties with the saunders; but has more of the turpentine in it, and ſometimes paſſes by urine. See SANTALUM.

LEO, *Lion*, the fifth of the twelve ſigns of the zodiac. See STAR, SIGN, and CONSTELLATION.

The ſtars in the conſtellation *Leo* in Ptolemy's catalogue are 32, in Tycho's 37, in the Britannic catalogue 94; the names, places, longitudes, latitudes, and magnitudes whereof, are as follow.

Cor LEONIS, *Lion's Heart*, a fixed ſtar of the firſt magnitude in the ſign *Leo*: called alſo *Regulus*, *Baſilicus*, &c. See REGULUS, *&c.*

LEONINE, in poetry, is applied to a kind of verſes which rime at every hemeſtic, the middle always chiming to the end. See VERSE, and RIME.

Of which kind we find ſeveral antient hymns, epigrams, prophecies, *&c.*—For inſtance, Muretus ſpeaking of the poetry of Lorenzo Gambara of Breſſe, ſays,

Brixia, veſtratis merdoſa volumina vatis,
Non ſunt noſtrates tergere digna nates.

The following one is from the ſchool of Salernum:

Ut vites pœnam de potibus incipe cænam.

The origin of the word is ſomewhat obſcure; Paſquier derives it from one Leoninus, or Leonius, who excelled in this way, and dedicated ſeveral pieces to pope Alexander III. Others derive it from pope Leo; and others from the beaſt called *lion*, by reaſon it is the loftieſt of all verſes.

M. Fauchet makes the *leonine* rime the ſame with what the French call the *rich*, and we the *double rime*, *i. e.* where two ſyllables have the ſame orthography, accentuation, and pronunciation with two others.

LEONTICA, feaſts or ſacrifices celebrated among the antients, in honour of the ſun.

They were called *leontica*, and the prieſts who officiated at them *leones*, in regard they repreſented the ſun under the figure of a lion radiant, bearing a tiara, and griping in his two fore paws the horns of a bull, who ſtruggled in vain to diſengage himſelf.

The critics are extremely divided about this feaſt; ſome will have it anniverſary, and to have made its return not in a ſolar, but a lunar year; but others hold its return more frequent, and give inſtances where the period was not above two hundred and twenty days.

The ceremony was ſometimes alſo called *Mithriaca*, Mithras being the name of the ſun among the antient Perſians.

There was always a man ſacrificed at theſe feaſts till the time of Hadrian; who prohibited it by a law. Commodus introduced the cuſtom afreſh, after whoſe time it was again exploded.

LEPIDOIDES*, or LEPIDOEIDES, in anatomy, a name of the ſquammous or ſcaly ſuture of the cranium. See SUTURE.

* The word is Greek, λεπιδοειδης; formed of λεπις, ſcale, and ειδος, form, figure. See SQUAMMOUS.

LEPROSY*, LEPRA, a foul, cutaneous diſeaſe, appearing in dry, white, thin, ſcurfy ſcabs, either over the whole body, or only ſome part of it; and uſually attended with a vehement itching, and other pains.

* The word is derived from the Greek λεπρα, which ſignifies the ſame; and that from λεπις, *ſquamma*, ſcale.

The *leproſy* ſeems to arise from a great obſtruction of perſpiration; whereby the thin, ſaline humours, are thrown off from the blood, and arreſted by the denſity and cloſeneſs of the cuticula. See CUTIS, and CUTICULA.

This diſtemper has been much more frequent in former times than at preſent, and much more in the hot countries of the eaſt, particularly among the Jews, than among us; perhaps by reaſon the ſalts which, by the appointment of nature, are to be eliminated through the pores of the skin, along with the recrementitious ſerum their proper vehicle, are, in hot countries, conveyed in greater plenty to the ſurface of the body, than in theſe northern regions they ordinarily are; and ſticking in their paſſage in the thin dry membrane of the cuticle, the aqueous parts, which are their vehicle, ſlip away from them by inſenſible evaporation, and leave them there to corrode and fret it, till at length, through the quantity ſo gathered, the membrane becomes dry, brittle, and white, which is the cauſe of that diſquammation, or falling away in white ſcales: that whiteneſs, as well as the brittleneſs, proceeding merely from the quantity of theſe ſalts, which are themſelves white; and when the moiſture is drawn from them, being aculeated, and having inſinuated themſelves into the pores of the cuticle, diſſolve the continuity of it by their points and edges, which, thus mortified and broken, is apt, on the leaſt friction, to fall off, as abovementioned.

The antients diſtinguiſhed two kinds of *leproſy*; *viz.* the *lepra Græcorum*, and *lepra Arabum*: though the two ſeem only to have differed in degree; the ſymptoms of the Grecian being further heightened and aggravated in the Arabian.

LEPRA *Arabum*, is the ſame with what is otherwiſe called *elephantiaſis*, by reaſon in this the patient's skin is rough and wrinkled like an elephant's hide. See ELEPHANTIASIS.

In the *lepra Arabum*, the skin is beſet with a dry ſcabby cruſt. As in the former caſe the ſalts, being left deſtitute of their humidity, are not ſo active, and therefore affect only the cuticle; in the latter caſe theſe ſalts, with their vehicle, crowding faſter than they can be evaporated through the pores of the skin (being ſtill *in fluore*, and ſo more cauſtic) corrode deeper, and eat not only the cuticle, but the excretory veſſels, and ſurface of the skin itſelf, which thereby ſpews out a liquor ſomewhat thicker than uſual; which, when the thinneſt and moſt aqueous parts are evaporated, are condenſed into that cruſt or ſcab, which is the diſtinguiſhing character of this diſeaſe.

Galen defines the *lepra*, an effuſion of thick diſorderly blood, that corrupts the whole habit of the body. Avicenna calls it an *univerſal cancer*.

The *lepra* begins within-ſide, a long time before it appears without-ſide: It was frequent in Europe in the Xth and XIth centuries, but ſeems at preſent almoſt extinct; unleſs we allow the venereal diſeaſe to be the ſame with the *lepra*, as was the opinion, among many others, of the learned Pitcairn, and as has been lately endeavoured to be proved by Mr. Becket, in a diſcourſe expreſly on the ſubject in the *Philoſophical Tranſactions*. See VENEREAL.

The ſymptoms of the antient *lepra*, as laid down by Galen, Aretæus, Pontanus, Ægineta, Cardan, Varanda, Gordon, Pharæus, and others, are as follow: The patient's voice is hoarſe, and comes rather through the noſe than the mouth; the blood full of little white ſhining bodies, like grains of millet, which upon filtration ſeparate themſelves from it; the ſerum is ſcabious, and deſtitute of its natural humidity, inſomuch that ſalt applied to it does not diſſolve; it is ſo dry, that vinegar poured on it boils; and is ſo ſtrongly bound together by little imperceptible threads, that calcined lead thrown into it ſwims. The face reſembles a coal half extinct, unctuous, ſhining, and bloated, with frequent hard knobs, green at bottom, and white at top. The hair is ſhort, ſtiff, and brinded, and not to be torn off without bringing away ſome of the rotten fleſh to which it adheres; if it grows again, either on the head or chin, it is always white. Athwart the forehead run large wrinkles, or furrows, from one temple to the other; the eyes red and enflamed, and ſhine like thoſe of a cat; the ears ſwoln and red, eaten with ulcers towards the bottom, and encompaſſed with little glands; the noſe ſunk, becauſe of the rotting of the cartilage; the tongue dry and black, ſwollen, ulcerated, divided with furrows, and ſpotted with grains of white; the skin covered with ulcers, that die and revive on each other, or with white ſpots or ſcales like a fiſh; it is rough and inſenſible, and when cut, inſtead of blood, yields a ſanious liquor. It arrives in time to ſuch a degree of inſenſibility that the wriſt, feet, or even the large tendon, may be pierced with a needle, without the patient's feeling any pain. At laſt the noſe, fingers, toes, and even privy members fall off entire, and by a death peculiar to each of them, anticipate that of the patient. It is added, that the body is ſo hot, that a freſh apple held in the hand an hour, will be dried and wrinkled, as if expoſed to the ſun for a week.

Matthew Prior, ſays, that in Chriſtendom there were fifteen thouſand hoſpitals for *lepers*; but the diſeaſe having been diſcontinued for two hundred years, the revenues of thoſe hoſpitals were abuſed, and perſons feigned themſelves *lepers*, to be entitled to the proviſion; which occaſioned their regulation in ſome countries, and their entire ſuppreſſion in others.

In France, they were united to the order of the religious of S. Lazarus and mount Carmel in 1664, and the adminiſtration of them given to the knights of that order. See LAZARUS. In England, they have been converted to other purpoſes.

Formerly the cauſes of *lepers* were committed to the eccleſiaſtical tribunals; and it was prohibited to proſecute a *leper* before a lay-judge, in regard they were under the protection of the church, which ſeparated them from the reſt of the people by a ceremony ſtill to be ſeen in the antient rituals.

As to the cure, that which proved effectual in thoſe ſouthern countries, fails among us, where the ſtrongeſt medicaments, and the moſt powerful mercurials, are neceſſary. Bathing is judged to be of good uſe in the *lepra*. Dogs and hares are ſaid to be ſubject to this diſeaſe. Among the Indians a white man is deſpiſed, this paſſing with them for a mark of a *leper*.

LEPUS, the *Hare*, a conſtellation of the ſouthern hemiſphere; whoſe ſtars in Ptolemy's catalogue are 12, in that of Tycho 13, in the Britannic catalogue 19; the names, places, longitudes, latitudes, and magnitudes whereof are as follow.

Names and Situations of the Stars.	Sign.	Longitude °	′	″	Latitude South. °	′	″	Magnit.

LE ROY *le veut*, words by which the royal aſſent is ſignified by the clerk of the parliament to public bills: to private bills this aſſent is expreſſed by *ſoit fait comme il eſt deſire*. See ROYAL.

LE ROY *s'aviſera*.—By theſe words to a bill, preſented to the king by his parliament, are underſtood his abſolute denial of that bill in a more civil way; and the bill thereby becomes wholly null and void. See PARLIAMENT.

LESBIAN *Cymatium*. See the article CYMATIUM.

LESSER *Barons*. See BARON.
LESSER *Bear*. See BEAR.
LESSER *Centaury*. See CENTAURY.
LESSER *Circle of a Sphere*. See CIRCLE.
LESSER *enharmonical Dieſis*. See DIESIS.
LESSER *Excommunication*. See EXCOMMUNICATION.
LESSER *Hexachord*. See HEXACHORD.

LESSOR, and LESSEE. See the article LEASE.

LETHARGY *, ληθαργια, in medicine, a diſeaſe conſiſting of a profound drowſineſs or ſleepineſs, wherein the patient can ſcarce be awaked; or, if awaked, remains ſtupid, without ſenſe or memory, and preſently ſinks again into his former ſleep.

* The word comes from the Greek ληθη, oblivion, and αργια, numbneſs, lazineſs.

The *lethargy* is uſually accompanied with a fever and delirium. Boerhaave makes the *lethargy* a gentle apoplexy, ariſing from the ſame cauſes, and to be known and cured in the ſame manner. See APOPLEXY.

Some authors diſtinguiſh the *lethargy* from the carus, in that this latter is without a fever, or at moſt is preceded with a violent one; whereas the *lethargy* is attended with a ſlow one. Celſus ranges the *lethargy* in the number of acute diſeaſes, the patient uſually dying on the ſeventh day. A *lethargy* frequently ſucceeds a frenzy.

LETHE, LETH, or LATHE, a meaſure or portion of lands, making one of the antient diviſions of England.

King Ælfred divided England into counties, as it ſtands at preſent; thoſe counties he ſubdivided into hundreds or tithings. The hundred was a diviſion, wherein were an hundred officers to ſecure the peace; the *lethe* or *lathe* comprehended three or four of theſe hundreds. See HUNDRED.

LETHE was alſo the juriſdiction of a viſcount; or a kind of aſſize, held once a year in each village, about Michaelmas.—Whether this was inſtituted by Ælfred, or no, is a queſtion?

LETTER, *Litera*, a character either in print or writing, by which any people have agreed to expreſs one of the ſounds, uſed

N to be placed in the Middle of the Sheet 5 U u, Vol. II.

uſed in conveying their thoughts to each other in ſpeech. See CHARACTER.

Letter is by ſome defined, a ſimple uncompounded ſound of the voice, that cannot be ſubdivided into any more ſimple, and generally marked with a particular character.

But it muſt be owned, that, ſtrictly ſpeaking, a *letter* is not the ſound itſelf, but rather the ſign of a ſound; for γραμμα, *litera*, is derived from γεγραμμαι, of γραφω, to write, and *litera* is formed from *litus*, the participle of *linere*, to ſmear, or mark: whence *obliterare* ſignifies to blot out. See WRITING.

Where a ſign or character does not expreſs a ſound entirely ſimple, but one reſolvible into ſeveral, it is not ſo properly a *letter* as an abbreviation, containing in itſelf as many *letters* as its power does ſimple ſounds. This is evident in the Latin &, *x*, and the Greek ξ, ψ, ς, *&c.* which are compoſed of *et*, *ks*, κς, ϖς, στ, *&c.*

On the contrary, a ſimple ſound, though expreſſed by ſeveral characters, is yet to be eſteemed one *letter*; for *th*, *ph*, are ſingle *letters*, as much as φ, θ, and *f*.

The *letters* F, G, H, K, Q, X, Y, Z, were unknown to the ancient Romans, as is proved by Dauſquius in his *Orthography*, where he traces the origin of the ſeveral *letters*. See F, G, H, *&c.*

Grammarians diſtinguiſh *letters* into *vowels* and *conſonants*; into *mutes*, *diphthongs*, *liquids*, and *characteriſtics*. See VOWEL, CONSONANT, DIPHTHONG, *&c.*

The Hebrews divide their *letters* into *guttural*, as *a*, *h*, *ch*, *gn*, aleph, he, chaph, hain; *dental*, as *z*, *ts*, *r*, zain, tſade, reſh; *labial*, as *b*, *m*, *u*, *p*, beth, mem, vau, phe; *lingual*, or thoſe chiefly formed by the tongue, as *d*, *t*, *l*, *n*, daleth, tau, lamed, nun; and *palatal*, as *g*, *i*, *c*, *k*, ghimel, jod, caph, coph. See GUTTURAL, DENTAL, *&c.*

Printers diſtinguiſh their *letters* into *capital*, majuſcule, initial, or upper caſe *letters*, which ſerve for the titles of books, proper names, *&c.* And minuſcule, *ſmall*, or under caſe *letters*: which are again divided, according to their ſize, into *pearl*, *nonpareil*, *pica*, *great canon*, &c.—They have alſo their flouriſhed *letters*, engraven on wood or metal, which take place of the illuminated *letters* of the ancient manuſcripts.

There are *letters* of various ſizes, or bodies; each of which, again, are ſometimes caſt with the Roman; ſometimes an Italic, and ſometimes an Engliſh, or Black *letter* face. There are alſo bodies with Greek, Hebrew, Arabic, the muſic face, *&c.*

The moſt uſual ſizes, or bodies, with their proportions, are ſhewn and exemplified in the following table; where it is to be obſerved, that the verſe anſwering to each is compoſed in the reſpective ſize or *letter*.

Pearl.	Which when he knew, and felt our feeble hearts,
Nonpareil.	Emboſt with bale, and bitter biting grief,
Brevier.	Which love had launced with his deadly darts;
Long Primer.	With wounding words, and terms of foul reprief,
Small Pica.	He pluck'd from us all hope of due relief,
Pica.	That erſt us held in love of ling'ring life.
Engliſh.	The hopeleſs, heartleſs 'gan the cunning thief
Great Primer.	Perſuade to die to ſtint all further ſtrife:
Double Pica.	To me he lent this rope, to him a ruſty knife:
Two lined Engliſh.	With which ſad inſtrument of haſty death,
Great Canon.	That woful lover lothing longer life,

The above ſizes were all caſt in the foundery of Mr. W. Caſlon; a perſon who, though not bred to the art of letter-founding, has, by dint of genius, arrived at an excellency in it unknown hitherto in England, and which even ſurpaſſes any thing of the kind done in Holland, or elſewhere.

A ſet or fount of any of theſe ſizes, includes current letters, capitals, numeral figures, points, ſpaces, *&c.* See FOUNT.

Letters make the firſt part or elements of grammar; an aſſemblage of theſe compoſe *ſyllables*, of thoſe *words*, and of theſe *ſentences*. See SYLLABLE, WORD, SENTENCE, *&c.*

The alphabet of every language conſiſts of a certain number of theſe *letters*, which ought each to have a different ſound, figure, and ſignification. See ALPHABET.

As the difference of articulate ſounds was intended to expreſs the different ideas of the mind, ſo one *letter* was originally intended to ſignify only one ſound, and not as at preſent, to expreſs ſometimes one ſound, and ſometimes another; which practice has brought a great deal of confuſion into the languages, and rendered the learning of the modern tongues infinitely more difficult than it would otherwiſe have been. This conſideration, together with the poverty of all the known alphabets, and their want of ſome *letters* to expreſs certain ſounds by, has occaſioned ſeveral attempts towards an univerſal alphabet, to contain an enumeration of all ſuch ſingle ſounds or *letters*, as are uſed in any language. A thing of very conſiderable uſe; a ſpecimen of which is given us by Mr. Lodwick, in the *Philoſophical Tranſactions*.

According to Critinus, Moſes invented the Hebrew *letters*, Abraham the Syriac and Chaldee; the Phœnicians thoſe of Attica, brought into Greece by Cadmus, and thence by the Pelaſgians into Italy; Nicoſtrata the Latin; Iſa the Egyptian; and Uulfilas thoſe of the Goths. See HEBREW, GOTHIC, *&c.*

As to the firſt *letters*, what they were, who firſt invented them, and among what people they were firſt in uſe, there is ſtill room to doubt; however, ſetting aſide conjectures, and prejudice, the buſineſs of antiquity ſeems to lie between the Egyptians and Chineſe.—Philo attributes the firſt invention of *letters* to Abraham; Joſephus, S. Irenæus, and others, to Enoch; Bibliander, to Adam; Euſebius, Clemens Alexandrinus, Corn. Agrippa, *&c.* to Moſes; Pomponius Mela, Herodian, Rufus Feſtus, Pliny, Lucan, *&c.* to the Phœnicians; S. Cyprian, to Saturn; Tacitus, to the Egyptians; and ſome to the Ethiopians.

The Egyptian mummies, and obeliſks, prove a great antiquity on the ſide of the hieroglyphics; but if the Chineſe chronology may be credited, their characters are vaſtly more ancient than thoſe of the Egyptians—The Chineſe make Fohi, the firſt of their kings, the inventer of their *letters*, and compute him to have lived 2950 years before Chriſt. During all which time, they pretend to have certain and written accounts in their books—If this holds true, their character muſt be older than Moſes by 1400 years, and even before Menes, the firſt king of Egypt, by 500 years: ſo that the Chineſe *letters* appear to be the moſt ancient of that kind; and the book *Yekim*, ſaid to be written by Fohi, the moſt ancient book.

But as China is ſo remote, and had ſo little communication with theſe parts of the world, we may reaſonably make another enquiry into the original of *letters* in the hither parts of Aſia, Egypt, and Europe.—Here, indeed, the Egyptians ſeem to have the beſt title.—It is more than probable, from the obeliſks, *&c.* that their hieroglyphics were the firſt manner of writing, and the original characters in theſe parts, as being prior to Moſes; and made, at leaſt in great meaſure, while the Iſraelites were ſlaves among them, and conſequently not well qualified for inventions ſo very curious, and judicious. See HIEROGLYPHIC.

Whether Cadmus, and the Phœnicians learnt *letters* from the Egyptians, or from their nearer neighbours of Judæa, and Samaria, is a queſtion? ſince ſome of the books of the Old Teſtament, being written in *letters*, is more likely to have given them the hint, than the hieroglyphics of Egypt.—But when, or whereſoever the Phœnicians learnt this art, it is generally agreed, that Cadmus, the ſon of Agenor, firſt brought *letters* to Greece; whence, in the following ages, they ſpread over the reſt of Europe. See GREEK.

Rudbecks, who in his *Atlantica* claims the glory of all inventions, from all other nations, for the Swedes, maintains, that the Ionians had *letters* before Cadmus; that at the time of the ſiege of Troy, the Greeks had but 16 *letters*, whereas the Phœnicians had 22: whence he concludes, that it was not either Cadmus, or the Phœnicians, who taught this art to the Greeks.—But, in regard the ancient northern nations had juſt 16 *letters*, like the Greeks, he concludes the Greeks muſt either have taught them to the people of the North, or have learnt them of them.—But becauſe the form and make of the Runic *letters* is more artleſs, and coarſe, than that of the Greek *letters*, he concludes that theſe laſt muſt be derived from the former; taking it as a principle, that thoſe who derive any thing from another, poliſh and improve it.—He even aſſerts, that by the golden apples which Hercules was obliged to ſteal, muſt be underſtood the *letters* in uſe among the Hyperboreans. See RUNIC.

There are few things on which there has been ſo much written, as on the original Hebrew *letters*; ſince Origen, Euſebius Cæſarienſis, S. Jerom, *&c.* have made it the ſubject of their enquiry. If they do not always go back to the beginning of the world, and the origin of *letters*, it is at leaſt enquired, what were the characters made uſe of by Moſes to tranſmit the law to poſterity, or thoſe uſed by the other hiſtorians, and prophets of the Old Teſtament, or even thoſe uſed by the Hebrews before the Babylonian captivity?—With regard to which, there are three principal opinions: ſome imagine the ancient Hebrew *letter* the ſame with that now in uſe; of this opinion are ſeveral doctors of the talmud, Poſtellus, Buxtorf, *&c.*—The ſecond opinion is, of thoſe who believe the Samaritan *letter* the more ancient; which is now the more common opinion, as without doubt it is the elder: ſeveral Miſchnic and Gemaric doctors, many of the rabbins, and fathers, Origen, Jerom, Euſebius, Beda, Genebrard, Ramban, Bellarmine, Scaliger, Druſius, Capella, Bibliander, Brerewood, Montanus, Walton, the two Voſſius's, Bochart, and Bernard, are of this opinion.—The third is, that from the beginning there were two Hebrew characters; the one ſacred, the other profane; which is the opinion of Azarias, R. de Bartenora, Poſtel, Buxtorf, Conringius, *&c.*—But this diſtinction of two kinds of characters ſeems a mere chimera.—See P. Souciet on the Samaritan medals, where he proves, that the *letters* in the inſcriptions of thoſe medals, are the genuine, original Hebrew characters.—See alſo the articles SAMARITAN, and HEBREW.

The art of joining *letters* to form words, and of combining the one and the other an infinite number of different ways, is a ſecret unknown to the Chineſe. Inſtead of the alphabetical *letters*, they at firſt, like the Egyptians, uſed hieroglyphics: they painted rather than wrote; ſtriving, by the natural images of things drawn on paper, to expreſs and communicate their ideas to one another. To write a bird, they were obliged to paint its figure; and to ſignify a foreſt, they drew a great number of trees. A circle ſerved for the ſun, and a creſcent for the moon.—But this manner of writing was not only very incommodious, but alſo very imperfect. For, beſides that they could but expreſs their thoughts by halves, even that little they could expreſs, was but very imperfectly delivered; and it was ſcarce poſſible not to be frequently deceived in it.—Further, they were under a neceſſity of writing large volumes to ſay very little matters, in regard their pictures took up a great deal of room.—To remedy theſe inconveniences, they changed, by little and little, their manner of writing, making it more ſimple, though leſs natural. They even invented ſeveral characters, to expreſs things that did not come within the reach of painting to repreſent; as voice, ſmell, thoughts, paſſions, and a thouſand other objects that have no body, or figure.—From ſeveral ſimple ſtrokes, they afterwards framed others more compound; and in this manner multiplied their *letters* and characters to infinity, contriving one or more for every word.

This multitude of *letters* ſeems the ſource of that ignorance which we find among the Chineſe. Their whole lives being ſpent in learning their *letters*, they have no time to apply themſelves to the ſtudy of things, but think themſelves very learned when they are able to read.—There are ſcarce any of them that know all their *letters*: they think it is a great progreſs they have made, when, after forty or fifty years hard ſtudy, they are able to underſtand fifteen or twenty thouſand.—But the generality of their learned men come ſhort of this: father le Compte is of opinion, that the greateſt doctor among them never underſtood half of their *letters* well; for the whole number he reckons eighty thouſand.—This is a prodigious inconvenience to foreigners, of which the miſſionaries in that country make loud complaints.

Among the Chineſe *letters*, there are ſome now almoſt wore out of uſe, and only preſerved out of reſpect to antiquity.—There is a ſecond claſs much leſs ancient among the former, only uſed in public inſcriptions.—A third, much more regular and beautiful, uſed in printing, and even in ordinary writing.—However, as the ſtrokes are to be diſtinctly formed, they cannot be wrote with any expedition.—For this reaſon, they have invented a fourth kind, where the ſtrokes being cloſer, and leſs diſtant from each other, allow them to be writ with more eaſe and readineſs. And this they call the *running letter*.

The Americans had no *letters* before the diſcovery of that country by the Spaniards.—The Acaanibas engrave their memorable events and epocha's on ſtones, and metals: their ſongs ſupply the reſt.—In Peru, and Chili, to keep an account of their goods and chattels, and to preſerve the memory of their particular affairs, the Indians have recourſe to certain knots of wool, which, by the variety of their colours, and ties, ſerve inſtead of characters and writing. The knowledge of theſe knots, which they call *quipos*, is one of their great ſciences; but which is always kept as a ſecret, and never revealed to the children, till the fathers think themſelves at the end of their days.

Double LETTER.	See	DOUBLE.
Final LETTER.		FINAL.
Guttural LETTER.		GUTTURAL.
Labial LETTER.		LABIAL.
LETTER *Foundery*.		FOUNDERY.
LETTER-*Founders Furnace*.		FURNACE.
LETTER-*Founders Mould*.		MOULD.

Numeral LETTERS, are thoſe uſed inſtead of ciphers, to expreſs numbers.

Tht Roman numerals are, C, D, I, L, M, V, X; which are all formed by deſcribing a circle, and drawing two lines through it, croſſing each other at right angles in the centre. See CHARACTER.

Dominical LETTER.	See the article	DOMINICAL.
Nundinal LETTER.		NUNDINAL.

LETTER is alſo a writing addreſſed, and ſent to one. See EPISTLE.

LETTER *of Attorney*, a writing authorizing an attorney to do ſome legal act in our ſtead; as, to give ſeiſin of lands, to receive debts, to ſue a third perſon, *&c.*

LETTER *of Credit*, among merchants, a *letter* which a merchant or banker directs to his correſpondent abroad, ordering him to credit the bearer as far as a certain ſum. See CREDIT.

LETTER *of Exchange*. See BILL, and EXCHANGE.

LETTER *of Licenſe*, in trade, is an inſtrument, or writing granted to a man who has failed, or broke, ſigned and ſealed by his creditors; which *letter* uſually gives a longer time for payment, ſo that the debtor having ſuch an aſſurance, may go about his buſineſs without fearing an arreſt.

LETTERS *of Mart*, or *Marque*, are *letters* under the privy-ſeal, granted to the king's ſubjects; impowering them to take, by force of arms, what was formerly taken from them by the ſubjects of ſome other ſtate, contrary to the law of mart. See MARQUE, and REPRIZAL.

LETTERS *Patent*, or *Overt*, are writings ſealed with the great ſeal of England, whereby a man is authorized to do, or enjoy any thing, which, of himſelf, he could not do. See PATENT.

They are ſo called, by reaſon of their form; as being open, with the ſeal affixed, ready to be ſhewn for the confirmation of the authority given by them.

Common perſons may grant *letters patent*; but they are rather called *patents*, than *letters patent*; yet, for diſtinction, thoſe granted by the king are ſometimes called *letters patent royal*.

Letters patent conclude with *teſte meipſo*; charters, with *hiis teſtibus*. See CHARTER, *&c.*

LETTERS *of Reſpite*, *letters* iſſued out by a prince, in favour of honeſt, unfortunate debtors, againſt too rigorous creditors, whereby payment is delayed for a certain term.

The uſe of theſe *letters* is very ancient: Caſſiodorus obſerves, they were in uſe in the time of Theodoric, king of the Goths: others will have them introduced towards the end of the eleventh century, by pope Urban II. in favour of thoſe who went on the croiſades.

They are ſtill in uſe in France, and ſome other countries: and take their name *à reſpirando*, becauſe they give the debtor a breathing while. See RESPITE.

LETTERED, LETRADOS, *Literati*. See LITERATI.

LEVANDIS *militum Expenſis*. See the article EXPENSIS.

LEVANT, in geography, ſignifies any country ſituate to the eaſt of us, or in the eaſtern ſide of any continent or country, or that on which the ſun riſes. See EAST.

LEVANT, in matters of commerce, *&c.* is generally reſtrained to the Mediterranean ſea; or, rather, to the country on the eaſtern part of it.

Hence, our trade thither is called the *Levant trade*; and a wind that blows from thence, out of the ſtreights-mouth, is called a *Levant wind*. See *Turkey* COMPANY.

LEVANT *Meaſures*.	See the article	MEASURE.
Bole of the LEVANT.		BOLE.

LEVANT *and couchant*, in law, is, when cattle have been ſo long in another man's ground, that they have lain down, and riſen again to feed.

LEVARI *Facias*, a writ directed to the ſheriff for levying a ſum of money on a man's lands and tenements, who has forfeited his recognizance.

LEVATIO *Arietum*. See the article ARIETUM.

LEVATOR, an epithet which anatomiſts give to ſeveral muſcles, whoſe uſe is to raiſe, or lift up the parts to which they belong. See ELEVATOR.

There are *levators* of the eye-lids, of the omoplate, of the anus, of the ſcapula, *&c.*—See *Tab. Anat.* (*Myol.*) *fig.* 2. *n.* 3.

LEVATUM. See TERRIS, *&* *Catalis tentis ultra debitum.*

LEUCOMA *, in phyſic, a little white ſpot on the cornea of the eye, called by the Latins *albugo*. See ALBUGO.

* The word is Greek, λευκωμα, from λευκος, white.

It is occaſioned by a humour gathered in this membrane; or by the ſcar following a wound, or by an ulcer in this part, as ſometimes happens in the ſmall-pox.

LEUCOPHLEGMATIA *, a kind of dropſy, otherwiſe called *anaſarca*. See ANASARCA.

* The word is Greek, λευκοφλεγματια, formed from λευκος, white, and φλεγμα, *pituita*, phlegm.

The *leucophlegmatia* conſiſts in a tumor, or bloating of the whole outer ſurface of the body, or ſome of its parts; white and ſoft, eaſily giving way to the touch, and preſerving the impreſſion made by the finger for ſome time.

It may either be owing to ſome diſorder of the blood; which in this diſeaſe, is of a pale colour, viſcid, and cold; or to an aqueous humour extravaſated, and gathered together in the muſcles, and the pores of the ſkin. See DROPSY.

LEVEL *, an inſtrument, wherewith to draw a line parallel to the horizon, and continue it out at pleaſure; and by this means to find the true level, or the difference of aſcent or deſcent, between ſeveral places, for conveying water, draining fens, *&c.*

* The word comes from the Latin, *libella*, the croſs beam that forms the brachia of a balance; which, to be juſt, muſt ſtand horizontally.

There are ſeveral inſtruments of different contrivance, and matter, invented for the perfection of *levelling*; all of which, for the practice, may be reduced to theſe that follow.

Air LEVEL, that which ſhews the line of *level*, by means of a bubble of air incloſed with ſome liquor in a glaſs tube of an indeterminate length and thickneſs, whoſe two edges are ſealed hermetically; that is, are cloſed with the glaſs itſelf, by heating it with the flame of a lamp, till it become ſoft and tractable.—When the bubble of air fixes itſelf at a certain mark, made exactly in the middle of the tube, the plane, or ruler wherein it is fixed, is *level*. When it is not *level*, the bubble will riſe to one end.

This glaſs tube may be ſet in another of braſs, having an aperture in the middle, whence the bubble of air may be obſerved.

The liquor wherewith the tube is filled, is ordinarily either oil of tartar, or aqua ſecunda; thoſe not being liable to freeze, as common water, nor to rarefaction and condenſation, as ſpirit of wine is.

The invention of this inſtrument is aſcribed to M. Thevenot.

Air LEVEL, *with Sights*, is an improvement on that laſt deſcribed; which by the addition of more apparatus, becomes more commodious, and exact.

It conſiſts of an *air level*, (*Tab. Surveying*, *fig.* 4.) about eight inches long, and ſeven or eight inches in diameter, ſet in a braſs tube, with an aperture in the middle. The tubes are carried in a ſtrong ſtreight ruler, a foot long, at whoſe ends are fixed two ſights exactly perpendicular to the tubes, and of an equal heighth, having a ſquare hole, formed by two fillets of braſs, croſſing each other at right angles, in the middle whereof is drilled a very little hole; through which, a point on a *level* with the inſtrument is deſcried.—The braſs tube is faſtened on the ruler by means of two ſcrews; one whereof, marked 4, ſerves to raiſe or depreſs the tube at pleaſure, for bringing it towards a *level*. The top of the ball and ſocket, is rivetted to a little ruler that ſprings; one end whereof is faſtened with ſcrews to the great ruler, and the other end has a ſcrew, 5, ſerving to raiſe and depreſs the inſtrument, when nearly *level*.

This inſtrument is yet leſs commodious than the following one; becauſe, though the holes be ever ſo ſmall, yet they will ſtill take in too great a ſpace to determine the point of *level* preciſely.

Air LEVEL, *with Teleſcope Sights*.—This *level*, repreſented in *Tab. Surveying*, *fig.* 5. is like the laſt; with this difference, that inſtead of plain ſights, it carries a teleſcope, to determine exactly a point of *level* at a good diſtance.

The teleſcope is in a little braſs tube, about 15 inches long, faſtened on the ſame rule as the *level*.—At the end of the tube of the teleſcope, marked 1, enters the little tube 1, carrying the eye-glaſs, and a hair horizontally placed in the focus of the object-glaſs 2; which little tube may be drawn out or puſhed into the great one, for adjuſting the teleſcope to different ſights.—At the other end of the teleſcope is placed the object-glaſs: the ſcrew 3, is for raiſing or lowering the little fork carrying the hair, and making it agree with the bubble of air, when the inſtrument is *level*; and the ſcrew 4, is for making the bubble of air agree with the teleſcope.—The whole is fitted to a ball and ſocket.

M. Huygens is ſaid to have been the inventor of this *level*; which has this advantage, that it may be inverted, by turning the rule and teleſcope half round: and if then the hair cut the ſame point that it did before the turn, it is a proof the operation is juſt.

It may be here obſerved, that one may add a teleſcope to any kind of *level*, by applying it upon, or parallel to the baſe, or ruler, when there is occaſion to take the *level* of remote objects.

Foot-LEVEL. See the article FOOT-*Level*.

Artillery Foot-LEVEL, is in form of a ſquare, having its two legs or branches of an equal length; at the juncture whereof is a little hole, whence hangs a thread and plummet, playing on a perpendicular line in the middle of the quadrant: it is frequently divided into 90 degrees, or rather into twice 45 degrees from the middle. See *Fig.* 6. *lit.* F.

This inſtrument may be uſed on other occaſions, by placing the ends of its two branches on a plane; for when the thread plays perpendicularly over the middle diviſion of the quadrant, that plain is aſſuredly *level*.

To uſe it in gunnery, place the two ends on the piece of artillery, which you may raiſe to any propoſed heighth by means of the plummet, whoſe thread will give the degree above the *level*.

Carpenters and Paviors LEVEL, conſiſts of a long ruler, in the middle whereof is fitted, at right angles, another ſomewhat bigger, at the top of which is faſtened a line with a plummet; which, when it hangs over a fiducial line at right angles with the baſe, ſhews that the ſaid baſe is horizontal.

This and the maſons *level*, though very common, are eſteemed the beſt for the practice of building, though the operations made by them can only be ſhort.

Gunners LEVEL, for levelling cannons and mortars, is an inſtrument, repreſented *Tab. Surveying*, *fig.* 8. conſiſting of a triangular braſs plate about four inches high, at the bottom of which is a portion of a circle divided into 45°; which number is ſufficient for the higheſt elevation of cannons and mortars, and for giving ſhot the greateſt range. On the center of this ſegment of a circle is ſcrewed a piece of a braſs, by means whereof it may be fixed or moved at pleaſure. The end of this piece of braſs is made ſo, as to ſerve for a plummet and index, in order to ſhew the different degrees of elevation of pieces of artillery.—This inſtrument has alſo a braſs foot to ſet upon cannon or mortars, ſo as when thoſe pieces are horizontal, the whole inſtrument will be perpendicular.

The uſe of this *level* is obvious; and conſiſts in placing the foot thereof on the piece to be elevated; in ſuch manner as that the point of the plummet may fall on the proper degree: this is what they call *levelling* the piece.

Maſons LEVEL, is compoſed of three rules, ſo joined as to form an iſoſceles rectangle, ſomewhat like a Roman A; at the vertex whereof is faſtened a thread, from which hangs a plummet, which paſſes over a fiducial line marked in the middle of the baſe, when the thing to which the *level* is applied is horizontal; but declines from the mark, when the thing is lower on one ſide than the other.

Plumb, or *Pendulum* LEVEL, that which ſhews the horizontal line, by means of another line perpendicular to that deſcribed by its plummet, or pendulum.

This inſtrument, repreſented *Tab. Surveying*, *fig.* 6. conſiſts of two legs, or branches, joined together at right angles; whereof that which carries the thread and plummet, is about a foot and a half long. This thread is hung towards the top of the branch, at the point 2. The middle of the branch where the thread paſſes, is hollow, that ſo it may hang free every where but towards the bottom, where there is a little blade of ſilver, whereon is drawn a line perpendicular to the teleſcope.—The ſaid cavity is covered by two pieces of braſs, making, as it were, a kind of caſe, leſt the wind ſhould agitate the thread; for which reaſon the ſilver blade is covered with a glaſs, G, to the end that it may be ſeen when the thread and plummet play upon the perpendicular.—The teleſcope 1, is faſtened to the other branch, or leg of the inſtrument, and is about two foot long; having a hair placed horizontally acroſs the focus of the object-glaſs, which determines the point of *level*, when the ſtring and plummet hang againſt the line on the ſilver blade.

All the accuracy of this inſtrument depends on the teleſcope's being fitted at right angles to the perpendicular.—It has a ball and ſocket, by which it is faſtened to its foot, and is ſaid to have been the invention of M. Picard.

Reflecting LEVEL, is that made by means of a pretty long ſurface of water, repreſenting the ſame object inverted, which we ſee erect by the eye; ſo that the point where thoſe two objects appear to meet, is in a *level* with the place where the ſurface of water is found.—This is the invention of M. Mariotte.

There is alſo another *reflecting level*, conſiſting of a mirror of ſteel, or the like, well poliſhed, and placed a little before the object-glaſs of a teleſcope ſuſpended perpendicularly.—This mirror muſt make an angle of 45 degrees with the teleſcope; in which caſe, the perpendicular line of the ſaid teleſcope is converted into an horizontal line; which is the ſame with the line of *level*. The invention of this is owing to M. Caſſini.

Water **Level**, that which ſhews the horizontal line by means of a ſurface of water, or other liquid; founded on this principle, that water always naturally places itſelf level.

The moſt ſimple is made of a long wooden trough, or canal, whoſe ſides are parallel to its baſe; ſo that being equally filled with water, the ſurface thereof ſhews the line of *level*.—This is the Chorobates of the antients, deſcribed by Vitruvius, Lib. VIII. c. 6. See Chorobates.

This ſort of *level* is alſo made with two cups fitted to the two ends of a pipe three or four foot long, about an inch in diameter; by means whereof the water communicates from the one to the other cup: and this pipe being moveable on its ſtand, by means of a ball and ſocket, when the two cups become equally full of water, their two ſurfaces mark the line of *level*.

This inſtrument, inſtead of cups, may alſo be made with two ſhort cylinders of glaſs, three or four inches long, faſtened to each extreme of the pipe with wax, or maſtic. Into the pipe is filled ſome common or coloured water, which ſhews itſelf through the cylinders, by means whereof the line of *level* is determined; the height of the water, with reſpect to the center of the earth, being always the ſame in both cylinders. This *level* though very ſimple, is yet very commodious for levelling ſmall diſtances.

Level *of M. Huygens's Invention*, conſiſts of a teleſcope, *a*, (*Tab. Surveying*, *fig.* 7.) in form of a cylinder; going through a ferril, in which it is faſtened by the middle.—This ferril has two flat branches, *b b*, one above, and the other below; at the ends whereof are faſtened little moving pieces, which carry two rings, by one of which the teleſcope is ſuſpended to a hook at the end of the ſcrew 3; and by the other, a pretty heavy weight is ſuſpended, in order to keep the teleſcope in equilibrio.—This weight hangs in the box 5, which is almoſt filled with linſeed oil, oil of wallnuts, or other matter that will not eaſily coagulate, for more aptly ſetting the balance of the weight and teleſcope.—The inſtrument carries two teleſcopes cloſe and very parallel to each other, the eye-glaſs of the one being againſt the object-glaſs of the other, that one may ſee each way without turning the *level*.—In the focus of the object-glaſs of each teleſcope, muſt a little hair be ſtrained horizontally, to be raiſed and lowered as occaſion requires by a little ſcrew.—If the tube of the teleſcope be not found *level* when ſuſpended, a ferril, or ring 4, is put on it, to be ſlid along till it fixes to a *level*.—The hook on which the inſtruments is hung, is fixed to a flat wooden croſs; at the ends of each arm whereof there is a hook, ſerving to keep the teleſcope from too much agitation in uſing, or in carriage. To the ſaid flat croſs is applied another hollow croſs, that ſerves as a caſe for the inſtrument; but the two ends are left open, that the teleſcope may be ſecured from the weather, and always in a condition to uſe. The foot of this inſtrument is a round braſs plate, to which are faſtened three braſs ferrils, moveable by means of joints, wherein are put ſtaves; and on this foot is placed the box.

LEVELLING, the art or act of finding a line parallel to the horizon, at one or more ſtations, in order to determine the height of one place with reſpect to another; for the laying grounds even, regulating deſcents, draining moraſſes, conducting waters, &c. See Level.

One place is ſaid to be higher than another, or *out of level* with it, when it is more remote from the center of the earth; and a line equally diſtant from the center of it in all its points, is called the *line of true level*: whence, becauſe the earth is round, that line muſt be a curve, and make a part of the earth's circumference, or an arch concentrical with it, as the line BCFG, *Tab. Surveying*, *fig.* 9. all the points whereof are equally diſtant from the center of the earth A.

But the line of ſight, which the operations of levels give, is a tangent, or a right line perpendicular to the ſemidiameter of the earth; one extreme of which tangent being the point of contact, the other will be that of a ſecant drawn from the center of the earth; and the point which determines it, will be above the ſurface of the earth, and of the true level, as much as that ſecant exceeds the radius, or ſemidiameter of the earth.

This extremity of the tangent is ſaid to be in the *apparent level*; as being that given by the ſight; but is eaſily reduced to the *true level*, becauſe we know, by trigonometry, how much each ſecant exceeds the radius; and becauſe, by meaſuring, we have diſcovered the preciſe length of that radius.—It was for want of the knowledge of this, that the ancients were not able to reduce the apparent level to the true one; and accordingly, to prevent falling into an error, never *levelled* above 20 feet at once, where ſuch reduction was not neceſſary.

By the tables ſince made, it appears, that at the diſtance of 100 yards, the apparent level is raiſed above the true one about one third of a line: ſo that the ancients, in this reſpect, were more ſcrupulous than needed.—By means of this reduction, we are now able to *level* diſtances of one or two miles, at a ſingle operation, which the ancients could not do in leſs than 300.

The operation of *levelling* is as follows: Suppoſe the heighth of the point A, (*Tab. Surveying*, *fig.* 10.) on the top of a mountain, above that of the point B, and at the foot thereof, required?—Place the level about the middle diſtance, between the two points, as in D, and ſtaffs in A and B, and let there be perſons inſtructed with ſignals for raiſing and lowering on the ſaid ſtaffs, little marks of paſteboard, or other matter. The level being placed horizontally by the bubble, &c. look towards the ſtaff AE, and cauſe the mark to be raiſed, or lowered, till the middle, upper edge, or other moſt conſpicuous part appear in the viſual ray. Then meaſuring exactly the perpendicular heighth of the point A, above the point E, which ſuppoſe 6 feet 4 inches, ſet that down in your book: then turn the level horizontally about, that the eye-glaſs of the teleſcope may be ſtill next the eye when you look the other way, (if you have only plain ſights, the inſtrument need not be turned) and cauſe the perſon at the ſtaff B to raiſe or lower his mark, till ſome conſpicuous part of it fall in the viſual ray, as at C; then meaſure the perpendicular heighth of C above B, which ſuppoſe 16 feet, 16 inches; ſet this alſo down in the book above the other number of the firſt obſervation; ſubtract the one from the other, the remainder will be 10 feet 4 inches, which is the difference of level between A and B, or the heighth of the point A above the point B.

Note, if the point D, where the inſtrument is fixed, be in the middle between the two points A and B, there will be no neceſſity for reducing the apparent level to the true level; the viſual ray, in that caſe, being raiſed equally above the true level.

If it be further required to know whether there be a ſufficient deſcent for conveying water from the ſpring A, to the point B, *Tab. Surveying*, *fig.* 11.—Here, in regard the diſtance from A to B is conſiderable, it is required that ſeveral operations be made. Having then choſen a proper place for the firſt ſtation, as at I, ſet up a ſtaff in the point A, near the ſpring, with a proper mark to ſlide up and down the ſtaff, as L; and meaſure the diſtance from A to I, which ſuppoſe 2000 yards. Then the level being adjuſted in the point I, let the mark L be raiſed and lowered till ſuch time as you ſpy ſome conſpicuous part of it through the teleſcope, or ſights of the level, and meaſure the heighth AL, which ſuppoſe 13 foot 5 inches. But in regard the diſtance AI is 2000 yards, you muſt have recourſe to your table for a reduction, ſubſtracting 11 inches, which will leave the heighth AL, 12 feet 6 inches; and this note down in your book. Now turn the level horizontally about, ſo as the eye-glaſs of the teleſcope may be towards the ſtaff at A; and fixing up another ſtaff at H, cauſe the mark G to be moved up and down, till you ſpy ſome conſpicuous part through the teleſcope, or ſights. Meaſure the heighth HG, which ſuppoſe 6 yards, 4 foot, 2 inches. Meaſure likewiſe the diſtance of the points IH, which ſuppoſe 1300 yards; for which diſtance, according to the table, 4 inches 8 lines muſt be ſubſtracted from the heighth HG, which conſequently will but leave 6 yards, 3 feet, 9 inches, 4 lines, to be taken down in your book.

This done, remove the level forwards to ſome other eminence, as E, whence the ſtaff H may be viewed; as alſo another ſtaff at D, near the place whither the water is to be conveyed. The level being again adjuſted in the point E, look back to the ſtaff H; and managing the mark as before, the viſual ray will give the point F. Meaſure the heighth HF, which ſuppoſe 11 feet, 6 inches. Meaſure likewiſe the diſtance HE, which ſuppoſe 1000 yards; for which diſtance the table gives 2 inches, 9 lines of abatement; which being taken from the heighth HF, there will remain 11 feet, 3 inches, 3 lines, which enter in your book. Laſtly, turning the level to look at the next ſtaff D, the viſual ray will give the point D. Meaſure the heighth of D from the ground, which ſuppoſe 8 feet, 3 inches. Meaſure alſo the diſtance from the ſtation E to B, which ſuppoſe 900 yards; for which diſtance the table gives 2 inches, 3 lines of abatement; which being taken from the heighth BD, there will remain 8 feet, 9 lines, which enter as before.

For the manner of entering down obſervations in your book, obſerve that when a proper place or ſtation for the level, between the two points, has been pitched upon, you muſt write down the two heighths obſerved at that ſtation, in two different columns, *viz.* under the firſt column, thoſe obſerved in looking through the teleſcope when the eye was from the ſpring, or towards the point, which we may call *back-ſights*; and under the ſecond column, thoſe obſerved when the eye was next the ſpring, which we call *fore-ſights*, in the manner following:

Back-ſights.	*foot.*	*inch.*	*lin.*	Fore-ſights.	*foot.*	*inch.*	*lin.*
Firſt heighth corrected	12	6	0	Second heighth	21	09	4
Third heighth	11	3	3	Fourth heighth	8	00	9
	23	9	3		29	10	1

Having ſummed up the heights of each column ſeparately, ſubſtract the leſſer from the greater, the remainder will be the difference of level between the points A and B; as in this example:

feet. inch. line.
29 : 10 : 01
23 : 09 : 03
6 : 00 : 10 —The difference of heighth, or level, between the points A and B.

If the diſtance of the two points be required, add all the diſtances meaſured, together; and dividing the difference of heighth by the yards of the diſtances, for each 200 yards you will have a deſcent of about 2 inches, 9 lines.

Dr. Halley ſuggeſts a new method of *levelling*, which has been put in practice by ſome of the French academy: this is performed wholly by means of the barometer, in which the mercury is found to be ſuſpended to ſo much the leſs heighth, as the place is further remote from the center of the earth.—Hence it follows, that the different heights of the mercury, in two places, give the difference of level. See BAROMETER.

Mr. Derham, from ſome obſervations he made at the top and bottom of the Monument, found that the mercury fell one tenth of an inch at every 82 feet of perpendicular aſcent, when the mercury was at 30 inches.—Dr. Halley allows of one tenth of an inch for every 30 yards; which, conſidering how accurately the barometers are now made, an inch in ſome of them being divided into an hundred or more parts, all very ſenſible, he thinks this method ſufficiently exact to take the levels for the conveyance of water, and leſs liable to errors than the common levels.

The ſame author found a difference of three inches eight tenths, between the heighth of the mercury, at the top and bottom of Snowden hill in Wales.

For the common occaſions of *levelling* to be performed without much apparatus of inſtruments, time, or trouble, the following method may ſerve.—Set a pole upright in a ſpring, pond, river, or other place whence water is to be brought, and mark how many feet and inches are above water.—Then ſet up another pole, of equal length with the other, in the place to which the water is to come. Place the center of a quadrant on the top of this laſt pole, the plummet hanging free; ſpy through the ſights the top of the pole that is in the water, and if the thread cuts any degree of the quadrant, the water may be conveyed by a pipe laid in the earth.—If you cannot ſee from one extreme to the other, the operation may be repeated in the manner already directed.

LEVELLING *Staves*, are inſtruments uſed in *levelling*, ſerving to carry the marks to be obſerved, and at the ſame time to meaſure the heights of thoſe marks from the ground.

They uſually conſiſt each of two long ſquare wooden rulers, made to ſlide over one another, and divided into feet, inches, &c.

LEVER *, or LEAVER, in mechanics, an inflexible right line, ſupported, in a ſingle point, on a fulcrum or prop; and uſed for the raiſing of weights: being either void of weight itſelf, or, at leaſt, having ſuch a weight as may be commodiouſly counter-balanced.

* The word is formed of the French *levier*, which ſignifies the ſame, formed of the verb *lever*, or Latin *levare*, to raiſe.

The *lever* is the ſecond, or, as others will have it, the firſt of thoſe called mechanical powers, or ſimple machines, as being, of all others, the moſt ſimple; and is chiefly applied for raiſing weights to ſmall heighths. See MECHANIC *Powers*.

In a *lever* there are three things conſidered: The weight to be raiſed, or ſuſtained, as O, (*Tab. Mechanics, fig.* 1.)—The power by which it is to be raiſed, or ſuſtained, as B. And the fulcrum, or prop D, whereon the *lever* is ſuſtained, or rather, on which it moves round, the fulcrum remaining fixed.

Levers are of three kinds: Sometimes the fulcrum is placed between the weight and the power, as in *fig.* 1. this we call a *lever of the firſt kind*. Sometimes, the weight is between the fulcrum and the power; which is called a *lever of the ſecond kind*, as in *fig.* 2. And ſometimes, the power acts between the weight and the fulcrum, as *fig.* 3. which is the *lever of the third kind*.

The power of the *lever* is founded on the following theorem, *viz.* ‘That the ſpace, or arch deſcribed by each point of a ‘ *lever*, and conſequently the velocity of each point of a *lever*, ‘ is as its diſtance from the fulcrum, or prop.’

From hence it follows, that the action of a power, and the reſiſtance of the weight, increaſe in proportion to their diſtance from the fulcrum.

And hence alſo it follows, that a power will be able to ſuſtain a weight, if the diſtance of the point in the *lever*, to which it is applied, be to the diſtance of the weight, as the weight to the intenſity of the power; which, if it be ever ſo little increaſed, muſt raiſe the weight. See this doctrine demonſtrated under the word MECHANIC *Powers*; and further illuſtrated under the word BALLANCE: between which, and the *lever*, there is a great analogy; a *lever* of the firſt kind being a ſort of ſtilyard to raiſe weights. See STILYARD.

The power and action of the *lever* will be fully illuſtrated by the following propoſitions.

1°. If the power applied to a *lever*, of any kind, ſuſtain a weight, the power is to the weight in a reciprocal ratio of their diſtances from the fulcrum.

This is the converſe of that demonſtrated under the head MECHANIC *Powers*.

2°. The weight of a *lever* of the firſt or ſecond kind A B, *fig.* 1. the diſtance of the center of gravity from the fulcrum C V, and the diſtances of the weight, and the power A C and C B, being all given; to find the power that will ſuſtain it.—Suppoſe the *lever* void of gravity, but in lieu thereof a weight hung at V; if then A C be made to C V, as the gravity of the *lever* to a fourth number, we ſhall have the weight which the *lever* is able to ſuſtain; and this ſubſtracted from the given weight, the remainder will be the weight to be ſuſtained by the power. Let C B then be to C A, as the remaining weight to a fourth weight; and we ſhall have the power to be applied in B, in order to ſuſtain the given weight with the given *lever*.

3°. The gravity of a *lever* of the firſt or ſecond kind A B, the diſtance of its center of gravity from the fulcrum B V, the diſtances of the power, and the weight B C and C A, being all given; to find the weight to be ſuſtained.—Find the part of the weight ſuſtained by the *lever* alone, as in the former problem; in the ſame manner find the other part of the weight, which the power applied in B is able to ſuſtain: add the two numbers together, the ſum is the weight required.

4°. The gravity, and center of gravity F, of a *lever* of the ſecond kind C B, with the weight G, its diſtance from the fulcrum C A, and from the power C B, being given; to find the power capable to ſuſtain the weight.—Suppoſe the *lever* void of gravity, but in lieu thereof a weight equal thereto hung in F, the power required to ſuſtain the *lever* alone; then find the power requiſite to ſuſtain the given weight G: add the powers together, the ſum will be the power required.

5°. If a power applied to a *lever* of any kind lift a weight, the ſpace of the firſt is to that of the laſt, as this laſt to a power able to ſuſtain the ſame weight; whence it follows, that the gain of force is always attended with the loſs of time, and vice verſa.

LEVERET, among ſportſmen, a young hare in the firſt year of its age. See *Hare*-HUNTING.

LEVIGATION, the reduction of hard and ponderous bodies, as coral, tutty, precious ſtones, &c. into a light, ſubtile powder; by grinding upon porphyry, a ſea-ſhell, marble, ſtone, or the like, as painters do their colours.

Levigation is much uſed in pharmacy, and chymiſtry; but unleſs the grinding inſtruments be extremely hard, they will wear away, ſo as ſometimes to double the weight of the medicine thus managed.

LEVITE *, an inferior kind of miniſter in the Jewiſh tabernacle, and temple, who had the care and management of the ſacred utenſils.

* The word comes from the Greek λευιτης; the root of which is the name *Levi*, which was given to that patriarch by his mother Leah, from the Hebrew לוה *lavah*, to be tied, or united; Leah hoping, by the birth of this ſon, to be more cloſely linked to her husband Jacob.

The *levites*, in the Jewiſh church, were an order inferior to the prieſts; and anſwered, in ſome meaſure, to deacons in the Chriſtian church. See PRIEST, and DEACON.

The *levites* of the old law had no ſettled lands allotted them for their maintenance, but lived chiefly of the offerings made to God.—They were diſtributed through all the tribes, each of which gave ſome of their cities to the *levites*, with grounds in their neigbourhood for the ſubſiſtence of their flocks.—According to the numeration made by Solomon, from the age of twenty, there were thirty eight thouſand *levites* capable of ſerving: twenty four thouſand of theſe he appointed for the daily miniſtry under the prieſts; ſix thouſand to be inferior judges in the cities, and to decide matters relating to religion, and of no great conſequence to the ſtate; four thouſand to be door-keepers, and to take care of the riches of the temple; and the reſt to do the office of chanters, or ſingers. See TEMPLE, TABERNACLE, &c.

LEVITY, the privation, or want of weight in any body, when compared with another that is heavier. See WEIGHT.

In which ſenſe, *levity* ſtands oppoſed to *gravity*. See GRAVITY.

The ſchools maintain, that there is ſuch a thing as *poſitive* and *abſolute levity*, and impute to this the riſe or emergency of bodies lighter in ſpecie than the fluids wherein they riſe. But we find by experience, that all bodies tend towards the earth, ſome ſlower, and ſome faſter, in all fluids or mediums, whether water, air, &c. — Thus, cork is ſaid to be lighter than gold; becauſe, under equal dimenſions, the gold will ſink in, and the cork ſwim upon water. See SPECIFIC *Gravity*.

Archimedes has demonſtrated, that a ſolid body will float any where in a fluid of the ſame ſpecific gravity, and that a lighter body will keep above a heavier. — The reaſon is, that of bodies falling towards the earth, thoſe which have a like number of equal parts, have equal gravity; ſince the gravity of the whole, is the ſum of the gravity of all its parts. —Now two bodies have an equal number of equal parts, if under the ſame dimenſions there be no intervals deſtitute of matter; whence it follows, that as no portion of matter is ſo ſmall, but that the body wherein it is contained may be wholly divided into parts equally ſmall, there can be no reaſon for the deſcent of theſe, which will not equally hold for the deſcent of that. See DESCENT, FLUID, &c.

Hence it may be concluded, that thoſe bodies which do not equally gravitate under the ſame dimenſions, do not contain equal portions of matter; and therefore when we ſee, that a cube of gold ſubſides in water, at the ſame time that an equal bulk of cork ſwims upon it, it is evident, that the gold muſt have a greater number of equal parts of matter, under the ſame bulk, than the cork, or the cork muſt have a greater number of vacuities than the gold; and that there are alſo in the water a greater number of vacuities, than in gold.

Hence, we have a clear idea both of denſity or gravity, and of *levity*; and know, that the latter cannot in a ſtrict ſenſe, be accounted any thing poſitive, but a mere negation, or abſence of body, which determines that body to be lighter than another which contains more matter.

Dr. Hooke, it is true, ſeems to maintain ſomething like a poſitive *levity:* which, if we miſtake not, is what he means by the term *levitation*; *viz.* a property of bodies directly contrary to that of gravitation towards the ſun.

This, he thinks, he has diſcovered in the ſtreams of ſeveral comets; which, though they had a deſcent from the nucleus of the comet towards the ſun, yet they quickly returned, and went oppoſite to the ſun, and that to a prodigious extent. See COMET, and ATMOSPHERE.

In effect, where the power of gravitation ceaſes, it ſhould ſeem ſome ſuch contrary force does begin; whereof we have inſtances in the phænomena of attraction.—This is what Sir Iſaac Newton calls the *vis repellens*, and appears to be one of the laws of nature; without which, it would be hard to account for rarefaction, and ſome other appearances. See REPULSION.

Paracentric Solicitation of LEVITY. See PARACENTRIC.

LEVY, LEVARE, in law, ſignifies *to gather*, or *collect:* as, to *levy* money, to *levy* troops, &c.

LEVY ſometimes alſo denotes to erect, or ſet up: as, to *levy* a mill.—*Levy* alſo ſignifies to raiſe, or caſt up; as, to *levy* a ditch.

LEX, *Law*. See the article LAW.

LEX *amiſſa*, or *legem amittere*, in law, is underſtood of an infamous perjured perſon, who is ſaid to *loſe his law*; or, as Bracton has it, *non eſt ulterius dignus lege*. See INFAMOUS.

LEX *Judicialis*, is properly *purgatio per judicium ferri*; ſometimes called ſimply *judicium*. See JUDICIUM, and PURGATION.

LEX *Sacramentalis*, *purgatio per ſacramentum*. See OATH, and PURGATION.

LEX *Talionis*. See the article TALIO.

LEX *Terræ*, the law and cuſtom of the land; by which name it is diſtinguiſhed from the *civil law*. See COMMON *Law*.

LEGEM *Terræ amittere*. See the article AMITTERE.

LEXICON*, λεξικον, the ſame with *dictionary*. See DICTIONARY.

* The word is chiefly uſed in ſpeaking of Greek dictionaries: it is derived from the Greek λεξις, word, diction; of λεγω, I ſpeak.

LIBATION, LIBATIO, a ceremony in the heathen ſacrifices, wherein the prieſt ſpilt ſome wine, milk, or other liquor, in honour of the deity to whom the ſacrifice was offered, after having firſt taſted it himſelf. See SACRIFICE.

Alexander is ſaid to have ſacrificed a bull to Neptune; and for an offering to the ſea-gods, threw the golden veſſel, uſed for the *libation*, into the ſea.

Libations were alſo in uſe under the law of Moſes, being enjoined by God in Exodus xxix, and Numbers xv.

LIBEL, *Famoſus* LIBELLUS, a writing containing injuries, reproaches, or accuſations againſt the honour, and reputation of any perſon, particularly of a ſuperior, or governor. See SATYR.

Platina is of opinion, that a writing, how injurious ſoever it is, cannot be called a *libel*, if the author's name be to it.

Libellers, among the antient Romans, were puniſhed with death, but in after-times they were only whipped. Auguſtus ranked *famoſos libellos*, defamatory libels, among the crimes *læſæ majeſtatis*, of high treaſon.—F. Baldwin has publiſhed a comment on the imperial laws againſt *libels*. Scandalous pictures are reckoned amongſt *libels*.

A *libel*, the lawyers ſay, may be either *in ſcriptis*, or *ſine ſcriptis: in ſcriptis*, when a writing is compoſed, or publiſhed to another's diſgrace, which may be done either *verbis*, *aut cantilenis*; as, where this is maliciouſly repeated, or ſung in the preſence of others: or elſe *traditione*, when the *libel*, or any copy of it, is delivered out to ſcandalize the party.

A *libel ſine ſcriptis*, may be twofold. 1°. *Picturis*, as to paint the party in a ſhameful, or ignominious manner: or, 2°. *Signis*, as to fix a gallows, or other ignominious ſigns, at the door of the party, or elſewhere.

The puniſhment of *libelling* in England, is putting the criminal in the pillory, whipping, fining, &c.

LIBEL alſo ſignifies the original declaration of any action in the civil law. See ACTION, and DECLARATION.

LIBELLATICI, an antient, kind of apoſtates from Chriſtianity, under the perſecution of Decius; who, to prevent their being obliged to renounce the faith, and ſacrifice to idols in public, made application to the magiſtrates, and abjured their faith in private; obtaining certificates of them, either by intreaty or by money*; by which they were atteſted to have complied with the orders of the emperor, and were thereby ſheltered from any further moleſtation, on account of their religion.

* Theſe certificates were called *libelli*; whence the people, who obtained them, came to be denominated *libellatici*.

Others, particularly the centuriators of Magdebourg, are of opinion, that the *libellatici* were only ſuch as fed the magiſtrates with money, to ſcreen them from perſecution, and from being obliged to renounce Chriſtianity.

M. Tillemont retains ſomewhat of each opinion; he thinks the *libellatici*, applying themſelves to the magiſtrates, bought off the ſacrificing and abjuration, and obtained letters by which they were declared to have renounced Chriſt, and ſacrificed to idols, though, in effect, they had done neither.

LIBERAL* *Arts*, are ſuch as depend more on the labour of the mind, than on that of the hand; or, that conſiſt more in ſpeculation, than operation; and have a greater regard to amuſement and curioſity, than neceſſity. See ART.

* The word comes from the Latin *liberalis*; which, among the Romans, ſignified a perſon who was not a ſlave, and whoſe will, of conſequence, was not checked by the command of any maſter.

Such are grammar, rhetoric, painting, ſculpture, architecture, muſic, &c.—The *liberal arts* uſed formerly to be ſummed up in the following Latin verſe:

Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Aſtra.

And the *mechanical arts*, which, however, are innumerable, under this:

Rus, Nemus, Arma, Faber, Vulnera, Lana, Rates.

LIBERALIA, feaſts celebrated by the antient Romans, in honour of Liber, or Bacchus: the ſame with thoſe which the Greeks called *Dionyſia* and *Dionyſiaca*. See DIONYSIA.

They took their name from *liber*, *i. e.* free; a title conferred on Bacchus, in memory of the liberty or freedom which he granted to the people of Bœotia; or perhaps becauſe wine, whereof he was the reputed deity, delivers men from care, and ſets their minds at eaſe and freedom.—Varro derives the name of this feaſt from *liber*, conſidered as a noun adjective, and ſignifying *free*; becauſe the prieſts were free from their function, and eaſed of all care during the time of the *liberalia*. For, in effect, it was the old women who officiated in the ceremonies and ſacrifices of theſe feaſts.

LIBERANDIS *Terris*. See the article TERRIS.

LIBERI *Tauri Libertas*. See the article TAURI.

LIBERIA, a feaſt held among the Romans on the day whereon their children laid aſide their juvenile habits, and aſſumed the robe called *toga libera*. See TOGA, and VIRILE.

The *liberia* were kept on the ſixteenth of the calends of April; that is, the ſeventeenth of March.

LIBERTATES *Angliæ Cuſtodes*. See CUSTODES.

LIBERTUS, or LIBERTINUS, among the Romans, a *freed man*; or a perſon ſet free from a legal ſervitude. See SLAVE, and MANUMISSION.

Theſe ſtill retained ſome mark of their antient ſtate: He who made a ſlave free, having a right of patronage over the *libertus:* ſo that if the latter failed of ſhewing due reſpect to his patron, he was reſtored to his ſervitude; and if the *libertus* died without children, his patron was his heir.

LIBERTINES, LIBERTINI, a religious ſect which aroſe in the year 1525; whoſe principal tenets were, That there is but one only ſpirit, which is that of God; who is diffuſed through all things; who is and lives in all creatures; that our ſouls are nothing but this ſpirit of God: That the ſoul dies with the body; that ſin is a mere chimæra, and only ſubſiſts in opinion, for that it is God that does all, both good and evil; that paradiſe is a dream, and held a phantom invented by prieſts, and religion a ſtate-trick to keep men in awe; that ſpiritual regeneration only conſiſts in ſtifling the remorſe of conſcience; repentance, in avowing to have done no evil; and that it is lawful, and even expedient, to diſſemble in matters of religion. See FLORINIANS, PRISCILLIANISTS, &c.

To theſe they added horrible blaſphemies againſt Jeſus Chriſt; ſaying, he was nothing but a mere je ne ſcai quoi, compoſed of the ſpirit of God, and of the opinion of men.

Theſe maxims occaſioned their being called *Libertines*; and the word has been uſed in an ill ſenſe ever ſince.

The *Libertini* ſpread principally in Holland and Brabant. Their leaders were one Quintin, a Picard, and another called Chopin, who joined with him, and became his diſciple.

LIBERTY, LIBERTAS, is uſually underſtood of that ſtate wherein a man acts freely; or that power by which he determines himſelf voluntarily either to good or evil, to this thing or that.

In which ſenſe *liberty* amounts to the ſame with *freedom*, and ſtands oppoſed to *neceſſity*. See FREEDOM, and NECESSITY.

Liberty may be defined, an active indifference of the will, to will, or not to will any thing. See WILL.

Moſt of the ſchoolmen confound *liberty* and the will together, and make one definition ſerve for both. They diſtinguiſh *liberty* into a great many kinds; as,

LIBERTY *of Contrariety*, *Contrarietatis*, which is a freedom of doing two things not only different, but contrary to each other.

LIBERTY *of Contradiction*, a power either of doing a thing, or letting it alone.

Jeſus Chriſt had not the *liberty* of contrariety, with regard to good and evil, for he could not do evil; but he had a *liberty* of contradiction with regard to good.

Next **LIBERTY**, *Proxima*, is a full, abſolute freedom of doing any thing.

Remote **LIBERTY**, is a *liberty* that comprehends a natural power, though embarraſſed with obſtacles, which it is in our power to remove, and to attain to a next *liberty*.

Thus he who has not the actual grace neceſſary for fulfilling his duty, but has yet the actual grace of prayer, has a next *liberty* with regard to prayer, and a remote *liberty* with regard to his duty.

Cicero defines *liberty*, the power of living after a man's own wiſh, without any cauſe or impediment to oblige him to do one thing rather than another.

F. Malebranche gives us a ſtill more philoſophical definition: The will he defines to be that impreſſion, or natural motion, which inclines towards good in the general; and by *liberty* he underſtands, that power which the mind has of determining this general impreſſion towards ſuch objects as pleaſe us; and ſo of directing our general inclinations to ſome particular things. See NATURAL *Inclination*.

Whence it is eaſy to perceive, that though all natural inclinations be voluntary, yet they are not all free; not, we mean, with a *liberty* of indifference, which includes a power of willing, or not willing; or of willing quite the contrary to that which our natural inclinations lead us to.

For, though it is voluntarily and freely that we love good in general, it being abſurd to ſuppoſe we ſhould love any thing without the will, or that the will can ever be conſtrained; yet we do not love it freely (in the ſenſe juſt laid down) becauſe it is not in the power of the will not to deſire to be happy.

It muſt be obſerved, however, that the mind, conſidered as determined towards good in general, cannot divert its motion to any particular good, unleſs the ſame mind, conſidered as capable of ideas, have ſome knowledge of that particular good: That is, in plainer terms, the will is a blind power, that cannot direct itſelf to any thing but what the underſtanding repreſents to it: So that the power which the will has to determine its impreſſion towards general good, or its natural inclinations, variouſly, conſiſts in the power it has to command the underſtanding to repreſent ſome particular good.

This, a perſon, for inſtance, repreſents ſome dignity to himſelf as a good to be wiſhed for; immediately the will deſires this good; that is, the impreſſion which the mind continually receives towards good in general, determines it to this dignity. But as that dignity is not the univerſal good, nor is conceived clearly and diſtinctly as ſuch by the mind (for the mind cannot conceive a thing clearly which is not) the impreſſion we have towards good in general, is not entirely exhauſted by that particular good; the mind has an inclination to go further; it does not love that dignity neceſſarily or invincibly, and in this reſpect is free.

Now, its *liberty* conſiſts in this, that not being fully convinced that this good contains in it all the good it is capable of enjoying, it may ſuſpend its judgment and its deſire.

The caſe is nearly the ſame with regard to the knowledge of truth: we love this, as we do the enjoyment of good, by a natural impreſſion; which impreſſion is not invincible in the latter, excepting evidence be full, and our knowledge of the object compleat. We have the ſame *liberty* in our falſe judgments, that we have in our irregular appetites. See JUDGMENT, WILL, &c.

The doctrine of Pelagius, with regard to *liberty*, is built on philoſophy, which does not allow us to have loſt our original *liberty* of doing good. See PELAGIAN.

LIBERTY *of Conſcience*, a right or power of making profeſſion of any religion, or ſerving God in any manner that a man ſees fit.

This ſeems to be a natural right, it is vigorouſly oppoſed by the generality of the Romaniſts, and even by many of the Reformed, though it ſeems as if the reformation could ſcarce ſubſiſt without it. See TOLERATION, and PERSECUTION.

LIBRA, *Ballance*, one of the mechanical powers. See BALLANCE.

LIBRA, is alſo one of the twelve ſigns of the zodiac; exactly oppoſite to Aries; ſo called, becauſe when the ſun is in this ſign, at the autumnal equinox, the days and nights are equal, as if weighed in a ballance.

Stars in the conſtellation Libra.

LIBRA, alſo denotes the ancient Roman pound, borrowed from the Sicilians, who called it *litra*, λίτρα. See POUND.

The *libra* was divided into twelve unciæ, or ounces, equal to about ten ounces and a half of our weight.

The diviſions of the *libra* were, the *uncia*, one twelfth; the *ſextans*, one ſixth; the *quadrans*, one fourth; the *triens*, one third; the *quincunx*, five ounces; the *ſemis*, ſix; the *ſeptunx*, ſeven; the *bes*, eight; the *dodrans*, nine; the *dextans*, ten; the *deunx*, eleven; laſtly, the *as* weighed twelve ounces, or one *libra*. See AS.

The Roman *libra* was uſed in France for the proportions of their coin, till the time of Charlemagne, or perhaps till that of Philip I. in 1093; their ſols being ſo proportioned, as that twenty of them are equal to the *libra*.

By degrees, it became a term of account, and every thing of the value of twenty ſols, were called a *livre*. See LIVRE.

The Romans had alſo a coin called *libra*, equal to twenty denarii: though Scaliger will have it, that *libra* was, even among them, a term of account, not a coin. See POUND.

Libra *Penſa*, in our law books, denotes a pound of money in weight. See Pound, and Money.

It was uſual, in former days, not only to tell the money, but to weigh it; in regard many cities, lords, and biſhops, having their mints, coined money, and often very bad too: for which reaſon, though the pound conſiſted of twenty ſhillings, they always weighed it. See Pensa.

LIBRARII, among the ancients, were a ſort of copiſts, who tranſcribed in beautiful, or, at leaſt, legible characters, what had been wrote by the notarii in notes, and abbreviatures. See Note, Notary, Calligraphus, &c.

LIBRARY, an edifice, or apartment deſtined for the placing of books; or the books themſelves lodged therein. See Book.

Some authors refer the origin of *libraries* to the Hebrews; and obſerve, that the care theſe took for the preſervation of their ſacred books, and the memory of what concerned the actions of their anceſtors, became an example to other nations, particularly the Egyptians. Oſmanduas, king of Egypt, is ſaid to have taken the hint firſt; who, according to Diodorus, had a *library* built in his palace, with this inſcription over the door, Φυχης Ιατρειον. Nor were the Ptolomys, who reigned in the ſame country, leſs curious, and magnificent in books.

The ſcripture alſo ſpeaks of a *library* of the kings of Perſia, Eſdras v. 17. vi. 1. which ſome imagine to have conſiſted of the hiſtorians of that nation, and of memoirs of the affairs of ſtate; but, in effect, it appears rather to have been a depoſitory of laws, charters, and ordinances of the kings.—The Hebrew text calls it the *houſe of treaſures*, and afterwards the *houſe of the rolls*, where the treaſures were laid up.—We may, with more juſtice, call that a *library*, mentioned in the ſecond of Eſdras to have been built by Nehemiah, and in which were preſerved the books of the prophets, and of David, and the letters of their kings.

The firſt who erected a *library* at Athens, was the tyrant Piſiſtratus; and yet Strabo refers the honour of it to Ariſtotle. That of Piſiſtratus was tranſported by Xerxes into Perſia, and afterwards brought back by Seleucus Nicanor to Athens. Long after, it was plundered by Sylla, and re-eſtabliſhed by Hadrian.—Plutarch ſays, that, under Eumenes, there was a *library* at Pergamus, containing 200,000 books.—Tyrannian, a celebrated grammarian, cotemporary with Pompey, had a *library* of 3000 volumes.—That of Ptolemy Philadelphus, according to A. Gellius, contained 700,000, all in rolls, burnt by Cæſar's ſoldiers.—Conſtantine, and his ſucceſſors, erected a magnificent one at Conſtantinole; which, in the eighth century, contained 300,000 volumes, all burnt by order of Leo Iſaurus: and, among the reſt, one wherein the *Iliad*, and *Odyſſee* were written in letters of gold, on the guts of a ſerpent.

The moſt celebrated *libraries* of ancient Rome, were the Ulpian, aud the Palatin. They alſo boaſt much of the *libraries* of Paulus Æmilius, who conquered Perſius; of Lucius Lucullus, of Aſinius Pollio, Atticus, Julius Severus, Domitian, Serenus, Pamphilus Martyr, and the emperors Gordian and Trajan.

Anciently, every large church had its *library*; as appears by the writings of S. Jerom, Anaſtaſius, and others. Pope Nicholas laid the firſt foundation of that of the Vatican, in 1450. It was deſtroyed by the conſtable Bourbon, in the ſacking of Rome, and reſtored by pope Sixtus V. and has been conſiderably enriched with the ruins of that of Heidelberg, plundered by count Tilly in 1622.

One of the moſt compleat *libraries* in Europe, is ſaid to be that erected at Florence by Coſmo de Medicis; over the gate whereof is wrote, *labor abſque labore*. Though it is now exceeded by that of the French king; begun by Francis I. augmented by cardinal Richelieu, and compleated by M. Colbert.

The emperor's *library* at Vienna, according to Lambecius, conſiſts of 80000 volumes, and 15940 curious medals.

The *Bodleian library* at Oxford, built on the foundation of that of duke Humphry, exceeds that of any univerſity in Europe, and even thoſe of all the ſovereigns of Europe, except the emperor's and French king's, which are each of them older by a hundred years.—It was firſt opened in 1602, and has ſince found a great number of benefactors; particularly Sir Rob. Cotton, Sir H. Savil, archbiſhop Laud, Sir Kenelm Digby, Mr. Allen, Dr. Pocock, Mr. Selden, and others. The Vatican, the Medicean, that of Beſſarion at Venice, and thoſe juſt mentioned, exceed the Bodleian in Greek manuſcripts; which yet out-does them all in oriental manuſcripts.

As to printed books, the Ambroſian at Milan, and that of Wolfembuttle, are two of the moſt famous, and yet both inferior to the Bodleian.

The *Cotton library* conſiſts wholly of manuſcripts, particularly of ſuch as relate to the hiſtory and antiquities of England; which, as they are now bound, make about 1000 volumes.

LIBRATA *Terræ*, a portion of ground containing four oxgangs, and every oxgang thirteen acres.

With us, it is ſo much land as is yearly worth 20*s*. In Henry the third's time, he that had *quindecim libratas terræ*, was to receive the order of knighthood. See Knight, and Knights-Fee.

Some ſay, that as money is divided into pounds, ſhillings, pence, and farthings, the ſame degrees are to be obſerved in the diviſion of lands; and therefore, as *quadrans* ſignifies a farthing, ſo *quadrantata* is the fourth part of an acre; *obolata* an half; *denariata*, a whole acre; *ſolidata*, 12 acres; and *librata*, 20 times 12 acres; *i. e.* 240 acres. See Farthingdeal.

LIBRATION, in aſtronomy, an apparent irregularity in the motion of the moon, by which ſhe ſeems to *librate*, or waver about her own axis; ſometimes, from the eaſt to the weſt; and ſometimes, from the weſt to the eaſt. See Moon.

Hence it is, that ſome parts in the moon's weſtern limb, or margin, at one time, recede from the centre of the diſk; and at another, move towards it: by which means, ſome of thoſe parts, which were before viſible, ſet and hide themſelves in the inviſible ſide of the moon, and afterwards become again conſpicuous.

This *libration* of the moon, is owing to her equitable rotation round her own axis, and her unequal motion in the perimeter of her orbit. For if the moon moved in a circle, whoſe centre coincided with the centre of the earth, and turned round its axis in the preciſe time of its period round the earth; the plane of the ſame lunar meridian would always paſs through the earth, and the ſame face of the moon would be conſtantly and exactly turned towards us. But ſince the real motion of the moon is in an ellipſis, in whoſe focus is the earth, and the motion of the moon about the earth is equable; or, which is the ſame thing, every meridian of the moon, by the rotation, deſcribes angles proportional to the times: the plane of no one meridian will conſtantly paſs through the earth.

Libration *of the Earth*, is that motion whereby the earth is ſo retained in its orbit, as that its axis continues conſtantly parallel to the axis of the world.

This, Copernicus calls the *motion of libration*; and may be illuſtrated thus: Suppoſe a globe, with its axis parallel to that of the earth, painted on the flag of a maſt, moveable on its axis, and conſtantly driven by an eaſt wind, while it ſails round an iſland; it is evident, the painted globe will be ſo *librated*, as that its axis will be parallel to that of the world, in every ſituation of the ſhip.

LICENCE, Licentia, in law, a power, or authority given to another to do ſome lawful act. See Licentiate.

A *licence* is a perſonal power, and cannot be transferred to another: though a *licence* may be granted to a man and his aſſigns.

Licence is alſo uſed, in the civil law, for a permiſſion, or leave granted by a ſuperior.

Juſtinian appointed four years to be ſpent in the ſtudy of the law; after which, thoſe who had diſcharged this obligation, were ſaid to have *licence*, or permiſſion to retire from ſtudy.

Licence is alſo applied to the letters, or certificates taken out in univerſities, whether in law, phyſic, or divinity. See Degree.

Licence, in the Sorbonne, denotes a period of two years, which the batchelors are obliged to paſs in aſſiſting at acts, and diſputing in them, to qualify themſelves for being admitted doctors.

Letter of **Licence**. See the article Letter.

Licence *to ariſe*, in law, Licentia *ſurgendi*, is a liberty, or ſpace of time given by the court to a tenant, who is aſſoined *de malo lecti* in a real action, to riſe out of his bed and go about his buſineſs. See Essoin.

Licences, in painting, are the liberties which the painter takes in diſpenſing with the rules of perſpective, and the other laws of his art.

Poetical **Licence**, is the liberty which poets claim of diſpenſing with the ordinary rules of grammar.

Anciently, poets had much greater *licences* than are now allowed.—The Greeks, by having recourſe to the ſeveral dialects of their tongue, could lengthen out a word if it were too ſhort, or retrench ſomething from it if it were too long.—The old poets did what they pleaſed with their language, and ſubjected it not only to all their neceſſities, but their caprices too.

Et data Romanis venia eſt indigna poetis.

But theſe became ridiculous in courſe of time; and the poets are now deſpoiled of moſt of their ancient privileges.

LICENCIATE, or Licentiate, he who has obtained the degree of a *licence*. See Licence, and Degree.

Moſt of the officers of judicature in Spain, are known by no other name than that of *licenciates*.—To paſs *licenciate* in the common law, civil law, or phyſic, they muſt have ſtudied ſeven years; in divinity, ten.

Licentiate, among us, is uſually underſtood of a phyſician, who has a *licence* to practice, granted him by the college of phyſicians, or biſhop of the dioceſe. See College.

A perſon practiſing phyſic, without ſuch *licence*, in caſe his patient dies under his hands, is guilty of felony in the eye of the law.

LICHEN, Λειχην, a cutaneous diſtemper, otherwiſe called *impetigo*. See Impetigo.

LIE, or Lye *under the ſea*.—The ſailors ſay, a ſhip *lies under the ſea*, when, her helm being made faſt a-lee, ſhe lies ſo a-hull, that the ſea breaks upon her bow, or broad-ſide.

LIEGE *, LIGIUS, properly ſignifies a *vaſſal*, who holds a kind of fee, that binds him in a cloſer obligation to his lord than other people. See VASSAL.

* The term ſeems to be derived from the French *lier*, to bind; in regard of a ceremony uſed in rendering faith, or homage, which was by locking the vaſſal's thumb, or his hand, in that of the lord, to ſhew that he was faſt bound by his oath of fidelity.—Cujus, Vigenere, and Bignon, chuſe rather to derive the word from the ſame ſource with *leudis*, or *leodi*, loyal, faithful.—But Du Cange falls in with the opinion of thoſe who derive it from *liti*, a kind of vaſſals, ſo firmly attached to their lord. on account of lands or fees held of him, that they were obliged to do him all manner of ſervice, as if they were his domeſtics. He adds, this was formerly called *litgium ſervitium*, and the perſon *litge*.—In this ſenſe, the word is uſed *leg. Edw. cap.* 29. *Judæi ſub tutela regis ligea debent eſſe*; that is, wholly under his protection.

By *liege homage*, the vaſſal was obliged to ſerve his lord towards all, and againſt all, excepting his father.—In which ſenſe, the word was uſed in oppoſition to *ſimple homage*; which laſt, only obliged the vaſſal to pay the rights, and accuſtomed dues to his lord; and not to bear arms againſt the emperor, prince, or other ſuperior lord: ſo that a *liege man* was a perſon wholly devoted to his lord, and entirely under his command *.

* *Omnibus, &c. Reginaldus rex Inſularum, ſalutem. Sciatis quod deveni homo* ligeus *domini regis Angliæ Johannis, contra omnes mortales quamdiu vixero, & inde ei fidelitatem & ſacramentum præſtiti, &c.* M. S. *penes* W. Dugdale.

But it muſt be obſerved, there were formerly two kinds of *liege homage*: the one, by which the vaſſal was obliged to ſerve his lord, againſt all, without exception, even his ſovereign; the other, by which he was to ſerve him againſt all, except ſuch other lords as he had formerly owed *liege homage* to. See HOMAGE.

In our old ſtatutes, *lieges*, and *liege people*, are terms peculiarly appropriated to the king's ſubjects; as being *liges*, *ligi*, or *ligati*, obliged to pay allegiance to him; 8 Hen. VI. 14 Hen. VIII. *&c.* though private perſons had their *lieges* too *.

* *Reinaldus Dei gratia abbas Rameſiæ, præpoſito & hominibus de Branceſtre, & omnibus vicinis Francis & Anglis, ſalutem Sciatis me dediſſe terram Ulfe, in depedene (hodie depedale) huic Boſelino & uxori ejus Alſniæ—ea conditione quod effecti ſint homines* liges. *Lib. Rameſ.*

LIEGE *Vaſſalage.* See the article VASSALAGE.

LIENTERY *, Λειντερια, in phyſic, a kind of looſeneſs, wherein the food paſſes ſo ſuddenly through the ſtomach and guts, as to be thrown out by ſtool, with little or no alteration.

* The ancients were of opinion, the *lientery* was owing to the too great ſmoothneſs, and ſlipperineſs of the inſide of the inteſtines, by which they let the food ſlip off before it was digeſted: and hence they gave it this name, which is formed from λειος, ſmooth, poliſhed, and εντερον, inteſtine.

The *lientery* is generally owing either to a defect in the ferment of the ſtomach, or to a relaxation of the pylorus, attended with ſo briſk an irritation of the fibres of the ſtomach, that inſtead of retaining the aliment, it lets it paſs.—Exceſs of drinking ſometimes occaſions this diſeaſe, by relaxing the ſtomach, and eſpecially the pylorus, too immoderately.

LIEUTENANT, *locum tenens*, a deputy, or officer, who holds the place of a ſuperior, and diſcharges that function in his abſence, which he ought to exerciſe in perſon.

Of theſe, ſome are civil; as lords *lieutenants* of kingdoms, who are the king's viceroys, and govern in his ſtead; and lords *lieutenants* of counties. See LORD, and COUNTY.

But the term is moſt frequent among military men, among whom there is a variety of *lieutenants*.—As,

LIEUTENANT-*General*, a great officer, the next in rank to the general of an army; who, in battle, commands one of the lines, or wings; a detachment in a march, or a flying camp. —Alſo, a quarter at a ſiege, or one of the attacks—when it is his day of duty. See GENERAL.

In France, they have alſo *lieutenant-generals* of their naval forces, who command immediately under the admirals.

In Holland they have a *lieutenant-admiral*, which is the ſame with what we call a *vice-admiral*. See ADMIRAL.

LIEUTENANT-*General of the Ordnance*, is he who has the charge of the artillery, batteries, *&c.* under the maſter-general, or in his abſence. See ORDNANCE, *&c.*

LIEUTENANT-*Colonel of Foot*, is the ſecond officer in a regiment; he commands in the abſence of the colonel, and in battle takes poſt at his colonel's left.

The dragoons have alſo a *lieutenant-colonel*; but the horſe have not, properly, any; the firſt captain of the regiment ſupplies the office. See COLONEL.

LIEUTENANT-*Colonel of Horſe*, being only the firſt captain of the regiment; who commands in the abſence of the colonel, taking place of all the other captains.

Captain LIEUTENANT. See the article CAPTAIN.

LIFE, *Vita*, is a very ambiguous term.—For both God, and man, and a ſoul, and an animal, and a plant, are ſaid *to live*: yet there is not any thing common to all theſe, beſide a kind of active exiſtence; which, however, is of very different kinds. See ANIMAL, VEGETABLE, *&c.*

Life, then, in the general, expreſſes a kind of active, operative exiſtence; and is therefore conceived to conſiſt in motion.—But, particularly,

LIFE *of Body*, *Vita Corporis*, conſiſts in an uninterrupted motion therein.—A body, therefore, ſaid to be *living*, muſt conſiſt of various parts or members, both internal and external, ſo framed, and put together, as to conſtitute one whole. And theſe members muſt be moved, and warmed by ſome fluid ſubſtance, permeating the whole frame; by which heat and motion, the vital functions are to be performed.—Such are nutrition, generation, local motion, *&c.* See BLOOD, CIRCULATION, *&c.*

LIFE *of Mind*, *Vita Mentis*, is held by the Carteſians, to conſiſt in a perpetual cogitation, or uninterrupted courſe of thinking; which ſeems likewiſe to have been Ariſtotle's meaning, when he calls the ſoul εντελεχεια; which his interpreters call *actus*: thinking being the only proper act of the mind. See ENTELECHIA.

But Mr. Locke endeavours to refute this principle. See THINKING, SOUL, *&c.*

LIFE *of Man*, *Vita Hominis*, conſiſts in a continued communication of body and mind; or in operations, to which both the motions of the body, and ideas of the mind contribute.

Thus, *e. gr.* the mind now thinking of ſomething, on occaſion of that thought, there ariſes a certain motion in the body. —And now, again, the body moves firſt, which motion is followed by ſome thought of the mind. See SOUL.

In ſuch alternate or reciprocal operation, does the *life* of man conſiſt; conſidered as he is a compound of body and mind. See SENSATION, MOTION, *&c.*

LIFE, is more particularly uſed for the duration of an animal's being; or, the ſpace of time that paſſes between its birth and death. See DEATH, *&c.*

LIFE, is alſo uſed for the conſtitution; or, that principle of heat, and motion, which animates bodies, and makes them perceive, act, and grow.

In which ſenſe, *life* is divided into *animal*, *ſenſitive*, and *vegetative*. See ANIMAL, SENSITIVE, *&c.*

LIFE, in a medical ſenſe, is defined, the circulation of the blood. See CIRCULATION.

Prolongation of LIFE, is made by lord Bacon one of the three branches of medicine; the other two relating to the preſervation of health, and the cure of diſeaſes. See MEDICINE.

The theory of prolonging *life* he numbers among the deſiderata. Some means, or indications, that ſeem to lead to it, he lays down as follows.

Things are preſerved in two manners; either in their *identity*, or by *reparation*. In their *identity*, as a fly or ant in amber, a flower, or fruit, or wood, in a conſervatory of ſnow; a a dead carcaſs in balſams.—By *reparation*, as a flame, or a mechanical engine, *&c.*—To attain to the prolongation of *life*, both theſe methods muſt be uſed; and the human body muſt be preſerved both as inanimates, as flame, and as mechanical inſtruments are preſerved.

Hence ariſe three intentions for the prolongation of *life*: *retardation* of conſumption, proper *reparation*, and *renovation* of what begins to grow old.—Conſumption is occaſioned by two kinds of depredation; a depredation of the innate ſpirit, and a depredation of the ambient air.—Theſe may be each prevented two ways; either by rendering thoſe agents leſs predatory, or by rendering the paſſive parts (*viz.* the juices of the body) leſs liable to be preyed on.—The ſpirit will be rendered leſs predatory, if either its ſubſtance be condenſed, as by the uſe of opiates, grief, *&c.* or its quantity diminiſhed, as in ſpare and monaſtic diets; or its motion calmed, as in idleneſs and tranquility.—The ambient air becomes leſs predatory, if it be either leſs heated by the rays of the ſun, as in cold climates, in caves, mountains, and anachorets cells; or be kept off from the body, as by a denſe ſkin, the feathers of birds, and the uſe of oils and unguents, without aromatics. The juices of the body are rendered leſs liable to be preyed on, either by making them harder, or more moiſt and oily: harder, as by a coarſe ſharp diet, living in the cold, robuſt exerciſes, and ſome mineral baths: moiſter, as by the uſe of ſweet foods, *&c.* abſtaining from ſalts and acids; and eſpecially by ſuch a mixture of drink, as conſiſts wholly of fine ſubtile particles, without any acrimony or acidity.

Reparation is performed by means of aliment: alimentation is promoted four ways; by the concoction of the viſcera, ſo as to extrude the aliment, by exciting the exterior parts to the attraction of the aliment, as in proper exerciſes and frications, and ſome unctions and baths; by the preparation of the food itſelf, ſo as it may more eaſily inſinuate itſelf, and, in ſome meaſure, anticipate the digeſtion; as in various ways of dreſſing meats, mixing drinks, fermenting breads, and reducing the virtues of theſe three into one; by promoting the act of aſſimilation itſelf, as in ſeaſonable ſleep, ſome external application, *&c.*—The renovation of what begins to grow old, is performed two ways; by the inteneration of the habit of the body, as in the uſe of emollients, emplaſters, unctions, *&c.* of ſuch a nature, as do not extract, but impreſs;

or by purging off the old juices, and ſubſtituting freſh ones; as in ſeaſonable evacuations, attenuating diets, *&c.*

The ſame author adds theſe three axioms: that the prolongation of *life* is to be expected rather from ſome ſtated diets, than either from any ordinary regimen, or any extraordinary medicines; more for operating on the ſpirits, and mollifying the parts, than from the manner of feeding: and this mollifying of the parts without, is to be performed by conſubſtantials, impriments, and occludents. See Longævity.

LIGAMENT, in its general ſenſe, denotes any thing that ties or binds one part to another.

In which ſenſe the ancients applied the word to membranes, ſkin, fleſh, veins, and arteries; as being common *ligaments.*

Ligament, in its more proper ſignification, denotes a white, tough, ſolid, inflexible part, ſerving to incloſe, and keep together the junctures of the body.

It has no conſpicuous cavities; nor has it any ſenſe, leſt it ſhould ſuffer on the moving of the bones. It is found very different, according to the different parts where it is uſed. It is harder than a membrane, yet ſofter than a cartilage: its principal uſe is to gird and ſtrengthen the junctures, to prevent the diſlocation of the bones, and even to faſten them together, when they have no articulation.—It alſo ſerves as a covering to the tendons, to ſeparate them from the muſcles, and to hold up the ſuſpended entrails, leſt their weight ſhould throw them down—ſuch are the *ligaments* of the liver, the bladder, and matrix.

Ligaments are of different ſubſtances; ſome hard, others ſoft, membranous, nervous, and cartilaginous; as alſo of different figures, and ſituations: ſome ariſe from bones, others from cartilages, and others from membranes.

The *ligament* is held the moſt terreſtrial of all the parts of the body, after the bone and cartilage; being cold, dry, hard, and inſenſible, like them. See Cartilage, and Bone.

The principal *ligaments* of the body, are the cartilaginous *ligaments*, which bind the four bones of the metacarpus with the carpus. See Carpus, and Metacarpus.

The *ligaments* of the ſpine are very ſtrong, being fitted to the articulations of the vertebræ, to prevent their luxation in violent motions.—They are of two kinds; the one thick and fibrous, in form of a creſcent, which bind them both at top and bottom; and the others membranous, ſerving to faſten them the more ſecurely. See Spine, and Vertebra.

The *ligaments* of the liver are two in number; the firſt called *ligamentum ſuſpenſorium*, holds it ſuſpended to the diaphragm, penetrating into the ſubſtance of the liver, to hold it the more firmly: the latter is larger, but more lax; it comes from the external coat of the liver, and is faſtened to the cartilago xiphoides.—Some add a third, which is formed out of the umbilical veſſels; which, in adults, dry up, and become a *ligament.*

There are two *ligaments* belonging to the tongue; one which faſtens it, by its root, to the os hyoides; and another larger, inſerted into the middle and inferior part: this laſt is called the *frenum*, or the bridle of the tongue.—There are alſo *ligaments* belonging to the ſpleen. See Tongue, and Spleen.

The penis has a ſtrong *ligament*, called *ſuſpenſorium penis*, from its office in holding up the penis to the oſſa pubis; it ariſes from the fore-parts of thoſe bones, and is faſtened to the upper part of the corpora cavernoſa penis: it has another *ligamentum*, which faſtens the prepuce to the glans. See Penis, Prepuce, *&c.*

The uterus has four *ligaments*, two of them called *lata*, or *broad*; and two *rotunda*, or *round*, from their figures: the broad *ligaments* are membranous, ariſe from the proceſſes of the peritonæum, and are faſtened to the lateral parts of the bottom of the uterus, and ſerve to prevent it from falling down upon the neck, as ſometimes happens, when theſe *ligaments* are too much relaxed. See Matrix.

The round *ligaments* ariſe from the ſides of the womb, at the place where the tubæ fallopianæ are joined to it. At their firſt riſe they are broad; but, by degrees, as they recede farther from the womb, grow round and ſmooth; and, as the ſpermatic veſſels do in men, paſs betwixt the duplicature of the peritonæum, and ſo out of the abdomen, through the foramina of the oblique and tranſverſe muſcles of the abdomen, and running obliquely on the os pubis, terminate under the fat of the clitoris.—By the paſſages of theſe *ligaments*, women, and girls eſpecially, are expoſed to inguinal ruptures, as men are by the paſſages of the ſpermatic veſſels.

The ſubſtance of the broad *ligaments* is membranous, looſe, and ſoft; whence ſome have compared them to the wings of a batt, and called them *alæ veſpertilionum.*—The round *ligaments* are of a firmer texture, and conſiſt of a double membrane, wrapping up in it veins, arteries, nerves, and lymphæducts, and both theſe and the former have been ſometimes taken for muſcles.—By theſe *ligaments* the uterus is kept ſo tight, that no violence of internal flatus, or humours, can raiſe it above its place.—See *Tab. Anat. (Splanch.) fig.* 9. *lit. b. b. fig.* 11. *lit. i. i.* &c.

LIGAMENTUM *Annulare.* See Annular, and Wrist.

Ligamentum *Ciliare.* See Ciliare *Ligamentum.*

LIGATURE, in chirurgery, any thing tied about a part of the body: more eſpecially a bandage, or fillet of cloth, or linnen, ſerving to bind the arm, and facilitate the operation of bleeding.

Ligature, Ligatura, or **Ligatio**, denotes alſo the art, or manner of diſpoſing, and applying bandages for the cloſing of wounds, and performing many of the operations of chirurgery.

Ligature, among myſtic divines, ſignifies a total ſuſpenſion of the ſuperior faculties, or intellectual powers of the ſoul.—They pretend, that when the ſoul is arrived at a perfect contemplation, ſhe remains deprived of all her operations, and ceaſes to act, in order to be more ready, and prepared to receive the impulſe and communications of divine grace.—This paſſive ſtate of theſe contemplative people they call their *ligature.*

Ligature, is alſo uſed to ſignify a kind of bandage, or fillet, tied round the neck, arm, leg, or other part of the bodies of men or beaſts, to divert, or drive off ſome diſeaſe, accident, &c. See Amulet, &c.

Ligature, is alſo uſed for a ſtate of impotency, in reſpect to venery, cauſed by ſome charm, or witchcraft.

Kempfer tells us of an uncommon kind of *ligature*, or knotting, in uſe among the people of Maſſacar, Java, Malaja, Siam, *&c.*—By this charm, or ſpell, a man binds up a woman, and a woman a man, ſo as to put it out of their power to have to do with any other perſon; the man being thereby rendered impotent to any other woman, and all other men impotent with reſpect to the woman.

Some of their philoſophers pretend, that this *ligature* may be effected by the ſhutting of a lock, the drawing of a knot, the ſticking of a knife in the wall, at the point of time wherein the prieſt is joining a couple together; and that a *ligature*, thus effected, may be diſſolved, by the ſpouſe's urining through a ring.—This piece of ſuperſtition is ſaid to obtain alſo among the Chriſtians of the Eaſt.

The ſame author tells us, that during the ceremony of marriage in Ruſſia, he obſerved an old fellow lurking behind the church-door, and mumbling over a ſtring of words, and at the ſame time cutting a long rod, which he held under his arm, into pieces; which, it ſeems, is a common practice at the marriages of great perſons, and done with deſign to elude and counterwork any other perſon, that might poſſibly be inducing the *ligature.*

The ſecret of inducing a *ligature*, is delivered by the ſame author, as he was taught it on the ſpot, by one of their adepts; which, being a curioſity, we ſhall not ſcruple to add in his own words; not daring to make it ſpeak Engliſh.—*Puella amaſium, vel conjux maritum* ligaturus, *abſterget a concubitus actu, priapum, induſio—ut ſeminis quantum poteſt excipiet. Hoc probe convolutum ſub limine domus ſuæ in terram ſepeliat. Ibi quamdiu ſepultum reliquerit, tamdiu ejus haſta in nullius præterquam ſui (faſcinantis) ſervitium obediet, & prius ab hoc nexu non liberabitur quam ex clauſtro liminis libereter ipſum linteum. Vice verſa, vir lecti ſociam* ligaturus, *menſtruatum ab eo linteum comburito; ex cineribus cum propria urina ſubactis, efformato figuram priapi, vel, ſi cineres icunculæ fingendæ non ſufficiant, eoſdem ſubigito cum parte terræ quam recens perminxerit. Formatam iconem cautè exſiccato, ſiccamque aſſervato loco ſicco, ne humorem contrahat. Quamdiu ſic ſervaveris, omnes arcus dum ad ſcopum ſociæ collimaverint, momento contabeſcent: Ipſe vero dominus—Abrunum hunc ſuum prius humectato, quamdiu ſic manebit, tamdiu ſuſpenſo nexu priapus ipſi parebit, quin & alios quotquot fœmina properantes admiſerit.*

M. Marſhal mentions another form of *ligature*, which he received from a bramin at Indoſtan: ‘ If, *ſays he*, the little ‘ worm in the wood lukerara kara, be cut into two, and ‘ the one part ſtirs, and the other not; if the ſtirring part ‘ be bruiſed, and given with half a beetle to a man, and the ‘ other half to a woman, the charm will keep each from ever ‘ having to do with any other perſon.’ *Philoſoph. Tranſact.* Nº. 268.

Ligatures, among printers, are types conſiſting of two letters, or characters joined together, as *ff, ſt, fi.* See Letter.

The old editions of Greek authors, are extremely full of *ligatures*; the *ligatures* of Stephens are, by much, the moſt beautiful.

Some editions have been lately printed without any *ligatures* at all; and there was a deſign to explode them quite out of printing. Had this ſucceeded, the fineſt ancient editions would, in time, have grown uſeleſs; and the reading of old manuſcripts have been rendered almoſt impracticable to the learned themſelves.

LIGHT, that ſenſation occaſioned in the mind, by the view of luminous bodies; or that property in bodies, whereby they are fitted to excite thoſe ſenſations in us. See Sensation.

Light is alſo uſed to denote a certain action of the luminous body, on a medium between it and the eye; by means whereof, ſome ſuppoſe the one to act on the other.

This they call *ſecundary*, or *derivative light*; to diſtinguiſh it from that of luminous bodies; which is called *primary*, or *innate*.

Ariſtotle explains the nature of *light*, by ſuppoſing ſome bodies to be tranſparent, as air, water, ice, *&c.* but ſince, in the night-time, we do not ſee any thing through thoſe bodies, he ſays, they are only tranſparent potentially; whereas, in the day, they become really and actually tranſparent: and ſince it is *light* alone that can reduce that power into act, he defines *light* to be the act of a tranſparent body, conſidered as ſuch.—He adds, that *light* is not fire, nor is it any thing bodily, radiating from the luminous body, and tranſmitted through the tranſparent one; but the mere preſence of fire, or ſome other luminous body, at the tranſparent one.

This is Ariſtotle's doctrine of *light*, which his followers miſtaking, have foiſted on him another, very different; making *light* and colours, to be qualities of the luminous and coloured bodies themſelves, and, in all reſpects, like thoſe ſenſations which they occaſion in us: adding, that things lucid, or coloured, could not produce any ſenſations in us, unleſs they had ſomething ſimilar in themſelves, ſince *nihil dat quod in ſe non habet*. See QUALITY.

But the ſophiſm is apparent; for we find, that a needle, in pricking the fleſh, gives us pain, which no body ever imagined to exiſt in the needle.—But that it is not neceſſary there ſhould be any ſimilitude between the quality of the object, and the ſenſation it produces, appears ſtill more evident from a glaſs priſm, which is found to exhibit blue, yellow, red, and other colours extremely vivid; and yet no body will ſay there is any thing in the glaſs priſm like thoſe ſenſations. See PRISM, *&c.*

The Carteſians have refined conſiderably on this notion; and own, that *light*, as it exiſts in the luminous body, is nothing but a power or faculty of exciting in us a very clear and vivid ſenſation; adding, that what is required to the perception of *light*, is, that we be ſo formed, as to be capable of ſuch ſenſations; that in the hidden pores of tranſparent bodies, there be a certain ſubtile matter, which, by reaſon of its exceeding ſmallneſs, may penetrate even glaſs, and yet be ſtrong enough to ſhake certain capillaments at the bottom of the eye; and, laſtly, that this matter be impelled by the luminous body, ſo as to move the organ of ſight.

Primary *light*, therefore, they ſay, conſiſts in a certain motion of the particles of the luminous body, whereby they are enabled to propel, every way, the materia ſubtilis, lodged in the pores of tranſparent bodies; and ſecundary or derivative *light*, in a conatus to a motion, or an inclination of that matter, to recede from the centre of the luminous body in right lines. See MATERIA *Subtilis*, and CARTESIAN.

Father Malebranche explains the nature of *light*, from a ſuppoſed analogy between it and ſound; the latter, it is allowed, is produced by the vibrations of the inſenſible parts of the ſonorous body: which vibrations, if they be greater or leſs, that is, if they run through greater or leſs arches of the ſame circle, are ſtill performed in the ſame time, and the ſounds produced by them, only differ in a greater or leſs degree of ſtrength; but if there be a greater number of vibrations, in the ſame time, in one ſonorous body, than in another, theſe being cloſer, become of a different kind: and thus their ſounds alſo differ, forming what we call different tones, or notes; the quick vibrations forming the acute, and the ſlower the grave notes. See SOUND, ACUTENESS, and GRAVITY.

Thus he ſuppoſes it to be with *light*, and colours: all the parts of a luminous body are in a rapid motion, which, by very quick pulſes, is conſtantly compreſſing the ſubtile matter between the luminous body, and the eye, and excites vibrations of preſſion.—As theſe vibrations are greater, the body appears more luminous; and as they are more quick, or more ſlow, the body is of this, or that colour.

This hypotheſis, how ingenious ſoever, is now deſervedly diſcarded, ſince the great diſcoveries made by Sir Iſaac Newton, on the nature of *light*.—The primary *light* they talk of, we now know, conſiſts wholly in a certain motion of the particles of the lucid body, whereby they do not propel any fictitious matter, ſuppoſed to be lodged in the hidden pores of tranſparent bodies; but throw off, from the luminous body, certain very ſmall particles, which are emitted every way with great force: and the ſecundary, or derivative *light* conſiſts, not in a conatus, but a real motion of theſe particles, receding every way from the luminous body, in right lines, and with an incredible velocity.

For if *light* conſiſted in a mere preſſion, or pulſe, it would be propagated to all diſtances, in the ſame inſtant of time; the contrary of which appears, from the phænomena of the eclipſes of Jupiter's ſatellites, whoſe immerſions, as the earth approaches towards Jupiter, are found to anticipate ſomewhat on the true time, and to commence ſooner; and again, as the earth retires from Jupiter, their emerſions, which alone in that caſe can be obſerved, happen later and later, or loſe time: deviating thus, very conſiderably on either ſide, from the true time marked by the tables. This was firſt obſerved by M. Roemer, and ſince by other aſtronomers; the reaſon of which, is not owing to any eccentricity; but does apparently follow from this, that the *light* of the ſun, reflected from the ſatellites, has further to travel, ere it reaches the eye, in the one caſe, than in the other, by a ſpace equal to the diameter of the earth's annual orbit. See SATELLITES.

Light therefore, like other real bodies, does not move inſtantaneouſly, but in time.—Sir Iſaac Newton has ſhewn, paſt contradiction, that the *light* of the ſun is near ſeven minutes in its paſſage to the earth, which is the ſpace of 70,000,000 miles; a velocity 10,000,000 times greater than that, wherewith a ball flies out of the mouth of a cannon.

Further, if *light* were not a body, but conſiſted in a mere preſſion, or pulſion, it would never be propagated in right lines, but would be continually inflected ad umbram. Thus Sir Iſaac Newton, 'A preſſure on a fluid medium (*i. e.* a motion propagated by ſuch a medium beyond any obſtacle, which impedes any part of its motion,) cannot be propagated in right lines, but will be always inflecting and diffuſing itſelf every way, to the quieſcent medium beyond that obſtacle.—The power of gravity tends downwards, but the preſſure of water riſing from it, tends every way with an equable force, and is propagated with equal eaſe, and equal ſtrength in curves, as in ſtraight lines.—Waves, on the ſurface of the water, gliding by the extremes of any very large obſtacle, inflect, and dilate themſelves, ſtill diffuſing, gradually, into the quieſcent water beyond that obſtacle.—The waves, pulſes, or vibrations of the air, wherein ſound conſiſts, are manifeſtly inflected, though not ſo conſiderably as the waves of water; and ſounds are propagated with equal eaſe, through crooked tubes, and through ſtraight lines; but *light* was never known to move in any curve, nor to inflect itſelf ad umbram.'—The rays of *light*, therefore, are ſmall corpuſcles, emitted with exceeding celerity from the luminous body.—As to the force wherewith thoſe corpuſcles are emitted, ſo as to enable them to move at the inconceivable rate of 10,000,000 miles in a minute; hear the ſame great author: 'Among bodies of the ſame kind and virtue, by how much any one is ſmaller, by ſo much is its attractive power greater in proportion to its bulk. This power we find ſtronger in ſmall magnets, than in large ones, regard being had to the difference of their weights; and the reaſon is, that the particles of ſmall magnets being nearer to each other, more eaſily unite their forces intimately together, and act conjunctly.—For the ſame reaſon the rays of *light*, being of all other bodies the moſt minute, it may be expected, that their attractive powers ſhould be, of all others, the ſtrongeſt; and how ſtrong in effect they are, may be gathered from the following rules: the attraction of a ray of *light*, according to the quantity of its matter, is, to the gravity which any projected body has, according, likewiſe, to the quantity of its matter, in a ratio, compounded of the velocity of the ray of *light*, to the velocity of that projected body, and of the bending, or curvature of the line, which the ray deſcribes in the place of refraction, to the bending of the curvature, deſcribed by that projected body; provided, however, the inclination of the ray to the refracting ſurface, be the ſame with that of the projected body to the horizon. From which proportion I gather, that the attraction of the rays of *light*, is above 1,000,000,000,000,000 times greater, than the gravity of bodies on the ſurface of the earth, in proportion to the quantity of matter in each, if the *light* paſs from the ſun to the earth in the ſpace of ſeven minutes. But now, as in algebra, where affirmative quantities ceaſe, there negative ones begin; ſo in mechanics, where attraction ceaſes, there the repelling power muſt ſucceed: Therefore a ray of *light*, as ſoon as it is caſt off from the luminous body, by the vibrating motion of its parts, and is got out of the ſphere of its attraction, is propelled with an immenſe velocity.' See ATTRACTION, and REPULSION.

The wonderful diviſibility of the parts of matter, is no where more apparent, than in the minuteneſs of the particles of *light*: Dr. Niewentiit has computed, that an inch of candle, when converted to *light*, becomes divided into 269617040 parts, with 40, ciphers annexed; at which rate, there muſt iſſue out of it, when burning, 418,660, with 39 ciphers more, particles in the ſecond of a minute; vaſtly more than a thouſand times a thouſand million times the number of ſands the whole earth can contain; reckoning 10 inches to one foot, and that 100 ſands are equal to one inch. See *Relig. Philoſ.* VOL. III. p. 858.

The expanſion, or extenſion of any portion of *light*, is inconceivable; Dr. Hooke ſhews, it is as unlimited as the univerſe; proving it from the immenſe diſtance of ſome of the fixed ſtars, the *light* whereof becomes ſenſible to the eye, by means of a teleſcope; nor, adds he, is it only the great bodies of the ſun or ſtars, that are thus able to diſperſe their *light* through the vaſt expanſe of the univerſe; but the ſmalleſt ſpark of a lucid body muſt do the ſame, even the ſmalleſt globule, ſtruck from a ſteel by a flint.

Dr. s'Graveſand aſſerts, a lucid body to be that, which emits, or gives fire a motion in right lines; and makes the difference between *light* and heat, to conſiſt in this, That to produce the former, the fiery particles muſt enter the eye, in a rectilinear motion, which is not required in the latter: On the contrary, an irregular motion ſeems more proper for it, as appears from the rays coming directly from the ſun to the tops of mountains, which have not near that effect with thoſe in the valley, agitated with an irregular motion, by ſeveral reflections. See FIRE.

Whether or no there be always *light*, where there is fire, is diſputed among authors; as alſo, whether or no there be any luminous body without heat; heat being a motion that may be infinitely diminiſhed, and *light* a matter that may be infinitely rare: to which we may add, that no heat is ſenſible to us, unleſs it be more intenſe than that of our organs of ſenſe. See HEAT.

Sir Iſaac Newton obſerves, that bodies, and *light*, act mutually on one another; bodies on *light*, in emitting, reflecting, refracting, and inflecting it; and *light* on bodies, by heating them, and putting their parts into a vibrating motion, wherein heat principally conſiſts. For all fixed bodies, he obſerves, when heated beyond a certain degree, do emit *light*, and ſhine; which ſhining, &c. appears to be owing to the vibrating motion of their parts; and all bodies, abounding in earthy and ſulphurous particles, if ſufficiently agitated, emit *light*, which way ſoever that agitation be effected.—Thus ſea-water ſhines in a ſtorm, quick-ſilver when ſhaken in vacuo, cats, or horſes, when rubbed in the dark; and wood, fiſh, and fleſh, when putrefied.

The late Mr. Hawkſbee has furniſhed us with a great variety of inſtances of the artificial production of *light*, by the attrition of bodies naturally not luminous; as of amber rubbed on woollen cloth in vacuo, of glaſs on woollen, of glaſs on glaſs, of oyſter-ſhells on woollen, and of woollen on woollen, all in vacuo.

On the ſeveral experiments hereof, he makes the following reflections: That different ſorts of bodies afford remarkably different kinds of *light*, different both in colour and in force: That the effects of an attrition are various, according to the different preparations and managements of the bodies that are to endure it; and that bodies which have yielded a particular *light*, may be brought by friction to yield no more of that *light*.

M. Bernoulli found by experiment, that mercury amalgamated with tin, and rubbed on glaſs, produced a conſiderable *light* in the air; that gold rubbed on glaſs did it ſtill in a greater degree: but that, of all others, the moſt exquiſite *light* was that produced by the attrition of a diamond; being equally vivid with that of a burning coal briſkly agitated with the bellows. See ATTRITION, and FRICTION.

Mr. Boyle tells us of a piece of ſhining rotten wood, which upon exhauſting the air from it, was extinguiſhed; but upon its re-admiſſion, ſeemed to come to life again, and ſhone as before: being, no doubt, a real flame, and, like other flames, not to be preſerved without air. See PHOSPHORUS.

'That the particles of *light* are attracted by thoſe of other bodies,' is evident from innumerable experiments.—This phænomenon was firſt obſerved by Sir Iſaac Newton, who found by repeated trials, that the rays of *light* in their paſſage near the edges of bodies, whether opake or tranſparent, as pieces of metals, the edges of knives, broken glaſſes, &c. are diverted out of the right lines, and always inflected or bent towards thoſe bodies. See INFLECTION, and DEFLECTION.

This action of bodies on *light*, is found to exert itſelf at a ſenſible diſtance, though it always increaſes as the diſtance is diminiſhed; as appears very ſenſible in the paſſage of a ray between the edges of two thin planes at different apertures; in which there is ſomething very peculiar; the attraction of one edge being increaſed as the other is brought nearer it.—The rays of *light* in their paſſage out of glaſs into vacuum, are not only inflected towards the glaſs, but if they fall too obliquely, will revert back again to the glaſs, and be totally reflected.

The cauſe of which reflection cannot be attributed to any reſiſtance of the vacuum, but muſt be entirely owing to ſome force or power in the glaſs, which attracts or draws back the rays as they were paſſing into the vacuum.—And this appears farther from hence, that if you wet the poſterior ſurface of the glaſs with water, oil, honey, or a ſolution of quickſilver, then the rays which would otherwiſe have been reflected, will paſs into and through that liquor: which ſhews that the rays are not reflected till they come to that poſterior ſurface of the glaſs, nor even till they begin to go out of it; for if at their going out they fall into any of the foreſaid mediums, they will not then be reflected, but perſiſt in their former courſe, the attraction of the glaſs being in this caſe counterbalanced by that of the liquor.

From this mutual attraction between the particles of *light* and other bodies, ariſe two other grand phænomena, which we call the *reflection* and *refraction* of *light*: We know that the determination of a body in motion is changed by the interpoſition of another body in its way: thus *light* impinging on the ſurface of ſolid bodies, ſhould be turned out of its courſe, and beaten back or reflected, ſo as like other falling bodies to make the angle of its reflections equal to that of incidence.—This it is found by experience *light* does; and yet the cauſe of this effect is different from that juſt now aſſigned: the rays of *light* are not reflected by ſtriking on the very parts of the reflecting bodies, but by ſome power equably diffuſed throughout the whole ſurface of the body, whereby it acts on the *light*, either attracting or repelling it without contact: by which ſame power, in other circumſtances, the rays are refracted; and by which alſo, the rays are firſt emitted from the luminous body; as is abundantly proved by great variety of arguments, by Sir Iſaac Newton. See REFLECTION.

That great author puts it paſt doubt, that all thoſe rays which are reflected, though they approach the body infinitely near, yet never touch it; and that thoſe which do really ſtrike on the ſolid parts of bodies, adhere to them, and are as it were extinguiſhed and loſt.

If it be asked, how it happens, ſince we aſcribe the reflection of the rays to the action of the whole ſurface of the body without contact; how, I ſay, it happens that all the rays are not reflected from every ſurface, but while ſome are reflected, others paſs through and are refracted? The anſwer given by Sir Iſaac Newton is as follows:—Every ray of *light*, in its paſſage through any refracting ſurface, is put into a certain tranſient conſtitution or ſtate, which in the progreſs of the ray returns at equal intervals, and diſpoſes the ray at every return to be eaſily tranſmitted through the next refracting ſurface, and between the returns to be eaſily reflected by it: which alternation of reflection and tranſmiſſion appears to be propagated from every ſurface, and to all diſtances. What kind of action or diſpoſition this is, and whether it conſiſts in a circulating or vibrating motion of the ray or the medium, or ſomewhat elſe, he does not enquire; but allows thoſe who are fond of hypotheſes to ſuppoſe that the rays of *light*, by impinging on any reflecting or refracting ſurface, excite vibrations in the reflecting or refracting medium, and by that means agitate the ſolid parts of the body. Theſe vibrations, thus propagated in the medium, move faſter than the rays, ſo as to overtake them; and when any ray is in that part of the vibration which conſpires with its motion, its velocity is increaſed, ſo that it eaſily breaks through a refracting ſurface: but when it is in a contrary part of the vibration, which impedes its motion, it is eaſily reflected; and conſequently, that every ray is ſucceſſively diſpoſed to be eaſily reflected or tranſmitted by every vibration which overtakes it. The return of which diſpoſition of any ray to be reflected, he calls *fits of eaſy reflection*; and thoſe of its diſpoſition to be tranſmitted, he calls *fits of eaſy tranſmiſſion*; and the ſpace between the returns, *the interval of the fits*.—The reaſon, then, why the ſurface of all thick tranſparent bodies reflect part of the *light* incident on them, and refract the reſt, is, that ſome rays at their incidence are in fits of eaſy reflection, and others of eaſy tranſmiſſion.

For the Properties of Reflected LIGHT, ſee REFLECTION, MIRROR, &c.

Further, a ray of *light* paſſing out of one medium into another of different denſity, and in its paſſage making an oblique angle with the ſurface that ſeparates the mediums, will be refracted, or turned out of its right line; by reaſon the rays are more ſtrongly attracted by a denſer than a rarer medium. See REFRACTION.

That theſe rays are not refracted by ſtriking on the ſolid parts of bodies, but without any contact, by that ſame force wherewith they are emitted and reflected, exerting itſelf differently in different circumſtances, is proved in great meaſure by the ſame arguments which demonſtrate reflection to be performed without contact.

For the Properties, &c. *of Refracted* LIGHT, ſee REFRACTION, LENS, &c.

In iſland cryſtal is obſerved a kind of double refraction, very different from what we find in any other body: the rays that fall obliquely being not only diſperſed, with a double refraction in one and the ſame ſurface, but even the perpendicular rays themſelves are moſt of them divided into two beams, by means of the ſame double refraction; which beams are of the ſame colour with the incident beams, and are equal in degree of *light*, at leaſt nearly, to each other: whence the great philoſopher ſo often cited, takes occaſion to ſuſpect that there are in *light* ſome other original properties beſides thoſe hitherto deſcribed; and particularly, that the rays have different ſides, endued with ſeveral original properties.

For, of theſe refractions, the one is performed in the uſual manner, *i. e.* the ſine of incidence is to that of refraction as 5 is to 3; and the other in an unuſual manner: and yet the ſame ray is refracted ſometimes in the one manner, and ſometimes in the other, according to the various poſitions which its ſeveral ſides have, in reſpect of the cryſtal. Theſe diſpoſitions, he ſhews, muſt have exiſted originally in the rays, without having undergone any alterations in that reſpect, by the cryſtal. See *Iſland* CRYSTAL.

Every ray of *light* therefore has two oppoſite ſides, the one originally endued with a property whereon its unuſual refraction depends, and the other not endued with that property. See RAY.

Sir Iſaac Newton having obſerved the vividly coloured image projected on the wall of a darkned room, by the ſun-beams tranſmitted through a priſm, to be five times as long as broad; ſetting himſelf to enquire into the reaſon of this diſproportion, was led from other experiments to the experimentum crucis; whence he diſcovered the cauſe of the phænomenon to be, that ſome of the rays of *light* were more refracted than others, and therefore exhibited ſeveral images of the ſun under the appearance of one, extended lengthwiſe. See PRISM.

Thence he proceeded to conclude, that light itſelf is a heterogeneous mixture of rays differently refrangible: and hence he diſtinguiſhes *light* into two kinds, *viz.* that whoſe rays are equally refrangible, which he calls *homogeneal*, *ſimilar*, or *uniform light*; and that whoſe rays are unequally refrangible, which he calls *heterogeneal light*. See REFRANGIBILITY; ſee alſo HOMOGENEAL, and HETEROGENEOUS.

There are but three affections of *light*, wherein he obſerved its rays to differ, *viz.* refrangibility, reflexibility, and colour; and thoſe rays which agree in refrangibility, agree alſo in the other two: whence they may be well defined homogeneal, though in ſome other reſpects they may poſſibly be heterogeneal. See REFLEXIBILITY, and REFRANGIBILITY.

Again, the colours exhibited by homogeneal *light*, he calls *homogeneal* colours; and thoſe produced by heterogeneal *light*, *heterogeneal* colours.—Theſe definitions laid down, he advances ſeveral propoſitions.

As, firſt, That the ſun's *light* conſiſts of rays differing by indefinite degrees of refrangibility. Secondly, That rays, which differ in refrangibility, when parted from one another, do proportionably differ in the colours which they exhibit. Thirdly, That there are as many ſimple and homogeneal colours, as degrees of refrangibility, for to every degree of refrangibility belongs a different colour. Fourthly, Whiteneſs, in all reſpects like that of the ſun's immediate *light*, and of the uſual objects of our ſenſes, cannot be compounded of ſimple colours, without an indefinite variety of them; for to ſuch a compoſition there are required rays endued with all the indefinite degrees of refrangibility, which infer as many ſimple colours. Fifthly, the rays of *light* do not act on one another in paſſing through the ſame medium. Sixthly, The rays of *light* do not ſuffer any alteration of their qualities from refraction, nor from the adjacent quieſcent medium. Seventhly, There can no homogeneal colours be produced out of *light* by refraction, which are not commixed in it before; ſince refraction, as was before obſerved, changes not the qualities of the rays, but only ſeparates thoſe which have divers qualities, by means of their different refrangibility. Eighthly, The ſun's *light* is an aggregate of homogeneal colours; whence homogeneal colours may be called *primitive*, or *original.* See RAY, &c.

We have already obſerved that the rays of *light* are compoſed of diſſimilar or heterogeneous parts; ſome of them being in all probability greater, others leſs. Now the ſmaller the parts are, by ſo much the more refrangible they are, *i. e.* they are ſo much the more eaſily diverted out of their rectilinear courſe; and thoſe parts which differ in refrangibility, (conſequently in bulk) we have alſo obſerved, differ in colour.

Hence ariſes the whole theory of colours: Thoſe parts, *v. gr.* which are the moſt refrangible, conſtitute violet colour; that is, the moſt minute particles of *light*, when ſeparately impelled on the organ, do there excite the ſhorteſt vibrations in the retina, which are thence communicated by the ſolid part of the optic nerve in the brain, and excite in us the ſenſation of violet colour, the dimmeſt, and moſt languid of all colours: and thoſe particles, on the contrary, which are the leaſt refrangible, conſtitute a ray of a red colour; *i. e.* the greateſt particles of *light*, excite the longeſt vibrations in the retina, and ſo convey the ſenſation of a red colour, as being the moſt bright and vivid of all others. The other particles being diſtinguiſhed into little rays, according to their reſpective magnitudes and degrees of refrangibility, excite imtermediate vibrations, and ſo occaſion ſenſations of the intermediate colours; in like manner as the vibrations of the air, according to their different magnitudes, excite ſenſations of different ſounds.—The colours then of theſe little rays, not being any adventitious modifications of them, but connate, primitive, and neceſſary properties, reſulting, in all probability, from their different magnitudes, muſt be perpetual, and immutable, not to be altered by any reflection, refraction, or other ſubſequent modification.

For the doctrine of the colours of LIGHT, ſee COLOUR.

For the manner in which LIGHT *affects our ſenſes, and how it contributes to viſion*, ſee VISION.

LIGHT is alſo uſed, to ſignify the diſpoſition of objects, with regard to the receiving of *light*.

Thus we ſay, a painting is ſeen in its proper *light*, when its ſituation, with regard to the *light*, is the ſame with that for which it was painted.

LIGHTS *aboard Ships*. See the article SIGNALS.

LIGHTS, in architecture, denote doors, windows, and other places, through which the air, and *light* have a paſſage. See APERTION.

In the pantheon, all the *light* comes from on high; it has no *lights* but in the dome. See PANTHEON.

LIGHTS, in painting, are thoſe parts of a piece, which are illuminated, or, that lie open to the luminary by which the piece is ſuppoſed to be enlightened; and which, for this reaſon, are painted in bright vivid colours.

In which ſenſe, *light* is oppoſed to *ſhadow*. See SHADOW.

LIGHT is alſo uſed, for the luminous body that emits it.—There are various kinds of *lights*; *general lights*, as the air; *particular lights*, as a fire, a candle, and even the ſun.

Different *lights*, have very different effects on a picture, and occaſion a difference in the management of every part.—A great deal therefore depends on the painter's chuſing a proper *light* for his piece to be illuminated by, and a great deal more, in the conduct of the *lights* and ſhadows, when the luminary is pitched upon.

The ſtrength and relievo of a figure, as well as its gracefulneſs, depends entirely on the management of the *lights*, and the joining of thoſe to the ſhadows.

The *light* a figure receives, is either direct, or reflected, to each of which, ſpecial regard muſt be had.—The doctrine of *lights*, and ſhadows, makes that part of painting, called *clair-obſcure*. See CLAIR-OBSCURE.

LIGHT-*Houſe*. See the article PHAROS.

LIGHT-*Horſe*, an ancient term in our Engliſh cuſtoms, ſignifying an ordinary cavalier, or horſeman lightly armed, and ſo as to enter a corps, or regiment; in oppoſition to the men at arms, who were heavily accoutred, and armed at all points. See GUARD, GENDARMES, &c.

LIGHT *Species*. See the article SPECIES.

LIGHTER, a large broad boat, or floating veſſel, which goes with ſails, and oars; common on the river Thames; where it is uſed for the carriage of timber, coals, ballaſt, &c.

Lighters are of ſeveral kinds; as,

A balaſt gin, A cloſe *lighter*, A kiele,
A camel, A hoy, An open *lighter*.

LIGHTNESS. See the article LEVITY.

LIGNEA *Caſſia*. See the article CASSIA.

LIGNUM *Aloes*, or *wood of Aloes*.	See	ALOES.
LIGNUM *Balſami*.		BALSAM.
LIGNUM *Caſſiæ*.		CASSIA.

LIKE *Quantities*, in algebra, are thoſe which are expreſſed by the ſame letters, under the ſame power, or equally repeated in each quantity. See QUANTITY, and SIMILAR.

Thus $2b$, and $3b$; and $9ff$, and $3ff$, are *like quantities*; but $2b$, and $3bb$; and $9ff$, and $3fff$, are unlike ones, becauſe the quantities have not every where the ſame dimenſions, nor are the letters equally repeated.

LIKE *Signs*, or *Symbols*, in algebra, are when both are affirmative, or both negative. See CHARACTER.

If one be affirmative, and the other negative, they are unlike ſigns.

Thus $+64d$, and $+5d$, have *like* ſigns; but $+9f$, and $-7f$, have unlike ſigns.

LIKE *Figures*, in geometry, are ſuch as have their angles equal, and the ſides about thoſe equal angles proportional. See FIGURE.

LIKE *Arches*, in the projection of the ſphere in plano, are parts of leſſer circles, containing an equal number of degrees with the correſponding arches of greater ones. See ARCH.

LIKE *ſolid Figures*, in geometry, are ſuch as are contained under *like* planes, equal in number. See SIMILAR.

LIMB, LIMBUS, the outermoſt border, or graduated edge of an aſtrolabe, quadrant, or the like mathematical inſtrument. See ASTROLABE, QUADRANT, &c.

The word is alſo uſed for the primitive circle in any projection of the ſphere in plano.

LIMB, alſo ſignifies the outermoſt border, or edge of the ſun or moon, when the middle or diſc is hid in an eclipſe of either luminary. See DISC, ECLIPSE, &c.

Aſtronomers obſerve the lower and the upper *limb* of the ſun, in order to find its true heighth, which is that of its centre.

LIMB is alſo uſed among botaniſts for the outer edge, or border of plants, their leaves, and flowers.

LIMBECK. See the article ALEMBIC.

LIMBUS, or LIMB, is a term in the Romiſh theology, uſed for that place where the patriarchs are ſuppoſed to have waited for the redemption of mankind, and where they imagine our Saviour continued from the time of his death, to that of his reſurrection.

Du Cange ſays, the fathers called this place *limbus*, *eo quod ſit limbus inferorum*, as being the margin or frontier of the other world.

LIMBUS is alſo uſed by Catholics for the place deſtined to receive the ſouls of infants, who die without baptiſm; who have not deſerved hell, as dying in innocence; nor yet are worthy of heaven, becauſe of the imputation of original ſin. See HELL, PURGATORY, *&c.*

LIME, *calx of ſtone*, a white, ſoft, friable ſubſtance, prepared of ſtone, marble, free-ſtone, chalk, or other ſtony ſubſtance, by burning in a kiln. See CALX, STONE, CALCINATION, *&c.*

The great uſe of *lime* is in the compoſition of mortar for building; the fire taking away all its humidity, and opening its pores, ſo that it becomes eaſily reducible to powder, and miſcible with ſand. See MORTAR, and SAND.

Quick LIME, is that ſuch as it comes out of the kiln, or furnace.

Slaked LIME, is that diluted, or drenched in water, and reſerved for the making of mortar.

The beſt *lime*, is that made of the hardeſt, firmeſt, and whiteſt ſtones; and which is ſlaked at its coming out of the furnace.

Sir H. Wotton looks on it as a great error in the Engliſh, to make *lime* as they do, of refuſe, and ſtuff without any choice; whereas the Italians, at this day, and much more the ancients, burnt their firmeſt ſtones, and even fragments of marble, where it was plentiful; which, in time, became almoſt marble again for its hardneſs, as appears in their ſtanding theatres, *&c.*

We have two kinds of *lime* in common uſe in England; the one made of hard ſtone, the other of a ſoft, calcarius, or chalky ſtone; whereof the former is much the ſtrongeſt.—That made of ſoft ſtone, or chalk, is fitteſt for plaiſtering of ceilings and walls within doors; and that made of hard ſtones, for buildings, and for plaiſtering without doors.

Good *lime* may alſo be made of mill-ſtone, not coarſe and ſandy, but fine and greaſy; as alſo of all kinds of flints; though it is hard to burn them, unleſs in a reverberatory furnace, as being apt to run to glaſs.

Dieuſſant recommends *lime* made of ſea-ſhells as the beſt; but Goldman finds fault with it, as being impatient of moiſture, and therefore eaſily peeling off from the outſides of walls: it is, however, the common *lime* uſed in the Indies.

Before the ſtones be thrown into the kiln, they are to be broke in pieces; otherwiſe the air contained in their cavities, too much expanded by the heat, makes them fly with ſo much violence, as to damage the kiln.—According to Alberti, and Palladio, *lime* will not be ſufficiently burnt in leſs than ſixty hours intenſe heat.

The marks of a well burnt *lime*, according to Alberti, are, that its weight be to that of the ſtone in a ſeſquialterate proportion; that it be white, light, and ſonorous; that when ſlaked, it ſtick to the ſides of the veſſel.—To which Boeckler adds, that when ſlaked it ſend forth a copious thick ſmoke; and Dieuſſant, that it need a great deal of water to ſlake it.

To preſerve *lime* ſeveral years, ſlake, and work it up; dig a pit under ground, into which let it paſs through a hole open at the bottom of the veſſel. As ſoon as the pit is full, cover it up with ſand, to prevent its drying; thus keeping it moiſt till it be uſed.—Boeckler gives another method: Cover a ſtratum of *lime* two or three foot high with another of ſand of the like heighth; pour on water enough to ſlake the *lime*, but not to reduce it to duſt after ſlaking. If the ſand cleave into chinks, as the ſmoke aſcends, cover them up, ſo as no vent may be given thereto.—This *lime*, he adds, kept ten or twelve years, will be like glue; and will, further, be of particular uſe in painting walls, as being no way prejudicial to the colours. Sre MORTAR.

Lime is much uſed by tanners, ſkinners, *&c.* in the preparation of their leather. See TANNING, TAWING, *&c.*

It is alſo of ſome medicinal uſe; being applied externally in deſiccative, and epulotic medicines.

LIME-*Water* is ſaid to be an excellent remedy, taken internally: M. Burlet has an ample account of its effects, in the *French Memoirs*, chiefly from his own experience. But, he obſerves it ſucceeded much better in Holland, *&c.* than in France.—It is a powerful alterant, and like a pure alkaline water, fitted to blunt and deſtroy acid ferments, which are the principles of all obſtructions, and the cauſe of moſt chronic diſeaſes.—Its principal uſe is, in cachexies, green-ſickneſs, dropſy, ſcurvy, obſtructions of the liver, ſpleen, *&c.* See WATER.

It is made, by pouring ſix pounds of hot water, on one of *quick-lime*, leaving them to ſoak, and macerate for the ſpace of twenty four hours.

LIME-*Stone*, *lapis calcarius*, is a ſoftiſh ſtone, of a coarſe grain, and, being burnt in a kiln, makes an ingredient in mortar, plaiſter, *&c.* See LIME, MORTAR, *&c.*

Bird-LIME. See the article BIRD-LIME.

LIMITATION *of aſſize*, in law, is a certain time ſet down by the ſtatute, wherein a man muſt alledge himſelf, or his anceſtors to have been ſeized of lands ſued for by writ of aſſize: otherwiſe he cannot maintain his action.

LIMITED *Problem*, is that which admits but of one ſolution, or which can only be ſolved one way: as, to make a circle paſs through three points given, not lying in a right line; to deſcribe an equilateral triangle on a line given, *&c.* See PROBLEM, and DETERMINATE.

LIMITROPHOUS *Column*. See the article COLUMN.

LIMITS *of a Planet*, its greateſt excurſions, or diſtances from the ecliptic. See PLANET.

LIMNING, the art of painting in water-colours. See PAINTING.

In which ſenſe, *limning* ſtands contradiſtinguiſhed from *painting*, properly ſo called, which is done in oil-colours.

Limning is much the more ancient kind of painting. Till a Flemiſh painter, one John van Eyck, better known by the name of John of Bruges, found out the art of painting in oil, the painters all painted in water, and in freſco, both on their walls, on wooden boards, and elſewhere.—When they made uſe of boards, they uſually glued a fine linen cloth over them, to prevent their opening; then laid on a ground of white; laſtly, they mixed up their colours with water and ſize, or with water and yolks of eggs, well beaten with the branches of a fig-tree, the juice whereof, thus mixed with the eggs; and with this mixture they painted their pieces.

In *limning*, all the uſual colours are proper enough, excepting the white made of lime, which is only uſed in freſco. But the azure, and ultramarine, muſt always be mixed up with ſize, or with gum, in regard the yolks of eggs give yellow colours a greeniſh tincture. But there are always applied two lays of hot ſize ere the colours, mixed even with ſize, are laid on: the compoſition made with eggs, and the juice of the fig-tree, being only uſed for touching up and finiſhing, and to prevent the neceſſity of having a fire always at hand to keep the ſize hot; yet it is certain, that the ſize-colours hold the beſt, and are accordingly always uſed in cartoons, *&c.*—This ſize is made of ſhreds of thin leather, or of parchment.

To *limn* on linen, they chuſe that which is old, half worn, and cloſe.—This they ſtamp with white-lead, or a fine plaiſter beaten up with ſize; which, once dry, they go over it with a layer of the ſame ſize.

The colours are all ground in water, each by itſelf; and in proportion, as they are required in working, are diluted with ſize-water.—If the yolks of eggs are deſired, they dilute them with water made of equal quantities of common water and vinegar, with the yolk, white, and ſhell of an egg, and the ends of the little branches of a fig-tree cut ſmall, all well beaten together in an earthen pan.

If it be deſired to varniſh the piece when finiſhed, they go over it with the white of an egg well beaten, and then with varniſh.—This, however, is only to preſerve it from the wet: for the great advantage of *limning* conſiſts in its being without gloſs; in regard all its colours, thus void of luſtre, may be ſeen in all kinds of lights; which colours in oil, or covered with varniſh, cannot.

LINCOLNSHIRE *Plough*. See the article PLOUGH.

LINCTUS, a form of medicine, the ſame as *lambative*, *lohock*, and *eclegma*. See LAMBATIVE, LOHOCK, and ECLEGMA.

LINE, in geometry, a quantity extended in length only, without either breadth or thickneſs.

A *line* is ſuppoſed to be formed by the flux or motion of a point. See POINT.

There are two kinds of *lines*, viz. *right lines*, and *curve lines*. See RIGHT, and CURVE.

If the point A move towards B, (*Tab. Geometry*, *fig.* 1.) by its motion it deſcribes a *line*; and this, if the point go the neareſt way towards B, will be a right or ſtreight *line*, whoſe definition therefore is, the neareſt or ſhorteſt diſtance from any two points, or a *line* all whoſe points tend the ſame way.—If the point go any way about, as in one of the *lines* ACB, or A*c*B, it will trace out either a crooked *line*, as the upper A*c*B; or elſe two or more ſtreight ones, as in the lower ACB.

Right Lines are all of the ſame ſpecies; but curves are of an infinite number of different ſpecies.—We may conceive as many as there are different compound motions, or as many as there may be different ratio's between their ordinates and abſciſſes. See CURVE.

Curve Lines, are uſually divided into *geometrical*, and *mechanical*.

Geometrical LINES, are thoſe which may be found exactly, and ſecurely, in all their points. See GEOMETRICAL.

Mechanical LINES are thoſe, ſome or all of whoſe points are not to be found preciſely, but only tentatively, or nearly. See MECHANICAL.

Agreeably thereto, Des Cartes and his followers define *geometrical lines* thoſe which may be expreſſed by an algebraic equation of a determinate degree.—Which equation is alſo called *locus*. See LOCUS.

The ſame perſons define *mechanical lines*, thoſe which cannot be expreſſed by an equation of a determinate degree.

Others, conſidering that thoſe called by Des Cartes *mechanical lines*, notwithſtanding their not being of a determinate degree, are not leſs preciſe, and exact, and conſequently not leſs geometrical than the others; it being this preciſion which conſtitutes the geometricity of the *line*: For this reaſon, they chuſe rather to call thoſe *lines* which are reducible to a determinate degree, *algebraical lines*; and thoſe which are not, *tranſcendental lines*. See GEOMETRICAL, ALGEBRAICAL, MECHANICAL, and TRANSCENDENTAL.

Lines are alſo divided into thoſe of the *firſt order*, *ſecond order*, *third order*, &c. See CURVE.

Lines, conſidered as to their poſitions, are either *parallel*, *perpendicular*, or *oblique*: the conſtruction and properties of each whereof, ſee under PARALLEL, PERPENDICULAR, *&c.*

Euclid's ſecond book treats moſtly of *lines*, and of the effects of their being divided, and again multiplied into one another.

Circular LINES.	See the article	CIRCULAR.
Converging LINES.		CONVERGING.
Diverging LINES.		DIVERGING.
Generating LINE.		GENERATING.
Heliſpherical LINE.		HELISPHERICAL.
Hyperbolic LINE.		HYPERBOLIC.
Logiſtic LINE.		LOGISTIC.
Normal LINE.		NORMAL.

Proportional LINES, *the manner of conſtructing them, their properties*, &c. See PROPORTIONAL *Lines*.

Quadrature LINES.	See the article	QUADRATURE.
Reciprocal LINES.		RECIPROCAL.
Robervalian LINES.		ROBERVALIAN.
Vertical LINE.		VERTICAL.
Meaſure of a LINE.		MEASURE.

LINE, in geography, and navigation, is uſed by way of eminence for the equator, or equinoctial *line*. See EQUATOR.

The *line* in the heavens, is a circle deſcribed by the ſun in his courſe on the 21ſt day of March, and the 21ſt of September. —The *line* on the earth, is an imaginary circle, anſwering to that in the heavens.—It divides the earth, from eaſt to weſt, into two equal parts, and is at an equal diſtance from the two poles; ſo that thoſe who live under the *line*, have the poles always in their horizon. See POLE.

The latitudes commence from the *line*. See LATITUDE.

The ſeamen uſe to chriſten their freſh men, and paſſengers, the firſt time they cut the *line*. See BAPTISM.

LINE *of the Apſides*, in aſtronomy, is the *line* which joins the apſides; or it is the greater axis of the orbit of a planet. See APSIDES.

Fiducial LINE, the *line* or ruler which paſſes through the middle of an aſtrolabe, or the like inſtrument; and on which the ſights are fitted: otherwiſe called *alhidade*, *index*, *dioptra*, and *mediclinium*. Seee ALHIDADE, *&c.*

Horizontal LINE, a *line* parallel to the horizon. See HORIZON.

Iſochronal LINE.	See the article	ISOCHRONAL.
Meridian LINE.		MERIDIAN.

LINE *of the Nodes*, in aſtronomy, is the *line* which joins the nodes of the orbit of a planet; or the common ſection of the plane of the orbit with the plane of the ecliptic. See NODES.

Geometrical LINE, in perſpective, is a right *line* drawn in any manner on the geometrical plane.

Terreſtrial LINE, or *fundamental line*, in perſpective, is a right *line*, wherein the geometrical plane, and that of the picture, or draught, interſect one another.

Such is the *line* NI, (*Tab. Perſpective*, *fig.* 12.) formed by the interſection of the geometrical plane LM, and the perſpective plane, HL.

LINE *of the Front*, in perſpective, is any right *line* parallel to the terreſtrial *line*.

Vertical LINE, is the common ſection of the vertical, and of the draught.

Viſual LINE, is the *line*, or ray, imagined to paſs from the object to the eye.

LINE *of Station*, in perſpective, according to ſome writers, is the common ſection of the vertical and geometrical planes.

Others mean by it, the perpendicular height of the eye above the geometrical plane; others, a *line* drawn on that plane, and perpendicular to the *line* expreſſing the heighth of the eye.

Objective LINE, in perſpective, is any *line* drawn on the geometrical plane, whoſe repreſentation is ſought for in the draught, or picture.

LINE *of Diſtance*. See the article DISTANCE.

Horizontal LINE, in dialling, is the common ſection of the horizon, and the dial plane. See HORIZONTAL.

Horary LINES, or *Hour lines*, are the common interſections of the hour circles of the ſphere, with the plane of the dial. See HORARY, and HOUR *Lines*.

Subſtylar LINE, is that *line* on which the ſtyle or cock of a dial is erected, and is the repreſentation of ſuch an hour circle, as is perpendicular to the plane of that dial. See SUBSTYLAR.

Equinoctial LINE, in dialling, is the common interſection of the equinoctial, and the plane of the dial.

Contingent LINE. See the article CONTINGENT.

Dialling LINES.	See the article	DIALLING.
Meridian LINE.		MERIDIAN.
Vertical LINE.		VERTICAL.

LINE *of Meaſures*, is uſed by Oughtred to denote the diameter of the primitive circle in the projection of the ſphere in plano, or that *line* in which the diameter of any circle to be projected falls.

In the ſtereographic projection of the ſphere in plano, *line of meaſures* is that *line* in which the plane of a great circle, perpendicular to the plane of the projection, and that oblique circle, which is to be projected, interſects the plane of the projection; or it is the common ſection of a plane, paſſing through the eye-point, and the centre of the primitive; and at right angles to any oblique circle, which is to be projected, and in which the centre and pole of ſuch circle will be found.

LINE *of Direction*, in mechanics, is that wherein a body either actually moves, or would move, if it were not hindered. See DIRECTION.

The term is alſo uſed to ſignify the *line* that paſſes through the centre of gravity of the heavy body to the centre of the earth; which muſt alſo paſs through the fulcrum, or ſupport of the heavy body; without which it would fall.

LINE *of Gravitation of an heavy Body*, is a *line* drawn through its centre of gravity, and according to which it tends downwards. See GRAVITATION.

LINE *of the ſwifteſt Deſcent of an heavy Body*, is a *line* wherein the body will fall the ſwifteſt from one point to another: or, it is that curve which a body would deſcribe in its deſcent, if it moved the ſwifteſt poſſible. See DESCENT.

LINE *of a Projectile*. See the article PROJECTILE.

LINES *on the plain Scale*, are the *line* of chords, *line* of ſines, *line* of tangents, *line* of ſecants, *line* of ſemi-tangents, *line* of leagues.—The conſtruction and application whereof, ſee under the word SCALE, SAILING, *&c.*

LINES *on Gunter's Scale*, are the *line* of numbers, *line* of artificial ſines, *line* of artificial tangents, *line* of artificial verſed ſines, *line* of artificial ſines of rhumbs, *line* of artificial tangents of the meridian *line*, and *line* of equal parts. The conſtruction and application whereof, ſee under the word GUNTER's *Scale*.

LINES *of the Sector*, are the *line* of equal parts, or *line* of lines; *line* of chords, *line* of ſines, *line* of tangents, *line* of ſecants, *line* of polygons, *line* of numbers, *line* of hours, *line* of latitudes, *line* of meridians, *line* of metals, *line* of ſolids, *line* of planes. The conſtruction and uſe whereof, ſee under the word SECTOR.

LINE, in fortification, is ſometimes taken for a ditch, bordered with its parapet; and ſometimes for a row of gabions, or ſacks of earth, extended lengthwiſe on the ground, to ſerve as a ſhelter againſt the enemies fire. See TRENCH, GABION, *&c.*

When the trenches were carried on within thirty paces of the glacis, they drew two *lines*, one on the right hand, and the other on the left, for a place of arms.

Fundamental LINE, is the firſt *line* drawn for the plan of a place, and which ſhews its area.

Capital LINE, is that which is drawn from the point where the two demi-gorges meet, to the point of the baſtion. See CAPITAL.

Central LINE, is that drawn from the angle of the centre, to that of the baſtion.

LINE *of Defence*, is that which repreſents the courſe or flight of the bullet of any ſort of fire-arms, more eſpecially of a muſket-ball, from the place where the muſketeer muſt ſtand to ſcour, and defend the face of the baſtion.

LINE *of Defence fichant*, is that drawn from the angle of the curtin to that of the oppoſite baſtion; without touching the face of the baſtion.

This muſt never exceed 800 feet, which they reckon the diſtance at which a muſket-ball will do execution.

LINE *of Defence razant*, is that drawn from the point of the baſtion along the face, till it come to the curtin; and ſhews how much of the curtin will clear or ſcour the face.

This is alſo called the *line of defence ſtringent*, or *flanking*.

LINE *of Approach*, or *Attack*, ſignifies the work which the beſiegers carry on under covert, to gain the moat, and the body of the place. See APPROACH.

LINE *of Circumvallation*, is a *line* or trench cut by the beſiegers, within cannon-ſhot of the place, which ranges round their camp, and ſecures its quarters againſt any relief to be brought the beſieged. See CIRCUMVALLATION.

LINE *of Contravallation*, is a ditch bordered with a parapet, which ſerves to cover the beſiegers on the ſide of the place, and to ſtop the ſallies of the garriſon. See CONTRAVALLATION.

LINES *of Communication*, are thoſe which run from one work to another.—*See Tab. Fortif. fig.* 21. *n.* 2. 2. &c. ſee alſo COMMUNICATION.—But

The LINE *of Communication*, more eſpecially ſo called, is a continued trench, with which a circumvallation, or contravallation is ſurrounded; and which maintains a communication with all its forts, redoubts, and tenailles.

Line *of the Baſe*, is a right *line*, which joins the points of the two neareſt baſtions.

To Line *a work*, ſignifies to face it, chiefly with brick or ſtone: *e. gr.* to ſtrengthen a rampart with a firm wall, or to encompaſs a parapet or moat with good turf, *&c.*

Line, in the art of war, is underſtood of the diſpoſition of an army, ranged in order of battle; with the front extended as far as may be, that it may not be flanked.

An army uſually conſiſts of three *lines*; the *firſt* is the front, van, or advance guard; the main body forms the *ſecond*, in which is the general's poſt; the *third* is a reſerved body, or rear guard. See Guard.

It is a rule, to leave 150 paces diſtance between the firſt *line* and the ſecond, and twice as much between the ſecond and third, to give room for rallying.

Line, or Line *of Battle*, is alſo applied to the diſpoſition of a fleet on the day of engagement; on which occaſion, the veſſels are uſually drawn up, as much as poſſible, in a ſtraight *line*, as well to gain and keep the advantage of the wind, as to run the ſame board.

Ship of the Line, is a veſſel large enough to be drawn up in the *line*, and to have a place in a ſea-fight. See Ship.

Line *of Demarcation*, or *Alexandrian Line*, is a meridian paſſing over the mouth of the river Maragnon, and by the capes of Houmas, and Malabrigo; ſo called from pope Alexander VI. who, to end the diſputes between the crowns of Caſtile and Portugal, about their boundaries, in 1493, drew an imaginary *line* on the globe, which was to terminate the pretenſions of each. By which partition, the Eaſt-Indies fell to the lot of the Portugueſe; and the Weſt-Indies, then newly diſcovered, to the Caſtilians.

Bowling-Line.	See the article	Bowling.
Bunt-Line.		Bunt-*Lines.*
Crane-Lines.		Crane-*Lines.*
Furling-Lines.		Furling-*Line.*
Log-Line.		Log-*Line.*
Rat-Lines.		Rat-*Line.*
Rhumb-Line.		Rhumb-*Line.*
Water-Line.		Water-*Line.*

Line, in fencing, is that of the body directly oppoſite to the enemy, wherein the ſhoulders, the right arm, and the ſword ought always to be found; and wherein are alſo to be placed the two feet, at the diſtance of 18 inches from each other.

In this ſenſe, a man is ſaid te be in his *line*, to go out of his *line*, &c.

Line, in genealogy is a ſeries or ſucceſſion of relations, in various degrees, all deſcending from the ſame common father.

Direct Line, is that which goes from father to ſon; which is the order of aſcendants and deſcendants. See Direct.

Collateral Line, is the order of thoſe who deſcend from ſome common father related to the former, but out of the *line* of aſcendants, and deſcendants.—In this are placed uncles, aunts, couſins, nephews, *&c.* See Collateral, Ascendant, and Descendant.

Line alſo denotes a ſmall French meaſure, containing the 12th part of an inch, or 144th part of a foot. See Inch, *&c.*

The geometricians, notwithſtanding its ſmallneſs, conceive the *line* ſubdivided into ſix points.

The French *line* anſwers to the Engliſh *barley-corn.* See Measure.

Angling Line.	See the article	Angling, and Flote.
Gauge Line.		Gauge.
Plumb Line.		Plumb.
Rear Line.		Rear.
White Line, in printing.	See the article	White.
Line, *linum*, in agriculture, *&c.*		Flax.

LINEA * *Alba*, in anatomy, the concourſe of the tendons of the oblique and tranſverſe muſcles of the abdomen; dividing the abdomen in two, in the middle. See Abdomen.

* It is called *linea*, line, as being ſtraight; and *alba*, from its colour, which is white.

The *linea alba* receives a twig of a nerve from the intercoſtals in each of its digitations or indentings, which are viſible to the eye, in lean perſons eſpecially.

Linea *Mediana.* See the article Mediana.

LINEAL *Deſcent.*	See the article	Descent.
Lineal *Exegeſis.*		Exegesis.

LINEAMENT, a fine ſtroke or line obſerved in the face, and forming the delicacy thereof; being that which preſerves the reſemblance, and occaſions the relation of likeneſs or unlikeneſs to any other face.

It is by theſe, that phyſiognomiſts pretend to judge of the temper and manners of people. See Physiognomy, and Face.

Lineament is alſo uſed by the painters for the out-line of a face. See Contour.

LINEANS *Punctum.* See the article Punctum.

LINEAR *Problem*, in mathematics, is that which may be ſolved geometrically, by the interſection of two right lines.

E. gr. To meaſure an inacceſſible heighth by the means of two unequal ſticks, *&c.*

1

This is alſo called a *ſimple problem*, and is capable but of one ſolution. See Problem.

Linear *Numbers*, are ſuch as have relation to length only. See Number.

Such, *e. gr.* is a number which repreſents one ſide of a plane figure. If the plane figure be a ſquare, the *linear number* is called a *root.*

LINED *Moat.* See the article Moat.

LINEN-*Mills.*	See the article	Mill.
White Linen.		White.
Bleaching of Linen.		Bleaching.

LINGOT, or Ingot. See the article Ingot.

LINGUA, in anatomy. See the article Tongue.

LINGUÆ *Frænum.*	See the article	Frænum.
Linguæ *Medietas.*		Medietas.

LINIMENT *, Linimentum, a form of external medicine, made of unctuous ſubſtances, to rub on any part.

* The word comes from the Latin *linire*, to anoint gently.

The *liniment* is of a mean conſiſtence between an oil and an unguent. See Oil, and Unguent.

The uſe of *liniments* is to ſoften aſperities of the skin, moiſten parts that need humectation, reſolve the humours that afflict the patient, and give him pain.—There are various kinds of *liniments* uſed, according to the various occaſions.

LINSEED, or Line-Seed, a ſort of grain which enters the compoſition of ſeveral medicines, and yields, by expreſſion, an oil, that has moſt of the qualities of nut-oil, and is accordingly ſometimes uſed in lieu thereof in painting, and to burn.

That drawn without the aſſiſtance of fire, is of much eſteem in medicine, and ſuppoſed good in the cure of cattarhs, coughs, aſthma's, and other diſeaſes of the breaſt, *&c.*

LINSTOCK, a ſhort ſtaff of wood, about three foot long, having at one end a piece of iron divided into two branches, each of which has a notch to hold a piece of match, and a ſcrew to faſten it there; the other end being alſo ſhod with iron, and pointed, to ſtick into the ground.—It is uſed by the gunners in firing cannon.

LINTEL, in architecture, the piece of timber which lies horizontally over door-poſts, and window-jaums; as well to bear the thickneſs of the wall over it, as bind the ſides of the walls together. See Door, *&c.*

LINUM *Catharticum*, or *mountain-flax*, a medicinal plant, much uſed by common people; being a rough harſh purge, and powerful detergent, and evacuator of viſcid and watery humours from the moſt remote lodgments; which makes ſome fond of it in rheumatiſms: but it is only fit for robuſt conſtitutions.

Linum *Vivum*, or *Incombuſtible*, a foſſile, ſtony ſubſtance of a whitiſh colour and woolly texture, ſeparable into threads, or filaments, capable of being ſpun, and wove into a ſort of cloth, which will endure the fire without conſuming. See Incombustible.

This is the ſame with what is otherwiſe called *lapis amianthus*, or *asbeſtos*; ſometimes, *ſalamander's wool*, alſo *linum foſſile*, *linum Indicum*, *Creticum*, *Cyprium*, &c. See Asbestos.

As to the art of managing this mineral, and of ſpinning and weaving it, *&c.* the accounts we have are various.—Signior Caſtagnata, ſuperintendant of ſome mines in Italy, gives us the art of reducing it either into a very white skin, or a very white paper, either of which reſiſts the moſt violent fire. See Paper.

Marco Polo, the Venetian, gives us the manufacture of the *linum*, found in the province of Chinchinthelas in Tartary, from one Curſicar a Turk, ſuperintendant of the mines of that country, as follows.—The lanuginous mineral, being firſt dried in the ſun, is then pounded in a braſs mortar, and the earthy part ſeparated from the woolly, which is afterwards well waſhed from filth; being thus purged, it is ſpun into thread like other wool, and after wove into cloth, which, if foul or ſpotted, they cleanſe, he ſays, by throwing it into the fire for an hour's time, whence it comes out unhurt as white as ſnow: Which very method, according to the account given us by Strabo, ſeems to have been uſed, in ordering the Cretan amianthus; with this addition, that after it was pounded, and the earthy part ſeparated from the woolly, he ſays it was combed; and ſo does Agricola.

Signior Campani, after deſcribing four ſorts of the *linum*, whereof he had ſpecimens in his muſæum; the firſt ſent him from Corfu, the ſecond from Seſtri di Ponente, the third coarſer and darker than the reſt, and the fourth from the Pyreneans; and after obſerving, though he kept it three weeks in a glaſs-houſe fire, yet he found it unaltered, though it could not preſerve a ſtick, wrapped in it, from the fire: he proceeds to ſhew the manner of ſpinning it, and making it into cloth, which he effected thus:—He firſt laid the ſtone in water, if warm the better, for ſome time to ſoak; then opened and divided it with his hands, that the earthy parts might fall out of it, which are whitiſh like chalk, and ſerve to bind the thready parts together. This makes the water thick, and milky. That operation he repeated ſix or ſeven times, with freſh water, opening and ſqueezing it again, and again, till all the heterogeneous parts were waſhed out, and then the flax-like parts were collected, and laid in a ſieve to dry.

As to the ſpinning, he firſt ſhews a method diſcovered to him, which is thus.—Lay the *linum*, cleanſed as before, between two cards, ſuch as they card wool withal, where let it be gently carded, and then clapped in between the cards, ſo that ſome of it may hang out of the ſides; then lay the cards faſt on a table, or bench; take a ſmall reel, made with a little hook at the end, and a part to turn it by, ſo that it may be eaſily turned round. This reel muſt be wound over with white thread: then having a ſmall veſſel of oil ready, with which the fore-finger and thumb are conſtantly to be kept wet, both to preſerve the ſkin from the corroſive quality of the ſtone, and to render the filaments thereof more ſoft and pliant; by continuing to twiſt about the thread on the reel in the asbeſtos hanging out of the cards, ſome of the latter will be worked up together in it; and, by little and little, the thread may, with care, be woven into a coarſe ſort of cloth; and, by putting it into the fire, the thread and oil will be burnt away, and the incombuſtible cloth remain.

But finding this way, of uniting the ſtone with the thread, very tedious, inſtead of the thread, he put ſome flax on a diſtaff, and, by taking three or four filaments of the asbeſtos, and mixing them with the flax, he found they might be eaſily twiſted together, and the thread thus made much more durable and ſtrong; ſo that there is no need of carding, which rather breaks the filaments, than does any good: only open and ſeparate the filaments after waſhing, on a table, and take them up with the flax, which is ſufficient.

As to the making of paper, he ſays, in the waſhing of the ſtone there will remain ſeveral ſhort pieces in the bottom of the water, of which paper may be made in the common method. See PAPER.

He concludes with the beſt way of preſerving the cloth, or any thing made of the linen, which, by reaſon of its exceſſive dryneſs, is very apt to break and twiſt; and it conſiſts in keeping it always well oiled, which is the only preſervative.—When the cloth is put in the fire, the oil burns off, and the cloth comes out white and purified.

LIONCELES, in heraldry, a term for lions, when there are more than two of them born in any coat of arms, and no ordinary between them.

LIPOTHYMIA *, or LIPOPSYCHIA, in medicine, a ſudden diminution, or failure of animal and vital actions; otherwiſe called a *ſwooning*, or *deliquium*. See DELIQUIUM, SWOONING, SYNCOPE, &c.

* The word *lipothymia* comes from the Greek λειπω, *deficio*, and θυμος, *animus*; and *lipopſychia* from λειπω, and ψυχη, the ſoul.

In the *lipothymia* the pulſe is very faint; the ſenſes, both internal and external, and the animal motions, both voluntary and natural, extremely weakened, and the reſpiration ſcarce viſible.

The ordinary cauſes of the *lipothymia*, are great loſſes of blood, exceſſive evacuations, immoderate exerciſe, groſs hot air, ſuch as that in the midſt of crowds of people, &c.

LIPPITUDO, is uſed by Celſus, for a diſeaſe of the eyes, otherwiſe called *ophthalmia*. See OPHTHALMIA.

LIPPITUDO, is alſo uſed by modern writers, for a diſorder popularly called *blear-eyed*; ariſing from a decay of the natural moiſture of the eyes, which then feel dry, and appear red and angry. See SCLEROPHTHALMIA.

LIPS, *Labia*, the edge, or exterior part of the mouth; or that muſculous extremity, which ſhuts and covers the mouth, both above and below. See MOUTH.

The *lips*, beſides the common integuments, conſiſt of two parts, the exterior, hard, and muſculous; the interior, ſoft, ſpungy, and glandulous, covered with a fine membrane, the fore and protuberant parts of which are red, and called *prolabia.*—Authors generally content themſelves, with calling the ſubſtance of this part, ſpungy; but, in reality, it is glandulous, as appears by the ſcrophulous, and cancerous humours, to which it is ſubject.—The muſcles, of which the outer parts of the *lips* conſiſt, are either *common* to them with other parts, or *proper*; the common are the third pair of the noſe, the ſubcutaneous, and the buccinator.

The *lips* have ſix pair of muſcles peculiarly belonging to them, and an odd one; of theſe, three are peculiar to the upper and under *lip*, the other three, and the ſingle one, are common to both *lips*: the peculiar are, the *attollens labiorum ſuperius*, *deprimens labiorum inferius*, *attollens labiorum inferius*; the three common pair are, the *zygomaticus*, the *depreſſor labiorum*, the *attollens labiorum*; the odd one, *orbicularis*; which ſee.

All theſe parts are ſerved with blood, by ſome branches of the carotids, which the veins carry back to the external jugulars.—Their nerves come from the fifth, ſixth, and eighth pair of the head, and ſome from the par acceſſorium. The *lips* have a great ſhare in the action of ſpeech, and are of good uſe in taking in the food, &c.

LIPS, is alſo applied to the two extreme parts of the pudendum muliebre; between which is the rima, or fiſſure of the part. Theſe are more peculiarly called *labia pudendi*; being ſoft, oblong bodies; of a peculiar ſubſtance, not found in any other part of the body.

LIPS are alſo uſed, to ſignify the two edges of a wound.

LIQUEFACTION, an operation, by which a ſolid body is reduced into a liquid; or the action of fire or heat, on fat, and other fuſible bodies, which puts their parts into a mutual inteſtine motion.

The *liquefaction* of wax, &c. is performed by a moderate heat; that of ſal tartari, by the mere moiſture of the air: all ſalts *liquify*; ſand, mixed with alkalies, becomes *liquified* by a reverberatory fire, in the making of glaſs. See GLASS.

In ſpeaking of metals, inſtead of *liquefaction*, we ordinarily uſe the word *fuſion*. See FUSION.

LIQUET. See the article NON LIQUET.

LIQUID, a body which has the property of fluidity; and beſides that, a peculiar quality of wetting other bodies immerged in it, ariſing from ſome configuration of its particles, which diſpoſes them to adhere to the ſurfaces of bodies contiguous to them. See FLUID.

Denſity of LIQUIDS.	See	DENSITY.
LIQUID *Amber*.		AMBER, and BALSAM.
LIQUID *Confects*.		CONFECTS.
LIQUID *Laudanum*.		LAUDANUM.
LIQUID *Meaſures*.		MEASURE.
LIQUID *Storax*.		STORAX.
LIQUID *Sulphur*.		SULPHUR.

LIQUID, among grammarians, is a name applied to certain conſonants, oppoſed to *mutes*. See CONSONANT, and MUTE.

L, m, n, and r, are *liquids*. See L, M, N, &c.

LIQUIDATE *an action*. See the article ACTION.

LIQUIDATION, the act of reducing, and aſcertaining, either ſome dubious diſputable ſum, or the reſpective pretenſions, which two perſons may have to the ſame ſum.

LIQUOR. See the article DRINK, FLUID, &c.

Stygian LIQUORS.	See the article	STYGIAN *Liquors*.
Clearing of LIQUORS.		CLEARING.

LIQUORICE, LIQUORITIA, called alſo *glycyrrhiza*, and *radix dulcis*, a ſweet taſted root, of conſiderable uſe in medicine, againſt coughs, and other diſorders of the breaſt and lungs.

The ſhrub which bears it, is cultivated in divers parts of England, particularly about Pontefract in Yorkſhire; in ſome provinces of France, Spain, Germany, and Muſcovy; and eſpecially in Perſia, where it thrives better than any where elſe; there being ſome on the banks of the Caraſu, Kenki, and Kerniarpa, whoſe roots are thicker than the arm; and whoſe juice, in reſpect of ſtrength, virtue, &c. are preferable to others.

The root of the *liquorice* plant runs, or ſpreads a great way in the ground, and emerging into air from place to place produces ſo many new ſtems, or plants, few of which riſe above five feet high. Its leaves are thick, green, ſhining, half-round, and glutinous: its flowers red, like the hyacinth; and its ſeed contained in roundiſh pods.

In the culture, care muſt be taken to have a warm, light, rich ſoil, or to amend it with manure: they plant it in trenches, three ſpits deep, in February, and March, uſually in rows, at a foot diſtance from each other.—The parts choſe for this purpoſe, are ſets from the top of the plant, or the very top of the root; or elſe the runners that ſpread from the maſter-root.—In moiſt weather the branches may alſo be ſlipped and planted.

They are taken about November, or December, after they have ſtood three ſummers in the ground; for then the *liquorice* weighs moſt, and will keep with leſs loſs: not but that there is a continual diminution in this reſpect, from the firſt taking it.

New, green *liquorice* ſhould be choſe ſmooth, and even, about the thickneſs of the middle finger, ruddy without, yellowiſh within, eaſy to cut, and of an agreeable ſmell.

This root being boiled a long time in water, till the fluid has got a deep, yellow tincture; and the water, at length evaporated over a moderate fire; there remains a black, ſolid ſediment, which we alſo call *liquorice*, or *liquorice juice*, or ſometimes *Spaniſh juice*.

Chuſe it black without ſide, and of a ſhining black within; eaſy to break, and of an agreeable taſte.—The whitiſh, and yellowiſh *liquorice* juices are good for nought; being uſually no other than compoſitions of ſugar, ſtarch, a little gum tragacanth, and *liquorice* powder.

The native *liquorice* juice, is very ſweet upon the palate, even more than ſugar, or honey; and is yet accounted a great quencher of thirſt; on which account Galen preſcribes it in dropſies. It is very balſamic, and detergent; inſomuch that there is ſcarce any medicinal compoſition for diſeaſes of the breaſt, but it is an ingredient in.

LIST *, in the manufactures, denotes the border of a ſtuff, or that which bounds its width on each ſide. See CLOTH, &c.

* Du Cange derives the word from *liciæ*, which, in the age of corrupt Latin, was uſed for the incloſures of fields, and cities, as being antiently made with cords interlaced; or from *liſtæ*, *quia campum claudebant inſtar liſtarum panni*; as incloſing the ground after the manner that a *liſt* does a piece of cloth.

All cloths, and ſtuffs of ſilk, wool, or cotton, have *liſts*: *liſts* contribute to the goodneſs of the ſtuff, and further ſerve to ſhew their quality; which has given occaſion to ſeveral regulations relating to their matter, colour, work, *&c.* See DYING.

LIST is alſo uſed, to ſignify the incloſed field, or ground wherein the ancient knights held their juſts and combats.

It was ſo called, as being hemmed round with pales, barriers, or ſtakes, as with a liſt.

Some of theſe were double, one for each cavalier; which kept them apart, ſo that they could not come nearer each other, than a ſpear's length. See JUST, TURNAMENT, DUEL, *&c.*

LIST, LISTEL, or LISTELLO, in architecture, called alſo *cincture*, *fillet*, *ſquare*, and *reglet*; is a little ſquare moulding, ſerving to crown, or accompany larger mouldings; and, on occaſion, to ſeparate the flutings of columns. See FILLET, *&c.*

LISTENING, according to Rohault, conſiſts in extending, or bracing the tympanum of the ear, and putting it into ſuch a condition, as that it ſhall be the more affected by any tremulous motion of the external air. See TYMPANUM, HEARING, ATTENTION, *&c.*

LISTENING *Trumpet*. See the article TRUMPET.

LITANY*, an old church term, applied to the proceſſions, prayers, and ſupplications uſed for appeaſing the wrath of God, averting his judgments, or procuring his mercies.

* The word comes from the Greek λιτανεια, ſupplication; of λιτανευω, I beſeech.---Pezron would go further, and derive the λιτομαι, or λισσομαι, of the Greeks, from the Celtic *lit*, feaſt, ſolemnity.

Eccleſiaſtic authors, and the Roman order, by the word *litany*, uſually mean the people who compoſe the proceſſion, and aſſiſt at it; and Du Cange obſerves, that the word anciently ſignified *proceſſion*. See PROCESSION.

Simeon of Theſſalonica mentions, that in the ancient *litanies*, the people went out of the church, to denote the fall of Adam; and returned into it again, to ſhew the return of a pious ſoul to God, by repentance.

On occaſion of a plague that ravaged Rome, in the year 590, pope Gregory appointed a *litany*, or proceſſion, conſiſting of ſeven bands, or companies, who, marching from the ſeveral churches of the city, met at S. Mary Major.—The firſt company conſiſted of the clergy; the ſecond of abbots, with their monks; the third of abbeſſes, with their nuns; the fourth, of children; the fifth, of laymen; the ſixth, of widows; and the ſeventh, of married women.—And from this general proceſſion, that of S. Mark, called the *grand litany*, is judged to have taken its riſe.

LITANY, in a modern ſenſe, denotes a form of prayer, ſung or ſaid in churches; conſiſting of ſeveral periods, or articles; at the end of each whereof, is an invocation in the ſame terms.

LITERAL *Algebra*. } See the article { ALGEBRA.
LITERAL *Character*. } See the article { CHARACTER.

LITERALIS *Calculus*. See the article CALCULUS.

LITERARY *Criticiſm*. See the article CRITICISM.

LITERATI, *Letrados*, lettered, an eipthet given to ſuch perſons among the Chineſe, as are able to read, and write their language. See CHINESE.

The *literati* alone, are capable of being made mandarins. See MANDARINS.

LITERATI, is alſo the name of a particular ſect, either in religion, philoſophy, or politics; conſiſting principally of the learned men of that country; among whom it is called *Jukiao*, *i. e.* learned.

It had its riſe in the year of Chriſt 1400; when the emperor, to awaken the native affection of the people for knowledge, which had been quite baniſhed by the preceding civil wars among them, and to ſtir up emulation among the mandarins, choſe out forty two of the ableſt among their doctors, to whom he gave a commiſſion to compoſe a body of doctrine, agreeable to that of the ancients, which was then become the rule or ſtandard of the learned.—The delegates applied themſelves to the buſineſs, with a world of attention; but ſome fancy them rather to have wreſted the doctrine of the ancients, to make it conſiſt with theirs, than to have built up theirs on the model of the ancients.

They ſpeak of the Deity, as if it were no more than mere nature, or the natural power or virtue that produces, diſpoſes, and preſerves the ſeveral parts of the univerſe. It is, ſay they, a pure, perfect principle, without beginning or end; it is the ſource of all things, the eſſence of every being; and that which determines is to be what it is.—They make God the ſoul of the world; ſay, he is diffuſed throughout all matter, and produces all the changes that happen there. In ſhort, it is not eaſy to determine, whether they reſolve God into nature, or lift up nature into God; for they aſcribe to it many of thoſe things which we attribute to God.

This doctrine, in lieu of the idolatry that prevailed before, introduced a refined kind of atheiſm.—The work being compoſed by ſo many perſons of learning and parts, and approved by the emperor himſelf, was received with infinite applauſe by all the people.—Many were pleaſed with it, in regard, it ſeemed to ſubvert all religion: others approved it, becauſe the little religion that it left them, could not give them much trouble.—And thus was formed the ſect of the *Literati*; which conſiſts of the maintainers, and adherents to this doctrine. The court, the mandarins, and the perſons of fortune and quality, *&c.* are generally retainers to it; but a great part of the common people ſtill hold to their worſhip of idols.

The *Literati* freely tolerate the Mahometans, becauſe they adore, with them, the King of heaven, and Author of nature; but they bear a perfect averſion to all ſects of idolaters among them; and it was once reſolved to extirpate them. But the diſorder this would have occaſioned in the empire, prevented it: they now content themſelves with condemning them, in general, as hereſies; which they do ſolemnly every year at Pekin.

LITHARGE*, a metalline ſubſtance, formed of the ſpume of ſilver, or other metals; uſed in the compoſition of plaiſters, to give them a due conſiſtence.

* The word is Greek, λιθαργυρος, compoſed of λιθος, and αργυρος, ſilver.

There are two kinds of litharge, the one *natural*, the other *artificial*.

Natural LITHARGE, is a mineral, ſometimes found in lead mines, reddiſh, ſcaly, brittle, and ſomewhat reſembling white lead.—This *litharge* is ſo exceeding rare, that the ſhops ſell none but the

Artificial LITHARGE; which is of two kinds, *viz.* that *of gold*, and that *of ſilver*; or rather it is the ſame, with this difference, that the one has undergone a greater degree of fire than the other.

Indeed naturaliſts are not over-well agreed what the *artificial litharge* is: ſome conſider it as a metallic ſcum, raiſed on the ſurface of lead, when melted; after having ſerved to purify gold, ſilver, or copper.

Others conſider it as a metallic ſoot, or ſmoke, ariſing from thoſe metals mixed with the lead uſed in purifying them; which ſticking to the top of the chimnies of furnaces, is there formed in a kind of ſcales.

Laſtly, others conſider it as the lead itſelf, uſed in refining of thoſe metals, and eſpecially copper; which laſt opinion appears the moſt credible; and the rather, on account of the great quantities of theſe *litharges* brought from Poland, Sweden, and Denmark; where copper-mines are much more frequent, than thoſe of gold and ſilver.—The droſſy or recrementitious parts, fixing to the ſides of the teſt, are the *litharge*; and according to the degree of calcination, become of divers ſhades of a red colour. The deep is called *litharge of gold*, and the paler, *litharge of ſilver*.

Litharges are deſiccative, deterſive, and cooling; they make the conſiſtence of ſeveral plaiſters.—The potters uſe them to give a beautiful gloſs to their ware; and they are alſo uſed by painters, dyers, ſkinners, and glaſiers. When mixed with wine, they give it a bright ſpritely colour, but render it extremely unwholeſome.

LITHIASIS, Λιθιασις, in phyſic, the diſeaſe of the ſtone. See STONE, and CALCULUS.

LITHOCOLLA*, or LITHOCOLLUM, a cæment uſed by the lapidaries, to faſten their precious ſtones, in order for cutting them. See CÆMENT.

* The word comes from the Greek λιθος, ſtone, and κολλα, glue.

It is compoſed of reſin and brick-duſt.—For diamonds, they uſe melted lead, putting them into it before it be quite cold. For other cæments they mix marble-duſt with ſtrong glue; and to faſten their ſparks, add the white of an egg, and pitch.

LITHOMARGA. See the article MINERAL AGARIC.

LITHONTHRIPTICS*, medicines proper to diſſolve the ſtone in the bladder, and kidneys. See CALCULUS, and STONE.

* The word comes from the Greek λιθος, ſtone, and θρυπτω, I break.

LITHOTOMY, an operation in chirurgery, performed upon a human body, in order to extract the ſtone out of the bladder. See STONE, and CALCULUS.

This is performed three ſeveral ways, *viz.* by the *ſmall apparatus*, the *great apparatus*, and the *high apparatus*.

The firſt, is by cutting through the perinæum near the ſuture, on the left ſide, after the ſtone, by the fingers of the operator, has been brought to that part.—This is called *cutting upon the gripe*; but is almoſt diſuſed, by reaſon it ſubjects the patient to great hazards and inconveniencies.

In the *great apparatus*, which is that ordinarily practiſed, after the patient is conveniently placed and bound, the operator introduces a proper inſtrument, through the urinary paſſage into the bladder, in order to ſearch for the ſtone; which being found, that inſtrument is withdrawn, and another grooved one introduced the ſame way; which bulging in the perinæum, ſerves to direct the knife to the neck of the bladder. After the inciſion, a third inſtrument is thruſt into the aperture, till it join the former that was laſt introduced through the urinary paſſage, at which time that is withdrawn, whilſt this remains to guide the forceps directly into the bladder, to bring away the ſtone.—This way is called *cutting upon the ſtaff*.

The third method, called alſo the *high operation*, firſt practiſed by Pet. Franco, has been ſince deſcribed, and ſtrenuouſly pleaded for by a chirurgical writer, Roſſet, but it ſoon fell into oblivion; from which it was only recalled about the year 1719, by Mr. Douglas, a Surgeon of London, who collecting what ſcattered hints he could find relating to it, and improving them with his own obſervations, paved the way for its being brought into regular uſe, which before it never had been.—He was ſoon followed by Mr. Cheſelden, and ſome others. Of 31 patients cut by them in this manner, in a few years, 25 recovered.—It is true, Mr. Cheſelden has ſince quitted this method for the lateral operation.—Of late years, the French have begun to adopt the high operation; and M. Morand, a Surgeon of Paris, has wrote a book on the ſubject, chiefly taken from the Engliſh writers. See *Hiſt. Acad. R. Scien. an.* 1728. *p.* 36, ſeqq.

The manner of proceeding herein, is this: After the bladder is injected with a ſufficient quantity of warm water, and the patient conveniently placed, the operator ſlowly makes an inciſion above the os pubis, along the linea alba, till he gets ſight of the bladder, into which he directly plunges his knife, and afterwards draws out the ſtone.

The advantages attending this method, are, That it is performed in a very ſhort time; that the wound eaſily heals; that the dilaceration of parts, frequent in the other ways, is prevented; and that there is no danger of the incontinentia urinæ.—On the other hand, it is thought to be chiefly practicable upon young perſons, and ſuch as are lean; the wound in old and fat perſons being apt to mortify: moreover, if the operator be not very cautious, he may eaſily let out the inteſtines.

To theſe may be added the *lateral operation*, invented by Frere Jacques, a religious of the third order of S. Francis, towards the cloſe of the laſt century, and practiſed by him with great reputation in the Franche Comte. But this reputation it loſt again at Paris; which, however, did not hinder M. Rau, anatomy profeſſor at Leyden, from undertaking to rectify what was amiſs in it: in which he ſucceeded, inſomuch that the method is now known by his name, which has taken place of that of the firſt inventor. See *Hiſt. Acad. R. Scien. an.* 1699, *p.* 34. item, *an.* 1728, *p.* 38.

LITTER *, *Lectica*, a kind of vehicle born upon ſhafts; anciently eſteemed the moſt eaſy, and genteel way of carriage.

* Du Cange derives the word from the barbarous Latin *lecteria*, ſtraw or bedding for beaſts.—Others will rather have it come from *lectus*, bed, there being ordinariy a quilt and a pillow to a *litter*; in the ſame manner as to a bed.

Pliny calls the *litter* the traveller's chamber: it was much in uſe among the Romans, among whom it was born by ſlaves, kept for that purpoſe; as it ſtill continues to be in the Eaſt. The Roman *lectica*, made to be born by four men, was called *tetraphorum*; that born by ſix, *hexaphorum*; and that born by eight, *octaphorum*.

The invention of *litters*, according to Cicero, was owing to the kings of Bithynia: in the time of Tiberius they were grown very frequent at Rome; as appears from Seneca; and even ſlaves themſelves were born in them, though never by more than two perſons, whereas men of quality had ſix or eight.

LITTLE *Bairam.* } See the article { BAIRAM.
LITTLE *Capſtan.* } See the article { CAPSTAN.
LITTLE *Maſs.* } See the article { MASS.

LITTORAL *Shells*, among writers of natural hiſtory, are ſuch ſea-ſhells as are always found near the ſhores, and never far off in the deep. See SHELL.

Thoſe which are found in the bottom of the ſea, remote from the ſhore, are called *pelagiæ*. See PELAGIÆ.

LITURGY *, denotes all the ceremonies in general, belonging to divine ſervice.

* The word comes from the Greek λειτουργια, ſervice, public miniſtry; formed of λειτος, public, and εργον, work.

In a more reſtrained ſignification, *liturgy* is uſed among the Romaniſts to ſignify the maſs; and among us the common-prayer. See MASS, *&c.*

All who have written on *liturgies* agree, that, in the primitive days, divine ſervice was exceedingly ſimple, only clogged with a very few ceremonies, and conſiſting of but a ſmall number of prayers; but, by degrees, they increaſed the number of external ceremonies, and added new prayers, to make the office look more awful and venerable to the people. At length things were carried to ſuch a pitch, that a regulation became neceſſary; and it was found proper to put the ſervice, and the manner of performing it, into writing; and this was what they called a *liturgy*.

Liturgies have been different at different times, and in different countries.—We have the *liturgy* of S. Chryſoſtom, that of S. Peter, of S. James, the *liturgy* of S. Baſil, the Armenian *liturgy*, the *liturgy* of the Maronites, of the Cophtæ, the Roman *liturgy*, the Gallican *liturgy*, the Engliſh *liturgy*, the Ambroſian *liturgy*, the Spaniſh and African *liturgies*, &c.

LITUS, in medicine, the ſame as *liniment*. See LINIMENT.

LITUUS, among medaliſts, the ſtaff uſed by the augurs, made in form of a crozier. See AUGUR.

We frequently ſee it on medals, along with other pontifical instruments.—Aulus Gellius ſays, it was bigger in the place where it was crooked, than elſewhere.

LIVER *, a large glandulous viſcus, of a red ſanguine colour, ſituated immediately under the diaphragm, in the right hypochondrium, which it almoſt fills; and thence ſtretching itſelf over the right ſide of the ſtomach, towards the left hypochondrium, reaches behind the cartilago enſiformis, growing gradually thinner and narrower: It ſerves to purify the maſs of blood, by making a ſecretion of the bilious humour it contains.—See *Tab. Anat. (Splanch.) fig.* 1. *lit. a. b. fig.* 3. *lit. k. (Angeiol.) fig.* 4. *litt. a e e*, &c. *fig.* 5. See alſo BILE, and BLOOD.

* Plato, and other of the ancients, fix the principle of love in the *liver*; whence the Latin proverb, *Cogit amare jecur*: and in this ſenſe Horace frequently uſes the word, as when he ſays, *Si torrere jecur quæris Idoneum.*—The Greeks from its concave figure, called it ἧπαρ, vaulted, ſuſpended; the Latins call it *jecur*, q. d. *juxta cor*, as being near the heart. The French call it *foye*, from *foyer*, *focus*, or fire-place; agreeable to the doctrine of the ancients, who believed the blood to be boiled and prepared in it.—Eraſiſtratus, at firſt, called it *parenchyma*, i. e. *effuſion*, or *maſs of blood*: and Hippocrates, by way of eminence, frequently calls it the *hypochondrium*.

The upper part of the *liver* is convex, and perfectly ſmooth; the under concave, and ſomewhat more uneven, having four large fiſſures; one, through which the umbilical ligament paſſes; a ſecond on the left ſide, receiving the pylorus, and the beginning of the duodenum; a third on the right ſide, near the margin, in which the gall-bladder is lodged; and the laſt in the upper part, affording a paſſage to the vena cava.

Its figure is ſomewhat approaching to round, with thin edges, not altogether even, but notched in ſome places. Its magnitude is various in different ſubjects, according to the proportion of the body; though in a fœtus, or very young animal, it is always larger, in proportion, than in adults.—In dogs and other animals of the quadruped kind, it is divided into ſeveral diſtinct lobes, but in men it is generally continued; having one ſmall protuberance, which ſome account a little lobe.—It is ſometimes, however, obſerved in men to have been divided into two or three lobes. See LOBE, *&c.*

The *liver* is connected to ſeveral parts, but eſpecially to the diaphragm, to which it is faſtened by a broad, thin, but ſtrong ſemicircular ligament, called the *ſuſpenſory ligament*, derived from the common capſula of the porta, and gall ducts.—The continuity of this ligament being interrupted by the perforation of the vena cava, has given occaſion to ſome anatomiſts to divide it into two.—It is likewiſe, by another ſtrong ligament, which has its origin from the external coat of the *liver*, or, which amounts to the ſame, from the peritonæum, tied to the cartilago xiphoides; and by a third, which is formed out of the umbilical veſſels, which in adults dry up, and become a ligament, it is connected to the tendons of the abdominal muſcles in the linea alba at the navel.—Theſe ſeveral ligaments ſerve to keep it in its due ſituation: beſides which, it has ſome other connections by the blood-veſſels.

The *liver* has a motion, though not proper to itſelf, but depending on that of the diaphragm; to which being very firmly connected, it muſt needs obey its motion; and in expiration be drawn up, and in inſpiration be let down again.—It is covered with a thin ſmooth membrane, derived from the peritonæum, which may be ſeparated from the ſubſtance of the *liver*, though not without ſome danger of laceration.—

The ſubſtance of the *liver* is vaſcular and glandulous; which latter part is very ſoft and friable, and pretty eaſily ſcraped off from the veſſels, to which the glands every way adhere, as it were in bunches; which has made the anatomiſts call the conſiderable ones, the *internal lobes of the liver*.

The glands adhering thus to the veſſels, and conſtituting thoſe lobes, are wrapped up together in proper membranes; whence this appearance of diſtinct lobes.—Every one of theſe glands, according to Malpighi, is compoſed of ſix unequal ſides, or faces. They are all cloathed with their proper membranes, and have each an excretory duct; ſeveral of which joining together, form little trunks, which run all along with the branches of the porta; and theſe again uniting, form longer trunks, which are always found full of bile, and conſtitute the porus bilarius; which being diſtributed all over the *liver*, receives, in the foregoing manner, the bile; which is ſeparated by theſe glands, and terminating in the meatus hepaticus, and in the ductus communis, at length diſcharges the bile into the duodenum. See BILE.

Beſides this diſcharge by the porus bilarius, which is ſuppoſed to be the great one, the *liver* alſo delivers part of its bile into the gall-bladder, by a duct, called the *cyſt-hepatic duct*, firſt diſcovered by Dr. Gliſſon; by means whereof, there is an immediate communication between the porus bilarius and the gall-bladder; a particular deſcription of which laſt part, ſee under the words GALL, CYST-HEPATIC, *&c.*

Beſides theſe gall-veſſels, which are peculiar to the *liver*, it abounds with blood-veſſels, eſpecially veins; whereof the porta and cava are diſſeminated through the whole ſubſtance of it.—And here it is particularly remarkable of the porta, that after the manner of arteries, it ſhoots itſelf from a trunk into branches; and being at laſt loſt in capillaries, delivers the blood into the cava, by which it is immediately reconveyed to the heart.

The porta is formed out of the concurrence of divers veins, which, meeting together, make one of the moſt conſiderable venous trunks of the body, as to its bulk; though contrary to the courſe of other veins, it runs not far in a trunk, but is ſoon diſtributed again by ramifications into the *liver*. See Porta.

The blood conveyed into the *liver* by the porta, after the manner of the arteries, is received again, after having been purged of its bile in the glands of the *liver*, into innumerable veins, which empty themſelves into the cava, and are vulgarly, though improperly, called *branches* of the cava; but ought to be eſteemed the proper blood-veſſels of the *liver*; as the emulgents are of the kidneys; and which, as all the reſt do, except the pulmonary vein, empty themſelves into the cava; the common channel by which the blood returns to the heart. See Cava.

The arteries, which are called the *hepatic*, come from the right branch of the cœliac.—Dr. Gliſſon thinks the porta does ſo much the office of an artery, that no more arteries are neceſſary, than thoſe which furniſh nouriſhment to the membranes and capſula; but Dr. Drake judges, they ſerve for the nouriſhment of the whole part.—Theſe arteries are much bigger in men, than in other animals.—Mr. Cowper had ſeveral preparations, wherein the ſtem of each hepatic artery was as large as a gooſe-quill, and the branches in the *liver*, every where equal in magnitude to thoſe of the porus bilarius, which they accompany.—Dr. Drake conjectures, that in this viſcus in a human body, a larger ſtream, and directer impetus of arterious blood, is required to drive on the venous, becauſe of the erect poſture, than in animals of an horizontal poſition of body. For which reaſon horſes, &c. though of much larger ſize, and having much bigger *livers*, have theſe arteries much ſmaller than men; and not only ſo, but curled like the tendrils of a vine, to break the impetus, which, in that poſture, is not ſo neceſſary as in the erect. See Bile.

The *liver* has its nerves from the hepatic plexus, formed on the right hypochondrium by the branches of the intercoſtal, which wrapping themſelves about the arteries, make a ſort of net-work; and after ſpreading themſelves on the membrane and ſurface, diſappear.—The lymphæducts are numerous, though not eaſily diſcernible in human ſubjects, for want of live diſſections; but in other animals that may be diſſected alive, become very conſpicuous, by applying a ligature to the porta and the bilary duct.—*For the uſe of the* Liver *in the ſecretion of bile, ſee* Bile.

Liver of antimony. See the article Antimony.

LIVERY, properly ſignifies a colour, to which a perſon has ſome particular fancy, and by which he chuſes to diſtinguiſh himſelf and retainers, from others. See Colour.

Liveries are uſually taken from fancy, or continued in families by ſucceſſion.—The ancient cavaliers, at their turnaments, diſtinguiſhed themſelves by wearing the *liveries* of their miſtreſſes: Thus people of quality make their domeſtics wear their *livery*.

Father Meneſtrier, in his treatiſe of *Carrouſals*, has given a very ample account of the mixtures of colours in *liveries*. Dion tells us, that Oenomaus was the firſt who invented green and blue colours for the troops which, in the circus, were to repreſent land and ſea-fights. See Faction.

The Romiſh church has alſo her ſeveral colours and *liveries*; white, for confeſſors and virgins, and in times of rejoicing; black, for the dead; red, for the apoſtles and martyrs; blue or violet, for penitents; and green, in times of hope.

Formerly great men gave *liveries* to ſeveral, who were not of their family or ſervants, to engage them in their quarrels for that year; but this was prohibited by the ſtatute 1 Hen. IV. and no man, of whatever condition, was allowed to give any *livery*, but to his domeſtic officers, and council learned in the law.

Livery, in law, alſo denotes the delivery of poſſeſſion, to thoſe tenants which held of the king in capite, or by knights ſervice. See Possession.

Livery is alſo uſed for the writ, which lies for an heir to obtain the poſſeſſion, or ſeiſin of his lands at the king's hands.

Livery *of Seiſin*, is a delivery of poſſeſſion of land or tenements, or things corporeal, to him who hath right, or probability of right to them. See Seisin.

Livery of Seiſin, is a ceremony uſed in the common law, in conveyance of lands, tenements, &c. where an eſtate in fee-ſimple, fee-tail, or other free-hold, ſhall paſs; and is a teſtimonial of the willing departing of him who makes the *livery*, from the thing whereof *livery* is made, as well as of a willing acceptance by the other party, of all that whereof the firſt has diveſted himſelf.

Anciently, there were a pair of gloves, a ring, knife, ear of wheat, &c. delivered, in ſign of *livery* and *ſeiſin*. See Investiture.

The uſual manner of *livery of ſeiſin* is thus.—If it be in the open field where is no houſe nor building, and if the eſtate paſs by deed, one openly reads it, or declares the effect of it; and after that is ſealed, the vender takes it in his hand, with a clod of earth, or a twig or bough, which he delivers to the vendee, in the name of poſſeſſion, or ſeiſin, according to the purport of the deed.—If there be a houſe or building on the land, the ceremony is to be done at the door of it, none being then left within; and the ring of the door is delivered to the vendee, who enters alone, ſhuts the door, and preſently opens it again.—If it be a houſe without land or ground, the *livery* is made, and poſſeſſion given, by delivery of the ring of the door and deed only; and where it is without deed, either of lands or tenements, there the party declares by word of mouth, before witneſſes, the eſtate he parts with, and then delivers ſeiſin, or poſſeſſion as aforeſaid: in which caſe the land paſſes as well as by deed, by virtue of the *livery of ſeiſin*.

LIVES. See Annuity, and Policy *of Inſurance*.

LIVRE *, a French money of account, conſiſting of twenty ſols; each ſol containing twelve deniers. See Money, Sol, &c.

The *livre* is of two kinds, *Tournois*, and *Pariſis*.

Livre *Tournois*, as above, contains twenty ſols Tournois, and each ſol twenty deniers Tournois.

Livre *Pariſis*, is twenty ſols Pariſis, each ſol Pariſis worth twelve deniers Pariſis, or fifteen deniers Tournois. So that a *livre Pariſis*, is equivalent to twenty five ſols Tournois: the word *Pariſis* being uſed in oppoſition to *Tournois*, by reaſon of the rate of money, which was one fourth higher at Paris, than at Tours.

One penny ſterling was equal to thirteen and a half deniers Tournois: ſo that the Engliſh pound ſterling, was equal to thirteen *livres*, ſix ſols, eight deniers of French money; while the exchange was on the foot of fifty four pence ſterling, to a French crown of ſixty ſols Tournois; which was the late par between England and France:—But at preſent, the French crown is but equal to 27 d. $\frac{1}{2}$ ſterling, on which footing the *livre* is but equivalent to 10 d. $\frac{1}{2}$ ſterling.

There have ſince been pieces of gold ſtruck, of twenty ſols value, and under Henry III. in 1575, ſpecies of ſilver of like value: Both the one and the other were called *francs*, and thus the imaginary coin became real. See Franc.

It appears that the Romans alſo had a kind of money which they called *libra*, or *libella*; which was the tenth part of their denarius; ſo called, becauſe equivalent to an *as*; which, at firſt, weighed a *libra*, or pound of copper.—Scaliger adds, that they uſed libra as a term of account, not as a coin: *Libra erat collectio nummorum, non nummus.* See Denarius, As, and Pound.

LIXIVIOUS, Lixivium, or Lixiviate, in chymiſtry, is underſtood of ſalts extracted from burnt vegetables, by lotion. See Salt.

Lixivious ſalts, are the fixed ſalts of plants, &c. extracted by calcining the plants, or reducing them to aſhes; and afterwards making a lixivium of thoſe aſhes with water. See Lixivium.

Mr. Boyle obſerves, that the difference between *lixivious* and urinous ſalts, conſiſts in this, that the former change the diſſolution of ſublimate in common water, into a yellow colour, which the latter do not. See Urinous.

LIXIVIUM, *Lye*, a liquor made by the infuſion of wood-aſhes; and which is more or leſs pungent and penetrating, as it is more or leſs impregnated with ſalts, and fiery particles abounding therein. See Ashes.

What is left after the evaporation of ſuch a liquor, is called a *lixivious ſalt*; ſuch as all thoſe are, which are made by incineration. See Lixivious.

Lixiviums are of notable uſe, not only in medicine, but alſo in bleaching, ſugar-works, &c. See Bleaching, Sugar, Pot-ashes, &c.

LOAD *a Mortar.* } See the article { Mortar.
Training a Load. } { Training.

LOADSTONE. See Magnet, and Direction.

LOAM, or Lome, the common ſuperficial earth; conſiſting of clay, with a ſmall admixture of ſand in it. See Earth, and Clay.

The word, it muſt be obſerved, is uſed with great uncertainty; by ſome authors, for the black mother earth, called *mould*; by others, for a reddiſh earth uſed in building, &c. See Soil, Mould, &c.

Loam is alſo uſed for a ſort of mortar made of this laſt earth, by tempering it with mud-water, ſtraw, &c. See Mould, Earth, Soil, Mortar, &c.

LOBBY. See the article Antichamber.

---

* The origin of the word is fetched hence, that anciently the Roman *libra*, or pound, was the ſtandard by which the French money was regulated; twenty ſols being made equal to the *libra*.—By degrees the *libra* became a term of account, ſo that any coin juſt worth twenty ſols was a *livre*, or *libra*; and ſince the time of Charlemagne, all contracts have been made on the foot of this imaginary coin; though the ſols have frequently changed their weight and alloy. See Libra.

LOBE, λοβος, amongſt anatomiſts, is applied to each of the two parts whereof the lungs conſiſt. See LUNGS.

This ſeparation into *lobes*, is of uſe in dilating the lungs, by cauſing them to receive more air, and preventing their being too much ſqueezed, when the back is bent.—For this reaſon it is, that beaſts, which are always inclining towards the earth, have more *lobes* in their lungs than men: even their liver is divided into *lobes*, whereas that of man is continued. See *Tab. Anat. (Splanch.) fig.* 14. *lit. dd*, &c. ſee alſo LIVER.

LOBE is alſo uſed for the tip of the ear; which is more fat and fleſhy than any other part thereof. See EAR.

Du Laurent ſays, that the word *lobe*, in this laſt ſenſe, comes from the Greek λωβειν, to ſhame, or be aſhamed: this part of the ear being ſaid to bluſh, when the perſon is aſhamed.

LOBE is alſo uſed in ſpeaking of fruits and grains.

Thus the bean conſiſts of two equal parts, called *lobes*, which compoſe the body thereof, and are encompaſſed with the outer skin.—And all other grains, even the ſmalleſt, are divided, like the bean, into two *lobes*, or equal parts; as Dr. Grew has ſhewn in his *Anatomy of Plants*. See FRUIT.

LOBULE, LOBELLUS, in anatomy, a little *lobe*. See LOBE.

Each lobe of the lungs is divided into ſeveral leſſer lobes, or *lobules*, which are faſtened on each ſide, to the largeſt branches of the trachea.—Each *lobule* conſiſts of a great number of little round veſicles, which have all a communication with one another.—It is into theſe veſicles that the air enters, by the trachea in inſpiration; ſtill quitting them again in expiration. See *Tab. Anat. (Splanch.) fig.* 14. *lit. ff*, &c. ſee alſo LUNGS, ASPERA, *&c.*

LOCAL, ſomething ſuppoſed to be tied, or annexed to ſome particular place. See PLACE.

Thus, in law, a thing is ſaid to be *local*, i. e. annexed, or fixed to the freehold.—An action of treſpaſs for battery, *&c.* is tranſitory, not *local*; that is, it is not neceſſary, that the place where battery was committed, ſhould be ſet down as material in the declaration; or if it be ſet down, the defendant cannot traverſe it, by ſaying, he did not commit the battery in the place mentioned in the declaration, and ſo avoid the action. See BATTERY.

Choſe **LOCAL**. See the article CHOSE.

LOCAL *Cuſtoms*, are thoſe peculiar to ſome lordſhip, or other diſtrict, and not agreeable to the general cuſtoms of the country, See CUSTOM.

Treſpaſs **LOCAL**. See the article TRESPASS.

LOCAL *Problem*, in mathematics, is ſuch an one, as is capable of an infinite number of different ſolutions; by reaſon the point, that is to ſolve it, may be indifferently taken within a certain extent; *e. gr.* any where in ſuch a line, within ſuch a plane figure, *&c.* which is called a *geometrical locus*.

A *local problem* may be either *ſimple*, as when the point ſought is in a right line; *plane*, as when the point ſought is in the circumference of a circle; *ſolid*, as when the point required is in the circumference of a conic ſection; or, *ſurſolid*, as when the point is in the perimeter of a line of a *higher kind*, as the geometers call it. See LOCUS.

LOCAL, or *artificial Memory*. See the article MEMORY.

LOCAL *Colours*, in painting, are ſuch as are natural and proper for each particular object in a picture. See COLOUR.

They are ſo called, to diſtinguiſh them from the clair obſcure, which conſiſts wholly of black and white. See CLAIR-OBSCURE.

LOCAL *Motion*. See the article MOTION.

LOCATION, in the civil law, an act by which any thing is let out, on rent. See RENT, LEASE, *&c.*

The ſecond title of the nineteenth book of the *Digeſt*, is on the ſubject of *location* and *conduction*.—*Location* and *conduction* are relative terms, and are uſed as well for the action of him that lets, as for that of him who takes on that letting.

Tacit **LOCATION**, is, when the perſon who takes, continues on the premiſes beyond the term of his leaſe; which, by the civil law he is allowed to do, at leaſt for the ſpace of a year; on the ſame terms.

LOCH *, or LOHOCK, in pharmacy, a compoſition of a middle conſiſtence between a ſyrup and a ſoft electuary; chiefly uſed for diſeaſes of the lungs.

The Latins call it *linctus*, and the Greeks εκλειγμα, by reaſon the manner of taking it is by licking. See LINCTUS, and ECLEGMA.

LOCHIA, or LOCHES, Λοχια, the evacuations conſequent on the delivery of a woman in child-bed.

As ſoon as the uterus is eaſed of its load, its fibres, as alſo thoſe of the peritonæum, muſcles of the abdomen, *&c.* which had been extremely diſtended during the laſt period of geſtation, begin to contract themſelves, and their veſſels; particularly the uterus, which by this means expels the blood amaſſed in it.—At firſt pure blood is evacuated, and in conſiderable quantities; afterwards it is diluted, and comes out more ſparingly; at length it becomes viſcid, pale, *&c.*—Theſe are called the *loches*.

LOCIS *Communibus*. See the article COMMUNIBUS.

LOCK, a little inſtrument uſed for the ſhutting and faſtening of doors, cheſts, *&c.* only to be opened by a key. See KEY.

The *lock* is reckoned the maſter-piece in ſmithery; a great deal of art and delicacy being required in contriving and varying the wards, ſprings, bolts, *&c.* and adjuſting them to the places where they are to be uſed, and the various occaſions of uſing them.

From the various ſtructure of *locks*, accommodated to their different intentions, they acquire various names.—Thoſe placed on outer doors are called *ſtock-locks*; thoſe on chamber doors, *ſpring-locks*; thoſe on trunks, *trunk-locks*, *pad-locks*, &c.

Of theſe, the *ſpring-lock* is the moſt conſiderable, both for its frequency, and the curioſity of its ſtructure.—Its principal parts are, the main-plate, the cover-plate, and the pin-hole: to the main-plate belong the key-hole, top-hook, croſs-wards, bolt-toe or bolt-nab, drawback ſpring, tumbler, pin of the tumbler, and the ſtaples; to the cover-plate belong the pin, main-ward, croſs-ward, ſtep-ward, or dap-ward; to the pin-hole belong the hook-ward, main croſs-ward, ſhank, the pot or bread, bow-ward, and bit.

LOCULAMENTUM, in botany, denotes a cell, or partition in a ſeed-pod, for the ſeed of a plant. See SEED.

In ſome plants, we only find one *loculamentum* in a pod; in others two, three, or more.

LOCUS, *Place*, in a general ſenſe. See the article PLACE.

LOCUS *Geometricus*, denotes a line, by which a local or indeterminate problem is ſolved. See LOCAL *Problem*, and GEOMETRICAL.

A *locus* is a line, any point of which may equally ſolve an indeterminate problem.

This, if a right line ſuffice for the conſtruction of the equation, is called *locus ad rectam*; if a circle, *locus ad circulum*; if a parabola, *locus ad parabolam*; if an ellipſis, *locus ad ellipſin*; and ſo of the reſt of the conic ſections.

The *loci* of ſuch equations as are right lines, or circles, the ancients called *plain loci*; and of thoſe that are parabolas, hyperbolas, *&c.* *ſolid loci*.

Wolfius, and other moderns, divide the *loci* more commodiouſly into orders, according to the number of dimenſions to which the indeterminate quantities riſe.—Thus, it will be a *locus of the firſt order*, if the equation $x = ay : c$. A *locus of the ſecond* or quadrate order, if $y^2 = ax$, or $y^2 = a^2 - x^2$. *&c.* A *locus of the third* or cubic order, if $y^3 = a^3 x$, or $y^3 = ax^3 - x^3$, *&c.*

The better to continue the nature of the *locus*, ſuppoſe two unknown and variable right lines AP, PM, (*Tab. Analyſis, fig.* 29, 30.) making any given angle APM with each other; the one whereof, as AP, we call x, having a fixed origin in the point A, and extending itſelf indefinitely along a right line given in poſition; the other PM, which we call y, continually changing its poſition, but alſo parallel to itſelf. An equation only containing theſe two unknown quantities x and y, mixed with known ones, which expreſſes the relation of every variable quantity AP (x) to its correſpondent variable quantity PM (y): the line paſſing through the extremities of all the values of y, i. e. through all the points M, is called a *geometrical locus*, in general, and the *locus* of that equation in particular.

All equations, whoſe *loci* are of the *firſt order*, may be reduced to ſome one of the four following formula's:

$$1.\ y = \frac{bx}{a}.\quad 2.\ y = \frac{bx}{a} + c.\quad 3.\ y = \frac{bx}{a} - c.\quad 4.\ y = c - \frac{bx}{a}.$$

Where the unknown quantity y is ſuppoſed always to be freed from fractions, and the fraction that multiplies the other unknown qnantity x, to be reduced to this expreſſion $\frac{b}{a}$, and all the known terms to this c.

The *locus* of the firſt formula being already determined: To find that of the ſecond, $y = \frac{bx}{a} + c$; in the line AP, (*fig.* 31.) take $AB = a$, and draw $BE = b$, $AD = c$, parallel to PM. On the ſame ſide AP, draw the line AE of an indefinite length towards E, and the indefinite ſtraight line DM parallel to AE. I ſay the line DM is the *locus* of the aforeſaid equation, or formula; for if the line MP be drawn from any point M thereof parallel to AQ, the triangles ABE, APF, will be ſimilar: and therefore AB (a): BE (b) :: AP (x) : $PF = \frac{bx}{a}$; and conſequently PM (y) $= PF\left(\frac{bx}{a}\right) + FM\,(c)$.

To find the *locus* of the third form, $y = \frac{bx}{a} - c$, proceed thus: Aſſume $AB = a$, (*fig.* 32.) and draw the right lines $BE = b$, $AD = c$, parallel to PM, the one on one ſide AP, and the other on the other ſide; and through the points A, E, draw the right line AE of an indefinite length towards E, and through the point D, the line DM parallel to AE: I ſay, the indefinite right line GM ſhall be the *locus* ſought; for we ſhall have always PM $(y)=$EF $\left(\frac{bx}{a}\right)-FMc$.

---

* The word is originally Arabic; but continues ſtill in uſe among the apothecaries.

Laſtly, to find the *locus* of the fourth formula, $y=c-\frac{bx}{a}$; in AP (*fig.* 33.) take AB $=a$, and draw BE $=b$, AD $=c$, parallel to PM, the one on one ſide AP, and the other on the other ſide; and through the points A, E, draw the line AE indefinitely towards E, and through the point D draw the line DM parallel to AE. I ſay, DG ſhall be the *locus* ſought; for if the line MP be drawn from any point M thereof, parallel to AQ, then we ſhall have always PM (y) $=$FM$(c)-$PF$\left(\frac{bx}{a}\right)$.

Hence it appears, that all the *loci* of the *firſt* degree are ſtraight lines, which may be eaſily found, becauſe all their equations may be reduced to ſome one of the foregoing formula's.

All *loci* of the *ſecond* degree are conic ſections, *viz.* either the parabola, the circle, ellipſis, or hyperbola; if an equation be required to draw the conic ſection, which is the *locus* thereof; firſt draw a parabola, ellipſis, and hyperbola; ſo, as that the equations expreſſing the natures thereof, may be as compound as poſſible: in order to get general equations, or formula's, by examining the peculiar properties whereof we may know which of theſe formula's the given equation ought to have regard to; that is, which of the conic ſections will be the *locus* of the propoſed equation.—This known, compare all the terms of the propoſed equation with the terms of the general formula of that conic ſection, which you have found will be the *locus* of the given equation; by which means you will find how to draw the ſection which is the *locus* of the equation given.

For example; let AP (x), PM (y), be unknown, and variable ſtraight lines, (*fig.* 34.) and let m, n, p, r, s, be given right lines: In the line AP take AB $=m$, and drawn BE $=n$, AD $=r$, parallel to PM; and through the point A draw AE $=e$, and through the point D, the indefinite right line DG parallel to AE. In DG take DC $=s$, and with CG, as a diameter, having its ordinates parallel to PM, and the line CH $=p$, as the parameter, deſcribe a parabola CM: then the portion thereof, included in the angle PAD, will be the *locus* of the following general formula.

$$yy-\frac{2n}{m}xy+\frac{nn}{mm}xx-2ry+\frac{2nr}{m}x+rr=0.$$
$$-\frac{ep}{m}x+ps.$$

For if from any point M of that portion there be drawn the right line MP, making any angle APM with MP; the triangles ABE, APF, ſhall be ſimilar; therefore AB (m) : AE (e) :: AP (x) : AF or DG $=\frac{ex}{m}$. And AB (m) : BE (n) :: AP (x) : PF $=\frac{nx}{m}$. And conſequently GM or PM$-$PF$-$FG $=y-\frac{nx}{m}-r$, and CG or DG$-$DC $=\frac{ex}{m}-$. But from the nature of the parabola GM $=$ CG $\times$ CH; which equation will become that of the general formula, by putting the literal values of thoſe lines.

Again; if through the fixed point A you draw the indefinite right line AQ (*fig.* 35.) parallel to PM, and you take AB $=m$, and draw BE $=n$ parallel to AP, and through the determinate points A, E, the line AE $=e$; and if in AP you take AD $=r$, and draw the indefinite ſtraight line DG parallel to AE, and take DC $=s$: this being done, if with the diameter CG, whoſe ordinates are parallel to AP, and parameter the line CH $=p$, you deſcribe a parabola CM; the portion of this parabola contained in the angle BAP ſhall be the *locus* of this ſecond equation, or formula.

$$xx-\frac{2n}{m}yx+\frac{nn}{mm}yy-2rx+\frac{2nr}{m}y+rr=0.$$
$$-\frac{ep}{m}y+ps$$

For if the line MQ be drawn from any point M, therein, parallel to AP; then will AB (m) : AE :: AQ or PM (y) : AF or DG $=\frac{ey}{m}$. And AB (m) : BE (n) :: AQ (y) : QF $=\frac{ny}{m}$. And therefore GM or QM$-$QF$-$FG $=x-\frac{ny}{m}-r$; and CG or DG$-$DC $=\frac{ey}{m}-s$. And ſo by the common property of the parabola, you will have the aforegoing ſecond equation, or formula.

So likewiſe may be found general equations, or formula's to the other conic ſections.

Now if it be required to draw the parabola, which we find to be the *locus* of this propoſed equation $yy-2ay-bx+cc=0$; compare every term of the firſt formula with the terms of the equation, becauſe yy in both is without fractions; and then will $\frac{2n}{m}=0$, becauſe the rectangle xy not being in the propoſed equation, the ſaid rectangle may be eſteemed as multiplied by 0; whence $n=0$, and $m=e$; becauſe the line AE falling in AB, that is, in AP in the conſtruction of the formula, the points B, E, do coincide. Therefore, deſtroying all the terms adfected with $\frac{n}{m}$ in the formula, and ſubſtituting m for e, we ſhall get $yy-2ry-px+rr+ps=0$. Again, by comparing the correſpondent terms $-2ry$, and $-2ay$, as alſo $-px$, and $-bx$, we have $r=a$, and $p=b$; and comparing the terms wherein are neither of the unknown quantities x, y, we get $rr+ps=cc$, and ſubſtituting a and b for r and p, then will $s-\frac{cc-aa}{b}$, which is a negative expreſſion when a is greater than c, as is here ſuppoſed. There is no need of comparing the firſt terms yy and yy, becauſe they are the very ſame. Now the values of n, r, p, s, being thus found, the ſought *locus* may be conſtructed by means of the conſtruction of the formula, and after the following manner.

Becauſe BE $(n)=0$, (*fig.* 36.) the points B, E, do coincide, and the line AE falls in AP; therefore through the fixed point A draw the line AD $(r)=a$ parallel to PM, and draw DG parallel to AP, in which take DC $=\frac{aa-cc}{b}-s$; then with DC, as a diameter, whoſe ordinates are right lines parallel to PM, and parameter the line CH $(p)=b$, deſcribe a parabola: I ſay, the two portions OMM, RMS, thereof, contained in the angle PAO, formed by the line AP, and the line AO drawn parallel to PM, will be the *locus* of the given equation, as is eaſily proved. If in a given equation, whoſe *locus* is a parabola, xx is without a fraction; then the term of the ſecond formula muſt be compared with thoſe of the given equation.

Thus much for the method of conſtructing the *loci* of equations which are conic ſections. If, now, an equation, whoſe *locus* is a conic ſection, be given; and the particular ſection whereof it is the *locus*, be required:

All the terms of the given equation being brought over to one ſide, ſo that the other be equal to 0, there will be two caſes. *Caſe* 1. When the rectangle xy is not in the given equation. 1°. If either yy or xx be in the ſame equation, the *locus* will be a parabola. 2°. If both xx and yy are in the equation, with the ſame ſigns, the *locus* will be an ellipſis, or a circle. 3°. If xx and yy have different ſigns, the *locus* will be an hyperbola, or the oppoſite ſections regarding their diameters.

Caſe 2. When the rectangle xy is in the given equation. 1°. If neither of the ſquares xx or yy, or only one of them, be in the ſame, the *locus* of it will be an hyperbola between the aſymptotes. 2°. If yy and xx be therein, having different ſigns, the *locus* will be an hyperbola, regarding its diameters. 3°. If both the ſquares xx and yy are in the equation, having the ſame ſigns, you muſt free the ſquare yy from fractions; and then the *locus* will be a hyperbola, when the ſquare of $\frac{1}{2}$ the fraction multiplying xy, is equal to the fraction multiplying xx; an ellipſis, or circle, when the ſame is leſs; and an hyperbola, or the oppoſite ſections, regarding their diameters, when greater.

LOCUSTÆ, is uſed by botaniſts for the tender extremities of the branches of trees; ſuch as, it is ſuppoſed, John the baptiſt fed on in the wilderneſs. See ACRIDOPHAGI.

Some alſo uſe *locuſtæ* for beards, and pendulous ſeeds of oats, and of the gramina paniculata; to which the name is given on account of their figure, which ſomething reſembles that of a locuſt.

LODESMAN, or LOCMAN, a pilot eſtabliſhed for conducting veſſels in and out of harbours, or up and down navigable rivers. See PILOT.

LODGMENT, in military affairs, ſometimes denotes an incampment made by an army. See CAMP, and ARMY.

LODGMENT is more frequently uſed for a work caſt up by the beſiegers, during their approaches, in ſome dangerous poſt, which they have gained, and where it is abſolutely neceſſary to ſecure themſelves againſt the enemies fire; as in a covert-way, in a breach, the bottom of a moat, or any other part gained from the beſieged.

Lodgments are made by caſting up earth, or by gabions, or paliſades, wool-packs, faſcines, mantelets, or any thing capable of covering ſoldiers in the place they have gained, and are determined to keep.

LOG, a ſea term, ſignifying a ſmall piece of timber, of a triangular figure, on board a ſhip; into one end whereof, a convenient quantity of lead is caſt, to make it ſwim upright in the water: the other end being faſtened to the

LOG-*line*, a little chord, or line faſtened to one end of the *log*, and wound round a reel, fixed for that purpoſe in the gallery of the ſhip.

This line, from the diſtance of about ten fathom off the *log*, has certain knots or diviſions, which ought to be at leaſt 50 foot from each other: though it is the common practice at ſea, not to have them above 42 feet aſunder. See KNOT.

The uſe of the *log* and *line*, is to keep account, and make an eſtimate of the ſhip's way, or diſtance run; which is done by obſerving the length of line unwound in half a minute's time, told by a half-minute glaſs; for ſo many knots as run out in that time, ſo many miles the ſhip ſails in an hour.

Thus, if there be four knots veered out in half a minute, the ſhip is computed to run four miles an hour.

To heave the Log, as they call it, they throw it into the water, letting it run till it comes without the eddy of the ſhip's wake; then one holding a half-minute glaſs, turns it up juſt as the firſt knot turns off the reel (though ſome turn the glaſs as ſoon as the *log* touches the water.) As ſoon as the glaſs is out, the reel is ſtopped, and the knots run off are told, and their parts eſtimated.

The *log* ought to be heaved every hour, or every two hours.

The *log* is a very precarious way of computing, and muſt always be corrected by experience and good ſenſe, there being a great deal of uncertainty, both in the heaving of it, in the courſe of the currents, and in the ſtrength of the wind, which ſeldom keeps the ſame tenor for two hours together; which is the interval, between the times of uſing the *log*, in ſhort voyages, though in longer ones they heave it every hour.

Yet is this a much more exact way of computing, than any other in uſe; much preferable certainly to that of the Spaniards and Portugueſe, who gueſs at the ſhip's way, by the running of the froth, or water by the ſhip's ſide; or to that of the Dutch, who uſe to heave a chip over-board, and to number the paces they walk on the deck, while the ſhip ſwims between any two marks, or bulk-heads on the ſide.

Log-*Board*, is a table divided into four or five columns, whereon are marked the reckoning of every day; from whence they are entered into the *log-book*, or traverſe-book, ruled and columned juſt as the *log-board* is: whence it may be tranſcribed into the journals, and how much the ſhip gains in her courſe, be eſtimated daily. See Journal, Reckoning, Traverse, &c.

In the firſt column of the *log-board* is entered the hour of the day, from 1 to 1: in the ſecond, the rhumb, or the direction of the veſſel, with regard to the points of the compaſs: in the third, the number of knots run off the reel each time of heaving the *log*: in the fourth, the wind that blows: and in the fifth, obſervations made of the weather, variation of the compaſs, &c.

LOGARITHMIC, or *Logarithmical*, relating to logarithms. See Logistic.

Thus we ſay, *logarithmic* arithmetic, curve, line, ſcale, ſpiral. See Arithmetic, &c.

LOGARITHMS*, the indices of the ratio's of numbers one to another; or, a ſeries of artificial numbers proceeding in arithmetical proportion, correſponding to as many others proceeding in geometrical proportion; contrived for the eaſing and expediting of calculation. See Number, Index, Proportion, &c. ſee alſo Mesologarithm.

* The word is formed from the Greek λογος, ratio, and αριθμος, number; *q. d.* ratio of numbers.

Logarithms have been uſually defined *numerorum proportionalium æquidifferentes comites*; but this definition Dr. Halley and Stifelius think deficient, and more accurately define them, *the indices or exponents of the ratio's of numbers*; ratio being conſidered as a quantity ſui generis, beginning from the ratio of equality, or 1 to 1=0; and being affirmative when the ratio is increaſing, and negative when it is decreaſing.

The nature and genius of *logarithms* will be eaſily conceived, from what follows:—A ſeries of quantities increaſing or decreaſing according to the ſame ratio, is called a *geometrical progreſſion*; e. gr. 1. 2. 4. 8. 16. 32. &c. A ſeries of quantities increaſing or decreaſing, according to the ſame difference, is called an *arithmetical progreſſion*; e. gr. 3. 6. 9. 12. 15. 18. 21 24. Now, if underneath the numbers proceeding in a geometrical ratio, be added as many of thoſe proceeding in the arithmetical one; theſe laſt are called the *logarithms* of the firſt.

Suppoſe, *e. gr.* two progreſſions:

Geomet.	1.	2.	4.	8.	16.	32.	64.	128.	256.	512.
Arithmet.	0.	1.	2.	3.	4.	5.	6.	7.	8.	9.

Logarithms.

0 will be the *logarithm* of the firſt term, *viz.* 1; 5, of the 6th, 32; 7 the *logarithm* of the 8th, 128, &c.

The doctrine and uſe of *logarithms*, may be conceived from the following propoſitions.

1°. *If the* logarithm *of unity be* 0, *the* logarithm *of the factum or product will be equal to the ſum of the* logarithms *of the factors.*—For as unity is to one of the factors, ſo is the other factor to the product. So that the *logarithm* of the product, is a fourth equidifferent term to the *logarithm* of unity, and thoſe of the factors: but the *logarithm* of unity being 0, the ſum of the *logarithms* of the factors muſt be the *logarithm* of the factum, or product. *q. e. d.*

Hence, ſince the factors of a ſquare are equal to each other, *i. e.* a ſquare is the factum or product of its root multiplied into itſelf; the *logarithm* of the ſquare will be double the *logarithm* of the root.

In the ſame manner it appears, that the *logarithm* of the cube is triple; of the biquadrate, quadruple; of the fifth power, quintuple; of the ſixth, ſextuple, &c. of the *logarithm* of the root.

Unity, therefore, is to the exponent of the power, as the *logarithm* of the root to the *logarithm* of the power.

So that the *logarithm* of the power is had, if the *logarithm* of the root be multiplied by its exponent; and the *logarithm* of the root is had, if the *logarithm* of the power be divided by its exponent.

And hence we derive one of the great uſes of *logarithms*, which is to expedite and facilitate the buſineſs of multiplication, and extraction of roots; the former of which is here performed by mere addition, and the latter by multiplication.—Thus 3, the ſum of the *logarithms* 1 and 2, is the *logarithm* of 8, the product of 2 and 4.—In like manner 7, the ſum of the *logarithms* 2 and 5, is the *logarithm* of 128, the product of 4 and 32.—Again, 3, the *logarithm* of the ſquare root 8, is half the *logarithm* of 6, the ſquare root of 64; and 2, the *logarithm* of the cube root 4, is ſubtriple the *logarithm* 6 of the cube root 64.

2°. *If the* logarithm *of unity be* 0, *the* logarithm *of the quotient will be equal to the difference of the* logarithms *of the diviſor and dividend.*—For as the diviſor is to the dividend, ſo is unity to the quotient; therefore the *logarithm* of the quotient is a fourth equidifferent number to the *logarithms* of the diviſor, the dividend, and the *logarithm* of unity. The *logarithm* of unity, therefore, being 0, the difference of the *logarithm* of the diviſor, and that of the dividend, is the *logarithm* of the quotient. *q. e. d.*

Hence appears another great advantage of *logarithms*, viz. their expediting the buſineſs of diviſion, and performing it by a bare ſubſtraction. *E. gr.* 2. the difference between 7 and 5, is the *logarithm* of the quotient 4, out of 128 by 32. In like manner, 5, the difference between 8 and 3, is the *logarithm* of the quotient 32, out of 256 by 8.

An example or two will render the uſe of *logarithms* in multiplication, diviſion, &c. obvious.

	Num.	*Log.*		*Num.*	*Log.*

			Cube	729	3)2.86272(0.95424 *Cube R.*	

The properties of *logarithms* hitherto mentioned, and their various uſes, are taken notice of by Stifelius: but come all far ſhort of the uſe of *logarithms* in trigonometry, firſt diſcovered by the lord Napier.

To find the logarithm *of any number, and to conſtruct a canon of* logarithms *for natural numbers.*—1°. Becauſe 1. 10. 100. 1000. 10000. &c. conſtitute a geometrical progreſſion, their *logarithms* may be taken at pleaſure: to be able, then, to expreſs the *logarithms* of the intermediate numbers by decimal fractions, take 0.00000000, 1.00000000, 2.00000000, 3.00000000, 4.00000000, &c.—2°. It is manifeſt, that for thoſe numbers which are not contained in the ſcale of geometrical progreſſion, the juſt *logarithms* cannot be had: yet may they be had ſo near the truth, that, as to matters of uſe, they ſhall be altogether as good as if ſtrictly juſt.—To make this appear, ſuppoſe the *logarithm* of the number 9 were required: between 1.0000000 and 10.0000000, find a mean proportional, and between their *logarithms* 0.00000000 and 1.00000000 an equidifferent mean, which will be the *logarithm* thereof; that is, of a number exceeding three by $\frac{1622777}{10000000}$, and therefore far remote from nine. Between 3 and 10, therefore find another mean proportional, which may come ſomewhat nearer 9; and between the 10 and this mean another ſtill; and ſo on between the numbers next above and next underneath 9, till at laſt you arrive at 9 [illegible]; which not being one millionth part from 9, its *logarithm* may, without any ſenſible error, be taken for that of 9 itſelf. Seeking then in each caſe for the *logarithms* of the mean proportionals, you will at laſt have 0.954251, which is exceedingly near the true *logarithm* of 9.—3°. If in like manner you find mean proportionals between 1.0000000 and 3.1622777, and aſſign convenient *logarithms* to each, you will at length have the *logarithm* of the number 2, and ſo of the reſt.—4°. There needs not however, be ſo much pains taken in inveſtigating the *logarithms* of all numbers; ſince thoſe that conſiſt of aliquot parts being divided, and others mutually multiplying each other, their *logarithms* are eaſily found.—Thus if the *logarithm* of the number 9 be biſſected, we ſhall have the *logarithm* 0.47712125 of the number 3.

The indices, or characteriſtics of *logarithms*, correſpond to the denominative part of the natural numbers, as the other member of the *logarithm* does, to the denominative part of the number: *i. e.* the index ſhews the denomination, or place of the laſt (or left hand) figure of the number, and conſequently of all the reſt.—Thus 0, affixed to a *logarithm*, denotes the laſt figure of the number to which the *logarithm* anſwers, to be nothing diſtant (*i. e.* is in) the place of units. The index 1 ſhews the laſt figure of its number to be diſtant 1 place from the place of units, *i. e.* to be in the place of tens, and conſequently the number itſelf to be either 10, or ſome number between that and 100, and ſo of the other indices.—Hence all numbers, which have the ſame denominative, but not the ſame numerative parts, as all numbers from 1 to 10, from 10 to 100, &c. will have *logarithms*, whoſe indices are the ſame, but the other members different. Again, all numbers which have the ſame numerative, but not denominative part, will have different indices; but the reſt of the *logarithms* the ſame.—If a number be purely decimal, to its *logarithm* is affixed a negative index, ſhewing the diſtance of its firſt ſignificative figure, from the place of units. —Thus the *logarithm* of the decimal, 256 is $\overline{1}.40824$, of the decimal ,0256 is $\overline{2}.40824$, &c.

The firſt canon of *logarithms* for natural numbers, from 1 to 20000, and from 90000 to 100000, was conſtructed by Hen. Briggs, with the approbation of the inventor, the lord Napier, and the manner of conſtructing them ſhewn.—The chaſm between 20000 and 90000, was filled up by Adrian Ulach.—In the common tables we have only a canon from 1 to 10000.—There are various other methods of conſtructing *logarithms*, by Dr. Halley, Mr. Cotes, Dr. Brook Taylor, &c. which the reader may find in the *Philoſophical Tranſactions.*

To find the logarithm *for a number greater than any in the common canon, but leſs than* 10000000.—Cut off four figures on the left of the given number, and ſeek the *logarithm* in the table; add as many units to the index, as there are figures remaining on the right; ſubtract the *logarithm* found from that next following it, in the table: then, as the difference of numbers in the canon, is to the tabular diſtance of the *logarithms* anſwering to them, ſo are the remaining figures of the given number to the logarithmic difference; which, if it be added to the *logarithm* before found, the ſum will be the *logarithm* required. Suppoſe, *v. gr.* the *logarithm* of the number 92375 required. Cut off the four figures 9237, and to the characteriſtic of the *logarithm* corrreſponding to them, add an unit; then,

From the *logarith.* of the numb. 9238=3.9655780
Subſtract. *logarith.* numb.——9237=3.9655309

Remains tabular difference 471

10—471—5
5) 2 —— 1

235

Now to the *logarithm*——————4.9655309
Add the difference found——————235
The ſum is the *logarithm* required———4.9655544

To find the logarithm *of a fraction.*—Subtract the *logarithm* of the numerator, from that of the denominator, and to the remainder prefix the ſign of ſubſtraction.—Thus ſuppoſe it required to find the *logarithm* of the fraction $\frac{3}{7}$,

Logarithm of 7=0.8450980
Logarithm of 3=0.4771213

Logarithm of $\frac{3}{7}$=0.3679767

The reaſon of the rule is, That a fraction being the quotient of the denominator divided by the numerator; its *logarithm* muſt be the difference of the *logarithms* of thoſe two; ſo that the numerator being ſubſtracted from the denominator, the difference becomes negative.—Stifelius obſerved, that the *logarithms* of a proper fraction, muſt always be negative, if that of unity be 0; which is evident, a fraction being leſs than one.

For an improper fraction, *v. gr.* $\frac{9}{5}$, its numerator being greater than its denominator, its *logarithm* is had, by ſubſtracting the *logarithm* of the latter, from that of the former.

The *logarithm* of 9=0.9542425
Logarithm of 5=0.6989700

Logarithm $\frac{9}{5}$=0.2552725

In the ſame manner may a *logarithm* of a mixt number, as $3\frac{2}{7}$ be found, it being firſt reduced into an improper fraction $0\frac{23}{7}$.

To find the number correſponding to a logarithm *greater than any in the table.*—Firſt from the given *logarithm*, ſubſtract the *logarithm* of 10, or 100, or 1000, or 10000, till you have a *logarithm* that will come within the compaſs of the table; find the number correſponding to this, and multiply it by 10, or 100, or 1000, or 10000, the product is the number required.

Suppoſe, for inſtance, the number correſponding to the *logarithm* 7.7589982 be required; ſubſtract the *logarithm* of the number 10000, which is 4.0000000, from 7.589982; the remainder is 3.7589982, the number correſponding to which is $5741\frac{11}{100}$, this multiplied by 10000, the product is 57411100, the number required.

To find the number correſponding to a negative logarithm. —To the given negative *logarithm*, add the laſt *logarithm* of the table, or that of the number 10000; *i. e.* ſubſtract the firſt from the ſecond, and find the number correſponding to the remainder; this will be the numerator of the fraction, whoſe denominator will be 10000; *v. gr.* ſuppoſe it be required to find the fraction correſponding to the negative *logarithm*——————0.3679767, ſubſtract this from 4.0000000

The remainder is———3.6320233, the number correſponding to which is $4285\frac{71}{100}$, the fraction ſought therefore is $\frac{428571}{1000000}$.—The reaſon of the rule is, that as a fraction is the quotient, ariſing on the diviſion of the numerator by the denominator, unity will be to the fraction, as the denominator to the numerator; but as unity is to the fraction correſponding to the given negative *logarithm*, ſo is 10000 to the number correſponding to the remainder; therefore if 10000 be taken for the denominator, the number will be the numerator of the fraction required.

To find a fourth proportional to three given numbers.—Add the *logarithm* of the ſecond to that of the third, and from the ſum ſubſtract the *logarithm* of the firſt; the remainder is the *logarithm* of the fourth required. *E. gr.* let the given numbers be 4.68. and 3.

Logarithm 68=1.8325089
Logarithm 3=0.4771213

Sum=2.3096302
Logarithm 4=0.6020600

Logarithm required 1.7075702

The number in the tables correſponding to which is 51.—This problem is of the utmoſt uſe in trigonometry. See TRIANGLE, and TRIGONOMETRY.

LOGIC *, the art of thinking juſtly; or of making a right uſe of our rational faculties, in defining, dividing, and reaſoning. See THINKING, REASONING, &c.

* The word is Greek, λογικη, derived from λογος, *ſermo*, diſcourſe; in regard, thinking is only an inward, mental diſcourſe, wherein the mind converſes with itſelf.

Logic is alſo ſometimes called *dialectica*; and ſometimes the *canonical art*, as being a canon, or rule, for directing us in our reaſonings. See DIALECTICA.

As, in order to think aright, it is neceſſary that we apprehend, judge, diſcourſe, and diſpoſe or methodize rightly: hence apprehenſion, judgment, diſcourſe, and method, become the four fundamental articles of this art; and it is from our reflections on thoſe operations of the mind, that *logic* is, or ought to be wholly drawn. See PERCEPTION, JUDGMENT, DISCOURSE, &c.

Lord Bacon divides *logic* into four branches, according to the ends propoſed in each: for a man reaſons, either to find what he ſeeks, or to judge of what he finds, or to retain what he judges, or to teach what he retains; whence ariſe ſo many arts of reaſoning, *viz.* the art of *inquiſition*, or invention; the art of *examining*, or judgment; the art of *preſerving*, or of memory; and the art of *elocution*, or delivering. See MEMORY, ELOCUTION, &c.

Logic having been extremely abuſed, is now in ſome diſrepute. The ſchools have ſo clogged it with barbarous terms and phraſes, and have run it out ſo much into dry, uſeleſs ſubtilties, that it ſeems rather intended to exerciſe the mind in wrangling and diſputation, than to aſſiſt it in thinking juſtly. It is true, in its original, it was rather intended as the art of cavilling, than of reaſoning; the Greeks, among whom it had its riſe, being a people who piqued themſelves mightily upon their being able to talk ex tempore, and to argue, by turns, on either ſide the queſtion.—Hence their dialectici, to be always furniſhed with arms for ſuch recounters, invented a ſet of words and terms, rather than rules and reaſons, fitted for the uſes of contention and diſpute. See SOPHIST, DISPUTATION, SYLLOGISM, &c.

Logic, then, was only an art of words, which frequently had no meaning, but ſerved well to hide ignorance, inſtead of improving knowledge; to baffle reaſon inſtead of aſſiſting it; and to confound the truth, inſtead of clearing it.—Much of that heap of words, and rules, which we have borrowed from the old *logic*, is of little uſe in life; and is ſo far out of the common uſage, that the mind does not attend to them without trouble; and finding nothing in them to reward its attention, ſoon diſcharges itſelf, and loſes all ideas it had conceived of them.

But *logic* diſengaged from the jargon of the ſchools, and reduced into a clear and intelligible method, is the art of conducting the underſtanding in the knowledge of things, and the diſcovery of truth. See TRUTH, KNOWLEDGE, &c.

From its proper uſe we gain ſeveral very conſiderable advantages; for 1°. The conſideration of rules, incites the mind to a cloſer attention and application in thinking; ſo that we hereby become aſſured that we make the beſt uſe of our faculties. 2°. We hereby, more eaſily, and accurately diſcover, and point out the errors and defects in our reaſoning; for the common light of reaſon, unaſſiſted by *logic*, frequently obſerves an argumentation to be faulty, without being able to determine wherein the preciſe failure conſiſts.—3°. By theſe reflections on the order and manner of the operations of the mind, we are brought to a more juſt and complete knowledge of the nature of our own underſtanding. See SOUL, UNDERSTANDING, *&c.*

LOGICAL *Concrete.*	See the article	CONCRETE.
LOGICAL *Part.*		PART.

LOGISTA, the title of an officer at Athens, whoſe buſineſs was to receive, and paſs the accounts of magiſtrates, when they came out of their office.

The *logiſtæ* were in number ten; they were elected by lot; and had ten euthyni, or auditors of accounts, under them.

LOGISTIC, or *Logarithmic line*, a curve ſo called, from its properties and uſes, in conſtructing and explaining the nature of logarithms.

If the right line AX, (*Tab. Analyſis, fig.* 37.) be divided into any number of equal parts, and to the points of thoſe diviſions A, P, *p*, &c. be drawn lines continually proportional, the points N, M, *m*, &c. form the *logiſtic*, or *logarithmic line*, or *curve*.

Here the abſciſſes AP, A*p*, &c. are the logarithms of the ſemiordinates PM, *pm*, &c.

Hence if $AP = x$, $Ap = v$, $PM = y$, $pm = z$, and their logarithms y and $z = ly$ and lz; x will be $= ly$, and $v = lz$, conſequently $x : v = ly : lz$, that is, the denominators of the ratio's $AN : PM$, and $AN : pm$, are to one another, as the abſciſſes AP and A*p*.

Hence it follows, that there may be infinite other *logiſtic* lines invented, provided $xm : vm :: ly : lz$, that any of the roots or powers, may be the logarithms of the ſemiordinates.

The *logiſtic* will never concur with the axis, except at an infinite diſtance, ſo that AX is its aſymptote.

Quadrature of the LOGISTIC. See the article QUADRATURE.

LOGISTIC, or *logarithmic Spiral*, a line whoſe conſtruction is as follows—Divide the quadrant of a circle into any number of equal parts, in the points, P, *p*, *p*, &c. (*Tab. Analyſis, fig.* 22.) and from the radii CP, C*p*, C*p*, &c. cutting off CM, C*m*, C*m*, &c. continually proportional, the points M, *m*, *m*, &c. form the *logiſtic ſpiral.*

The arches therefore AP, A*p*, &c. are the logarithms of the ordinates CM, C*m*, &c. whence alſo it follows, that there may be infinite *logiſtic* ſpirals.

LOGISTICA, or LOGISTICAL *Arithmetic*, a denomination ſometimes given to the arithmetic of ſexageſimal fractions, uſed by aſtronomers in their calculations. See SEXAGESIMAL.

It was ſo called from a Greek treatiſe of one Barlaamus Monachus, who wrote about ſexageſimal multiplication very accurately, and entitled his book Λογιϛικη. This author Voſſius places about the year 1350, but miſtakes the work for a treatiſe of algebra.

Shakerly, in his *Tabulæ Britannicæ*, has a table of logarithms adapted to ſexageſimal fractions, which therefore he calls *logiſtical logarithms*; and the expeditious arithmetic of them, which is by this means obtained, and by which all the trouble of multiplication and diviſion is ſaved, he calls *logiſtical arithmetic.* See ARITHMETIC.

LOGOGRIPHUS *, a kind of ſymbol, or riddle, propoſed to ſtudents for their ſolution, in order to exerciſe and improve the mind. See ÆNIGMA.

* The word comes from the Greek λογος, diſcourſe, and γριφος, or γριπος, net.

The *logogriphus* uſually conſiſts in ſome equivocal alluſion, or mutilation of words, which, literally taken, ſignify ſomething different from the thing intended by it; ſo that it is a kind of medium, between a rebus, and proper ænigma. See REBUS, *&c.*

According to Kircher, *logogriphi* are a kind of canting arms: Thus a perſon called Leonard, who bore in his arms a lion, and nard, or ſpikenard; according to that father, made a *logogriphe. Oedip. Egypt.*

In another place, the ſame author defines *logogriphus* to be an ænigma, which, under one name or word, will bear various meanings, by adding or retrenching ſome part of it.—This kind of ænigmas is well known to the Arabs, among whom are authors who treat expreſly of it.

LOHOCH. See the article LOCH.

LOINS, *lambi*, in anatomy, that part of the body about the reins; properly the lower part of the ſpine of the back, compoſed of five vertebræ, larger than thoſe of the back, and ſerving them as a baſe; having their articulations pretty looſe, that the motion of the *loins* may be more free.—See *Tab. Anat. (Oſteol.) fig.* 3. *n.* 14. *fig.* 7. *n.* 16. *fig.* 9. * *fig.* 11. ſee alſo SPINE, and VERTEBRA.

LOLLARDS *, a religious ſect which aroſe in Germany, about the beginning of the fourteenth century; ſo called from its author Walter Lollard, who began to dogmatize in 1315.

* The monk of Canterbury derives the origin of the word *lollard* among us from *lolium*, a tare, as if the *Lollards* were the tares ſown in Chriſt's vineyard—Abella ſays, that the word *lollard* ſignifies *praiſing God*, from the German *loben*, to praiſe, and *Herr*, Lord; becauſe the *Lollards* imployed themſelves in travelling about from place to place, ſinging pſalms and hymns.

Lollard, and his followers, rejected the ſacrifice of the maſs, extreme unction, and penances for ſin; arguing that Chriſt's ſufferings were ſufficient. He is likewiſe ſaid to have ſet aſide baptiſm, as a thing of no effect; and repentance, as not abſolutely neceſſary, *&c.*—Lollard was burnt alive at Cologne, in 1322.

In England the followers of Wickliff were called, by way of reproach, *Lollards*, from ſome affinity there was between ſome of their tenets; though others are of opinion, that the Engliſh *Lollards* came from Germany. See WICKLIFFITE.

They were ſolemnly condemned by the archbiſhop of Canterbury, and the council of Oxford.

LONG *Accent*, in grammar, *&c.* a mark which ſhews that the voice is to ſtay ſome time on the vowel which it is placed over. See ACCENT.

Its figure is thus (-).

LONG *Boat*, is the largeſt and ſtrongeſt boat belonging to a ſhip, that can be hoiſted a-board of her. See BOAT.

Its uſe is to bring any goods, proviſions, *&c.* to, or from the ſhip; or, on occaſion, to land men any where, and particularly to weigh the anchor.

LONG *Hand.*	See	*Long* HAND.
LONG *Meaſure.*		MEASURE.
LONG *Muſcles*, in anatomy.		LONGUS.

LONGÆVITY, length of life. See LIFE, and AGE.

From the different *longævities* of men in the beginning of the world, after the flood, and in theſe ages, Mr. Derham draws a good argument, for the interpoſition of a divine providence.

Immediately after the creation, when the world was to be peopled by one man and woman, the ordinary age was 900 and upwards.—Immediately after the flood, when there were three perſons to ſtock the world, their age was cut ſhorter, and none of thoſe patriarchs, but Shem, arrived at 500—In the ſecond century we find none that reached 240: in the third, none but Terah that came to 200 years: the world, at leaſt a part of it, by that time being ſo well peopled, that they had built cities, and were cantoned out into diſtant nations.—By degrees, as the number of people increaſed, their *longævity* dwindled; till it came down at length to 70 or 80 years: and there it ſtood, and has continued to ſtand ever ſince the time of Moſes.—This is found a good medium, and by means hereof the world is neither overſtocked, nor kept too thin; but life and death keep a pretty equal pace. See MORTALITY, MARRIAGE, ANNUITY, *&c.*

That the common duration of man's life has been the ſame in all ages ſince the world was peopled, is plain both from ſacred, and profane hiſtory. To paſs by others, Plato lived to 81, and was accounted an old man; and the inſtances of *longævity* produced by Pliny, L. 7. c. 48. as very extraordinary, may moſt of them be matched in modern hiſtories; particularly in Dr. Plott's *Nat. Hiſt. of Oxf. and Staff.*—Among others, he tells of twelve tenants to the ſame perſon, who made up 1000 years; to ſay nothing of old Parr, who lived 132 years, 9 months; or of H. Jenkins of Yorkſhire, who lived 169 years; or of the counteſs of Deſmond, or Mr. Eckleſtone, both of Ireland, who each exceeded 140 years.

LONGIMETRY, the art of meaſuring lengths; both acceſſible, as roads, *&c.* and inacceſſible, as arms of the ſea, *&c.* See MEASURING.

Longimetry is a part of trigonometry, and a dependant on geometry, in the ſame manner as altimetry, planimetry, ſtereometry, *&c.*

The art of *longimetry*, ſee under the names of the inſtruments uſed in it, particularly THEODOLITE, CHAIN, *&c.*

LONGISSIMUS *Dorſi*, is a muſcle of the back, which, at its beginning, is not to be diſtinguiſhed from the ſacro-lumbaris; ariſing with it from the hinder part of the os ilium, and os ſacrum, and the firſt vertebra of the loins.

It runs upwards along the whole tract of the back, and is connected by tendons to each tranſverſe proceſs in its way, and ends ſometimes in the firſt vertebra of the back, and ſometimes in the firſt of the neck; and, as ſome authors ſay, reaches now and then to the proceſſus mammillaris of the os petroſum.

In conjunction with ſome others, this helps to keep the body erect.

LONGISSIMUS *Oculi.* See OBLIQUUS *Superior.*

LONGITUDE *of the Earth*, is ſometimes uſed to denote its extent from weſt to eaſt; according to the direction of the equator. See EARTH.

By which it ſtands contradiſtinguiſhed from *latitude of the earth*, which denotes its extent from one pole to the other. See LATITUDE.

LONGITUDE *of a Star*, in aſtronomy, is an arch of the ecliptic, counted from the beginning of Aries, to the place where a ſtar's circle of *longitude* cuts the ecliptic.

The *longitude* of a ſtar, as S, (*Tab. Aſtronomy, fig.* 14. *n.* 2.) is an arch of the ecliptic EL, comprehended between the beginning of Aries, and the circle of longitude TM, drawn through the centre of the ſtar *S*.

Longitude ſtands in the ſame relation to the ecliptic, that *right aſcenſion* does to the equator. See ASCENSION.

In which ſenſe, the *longitude* of a ſtar amounts to much the ſame as the ſtar's place in the ecliptic, reckoned from the beginning of Aries; which to find, ſee PLACE *of the Sun, or Star*.

LONGITUDE *of the Sun*, or *a Star*, from the next equinoctial point, is the number of degrees and minutes they are from the beginning of Aries or Libra, either before or after them; which can never be more than an 180 degrees.

LONGITUDE *of a place*, in geography, is its diſtance from ſome firſt meridian: or an arch of the equator, intercepted between the meridian of the place, and the firſt meridian. See MERIDIAN.

LONGITUDE, in navigation, is the diſtance of a ſhip or place, eaſt or weſt, from another, counted in degrees of the equator. If this diſtance be counted in leagues or miles, or in degrees of the meridian, and not in thoſe proper to the parallel of latitude, it is uſually called *departure*. See DEPARTURE.

To diſcover an exact method of finding the *longitude* at ſea, is a problem that has extremely perplexed the mathematicians of theſe two laſt ages; and for the ſolution whereof, great rewards have been publickly offered by the Engliſh, French, Dutch, and other nations: this being the only thing wanting to render navigation perfect. Various are the attempts that authors have made for this purpoſe, and various the methods they have propoſed; but ſtill without ſucceſs; all their ſchemes being found either falſe, precarious, impracticable, or in ſome way or other defective: ſo that the palm is ſtill unaſcertained.

What moſt of them aim at, is a method of determining the difference of time between any two points on the earth: for, every 15 degrees of the equator anſwering to an hour, *i. e.* one degree to 4 minutes of time, and one minute of a degree to 15 ſeconds of time; the difference of time being known, and turned into degrees, will give the *longitude*, and vice verſa. See TIME.

This, ſome have pretended to effect by clocks, watches, and other automata; but always in vain; no time-keeper, excepting a pendulum (which cannot be applied at ſea) being ſufficiently ſure and exact for the purpoſe. See PENDULUM.

Others, with more probability, and to better purpoſe, ſearch for a means to find the *longitude* in the heavens: for, if the exact times of any celeſtial appearance be known for two places, the difference of thoſe times gives that of the *longitude* of thoſe places.—Now in the ephemerides, we have the motions of the planets, and the times of all the celeſtial phænomena, as the beginning and ending of eclipſes, conjunctions of the moon with other planets, its entrance into the ecliptic, *&c.* accurately calculated for ſome one place. Therefore if the hour and minute be known, wherein any of the ſame phænomena are obſerved in an unknown place, the difference between the hour and minute, of that place, and that other to which the tables are calculated, and conſequently the difference of their meridians, and their *longitude* from each other, are known alſo.

Now the difficulty, here, does not conſiſt in the exact finding of the time, which is eaſily had from the ſun's altitude or azimuth; but the defect lies in the paucity of proper appearances, capable of being thus obſerved: for all ſlow motions (*v. gr.* that of Saturn) are at once excluded; as ſhewing but little difference in a conſiderable ſpace of time; and it being here required, that the phænomenon be ſenſibly varied in two minutes time, an error of two minutes in time producing another of thirty miles in the *longitude*.—Now there are no phænomena in the heavens that have theſe requiſites, excepting the ſeveral ſtages of an eclipſe of the moon; her *longitude*, or place in the zodiac; her diſtance from the fixed ſtars, or appulſe to them; her ingreſs into the ecliptic, or the points of her orbit, where that cuts the ecliptic; and the conjunction, diſtance, and eclipſes of Jupiter's ſatellites.—Of each of which in their order.

1°. The method by the eclipſes of the moon, is very eaſy, and ſufficiently accurate, were there but eclipſes every night.—At the moment wherein we ſee the beginning or middle of a lunar eclipſe by a teleſcope, we have nothing to do but take the altitude or azimuth of ſome fixed ſtar, from which the hour and minute are eaſily found; or without the altitude, if the ſtar be in the meridian.—This hour and minute, therefore, thus found, and compared with that expreſſed in the tables, gives the *longitude*. See ECLIPSE.

2°. The moon's place in the zodiac, is a phænomenon more frequent than that of her eclipſes; but then the obſervation thereof is difficult, the calculus intricate and perplexed, by reaſon of two parallaxes; ſo that it is ſcarce practicable to any tolerable degree of accuracy.—Indeed by waiting till the moon comes into the meridian of the place, and then taking the altitude of ſome remarkable ſtar, (the altitude being ſuppoſed to be firſt known) from this altitude, and the latitude, we ſhall be able to find the time pretty accurately; though it will be better to do it by ſome ſtar in the meridian.—Now, the time being found, it will be eaſy to find what point of the ecliptic is then in the meridian, or mid-heaven.—Thus we ſhall have the moon's place in the zodiac, correſponding to the time of our place.—Then, in the ephemeris, we find what hour it is in the meridian of the ephemeris, when the moon is in that part of the zodiac: thus we ſhall have the hour and minute of the two places for the ſame time; the difference of which, will give the difference of *longitude*.

3°. In regard there are many times when the moon cannot be obſerved in the meridian, there is therefore another ſtill more frequent phænomenon, from which the *longitude* is ſought, *viz.* the moon's appulſe, and receſs from the fixed ſtars: for from thence the moon's true place may be inveſtigated for the given time of obſervation.—But this method, by reaſon of the parallaxes, and the ſolution of oblique ſpherical triangles, and the various caſes, is ſo very difficult and perplexed, that mariners will ſcarce be able to make uſe of it; nor does it ſeem neceſſary here to give the praxis thereof. Thoſe, however, who are diſpoſed to uſe it, will find very great help in it from a ſtarry zodiac, publiſhed under the direction of Dr. Halley, containing all the ſtars to which the moon's appulſe can be obſerved.

4°. To find the *longitude* by the moon's ingreſs into the ecliptic, obſerve the moment of that ingreſs: then, in the ephemeris, ſee what hour it is in the meridian of the ephemeris, when that ingreſs happens.—The difference between theſe times, gives the difference of *longitude*. See MOON.

5°. The phænomena of Jupiter's ſatellites are generally preferred to thoſe of the moon, for finding the *longitude*; by reaſon the former are leſs liable to parallaxes, and do, further, afford a very commodious obſervation, in every ſituation of that planet above the horizon.—Their motion is very ſwift, and muſt be calculated for every hour; and for that reaſon are not found in the common ephemerides, but are had elſewhere.

Now, to find the *longitude* by means of theſe ſatellites; with a good teleſcope, obſerve a conjunction of two of them, or of one of them with Jupiter, or any other the like appearance; and, at the ſame time, find the hour and minute from the meridian altitude of ſome ſtar; then conſulting tables of the ſatellites, obſerve the hour and minute wherein ſuch appearance happens in the meridian of the place to which the tables are calculated.—The difference of time, as before, will give the *longitude*. See SATELLITES.

All methods which depend on the phænomena of the heavens having this one defect, that they cannot be obſerved at all times; and being, beſides, difficult of application at ſea, by reaſon of the motion of the ſhip; there are ſome, who, leaving the moon, and the ſatellites, have recourſe to clocks, and other automata: which, could they be made perfectly juſt and regular, ſo as to move with the ſun, without either gaining or loſing, and without being affected with the change of air, and of climates, the *longitude* would be had with all the eaſe and accuracy imaginable; nothing more being required but to ſet the machine by the ſun at the time of departure; and when the *longitude* of any place is deſired, to find the hour and minute from the heavens, (which is done at night by the ſtars, and in the day by the ſun;) for the difference between the time, thus obſerved, and that of the machine, gives the *longitude*.—But no ſuch machine has been yet diſcovered: wherefore recourſe has been ſtill further had to other methods.

Mr. Whiſton and Mr. Ditton have propoſed a method of determining the *longitude* by the flaſh and report of great guns.—Sounds, it is known, move pretty equally in all their ſtages, whatever the ſonorous body be that occaſions them, or whatever the medium that conveys them. If then a mortar or great gun be exploded at a place whoſe *longitude* is known, the difference between the time wherein the flaſh (which moves, as it were, inſtantaneouſly) is ſeen, and the ſound, which moves at the rate of four ſeconds in a mile, is heard, will give the diſtance of thoſe places from each other; whence, if their latitudes be known, the difference of *longitude* will be likewiſe known. See SOUND, *&c.*

Again, if the hour and minute of the exploſion be known, (for the place where it is made) by obſerving the hour and minute from the ſun or ſtars, at the place whoſe *longitude* is required; the difference between thoſe times, will give the difference of *longitude*.

Again, if the ſaid mortar be loaden with an iron ſhell full of combuſtible matter, and poſited perpendicularly, it will carry the ſame a mile high, which will be ſeen near a hundred miles; if therefore neither the ſound ſhould be heard, nor the flaſh ſeen, the diſtance of any remote place from the place of the mortar, may be determined from the altitude of the ſhell above the horizon of the place unknown: and the diſtance and latitudes known, the *longitude* is eaſily found.

According to this ſcheme, it was propoſed to have ſuch mortars fixed at proper diſtances, and at known ſtations, on all the frequented coaſts, iſlands, capes, &c. and to be exploded at certain hours, for the obſervation of mariners.

This method, though good in the theory, yet is found uſeleſs in the practice; as being extremely troubleſome, and yet precarious.—It ſuppoſes that ſounds may be heard forty, fifty, or ſixty miles; of which, it is true, we have inſtances, but they are very rare; and, ordinarily, the report of a cannon is not heard above half ſo far; and ſometimes much leſs.—It ſuppoſes, again, ſound to move always with equal velocity; whereas, in fact, its velocity is increaſed or diminiſhed as it moves with or againſt the wind.—It ſuppoſes, again, the ſtrength of powder uniform; and that the ſame quantity carries the ſame range; the contrary whereof is known to every gunner.—We ſay nothing of thick cloudy nights, when no lights can be ſeen; nor of ſtormy nights, when no ſound can be heard; even at inconſiderable diſtances.

8°. We have another method of finding the *longitude*, propoſed by the ſame Mr. Whiſton, *viz.* by the inclinatory, or dipping-needle: which ſee under the article DIPPING-*Needle*.

Angle of LONGITUDE.	See	ANGLE.
Argument of LONGITUDE.	See	ARGUMENT.
Circles of LONGITUDE.	See	CIRCLE.
Degree of LONGITUDE.	See	DEGREE.
Parallax of LONGITUDE.	See	PARALLAX.
Refraction of LONGITUDE.	See	REFRACTION.

LONGITUDE *of Motion*, is uſed by Dr. Wallis for the meaſure of motion, eſtimated according to the line of direction; on which principle, *longitude* of motion is the diſtance, or length, which the centre of any moving body runs through, as it moves on in a right line. See MOTION.

The ſame author calls the meaſure of any motion, eſtimated according to the line of direction of the vis motrix, the *altitude* of it.

Bellini alſo uſes the terms *longitude*, and *altitude* in the ſame ſenſe, in many places of his writings, which an ordinary reader finds hard to underſtand, for want of this interpretation.

By *altitude* alſo, in his nineteenth propoſition *de febribus*, he means the thickneſs of the viſcid matter in the blood-veſſels; or the greateſt length a viſcid particle is extended into, from the ſide of the canal to its axis.

LONGITUDINAL, in anatomy, is uſed to ſignify ſome part or member extended in length, or poſited lengthwiſe.

The membranes which compoſe the veſſels, are woven out of two kinds of fibres, the one *longitudinal*, the other *circular*, cutting the *longitudinal* at right angles. See MEMBRANE.

The *longitudinal* fibres are tendinous and elaſtic; the *circular*, muſculous and motrices, like ſphincters. See FIBRE.

LONGUS, LONG, an epithet given by anatomiſts to a great number of muſcles, hereby contradiſtinguiſhed from *breves*. See BREVIS.

The ſecond extenſor of the carpus is called *longus*, in compariſon of the third extenſor, which is called *brevis*, ſhort.

The *longus* has its origin in the bottom of the humerus, and lying along the radius, paſſes underneath the ligamentum annulare, and is inſerted into the carpus.

The ſecond of the flexors of the neck is alſo called the *longus*, or *longus colli*, and ſometimes *rectus*.—It has its origin in the lateral part of the body of the four upper vertebræ of the back, and is inſerted into the body of the four vertebræ of the neck, and ſometimes into the occiput: this, in conjunction with the ſcalenum, bends the neck.

The third of the ſix muſcles of the elbow, or arm, which is the firſt of its extenſors, is alſo called *longus*, as being the longeſt of the extenſors.—It has its origin on the upper ſide of the omoplate, near the neck, and deſcending by the hind part of the arm, is inſerted into the olecranum by a ſtrong aponeuroſis, which is common to it and the ſecond and third extenſor of the arm.

The ſecond muſcle of the thumb, which is the firſt of its extenſors, is alſo called *longus*, as being longer than another extenſor of the ſame thumb, called *brevis*.—The *longus* proceeds from the upper and external part of the bone of the elbow, and, riſing over the radius, is inſerted, by a forked tendon, into the ſecond bone of the thumb, which it extends.

One of the four muſcles of the radius is alſo called the *longus*.—This is the firſt of the two ſupinators, and has its origin three or four fingers breadth above the outer apophyſis of the humerus, whence running along the radius, it is inſerted into the inner parts of its lower apophyſis.—It is called *longus* with regard to the other ſupinator, which is called *brevis*.—Theſe two muſcles ſerve to turn the radius, ſo as the palm of the hand looks upwards; which makes the ſupination.

The firſt of the abductors of the leg is alſo called the *longus*, or *longus tibiæ*, and bears this title more juſtly than any of the others, as being the longeſt muſcle in the whole body.—It is alſo denominated *faſcialis*, on account of its bearing ſome reſemblance to a (*faſcia*) ſwathe; and *ſartorius*, or taylor's muſcle, becauſe it ſerves to bend the legs inward, as the taylors uſe to have them when at work. See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 40. *fig.* 2. *n.* 38.

LONGUS *Cubiti*, is a muſcle, which, with others, extends the cubitus.—It ariſes from the inferior coſta of the ſcapula, nigh its neck, and paſſing betwixt the two round muſcles, deſcends on the back ſide of the humerus; where it joins with the brevis, and brachiæus externus.

LOOF, or, as it is uſually pronounced, LUFF, a term uſed in conding of a ſhip.—Thus,

LOOF *up*, is to bid the ſteerſman keep nearer to the wind.

LOOF *into an Harbour*, is to ſail into it cloſe by the wind.

To ſpring the LOOF, or *Luff*, is when a ſhip, that was going large before the wind, is brought cloſe by the wind.

When a ſhip ſails on a wind, that is, on a quarter-wind, they ſay to the ſteerſman, *keep your luff! veer no more! keep her to! touch the wind! have a care of the lee-latch!* All which words ſignify much the ſame thing, and bid the man at helm to keep the ſhip near the wind.

LOOF *of a ſhip*, denotes that part of her aloft, which lies juſt before the cheſs-trees.

Hence the guns which lie here are called *loof-pieces*.

LOOKING-*Glaſs*, a plain glaſs ſpeculum, or mirror, which being impervious to the light, reflects its rays, and ſo exhibits the images of objects placed before it. See GLASS, SPECULUM, REFLECTION, &c.

The theory of *looking-glaſſes* and the laws whereby they give the appearances of bodies, ſee under MIRROUR.

The manner of grinding and preparing LOOKING-*glaſſes*, is as follows:—A plate of glaſs is fixed to a horizontal table, and to another leſſer table is fixed another plate, over the hind part of which is added a box loaded with ſtones, and other weights.—Over the firſt plate is ſprinkled fine ſand and water, in a ſufficient quantity, for the grinding, and the ſecond or leſs plate is laid on it, and thus worked this and that way, till each has planed the other's ſurface.—As they begin to grow ſmoother, finer ſand is uſed, and at laſt powder of ſmalt.—Being thus fitted for poliſhing, a wooden parallelepiped, lined with tripoli earth, or burnt tin, tempered with water, is laid on the plate, and worked to and again, till the glaſs have got a perfect politure.

It is found extremely difficult to bring the glaſs to an exact plainneſs. Hevelius judges more art required to bring glaſs to a perfect plane, than to a ſphere.—For poliſhing large plates of glaſs, they have a machine for the purpoſe.

The plates being poliſhed, a thin blotting paper is ſpread on a table, and ſprinkled with fine chalk; and this done, over the paper is laid a thin lamina, or leaf of tin, on which is poured mercury, which is to be equally diſtributed over the leaf with a hare's foot, or cotton. Over the leaf is laid a clean paper, and over that the glaſs plate.—With the left hand the glaſs-plate is preſſed down, and with the right the paper is gently drawn out; which done, the plate is covered with a thicker paper, and loaden with a greater weight, that the ſuperfluous mercury may be driven out, and the tin adhere more cloſely to the glaſs. When it is dried, the weight is removed, and the *looking-glaſs* is complete.

Some add an ounce of mercury, to half an ounce of marcaſite, melted by the fire; and leſt the mercury evaporate in ſmoke, pour it into cold water; and when cold, ſqueeze it through a cloth or leather. Some alſo add a quarter of an ounce of lead and tin to the marcaſite, that the glaſs may dry the ſooner. See FOLIATING.

LOOM, the weaver's frame; a machine whereby ſeveral diſtinct threads are wove into one piece. See WEAVING, and SHUTTLE.

Looms are of various ſtructures, accommodated to the various kinds of materials to be wove, and the various manner of weaving them; *viz.* for woollens, ſilks, linens, cottons, cloths of gold; and other works, as tapeſtry, ribbands, ſtockings, &c. divers of which will be found under their proper heads.

Heir-LOOM, in law. See the article HEIR-*Loom*.

LOOP-*Holes*, in the ſea language, are *holes* made in the coamings of the hatches of a ſhip, to fire muſkets through in a cloſe fight.

LOOSE *Style*. See the article STYLE.

LOOSENED. See the article HOOF-*looſened*.

LORD*, a title of honour attributed to thoſe who are noble, either by birth, or creation; and veſted with the dignity of a baron. See NOBILITY, and BARON.

* The word is of Saxon origin, and primarily denotes a bread-giver, alluding to the hoſpitality of our ancient nobles: It is formed, according to Camden, from hlaꝼoꞃꝺ, afterwards written loꞃeꝼꝺ; a compound of hlaꝼ, bread, and ꝼoꞃꝺ, to ſupply, afford.

In this ſenſe, *lord* amounts to the ſame with *peer* of the realm, *lord* of parliament. See PEER, and PARLIAMENT.

LORD is alſo applied to thoſe ſo called by the courteſy of England; as, all ſons of a duke, or marquis; and the eldeſt ſon of an earl.

LORD is alſo an appellation given to divers perſons honourable by office; as *lord* chief juſtice, *lord* chancellor, *lord* of the treaſury, admiralty, *&c.* See JUSTICE, CHANCELLOR, TREASURY, ADMIRAL, *&c.*

LORD is alſo a title ſometimes given to an inferior perſon who has a fee, and conſequently the homage of tenants within his manor. See FEE, and MANOR.

For by his tenants he is called *lord*, and in ſome places, for diſtinction ſake, *land-lord*.

It is in this laſt ſignification that the word *lord* is principally uſed in our law-books; where it is divided into *lord paramount*, and *lord meſn*.

***Lord* MESN**, is he that is owner of a manor, and by virtue thereof, hath tenants holding of him in fee, and by copy of court-roll; and yet holds himſelf of a ſuperior *lord*, called *lord-paramount*. See PARAMOUNT.

We alſo read of *very lord*, and *very tenant*. See VERY.

***Very* LORD**, is he who is immediate *lord* to his tenant; and *very tenant*, he who holds immediately of that *lord*.

So that where there is *lord* paramount, *lord* meſn, and tenant; the *lord* paramount is not very *lord* to the tenant.

LORD *High-admiral* of England, is one of the great officers of the crown, whoſe truſt and honour is ſo great, that it has ſeldom been given, excepting to ſome of the king's younger ſons, or near kinſmen. See ADMIRAL.

To him is, by the king, intruſted the management of all maritime affairs, as well in reſpect of juriſdiction, as protection; with the government of the Britiſh navy; and a power to decide all controverſies, and cauſes maritime, as well civil as criminal; ſuch as happen either on our own coaſts, or beyond ſea, amongſt his majeſty's ſubjects.

To him alſo belongs ſuch wrecks and prizes, as are called *lagon*, *jetſon*, and *flotſon*; that is, goods lying in the ſea floating, or caſt on ſhoar, excepting in ſuch royalties as are granted to other *lords* of manors, *&c.* with all great fiſhes, called *royal fiſh*, except whales and ſturgeon; a ſhare of prizes in time of war, and the goods of pirates and felons condemned. See FLOTSON, *&c.*

The *lord high admiral* has under him many officers of high and low condition; ſome at ſea, others at land; ſome of a military, others of a civil capacity: ſome judicial, others miniſterial.

In his court, called the *court of admiralty*, all proceſſes iſſue in his name, not the king's, as they do in all other courts; ſo that the dominion and juriſdiction of the ſea, may juſtly be ſtiled another commonwealth, or kingdom apart, and the *lord high admiral*, viceroy of the maritime kingdom.

He hath under him a lieutenant, who is judge of the admiralty, commonly a doctor of the civil law; the proceedings in this court, in all civil matters, being according to the civil law: but in criminal matters they proceed by a ſpecial commiſſion from the ſecretary, according to the laws of England. See ADMIRALTY.

LORD *Privy Seal*, has his office by patent: before the thirtieth of Henry VIII. he was, generally, an eccleſiaſtic; ſince which, the office has been uſually conferred on temporal peers, above the degree of barons. See PRIVY *Seal*.

The *lord privy-ſeal* receiving a warrant from the ſignet office, iſſues the privy-ſeal, which is an authority to the lord chancellor to paſs the great ſeal, where the nature of the grant requires the great ſeal.—But privy-ſeals for money begin in the treaſury, from whence the firſt warrant iſſues, counterſigned by the lord treaſurer.—On the *lord privy ſeal* are attendant four clerks, who have two deputies to act for them.

LORD *Steward of the King's Houſhold*, is the principal officer for the civil government of the king's ſervants below ſtairs; over the officers of which he has juriſdiction. See STEWARD, and HOUSHOLD.

He is conſtituted by the delivery of the white ſtaff, which is eſteemed his commiſſion.—By virtue of his office, without any other commiſſion, he judges of all offences committed within the court, or the verge thereof, and gives judgment according to their ſeveral deſerts.

At the death of the ſovereign, he breaks his ſtaff over the grave in which the royal corps is depoſited, and thereby diſcharges all the officers under his power.

LORD *Advocate.*	See the article	ADVOCATE.
LORD *High Treaſurer.*		TREASURER.
LORD *Chamberlain of the Houſhold.*	See CHAMBERLAIN.	
LORD *Great Chamberlain of England.*		
LORD *High Chancellor of England.*	See	CHANCELLOR.
LORDS *of the Bed-chamber.*		BED-CHAMBER.
LORDS *of the Treaſury.*		TREASURY.

LORDS-*Lieutenants of Counties*, are officers of great diſtinction, appointed by the king for the managing the ſtanding militia of the county, and all military matters therein. See COUNTY.

They are generally of the principal nobility, and of the beſt intereſt of the county: they are to form the militia in caſe of a rebellion, *&c.* and march at the head of them, as the king ſhall direct. See MILITIA.

They have the power of commiſſioning colonels, majors, captains, and ſubaltern officers; alſo to preſent the king with the names of deputy-lieutenants; who are to be ſelected from the beſt gentry in the county, and act in the abſence of the *lords-lieutenants*.

Subſervient to the *lords-lieutenants*, and deputy-lieutenants, are the juſtices of peace; who, according to the order they receive from them, are to iſſue out warrants to the high and petty-conſtables, *&c.* for military ſervice, *&c.*

LOT, in a law ſenſe. See the article SCOT.

LOTION, LOTIO, popularly called *waſh*; denotes a form of medicine made up of liquid matters, chiefly uſed for beautifying the skin, and cleanſing it from thoſe deformities which a diſtempered blood ſometimes throws on it; or rather, are occaſioned by a preternatural ſecretion. For, generally ſpeaking, thoſe diſtempers of the skin, which are accounted ſigns of a foul blood, proceed from the natural ſalts thrown off by the cutaneous glands, which ought to be waſhed away through the kidneys; ſo that inſtead of ſweetners, which are uſually preſcribed on theſe occaſions, Dr. Quincy thinks the urinary diſcharge ſhould be promoted, or that of the skin rectified by proper *lotions*, or ointments and frictions.

LOTION alſo denotes a remedy, holding a medium between a fomentation and a bath.

There are refreſhing and ſomniferous *lotions* for feveriſh perſons, made of leaves, flowers and roots boiled, wherewith the feet and hands of the patient are waſhed; and after waſhing, wrapped up in linen ſteeped in the ſame decoction till dry.

There are *lotions* alſo for the head and hair, made of the aſhes of vine-twigs.

LOTION *of the Philoſophers*, in chymiſtry, is a cohobation which nature makes of what is raiſed up, and afterwards falls back again to the bottom of the veſſel.

LOTION, in pharmacy, denotes a preparation of medicines, by waſhing them in ſome liquid, either made very light, ſo as to take away only the dregs; or ſharp, ſo as to penetrate them, in order to clear them of ſome ſalt, or corroſive ſpirit, as is done to antimony, precipitates, magiſteries, *&c.* or intended to take away ſome foulneſs, or other ill quality; or to communicate ſome good one. See ABLUTION.

LOTTERY, a kind of game at hazard, wherein ſeveral lots of merchandize, or ſums of money, are depoſited as prizes, for the benefit of the fortunate.

The deſign of *lotteries*, and the manner of drawing them, are too well known among us to need a deſcription: they are very frequent in England and Holland, where they cannot be ſet on foot without the permiſſion of the magiſtrate.—In France too, there have been ſeveral *lotteries* in favour of their hoſpitals.

M. le Clerc has compoſed a treatiſe of *lotteries*, wherein is ſhewn what is laudable, and what blameable in them.—Gregorio Leti has alſo a book on the ſubject of *lotteries*.—Father Meneſtrier has a treatiſe on the ſame, publiſhed in 1700; where he ſhews their origin, and uſe among the Romans.—He diſtinguiſhes ſeveral kind of *lotteries*, and takes occaſion to ſpeak of chances, and reſolves ſeveral caſes of conſcience relating thereto.

LOVE.	See the article	PLEASURE, and PAIN.
***Platonic* LOVE.**		PLATONIC.

LOUIS, LEWIS, LOUIS D'OR, or LEWIDORE, a French coin, firſt ſtruck in 1640, under the reign of Louis XIII. and which has now a conſiderable currency. See COIN.

Louis d'ors, at firſt, were valued at ten livres, afterwards at eleven, and at length at twelve and fourteen. In the latter end of the reign of Louis XIV. they were riſen to twenty, and in the beginning of that of Louis XV. to thirty and thirty ſix, nay, forty and upwards; with this difference, however, that in the laſt coinings the weight was augmented in ſome proportion to the price, which in the former reign, was never regarded.

On one ſide of the coin is the king's head ſeen, with his name; and on the other, a croſs compoſed of eight L's cantoned with crowns. The legend is, *Chriſtus regnat*, *vincit*, *imperat*.—The reverſe has been frequently changed; at preſent, it bears a hand of juſtice croſſed in a ſaltier, with a ſcepter.

There are alſo *white* LOUIS's, or LOUIS *d' argent*; ſome of 120, others of ſixty ſols a piece, called *ecus*; and among us, *French crowns*, *half crowns*, &c.

On the one ſide whereof is the king's head, and on the other the French arms, with this legend, *Sit nomen Domini benedictum*. See CROWN.

***Knights of* S. LOUIS**, is the name of a military order, inſtituted by Louis XIV. in 1693.

Their collar is of a flame colour, and paſſes from left to right.—The king is their grand maſter.—There are in it eight great croſſes, and twenty four commanders.—The number of knights is not limited. At the time of their inſtitution, the king charged his revenue with a fund of three hundred thouſand livres, for the penſions of the commanders and knights.

LOW *Airs*, in horſemanſhip. See the article AIRS.

Low *Flank*, in fortification.	See	Flank.
Low *Hemiſphere*.		Hemisphere.
Low *Maſs*.		Mass.
Low *Style*.		Style.

Low-*Bellers*, in our ſtatute-books, are perſons who go in the night-time with a light and a bell; by the ſight and noiſe whereof, birds ſitting on the ground become ſtupified, and ſo are covered with a net and taken.

Lower *Exchequer*.	See	Exchequer.
Lower *Ocean*.		Ocean.
Lower *polar Dial*.		Dial.
LOWERING *the Flag*.		Flag.
LOWEST *Region*.		Region.

LOXODROMIC *Table*. See the article Table.

LOXODROMICS, the art or method of oblique ſailing, by the loxodromy, or rhumb. See Sailing, and Rhumb.

LOXODROMY *, Loxodromia, the line which a ſhip deſcribes in ſailing on the ſame collateral rhumb. See Rhumb.

* The word is Greek, formed of λοξος, oblique, and δρομος, courſe.

The *loxodromy*, called alſo the *loxodromic line*, cuts all the meridians in the ſame angle, called the *loxodromic angle*. See Angle.

LOZENGE *, or Lozange, a kind of parallelogram, or quadrilateral figure, conſiſting of four equal and parallel lines, or ſides, whoſe angles are not right, but whereof two oppoſite ones are acute, and the other two obtuſe; the diſtance between the two obtuſe ones being always equal to the length of one ſide. See Parallelogram.

* Scaliger derives the word *lozenge* from *laurengia*; this figure reſembling, in ſome reſpects, that of a laurel-leaf.

In geometry, it is ordinarily called *rhombus*; and when the ſides are unequal, *rhomboides*. See Rhombus, and Rhomboides.

Lozenge, in heraldry, is a rhombus, or figure of equal ſides, but unequal angles: reſembling a quarry of glaſs in our old windows; placed erect, point-ways.—See *Tab. Herald. fig.* 69. It is in this figure that all unmarried gentlewomen and widows bear their coats of arms; becauſe, as ſome ſay, it was the figure of the Amazonian ſhield; or, as others, becauſe it is the antient figure of the ſpindle.

The *lozenge* differs from the *fuſil*, in that the latter is narrower in the middle, and not ſo ſharp at the ends. See Fusil.

Lozenge is alſo a form of medicine, made into ſmall pieces, to be held or chewed in the mouth, till they are melted or waſted: the ſame with what are otherwiſe called *trochiſci*, *troches*. See Troche.

LUCARIA *, an antient feaſt celebrated by the Romans.—Sext. Pompeius obſerves, that the *Lucaria* were ſolemnized in the wood, where the Romans, defeated and purſued by the Gauls, retired and concealed themſelves.

* The word, according to Feſtus, and Sext. Pompeius, comes from *lucus*, a grove, or wood.—Varro derives it from *luce*, the ablative of the word *lux*, light, and liberty.—But the former etymology ſeems the more natural.

It was held in the month of July, in memory of the aſylum they found in that wood, which was between the Tyber and the road called Via ſalaria.

LUCIANISTS, or Lucanists, a religious ſect, ſo called from Lucianus, or Lucanus, a heretic of the ſecond century; being a diſciple of Marcion, whoſe errors he followed; adding ſome new ones to them.

Epiphanius ſays, he abandoned Marcion; teaching that people ought not to marry, for fear of enriching the Creator: and yet other authors mention, that he held this error in common with Marcion, and other Gnoſtics.—He denied the immortality of the ſoul; aſſerting it to be material. See Marcionites.

There was another ſect of *Lucianiſts*, who appeared ſome time after the Arians.—They taught, that the Father had been a Father always, and that he had the name even before he begot the Son; as having in him the power, or faculty of generation: and in this manner they accounted for the eternity of the Son.

LUCID *Intervals*, the fits of lunatics, or maniacs, wherein the phrenzy leaves them in poſſeſſion of their reaſon. See Madness, and Phrenzy.

It is ſaid, lunatics are capable of making a will in their *lucid intervals*. See Testament.

LUCIDA *Coronæ*, a fixed ſtar, of the ſecond magnitude, in the northern crown. See Corona *Borealis*.

Lucida *Lyræ*, a bright ſtar, of the firſt magnitude, in the conſtellation Lyra. See Lyra.

LUCIDUM *Septum*. See the article Septum.

LUCIFERIANS, a religious ſect, who adhered to the ſchiſm of Lucifer biſhop of Cagliari, in the fourth century.

S. Auguſtine ſeems to intimate, that they believed the ſoul tranſmitted to the children from their fathers.—Theodoret ſays, that Lucifer was the author of a new error.—The *Luciferians* increaſed mightily in Gaul, Spain, Egypt, &c.—The occaſion of the ſchiſm was, that Lucifer would not allow any acts he had done to be aboliſhed.—There were but two *Luciferian* biſhops, but a great number of prieſts and deacons.—The *Luciferians* bore a peculiar averſion to the Arians.

LUDI *Circenſes*.	See the article	Circenses.
Ludi *Florales*.		Florales.

LUDICROUS *Games*. See the article Games.

LUES, in a general ſenſe, is uſed for a diſeaſe of any kind. See Disease.

Lues, in a more particular ſenſe, is reſtrained to contagious and peſtilential diſeaſes. See Plague, &c.

Lues, in the more common and modern uſe of the word, eſpecially when joined with *gallica*, or *venerea*, is reſtrained only to the French pox. See Venereal *Diſeaſe*.

LUFF, a ſea term, the ſame with *loof*. See Loof.

LULLY'*s Art*. See the article Art.

LUMBAGO, pains about the loins, and the ſmall of the back; ſuch as precede ague-fits, and fevers.

They ariſe commonly from fullneſs, and acrimony; in common with a diſpoſition to yawning, ſhuddering, and erratic pains in other parts; and go off with evacuation, generally by ſweat, and other critical diſcharges of fevers.

LUMBAL *Glands*.	See the article	Gland.
Lumbal *Nerves*.		Nerve.

LUMBARIS, an epithet given to thoſe branches of the aorta, which carry the blood to the muſcles of the loins. See Aorta, and Artery.

Lumbaris, is alſo applied to certain veins, which bring back the blood from the loins into the trunk of the vena cava. See Vein.

There is alſo a muſcle of the thigh which bears this name. See Psoas.

LUMBRICAL *, Lumbricalis, an appellation given to four muſcles of the hand, and as many of the feet, which act as adducents of the fingers, and toes.

* The word is formed from *lumbricus*, worm; on account of their figure, and ſmallneſs, which gives them a reſemblance to worms.—On which account, they are alſo called *vermiculares*.

Lumbricales *Manus*, are muſcles of the hands, commonly ſuppoſed to be nothing but branches of the tendons of the perforans, which go to the inſide of the firſt bone on each finger, and are ſuppoſed to contribute to the variety of motions with the fingers, by giving a diverſion to the direct actions of the other muſcles; but ſimply, they only ſerve to draw the fingers towards the thumb.—Though Mr. Cowper obſerves, that ſome of them have diſtinct origins; and ſuſpects that the reſt may have ſo too, and therefore makes them diſtinct muſcles.

Lumbricales *Pedis*, are muſcles of the foot, which ariſe, as in the hand, one from each tendon of the perforans, or profundus, and go to the inſide of each of the leſſer toes.

LUMINOSA *Semita*. See the article Semita.

LUMINOUS *Column*.	See the article	Column.
Luminous *Fire*.		Fire.

LUNA, in aſtronomy, the moon. See the article Moon.

Luna, in the jargon of the chymiſts, ſignifies *ſilver*; ſo called from the ſuppoſed influence of the moon thereupon.

The medicinal virtues of this metal, Dr. Quincy ſays, are none at all, until it have undergone very elaborate preparations. See Silver.

Cryſtals of Luna.	See the article	Crystal.
Vitriol of Luna.		Vitriol.

LUNALE *Bezoardicum*. See the article Bezoardicum.

LUNAR, ſomething belonging to the moon. See Moon.

Lunar *periodical Months*, conſiſt of twenty ſeven days, ſeven hours, and a few minutes.

Lunar *ſynodical Months*, conſiſt of twenty nine days, twelve hours, and three quarters of an hour. See Lunation.

Lunar *Years*, conſiſt of three hundred and fifty four days, or twelve ſynodical months. See Year.

In the firſt ages, the year uſed in all nations was *lunar*; the variety of courſe being more frequent in this planet, and of conſequence more conſpicuous, and better known to men, than thoſe of any others.—The Romans regulated their year, in part, by the moon, even till the time of Cæſar. See Year.

The Jews too had their *lunar* months.—Some rabbins pretend, that the *lunar* month did not commence till the moment the moon began to appear; and that there was a law, which obliged the perſon who diſcovered her firſt, to go and inform the ſanhedrin thereof.—Upon which the preſident ſolemnly pronounced the month begun, and notice was given of it to the people by fires lighted on the tops of mountains. But this looks ſomewhat chimerical.

Lunar *Dial*.	See the article	Dial.
Lunar *Eclipſe*.		Eclipse.
Lunar *Horoſcope*.		Horoscope.
Lunar *Rainbow*.		Rainbow.

LUNATIC,

LUNATIC, Lunaticus, a perſon affected, or governed by the moon.—Hence, epileptics were antiently called *lunatici*, in regard the paroxyſms of that diſeaſe ſeem to be regulated by the changes of the moon. See Epilepsy.

Mad people are ſtill called *lunatics*, from an antient opinion, that they are much influenced by that planet.—A much ſounder philoſophy hath taught us, that there is ſomething in it; but not in the manner the antients imagined; nor otherwiſe than what the moon has in common with other heavenly bodies, occaſioning various alterations in the gravity of our atmoſphere, and thereby affecting human bodies. See Comet, Planet, *&c.* ſee alſo Tides.

LUNATION, the period or ſpace of time between one new moon, and another. See Moon.

Lunation is alſo called *ſynodical month*; conſiſting of 29 days, 12 hours, and three quarters of an hour. See Month, *&c.*

At the end of 19 years the ſame *lunations* always return, on the ſame day; but not at the ſame preciſe time of the day; there being a difference of one hour, 27 minutes, and 33 ſeconds: wherein the antients were miſtaken, taking the uſe of the golden number to be more ſure and infallible than it is. See Golden *Number*.

It has been found ſince, that in 312 years and an half, the *lunations* gain a day on the beginning of the month; ſo that when they came to reform the calendar, the *lunations* happened in the heavens, four or five days ſooner than was ſhewn by the golden number.—To remedy which, we now make uſe of the perpetual cycle of epacts.

We take 19 epacts, which anſwer to a cycle of 19 years; and when at the end of 300 years the moon has gained a day, we take 19 other epacts: which is alſo done, when, by the omiſſion of an intercalary day, which happens three times in 400 years, the calendar is adjuſted to the ſun.

Care is taken that the index of the epacts muſt never be changed, excepting at the concluſion of a century, when there is occaſion for it, on account of the metemptoſis, or proemptoſis; that is, of the lunar or ſolar equation.—When the biſſextile or intercalary day is ſuppreſſed without a lunar equation, the next following, or lower index is taken, as was done in 1700.—When there is a lunar equation, without ſuppreſſing the biſſextile, the next preceeding, or higher index is taken; as will be done in 2400.—When there is both an equation, and a ſuppreſſion, as in 1800; or neither the one nor the other, as in 2000; the ſame index is retained. See Epact.

LUNE, Lunula, in geometry, a plane in form of a creſſent, or half-moon; terminated by the circumference of two circles, that interſect each other within.

Though the quadrature of the entire circle was never yet effected, yet geometricians have found out the ſquares of many of its parts.—The firſt partial quadrature was that of the *lunula*, given by Hippocrates of Scio, who, of a ſhipwrecked merchant, commenced geometrician. See Circle, and Quadrature,

Let AEB (*Tab. Geometry*, *fig.* 8.) be a ſemicircle, and $GC = GB$; with the radius BC deſcribe a quadrant AFB; then will AEBFA be Hippocrates's *lune*.

And ſince $BC^2 = 2GB^2$, the quadrant AGBC will be equal to the ſemicircle AEB; taking away therefore from each the common ſegment AFBGA; $AEBFA =$ to the triangle $ACB = GB^2$.

Lune, in fortification. See the article Demi-*Lune*.

LUNETTE, in fortification, an enveloped counterguard, or elevation of earth, made in the middle of the foſs, before the curtin, about five fathom in breadth.

Lunettes are uſually made in ditches full of water, and ſerve to the ſame purpoſe as fauſſebrays, to diſpute the paſſage of the ditch. See Faussebray.

The *lunette* conſiſts of two faces, which form a re-entering angle; and its terreplein being only twelve feet wide, is a little raiſed above the level of the water; having a parapet three fathom thick.

LUNGS, a part of the human body, compoſed of veſſels, and membranous veſicles; ſerving for reſpiration. See Respiration.

The *lungs* are connected, above, to the fauces, by means of the trachea; and below, to the vertebræ of the thorax; and to the ſternum and diaphragm, by means of the pleura.—They are divided into two great lobes, by the mediaſtinum, and thoſe again into others leſſer; the right ſometimes into three or four, by means of ſome fiſſures running from the fore to the back edge.—The great lobes, when inflated, reſemble each of them a horſe's hoof in figure, but together they are liker an ox's inverted.—See *Tab. Anat. (Splanch.) fig.* 12. *lit. tt. fig.* 14. ſee alſo Lobe, and Lobule.

The ſubſtance of the *lungs* is membranous, conſiſting chiefly of innumerable cells or veſicles; which ſeem to be nothing but expanſions of the membranes of the bronchia, to which they hang like grapes in cluſters; ſo that by blowing into one of the branches of the bronchia, thoſe cells or veſicles belonging to it, are blown up; the reſt, which do not, remaining ſtill flaccid and unaltered. See Bronchia.

Theſe cluſters of veſicles, or cells, are called the *internal lobules*; by which name they are diſtinguiſhed from the leſſer lobes ſpoken of.—They are ſeparated from one another by interſtices, which receive the veſſels; and are filled up with membranes propagated from the lobules, and lying ſome parallel, ſome angular.—Theſe lobules diſcover and diſplay themſelves very exactly, if the larger trunks of the bronchia be laid open, and the leſſer blown into; by which means every lobule belonging to that branch will be inflated, and riſe very diſtinctly, and ſhew its extent.

The whole ſubſtance of the *lungs* is covered with a common membrane, which is diviſible into two coats; the outer thin, ſmooth, and nervous; the inner ſomewhat thicker and rougher, conſiſting moſtly of the extremities of veſſels and veſicles, through the impreſſion of which it is pitted, and reſembles, in ſome meaſure, a honey-comb.—Some affirm, that in this coat are abundance of perforations or pores, ſo diſpoſed, that they readily imbibe any humidity from the cavity of the thorax, but ſuffer nothing to eſcape into it: but this ſeems little more than fancy.

The veſſels of the *lungs* are the bronchia, the pulmonary and bronchial arteries and veins, nerves and lymphatics.—Of theſe veſſels ſome are *proper*, and ſome *common*, in reſpect of the ſervice they are of to the reſt of the body.—The *common* are the bronchia, the pulmonary artery and vein, the nerves and lymphatics; the *proper* are the bronchial artery and vein. See Bronchia, Bronchial, Pulmonary, *&c.*

Dr. Willis, contrary to the common opinion, aſcribes to the *lungs* a great number of nerves, which come from the trunk of the par vagum; and which, being diſtributed through the ſubſtance of the *lungs*, embrace the aerious and ſanguiferous veſſels. He alſo aſſerts, that the veſiculæ have muſculous fibres, to enable them to exert a greater contractive force in expiration; though others deny any ſuch fibres.—Diemerbroeck obſerves, that the veſicles admit not only of air, but alſo of other groſſer matters; and inſtances two aſthmatic perſons which he opened; the one a ſtone-cutter, the veſiculæ of whoſe *lungs* were ſo ſtuffed with duſt, that, in cutting, his knife went as if through a heap of ſand; and the other a feather-driver, in whom the veſicles were full of the fine duſt, or down of feathers. See Asthma.

Polypus of the **Lungs**, See the article Polypus.

LUNISOLAR, in aſtronomy and chronology, denotes ſomething compoſed of the revolution of the ſun, and of that of the moon. See Revolution, Period, *&c.*

Lunisolar *Year*, is a period of years made by multiplying the cycle of the moon, which is nineteen, by that of the ſun, which is twenty eight; the product of which is five hundred thirty two; in which ſpace of time, thoſe two luminaries return to the ſame points. See Year.

LUNULAR *Angles*. See the article Angle.

LUPERCALIA *, feaſts inſtituted in antient Rome, in honour of the god Pan. See Fauns.

The *lupercalia* were celebrated on the fifteenth of the calends of March, that is, on the fifteenth of February, or, as Ovid obſerves, on the third day after the ides. They are ſuppoſed to have been eſtabliſhed by Evander.

On the morning of this feaſt, the luperci, or prieſts of Pan, ran naked through the ſtreets of Rome, ſtriking the married women they met on the hands and belly, with a thong, or ſtrap of goat's leather, which was held an omen promiſing them fecundity, and happy deliveries. See Luperci.

The reaſon of this indecent cuſtom, in celebrating the *lupercalia*, took its riſe riſe from Romulus and Remus; for while they were aſſiſting at this feaſt, a body of robbers, taking hold of the occaſion, plundered them of their flocks. Upon this the two brothers, and all the youth that were with them, throwing off their clothes, to be the more expedite, purſued the thieves, and recovered their prey.—This ſucceeded ſo well, that thenceforward this ceremony became a part of the *lupercalia*.

This feaſt was aboliſhed in the time of Auguſtus, but afterwards reſtored, and continued to the time of the emperor Anaſtaſius.—Baronius ſays, it was aboliſhed by the pope, in 496.

LUPERCI, a name given to the prieſts of the god Pan. See Lupercalia.

The *luperci* were the moſt antient order of prieſts in Rome; they were divided into two colleges, or companies, the one called *Fabii*, and the other *Quintilii*. To theſe Cæſar added a third, which he called *Julii*.

Suetonius mentions the inſtitution of this new college of *luperci*, as a thing that rendered Cæſar more odious than he was; however, it appears from the ſame paſſage of Suetonius, that this new company was not inſtituted by Cæſar, nor in honour of Pan, but by ſome friends of Cæſar, and in honour of himſelf.

LUPI *Crepitus*. See the article Crepitus.

Centaurus cum **LUPO**. See the article Centaurus.

---

* The word comes from Lupercal, the name of a place under the Palatine mountain, where the ſacrifices were performed.

LUPUS, *Wolf*, in aſtronomy, a ſouthern conſtellation, conſiſting of nineteen ſtars. See STAR, and CONSTELLATION.

LURE*, in falconry, a piece of red leather cut in form of a bird, with two wings, ſtuck with feathers; and ſometimes baited with a piece of fleſh: wherewith to reclaim, or call back a hawk. See RECLAIMING, HAWK, and FALCONRY.

* The word comes from the French *leurre*, which ſignifies the ſame; formed, according to Skinner, from the Anglo-Saxon, *læura*, traitor; according to Tripaud, from *leora*, craftineſs.

LUSTER, or **LUSTRE**, gloſs, or brightneſs appearing on any thing; particularly manufactures of ſilk, wool, or ſtuff.

LUSTRE is alſo uſed for a certain compoſition, or manner of giving that gloſs, or brilliant.

The *luſtre* of ſilks, in which their chief beauty conſiſts, is given them by waſhing in ſoap, then clear water, and dipping them in alum-water cold. See SILK.

The *luſtre* of black taffaty is given by double-brewed beer, boiled with orange or lemon juice; that of coloured taffaties with water of gourds, diſtilled in an alembic.

Curriers give a *luſtre*, or gloſs to their leather, ſeveral ways, according to the colour to be illuſtrated.—For blacks, the firſt *luſtre* is with juice of barberries; the ſecond with gum arabic, ale, vinegar, and Flanders glue boiled together: for coloured leathers, they uſe the white of an egg beaten in water: Morocco's have their *luſtre* from juice of barberries, and lemon or orange.

For hats, the *luſtre* is frequently given with common water, ſometimes a little black dye is added.—The ſame *luſtre* ſerves ſkinners, except that in white furs they never uſe any black dye.—For very black furs, they ſometimes prepare a *luſtre* of galls, copperas, Roman alum, ox's marrow, and other ingredients.

The *luſtre* is given to cloths and mohairs, by preſſing them under the calender. See CALENDER, and PRESSING.

LUSTRAL, an epithet applied by the ancients, to the water uſed in their ceremonies, to ſprinkle and purify the people. From them the Romaniſts have borrowed the holy water uſed in their churches. See *Holy* WATER.

LUSTRAL *Day*, *Dies* LUSTRICUS, that whereon the illuſtrations were performed for a child, and its name given; which was uſually the ninth day from the birth of a boy, and the eighth from that of a girl. Though others performed the ceremony on the laſt day of that week wherein the child was born, and others on the fifth day from its birth.

Over this feaſt-day the goddeſs Nundina was ſuppoſed to preſide, the midwives, nurſes, and domeſtics handed the child backwards and forwards, around a fire burning on the altars of the gods, after which they ſprinkled it with water. The old women mixed ſaliva and duſt with the water.—The whole ended with a ſumptuous entertaintainment.

LUSTRATION, *Expiation*; ſacrifices, or ceremonies, by which the Romans purified their cities, fields, armies, or people, defiled by any crime, or impurity. See LUSTRUM, EXPIATION, PURIFICATION, *&c.*

Some of their *luſtrations* were public, others private.

There were three ſpecies, or manners of performing *luſtration*; viz. by fire and ſulphur; by water; and by air; which laſt was done by fanning and agitating the air round the thing to be purified. See ABLUTION.

There was alſo a peculiar kind of *luſtration* for young children. See LUSTRAL *Day*.

Lomeir has a volume expreſs on the *luſtrations* of the ancients: Joh. Lomeieri Zutphanenſis *Epimenides, ſive de veterum gentilium Luſtrationibus*; firſt printed at Utrecht in 1681, and ſince, with additions, in 1702. 4°.

All perſons, ſlaves only excepted, he ſhews, were miniſters of ſome ſort of *luſtration*.—When any one died, the houſe was to be ſwept after a particular manner, by way of purification; the prieſt threw water on new-married people, with the like intention.—To purify themſelves, people would even ſometimes run naked through the ſtreets; ſuch was their extravagance. And, as if fancy was not fertile enough in inventing modes of *luſtration*, they even uſed enchantments to raiſe the dead, in order to get inſtructions what they muſt do to purge themſelves of their ſins. Add, that they frequently raiſed the opinion of the ſanctity of their expiations by fictitious miracles.

The birds, ſay they, practiſe *luſtration*, both by waſhing themſelves, and throwing water on their neſt. The hen takes ſtraw, and uſes it to purify her chickens.—There was ſcarce any action, at the beginning and end of which the Gentiles did not perform ſome ceremony to cleanſe themſelves, and appeaſe the gods. When they had no animals to ſacriſice, they made the figure of the beaſt they would offer in dough, metal, or other matter; and thus ſacrificed in effigy.

Some expiations were performed in the water; for which reaſon, certain fountains and rivers were in great reputation: others were performed in the air.—A certain Heathen cauſed himſelf to be ſeriouſly ſifted in a ſieve, as we now ſift corn: another hung himſelf by a cord, and was toſſed backwards and forwards: another ſhut his eyes, and ſet himſelf blindfold to find out a noſegay tied to a cord: others played at ſee-ſaw, as a more efficacious way of appeaſing the gods.

Fire was much uſed for expiation: Sometimes the penitents were caſt into the fire; at others, only brought to the flame, or ſmoke.

It was common, on theſe occaſions, to ſhed human blood: The prieſts of Cybele, Bellona, and Baal, made cruel inciſions on themſelves.—Erectheus, king of Attica, ſacrificed his daughter to Proſerpina. Several had their throats cut at Rome, to obtain the emperor's health from the gods. Thoſe who commanded armies, offered one of their ſoldiers to appeaſe the anger of the gods; that he alone might ſuffer all the wrath the army deſerved.

All ſorts of perfumes, and odoriferous herbs, had place in *luſtration*.—The egg was much uſed among them, as being the ſymbol of the four elements; its ſhell, they ſay, repreſents the earth; the yolk, a globe of fire; the white, reſembles the water; and beſides, it has a ſpirit which repreſents the air. For this reaſon it is, that the Bonza's, or Indian prieſts, believe to this day that the world came out of an egg.—There is ſcarce any pot-herb, pulſe, tree, mineral, or metal, which they did not offer the gods by way of expiation: Nor did they forget milk, bread, wine, or honey: what is more, they made uſe of the very ſpittle, and urine.

The poets had feigned that the gods purified themſelves, and they did not omit to purify their ſtatues,—They made a *luſtration* for children, the eighth day after their birth.—When a man, who had been falſely reputed dead, returned home, he was not to enter his houſe by the door.—It was a ſettled cuſtom to offer no expiation for thoſe who were hanged by order of juſtice; or that were killed by thunder. Neither did they offer any for thoſe who were drowned in the ſea; it being the common opinion, that their ſouls periſhed with their bodies. And hence it was, that perſons in danger of ſhipwreck ſometimes thruſt their ſwords through their bodies, that they might not die in the ſea; where they thought their ſoul, which they ſuppoſed to be a flame, would be totally extinguiſhed.

The moſt celebrated expiatory ſacrifice was the hecatomb, when they offered an hundred beaſts; though they commonly did not offer ſo many, but contented themſelves with killing twenty five; but thoſe being quadrupeds, their feet came to an hundred. See HECATOMB.

Luſtrations, and luſtratory ſacrifices were not only performed for men, but alſo for temples, altars, theatres, trees, fountains, rivers, ſheep, fields and villages. When the Arval brothers offered a victim for the fields, their ſacrifice was called *ambarvalia*. See AMBARVALIA.

Cities were all to be purified, from time to time: Some walked the victim round their walls, and then ſlew him.—The Athenians ſacrificed two men, one for the men of their city, and the other for the women. The Corinthians ſacrificed the children of Medea ſo; though the poets ſay, Medea killed them herſelf. The Romans performed the ceremony of purifying their city every fifth year; whence the name of *luſtrum*, given to the ſpace of five years. See LUSTRUM.

Divers of the expiations were auſtere: ſome faſted; others abſtained from all ſenſual pleaſures: ſome, as the prieſts of Cybele, caſtrated themſelves; others, that they might live chaſte, eat rue, or lay under the branches of a ſhrub called *agnus caſtus*. See AGNUS *Caſtus*.

The poſtures of the penitents were different, according to the different ſacrifices: They ſometimes joined prayers to the ſolemnity; at other times, a public confeſſion of ſins was made.—The Indians, when they ſacrifice to Hercules, call him a thouſand reproachful names; and think they incur his anger, if any reſpectful term come out of their mouth.

The prieſts changed their habits, according to the ceremonies to be performed: white, purple, and black, were the moſt uſual colours. They had their heads always covered, and long hair, except in the ſacrifices of Saturn, Hercules, Honour, and a few others: only the prieſts of Iſis were ſhaven, becauſe that goddeſs underwent the ſame operation, after the death of her huſband Oſiris.—In ſome ceremonies the prieſts were ſhod, in others barefoot: the poets expreſs the former by the word *vincula*. They had no girdles; nay, they durſt not pronounce the word *ivy*, becauſe ivy cleaves to every thing.—In the ſacrifices of Venus, and the Moon, every one took the habit of the contrary ſex.—Every thing was to be done by odd numbers; becauſe they looked on an even number, which may be equally divided, as the ſymbol of mortality and deſtruction. The odd number was with them holy: hence Neptune's trident, Cerberus's three heads, and Jupiter's thunder-dart, with three points.

They caſt into the river, or at leaſt out of the city, the animals, or other things that had ſerved for a *luſtration* or ſacrifice of atonement; and thought themſelves threatened with ſome great misfortune, when by chance they trod upon them.—At Marſeilles, they took care to feed a poor man for ſome time; after which, they charged him with all the ſins of the country, and drove him away: Thoſe of Leucade faſtened a number of birds to a man charged with their ſins, and in that condition caſt him headlong from a high tower; and if the birds hindered his being killed, they drove him out of the country.

Part of theſe ceremonies were aboliſhed by the emperor Conſtantine, and his ſucceſſors; the reſt ſubſiſted till the Gothic kings were maſters of Rome, under whom they expired; except that ſeveral of them were adopted by the popes, and brought into the church, where they make a figure to this day: witneſs the numerous conſecrations, benedictions, exorciſms, ablutions, ſprinklings, proceſſions, feaſts, *&c.* ſtill in uſe in the Romiſh church. See CONSECRATION, *&c.*

LUSTRUM*, a term uſed by the Romans, to ſignify a ſpace of five years.

* Varro derives the word from *luo*, to pay; becauſe at the beginning of every fifth year, they paid the cenſus, or tribute impoſed by the cenſors; whoſe authority, at their firſt inſtitution, was continued to them for five years; though afterwards it was abridged to one.—Others rather derive the word from *luſtrare*, to make a review; becauſe once in five years, the cenſors reviewed the army. See CENSUS, and CENSOR.

LUSTRUM was alſo a ceremony, or ſacrifice uſed by the Romans, after numbering their people once in five years. See LUSTRATION.

LUTE, **LUTUM**, in chymiſtry, a compoſition of certain tenacious ſubſtances, wherewith to cloſe the apertures, and junctures of veſſels in diſtillation, *&c.*

Under *lute* is comprehended any ſort of cement, or plaiſter, uſed either in the conſtruction of furnaces, or in fitting to them veſſels of glaſs, or earth, that are to reſiſt a very violent fire.—*Lutes* are made of flower and water; others, of quick-lime and whites of eggs; others, of iron filings, brick-duſt, and linſeed oil; others, of potter's earth, river ſand, horſes dung, powder of broken pots, caput mortuum of vitriol, droſs of iron, beaten glaſs, flocks of wool mixed with ſalt water, or bullock's blood.

The *lute* uſed by Lemery, was only two parts of ſand, and one of clay, tempered together in water; which does very well for joining the noſes of retorts, and their receivers in diſtilling of volatile ſpirits, *&c.*

In diſtilling by the alembic, or veſica, or copper body, with its head or ſerpentine, a wet bladder ſerves very well to *lute* the junctures of the veſſels: but for the diſtillation of corroſive ſpirits, as alſo to ſtop the cracks of glaſſes, *&c.* the following compoſition is recommended, *viz.* ſtarch boiled, or fiſh-glue diſſolved in ſpirit of wine, with flower of ſulphur, maſtic, and lime ſlacked in milk.

LUTE*, a muſical inſtrument of the ſtring-kind; which had anciently but five rows of ſtrings; though in courſe of time four, five, or ſix more have been added.

* Some derive the word from the German *laute*, which ſignifies the ſame; or from *lauten ſonare*.—Scaliger and Bochart derive it from the Arabic, *allaud*.

The *lute* conſiſts of four principal parts: the table; the body or belly, which has nine or ten ſides; the neck, which has nine or ten ſtops or diviſions marked with ſtrings; and the head or croſs, wherein are ſcrews, for raiſing or lowering the ſtrings to the proper tone.—In the middle of the table is a roſe, or paſſage for the ſound. There is alſo a bridge that the ſtrings are faſtened to, and a piece of ivory between the head and the neck, to which the other extremity of the ſtrings are fitted. In playing, the ſtrings are ſtruck with the right hand, and with the left the ſtops are preſſed.

The *lutes* of Bologna are eſteemed the beſt; on account of the wood, which is ſaid to have an uncommon diſpoſition for producing a ſweet ſound.—The theorbo is an improvement on the *lute*.

Temperament of the **LUTE**, denotes the alteration requiſite to be made in the intervals, both with regard to concords, and diſcords, in order to render them more juſt on that inſtrument.

*Archi-*LUTE. See the article ARCILEUTO.

Theorbo LUTE. See the article THEORBO.

LUTHERANISM, the ſentiments of Dr. Martin Luther, and his followers, with regard to religion.

Lutheraniſm had its riſe in the 16th century: its author was born at Eiſleben in Thuringia, in 1483.—After his ſtudies, he entered himſelf among the Auguſtines; and in 1512, took the cap of a doctor in theology, in the univerſity of Wirtemberg.

In 1516, he attacked the ſchool-divinity in ſeveral theſes.—In 1517, Leo X. having ordered indulgences to be diſpenſed to thoſe who ſhould contribute towards the building of S. Peter's church at Rome, he gave a commiſſion thereof to the Dominicans.—The Auguſtines thinking they had a title to it before any body elſe, John Staupitz, their commiſſary-general, appointed Luther to preach againſt thoſe diſpenſers of indulgences. See INDULGENCE.

Luther acquitted himſelf, in a manner, that perhaps the commiſſary had not imagined: from the preachers of indulgences he proceeded to indulgences themſelves, and inveighed very warmly, both againſt the one and the other.

At firſt he only advanced ambiguous propoſitions; but being engaged in diſpute about them, he maintained them openly, and without reſerve; inſomuch, that in 1520 he was ſolemnly condemned, and excommunicated by the pope.—But neither the pope's thunder, nor the condemnation of ſeveral univerſities, could make any impreſſion of terror upon him; but he continued preaching, writing and diſputing, not againſt indulgences only, but ſeveral other corruptions which then prevailed in the church.

The character of the man, the ſtrength of his arguments, and the weakneſs of his adverſaries cauſe, ſoon procured him a number of followers.—And thus it was that *Lutheraniſm* was formed; the adherents whereto were called *Lutherans*, from *Lutherus*, a name which has a Greek turn, and which he aſſumed in lieu of his family name, *Lotter*, or *Lauther*; it being the cuſtom of thoſe days, for men of learning to give themſelves Greek names: witneſs Eraſmus, Melanchthon, Bucer, *&c.* See NAME.

In 1523, Luther quitted the habit of a religious, and in 1524, married; after having been a happy inſtrument of reforming a great part of Germany, under the protection of George duke of Saxony.—He died at his native place, in 1546. See REFORMATION.

The firſt who received *Lutheraniſm*, were the people of Mansfeld, and the Saxons: it was preached at Kreichſaw, in 1521.—It was received at Goſlar, Roſtock, Riga in Livonia, Rentling, and at Hall in Suabia, at Augsburg, Hamburg, and Treptow in Pomerania, in 1522.—In Pruſſia, in 1523; at Einbech in the dutchy of Lunenburg, at Nuremberg, and Breſlaw, in 1525.—In Heſſe, in 1526; at Aldenburg, Straſburg, and Brunſwick, in 1528; at Gottingen, Lemgou, and Lunenburg, in 1530; at Munſter, and Paderborn in Weſtphalia, in 1532; at Ethlingen, and Ulm, in 1533; in the dutchy of Grubenhagen, at Hanover, and in Pomerania, in 1534; in the dutchy of Wirtemberg, in 1535; at Cothus, in the lower Luſace, in 1537; in the county of Lippe, in 1538; in the electorate of Brandenburg, at Bremen, Hall in Saxony, Leipſic in Miſnia, and at Quedlenburg, in 1539; at Embden in Eaſt-Friſeland, Hailbron, Halberſtadt, and Magdeburg, in 1540; in the palatinate of the dutchy of Newburg, at Regensburg, and Wiſmar, in 1542; at Buxtende, Hildeſheim, and at Oſnaburg, in 1543; in the lower Palatinate, in 1546; in Mecklemburg, in 1552; in the marquiſate of Durlach, and that of Hochberg, in 1556; in the county of Bentheim, in 1564; at Haguenaw, and in the lower marquiſate of Baden, in 1568; and in the dutchy of Magdeburg, in 1570. *Jovet*, T. I. p. 460, ſeq.

Lutheraniſm has undergone ſome alterations ſince the time of its founder.—Luther rejected the epiſtle of S. James, as inconſiſtent with the doctrine of S. Panl, in relation to juſtification; he alſo ſet aſide the Apocalypſe: both which are now received as canonical, in the Lutheran church.

Luther reduced the number of ſacraments to two, *viz.* baptiſm, and the euchariſt; but he believed the impanation, or conſubſtantiation: that is, that the matter of the bread and wine, remain with the body and blood of Chriſt; and it is in this article, that the main difference between the Lutheran and Engliſh churches conſiſts. See CONSUBSTANTIATION.

Luther maintained the maſs to be no ſacrifice; exploded the adoration of the hoſt, auricular confeſſion, meritorious works, indulgences, purgatory, the worſhip of images, *&c.* which had been introduced in the corrupt times of the Romiſh church. He alſo oppoſed the doctrine of free will; maintained predeſtination, aſſerted that we are neceſſiated in all we do, that all our actions done in a ſtate of ſin, and even the virtues themſelves, of heathens, are crimes; that we are only juſtified by the imputation of the merits and ſatisfaction of Chriſt. He alſo oppoſed the faſtings in the Romiſh church, monaſtical vows, the celibate of the clergy, *&c.*

Some authors reckon thirty nine different ſects, which at different times have ſprung up among the Lutherans, *viz.* the *Confeſſioniſts*, *Antinomians*, *Samoſatenſes*, *Inferani*, *Antidiaphoriſts*, *Antiſwenkfeldians*, *Antioſiandrians*, *Anticalviniſts*, *Layers on of hands*, *Biſſacramentales*, *Triſſacramentales*, *Majorites*, *Adiaphoriſts*, *Quadriſacramentales*, *Luthero-calviniſts*, *Anmetes*, *Medioſiandrians*, *Confeſſioniſts firm and wavering*, *Swenkfeldians*, *Onandrians*, *Stanoandrians*, *Antiſtancarians*, *Zuinglians ſimple*, *Zuinglians ſignificative*, *Carloſtadians*, *Evargic Tropiſts*, *Arrabonarii ſpiritual*, *Sucefeldians*, *Serveтиſts*, *Davidics* or *Davidi-Georgians*, *Mennonites*, &c. *Jovet*, T. I. p. 475.

LUTHERANS, a ſect of Proteſtants who profeſs *Lutheraniſm*, or adhere to the doctrine and tenets of Luther. See LUTHERANISM.

The *Lutherans*, of all Proteſtants, are thoſe who differ leaſt from the Romiſh church.—They are divided into ſeveral ſects; the principal whereof are recited in the following articles, and in their proper places in the courſe of this book.

Moderate **LUTHERAN**, one who ſoftens or mitigates Luther's doctrine; or follows the doctrine of Luther thus mitigated. —Melanchthon was the firſt of this ſect.

Lax **LUTHERAN**, is an appellation given to thoſe who complied with the Interim, and who formed three different parties; that of Melanchthon, Pacius, or Pfeffinger, and that of the univerſity of Leipſic, and the divines of Franconia. See INTERIM, and ADIAPHORIST.

Rigid **LUTHERAN**, one who ſtill maintains the ancient Lutheraniſm of Luther, and the firſt *Lutherans*.

As to the articles of predeſtination, and grace, the *Lutherans* are no longer rigid.—The head of the *rigid Lutherans* was Flaccius Illyricus, the chief of the four authors of the *Eccleſiaſtical Hiſtory divided into Centuries*; known under the name of *Magdeburg Centuries*, or *Centuriators*.—This man could not bear the leaſt alteration to be made in Luther's doctrine.

LUTHERO-CALVINIST, one who holds the opinions of *Calvin*, together with thoſe of *Luther*; ſo far as they are capable of ſubſiſting together.

LUTHERO-OSIANDRIAN, one who blends together the doctrine of *Luther*, and that of *Lucas Oſiander*.

LUTHERO-PAPIST, an appellation given to thoſe *Lutherans* who excommunicated the Sacramentarians.

LUTHERO-ZUINGLIAN, one who jumbles together the opinions of *Luther* and *Zuinglius*.

Martin Bucer, of Scheleſtadt in Alſace, who, from a Dominican, by a twofold apoſtaſy, as the Romaniſts call it, became a *Lutheran*, was the head of the *Luthero-Zuinglians*; whoſe tenets were not ſo much a mixture of *Lutheraniſm* and *Zuinglianiſm*:—But what rather entitled them to the appellation was, that they formed a ſociety, who agreed to tolerate and bear with each other's opinions.

LUTHERN *, a kind of window over the cornice, in the roof of a building; ſtanding perpendicularly over the naked of the wall; and ſerving to illuminate the upper ſtory. See WINDOW.

* The word comes from the French, *lucarne*, of the Latin, *lucerna*, light, or lantern.

The French architects diſtinguiſh theſe into various kinds, according to their various forms; as *ſquare*, *ſemicircular*, *bulls eyes*, *flat arches*, *Flemiſh lutherns*, *&c.*

LUTUM *Sapientiæ*, is the hermetical ſeal; made by melting the end of a glaſs veſſel by a lamp, and twiſting it up with a pair of pliers. See HERMETICAL *Seal*.

LUXATION *, LUXATIO, in medicine and ſurgery, the ſlipping of the head of a bone from its proper receptacle into another place; whereby the natural motion of the joint is deſtroyed. See BONE, and ARTICULATION.

* The word is Latin, formed from *luxare*, to looſen.

Luxation is the ſame with what is otherwiſe called *diſlocation*; being the diſplacing of a bone, or rather the disjointing of two bones, articulated together for the motion of the part.

Luxations are either *violent*, proceeding from ſome external cauſe; as falls, ſtrains, blows, leaps, extenſions, *&c.*—Or *gentle*, ariſing from internal cauſes; as a natural laxity of the ligaments, a fluxion of humours, or gradual collection thereof between the joints, *&c.*

Luxation, properly, has place only amongſt bones whoſe ſtructure determines them to a manifeſt motion, as are all thoſe united by diarthroſis; thoſe articulated by ſynarthroſis, where there is no manifeſt motion, are indeed ſubject to fracture, caries, exoſtoſis, *&c.* but not to *luxation*. See DIARTHROSIS, *&c.*

Luxations, again, are either *perfect*, or *imperfect*.

Perfect, or *compleat* **LUXATION**, ΕΞΑΡΘΡΗΜΑ, is that where the head of a bone is actually ſtarted out of the cavity of another.—It is known by a tumour, or protuberance, formed by the head of the ſeparated bone, which raiſes up the ſkin, and muſcular fleſh above its natural level in the part not deſtined to receive it; and a hollowneſs or ſinking in the place from whence it is ſtarted, perceivable by the touch.—It is alſo attended with great pain, a total abolition of motion, and a ſhortening of the limb.

Imperfect, or *partial* **LUXATION**, ΠΑΡΑΡΘΡΗΜΑ, called alſo *ſubluxation*, is where the motion is only much impaired, the joint weakened, and a deformity perceivable in it, when compared with the oppoſite part, which is ſound.—This is otherwiſe called a *ſtrain*, when it proceeds from an external cauſe; or, ſimply, a *relaxation*, when from an internal one.

A *luxation* is ſaid to be *ſimple*, when it has no other accident or injury accompanying it—*complicated*, when it is attended with a wound, inflammation, fracture, or the like.

The cure of a *luxation*, is by a ſpeedy reduction of the diſlocated member to its natural place.—To this are neceſſary, 1°. *Extenſion*, αντιτασις, which a luxated as well as fractured member requires; as well on account of the contraction of the tendons, as that the head of the bone may more directly be intruded into its ſeat.—This extenſion is made either by the hands alone, which is called *modus palæſtricus*, becauſe, among wreſtlers, diſlocated members uſe to be reduced after this manner; or by ligatures, or towels; or by inſtruments, or great machines, when the *luxation* is difficult, and inveterate.

2°. After extenſion, follows the intruding of the joint into the natural cavity; which, likewiſe, may either be effected by the hands only, or by the heel, (as when the head of the os humeri is fallen into the arm-pit) or by means of ladders, doors, peſtles, or Hippocrates's inſtrument, called *ambe*.—This way is termed *methodical*, by way of diſtinction from the third, which is called *organical*, becauſe performed by large inſtruments, and machines, but now altogether out of uſe.

Gourmelinus to theſe adds αποθεσις, the very act of reducing the member into its own place, which is to be known by the ſound uſually heard, and from the uſe and motion of the reduced joint.

Laſtly, becauſe on account of the laxity of the tendons, *&c.* the reduced bone cannot remain in its natural poſition, it is neceſſary yet further to apply compreſſes and bandage; by whoſe means the articulation is preſerved ſafe, till the ligaments may acquire their uſual ſtrength of elaſticity and aſtriction.

LYCANTHROPY *, ΛΥΚΑΝΘΡΩΠΙΑ, a ſpecies of madneſs, wherein thoſe affected run, in the night-time, howling about the fields like wolves; and ſome bite and ſnarl like dogs: whence the diſeaſe is alſo called by the ancients, *cynanthropy*.

* The word is formed of the Greek λυκος, wolf, and ανθρωπος, man: *q. d.* man-wolf.

Lycanthropy is alſo uſed for an imaginary metamorphoſis of a man into a wolf, by magic power; wherein the perſons affected ſeem not only to themſelves in the form of wolves, but to others. See METAMORPHOSIS.

LYCEUM, ΛΥΚΕΙΟΝ, the name of a celebrated ſchool, or academy at Athens, where Ariſtotle explained his philoſophy. See ARISTOTELIAN.

The place was compoſed of portico's, and trees planted in the quincunx form, where the philoſophers diſputed walking. See PERIPATETIC.

Hence, *philoſophy of the lyceum* is uſed, to ſignify the philoſophy of Ariſtotle, or the peripatetic philoſophy.

Suidas obſerves, that the *lyceum* took its name from its having been originally a temple of Apollo *Lyceus*; or rather, a portico, or gallery built by Lycus, ſon of Apollo: but others mention it to have been built by Piſiſtratus, or Pericles.

LYCOCTONON. See the article ACONITE.

LYDIAN *Mode*. See the article MODE.

LYGMOS, ΛΥΓΜΟΣ. See the article HICCUP.

LYMPH, LYMPHA, in anatomy, a thin tranſparent humour, ſomething like water; ſecreted from the ſerum of the blood in all parts of the body, and returned to the blood again, by proper ducts of its own, called *lymphatics*; and ſuppoſed, by ſome, to be the immediate matter of nutrition. See LYMPHATICS, HUMOUR, NUTRITION, *&c.*

If the *lymph* be chymically examined, it will be found to contain a great deal of volatile, but no fixed ſalt, ſome phlegm, ſome ſulphur, and a little earth.

The uſe of the *lymph* may be gathered from the conſideration of the parts into which it diſcharges itſelf.—That which comes from the head, neck, and arms, is thrown into the jugular and ſubclavian veins.—All the lymphatics, which the parts in the cavity of the thorax ſend out, empty themſelves into the thoracic duct; and the *lympha*, from all the reſt of the body, flows to the common receptacle: ſo that there can be no doubt, but that its chief uſe is to dilute, and perfect the chyle, before it mixes with the blood. See CHYLE, CHYLIFICATION, and SANGUIFICATION.

LYMPHATICS, or LYMPHÆDUCTS, a ſort of fine, ſmall, tranſparent veſſels, generally ariſing from the glands, and conveying back to the blood a tranſparent liquor, called *lymph* or *lympha*. See LYMPH.

Theſe, though not ſo viſible as the other veſſels, becauſe of their minuteneſs, and tranſparency, are, however, exiſtent in all parts of the body; but the difficulty of finding them, has prevented their being deſcribed in many parts.

The *lymphatics* are contracted at ſmall and unequal diſtances by two oppoſite ſemi-lunar valves, which permit the lymph to paſs through them towards the heart; but ſhut, like flood-gates, upon its returning.

They ariſe in all parts of the body, but after what manner, needs no great diſpute; for, without doubt, all the liquors in the body, excepting the chyle, are ſeparated from the blood in the fine capillary veſſels, by a different pipe from the common channel in which the reſt of the blood moves: but whether this pipe be long or ſhort, whether it be viſible or inviſible, it is ſtill a gland, whilſt it ſuffers ſome part of the blood to paſs through it; denying a paſſage to the reſt. See GLAND.

Now, the glands which ſeparate the lymph muſt be of the ſmalleſt kind, for they are inviſible to the fineſt microſcope; but their excretory ducts, the *lymphatic* veſſels, unite with one another, and grow larger, as they approach the heart: yet, they do not open into one common channel, as the veins do; for ſometimes we find two, or three, or more *lymphatics*, running by one another; which only communicate by ſhort intermediate ducts, and which unite, and immediately divide again.—In their progreſs, they always touch at one or two conglobate or veſicular glands, into which they diſcharge themſelves of their lympha.—Sometimes the whole *lymphatic* opens, at ſeveral places, into the gland; and ſometimes it ſends in only two or three branches, whilſt the main trunk paſſes over, and joins the *lymphatics* which ariſe from the oppoſite ſides of the gland, exporting again their lympha to their common receptacle.

The glands of the abdomen, which receive the *lymphatics* from all its parts, as likewiſe from the lower extremities, are the glandulæ inguinales, ſacræ, iliacæ, lumbares, meſentericæ, and hepaticæ; all which ſend out new *lymphatics*, which pour their contents into the receptaculum chyli; as thoſe of the cheſt, head, and arms do into the ductus thoracicus, jugular and ſubclavian veins.

Theſe glands are round and ſmooth bodies, about the bigneſs of a hazle nut, bigger or leſſer, according to the number of *lymphatics* they receive.—Their ſubſtance is membranous, and their whole bulk divided into little cells, which receive the lymph from the *lymphatics*; and are therefore improperly called *glands*, becauſe they ſeparate no liquor from the blood.

It is true, that their exporting *lymphatics*, communicating with their arteries, do receive a lymph from them; but this is done without the help of conglobate glands; as the lacteal veins do with the capillary arteries of the guts; the chief uſe of their veſicular bodies ſeems to be, that the ſlow-moving lympha may receive a greater velocity from the elaſtic contraction of their membranous cells, as well as from the new lymph immediately derived from the arteries. See GLAND.

LYRA, a conſtellation in the northern hemiſphere. See STAR, and CONSTELLATION.

The number of its ſtars in Ptolemy's and Tycho's catalogues are 10, in the Britannic catalogue 19; the names, places, longitudes, latitudes, and magnitudes whereof, are as follow:

Stars in the conſtellation Lyra, *or* Vultur Cadens.

Names and Situations of the Stars.	Signs.	Longitude °	′	″	Latitude North. °	′	″	Magnit.

LYRA *Lucida*. See the article LUCIDA.

LYRE, LYRA, a ſtringed inſtrument much uſed among the ancients; ſaid to have been invented by Mercury, on occaſion of his finding a dead ſhell-fiſh, called by the Greeks, *chelone*, and Latins, *teſtudo*, left on an inundation of the Nile; of the ſhell whereof he formed his *lyre*; mounting it with ſeven ſtrings, according to Lucian, and adding a kind of jugum to it, to ſtretch or looſen the ſtrings.

Boethius relates the opinion of ſome, who ſay, that Mercury's *lyre* had but four ſtrings, in imitation of the mundane muſic of the four elements.—Diodorus Siculus ſays it had but three ſtrings, in imitation of the three ſeaſons of the year; which were all the Greeks counted, *viz.* ſpring, ſummer, and winter.—Nicomachus, Horace, Lucian, and others, make it have ſeven ſtrings, in imitation of the ſeven planets.

This three, four, or ſeven ſtringed inſtrument, Mercury gave to Orpheus; who being torn to pieces by the Bacchantes, the *lyre* was hung up by the Leſbians in Apollo's temple.—Others ſay, Pythagoras found it in ſome temple in Egypt, and added an eighth ſtring.—Nicomachus ſays, that when Orpheus was killed, this *lyre* was caſt into the ſea, and thrown up at Antiſſa, a city of Leſbos; where the fiſhermen finding it, gave it to Terpander; who carried it into Egypt, and called himſelf the inventor.—The ſeven ſtrings were diatonically diſpoſed, by tones, and ſemi-tones; and Pythagoras's eighth ſtring made up the octave.

Mr. Barnes, in the prolegomena to his edition of *Anacreon*, has an enquiry into the antiquity and ſtructure of the *lyre*; of which he makes Jubal the firſt inventor. For the ſeveral changes this inſtrument underwent, by the addition of new ſtrings, he obſerves, that according to Diodorus, it had originally only three; whence it was called τριχορδος. Afterwards, it had ſeven ſtrings; as appears from Homer, Pindar, Horace, Virgil, &c. Feſtus Avienus gives the *lyre* of Orpheus nine ſtrings. David mentions an inſtrument of that ſort ſtrung with ten, *in pſalterio decachordo*. Timotheus of Miletus added four to the old ſeven, which made eleven. Joſephus, in his *Jewiſh Antiquities*, makes mention of one with twelve ſtrings; to which were afterwards added ſix others, which made eighteen in all.—Anacreon himſelf ſays, p. 253. of Mr. Barnes's edition, *canto viginti totis chordis*.—For the modern *lyre*, or Welſh harp, conſiſting of forty ſtrings, it is ſufficiently known.

From the *lyre*, which all agree to be the firſt inſtrument of the ſtringed kind in Greece, aroſe an infinite number of others, differing in ſhape, and number of ſtrings; as the pſalterium, trigon, ſambucus, pectis, magadis, barbiton, teſtudo, (the two laſt uſed promiſcuouſly, by Horace, with the *lyre* and *cithara*) epigonium, ſimmicium, and pandura; which were all ſtruck with the hand, or a plectrum. See PSALTERY, SAMBUCA, MAGADIS, BARBITON, CITHARA, &c.

LYRE, among painters, ſtatuaries, &c. is an attribute of Apollo, and the muſes. See ATTRIBUTE.

LYRIC, ſomething ſung, or played on the lyre or harp. See LYRE.

LYRIC is more particularly applied to the ancient odes, and ſtanza's; which anſwer to our *airs*, or *ſongs*, and may be played on inſtruments. See ODE.

The ancients were great admires of *lyric verſes*; which name, Mr. Barnes obſerves, they gave to ſuch verſes as were ſung to the lyre. See VERSE.

This ſpecies of poetry was originally employed in celebrating the praiſes of gods and heroes; though it was afterwards introduced into feaſts, and public diverſions: it is a miſtake to imagine Anacreon, as the Greeks do, the author of it; ſince it appears from ſcripture to have been in uſe above a thouſand years before that poet.—Mr. Barnes ſhows how unjuſt it is to exclude heroic ſubjects and actions from this ſort of verſe, *lyric poetry* being capable of all the elevation and ſublimity ſuch ſubjects require; which he confirms by the example of Alcæus, Steſichorus, Anacreon, and Horace, and by his own eſſay, *A Triumphal Ode, inſcribed to the duke of Marlborough*, at the head of this edition: he concludes with the hiſtory of *lyric poeſy*, and of thoſe ancients who excelled in it.

The characteriſtic of *lyric poetry*, which diſtinguiſhes it from all others, is *ſweetneſs*.—As *gravity* rules in heroic verſe; *ſimplicity*, in paſtoral; *tenderneſs*, and *ſoftneſs*, in elegy; *ſharpneſs*, and *poignancy*, in ſatyr; *mirth*, in comedy; the *pathetic*, in tragedy; and the *point*, in epigram: ſo in the *lyric*, the poet applies himſelf wholly to ſooth the minds of men, by the ſweetneſs and variety of the verſe, and the delicacy of the words, and thoughts; the agreeableneſs of the numbers, and the deſcription of things moſt pleaſing in their own nature. See ODE, SONG, &c.

LYSIARCHA, an ancient kind of magiſtrate, being the pontiff of Lycia, or ſuperintendant of the ſacred games of that province.

Strabo obſerves, that the *Lyſiarcha* was created in a council, conſiſting of the deputies of twenty three cities; that is, of all the cities in the province: ſome of which cities had three voices, others two, and others but one.

Cardinal Noris ſays, that the *Lyſiarcha* preſided in matters of religion; in effect, the *Lyſiarcha* was nearly the ſame with the *Aſiarcha*, and *Syriarcha*; who though they were all the heads of the councils, or ſtates of thoſe provinces, yet were they eſtabliſhed principally to take care of the games and feaſts celebrated in honour of the gods, whoſe prieſts they were inaugurated at the ſame time that they were created *Lyſiarcha*, *Syriarcha*, or *Aſiarcha*.

M.

M, A liquid conſonant, and the twelfth letter in the alphabet. See LETTER, and ALPHABET.

It is pronounced by ſtriking the upper lip againſt the lower; in which the pronunciation of this letter agrees with that of *b*: the only difference between the two conſiſting of a little motion made in the noſe in pronouncing *M*, and not in *b*: whence it happens that thoſe who have taken cold, for *M* ordinarily pronounce *b*; the noſe in that caſe being diſabled from making the neceſſary motion. See B.

Quintilian obſerves, that the *M* ſometimes ends Latin words, but never Greek; the Greeks always changing it in that caſe into *n*, for the ſake of the better ſound. See N.

M is alſo a numeral letter, and among the ancients was uſed for a thouſand; according to the verſe,

M caput eſt numeri quem ſcimus mille tenere.

When a daſh is added a top of it, as $\overline{M}$; it ſignifies a thouſand times a thouſand,

M, in aſtronomical tables, and other things of that kind, is uſed for *Meridional* or ſouthern; ſometimes for *Meridies*, or midday.

M, in medicinal preſcription, is frequently uſed to ſignify a manipule, or handful. See MANIPULE.

M is ſometimes alſo put at the end of a recipe, for *miſce*, mingle; or *mixtura*, a mixture. Thus, *m. f. julapium* ſignifies, mix and make a julep.

M, in law, the brand or ſtigma of a perſon convicted of manſlaughter, and admitted to the benefit of his clergy.—It is to be burnt on the brawn of his left thumb.

MACARONIC, or MACARONIAN *, a kind of burleſque poetry; conſiſting of a jumble of words of different languages, with words of the vulgar tongue latinized, and Latin words modernized. See BURLESQUE, &c.

* *Maccarone*, among the Italians, as has been obſerved by Cælius Rhodiginus, ſignifies a coarſe clowniſh man; and becauſe this kind of poetry, being patch'd out of ſeveral languages, and full of extravagant words, is not ſo polite and ſmooth as thoſe of Virgil, &c. the Italians, among whom it had its riſe, gave it the name of *Maccaronian*, *Maccaronic* poetry. Others chuſe to derive it *à Macaronibus*, from *Macaroons*, a kind of confection made of meal not boulted, ſweet-almonds, ſugar, and the white of eggs; accounted a great dainty among the country people in Italy; which, from their being compoſed of various ingredients occaſioned this kind of poetry, which conſiſts of Latin, Italian, Spaniſh, French, Engliſh, &c. to be called by their name.

For an inſtance; a bold fellow in the *Macaronic* ſtyle, ſays;

Enfilavi omnes Scadrones & Regimandos, &c.

Another example:

Archeros piſtoliferos furiamque manantum,
Et grandem eſmeutam quæ inopinum facta ruellæ eſt:
Toxinumque alto troublantem corda clochero, &c.

Theoph. Folingius, a Benedictin monk of Mantua, was the firſt who invented, or at leaſt cultivated, this kind of verſe: For though we have a *Macaronea Ariminenſis* in a very old letter, beginning, *Eſt Author Typhis Leonicus atque Paranſus*; yet it ſeems to have been the work of Guarinus Capellus Sarſinas, who in the year 1526 printed ſix books of *Macaronic* poetry, *in Cabrinum Gagamogæ Regem*: but as both theſe came out after the firſt edition of Folingius, which was publiſhed under the name of Merlinus Coccajus in 1520; ſo were they likewiſe much inferiour to him both in the ſtyle, invention and epiſodes wherewith he has enriched the hiſtory of Baldus; which make the ſubject of his poem.—The famous Rabelais firſt transferred the *Macaronic* ſtyle out of the Italian verſe into French proſe, and on the model thereof formed ſome of the beſt things in his *Pantagruel*.

Merlin Coccajus met with ſo much ſucceſs in his new way, that he compoſed another book partly in *Macaronic* ſtyle, called *Il Chars del tri per uno*; but with very different ſucceſs. After this, appeared in Italy, *Macaronica de ſyndicatu, & condemnatione doctoris Samſonis Lembi*, a low performance; and *Macaronis Forza*, an excellent one, by Steſonio a jeſuit. In 1620, Bajani publiſhed a *Carnavale Tabula Macaronea*. The laſt Italian who wrote in this way, was Cæſar Urſinius, to whom we owe *Capricia Macaronica magiſtri Stopini poetæ Pouzanenſis*, printed in 1636.

The firſt who ſucceeded in the *Macaronic* ſtyle among the French was *Antonius de Arena Provenſalis de Bragardiſſima Villa de Soleriis*, in two poems, which he has left us, *de Arte Danſandi, & de Guerra Neapolitana Romana & Genuenſi*. He was followed by another lawyer, who wrote *Hiſtoria braviſſima Caroli V. Imperat. a Provincialibus payſanis triumphanter fugati*. Some time after, Remi Belleau, among his other French poeſies, printed *Dictamen metrificum de bello Hugonotico, & ruſticorum pigliamine ad ſodales*; a piece much valued. This was ſucceeded by *Cacaſanga Reiſtro Suiſſo Lanſquenetorum per M. J. B. Lichiardum Recatolicatum Spaliporcinum poetam*; to which Stephen Tabouret returned an anſwer in the ſame ſtrain. Laſtly, John Edward de Monin entered the liſts, and left us *inter teretiſmata ſua carmen arenaicum de quorundam nugigerulorum piaſſa inſupportabili.* The *Recitus veritabilis ſuper terribili eſmeuta paiſanorum de Ruellio*, is one of the beſt pieces of this kind.

We have little in Engliſh in the *Macaronian* way; nothing ſcarce, but ſome little looſe pieces collected in Camden's remains: which is no diſcredit to our authors; for one may ſay of ſuch pieces in general,

Turpes eſt difficiles habere nugas,
Et ſtultus labor eſt ineptiarum.

But the Germans and Netherlanders have had their *Macaronic* poets; witneſs the *Certamen catholicum cum Calviniſtis*, of one Martinius Hamconius Friſius, which contains about twelve hundred verſes, all the words whereof begin with the letter *C*.

MACE, MACIS, a medicinal bark, or rind; the ſecond of the three which cover the nutmeg. See NUTMEG.

It is of an aſtringent and drying nature, and is uſed as a corrector in cardiac and cathartic compoſitions. See BARK.

MACEDONIANS. See the article SEMIARIAN.

MACERATION, in pharmacy, the operation of diſſolving a ſolid body by means of water. See DISSOLUTION.

In which ſenſe, the word amounts to much the ſame with liquefaction or liquation. See LIQUEFACTION.

MACERATION is alſo uſed for the infuſing a body in any menſtruous fluid, in order to a ſolution of its principles, whether with or without fire.

In which ſenſe *Maceration* amounts to much the ſame with *Digeſtion*. See DIGESTION.

Others reſtrain *Maceration* to that particular kind of digeſtion, which is performed in thick ſubſtances, as when having mixed roſes with fat to make Unguent. Roſatum, the mixture is expoſed for ſome days to the ſun, that the virtue of the roſes may be the better communicated to the fat.

MACHINE, MACHINA *, in the general, ſignifies any thing that ſerves to augment, or to regulate moving powers: or it is any body deſtined to produce motion, ſo as to ſave either time or force. See MOTION and POWER.

* The word comes from the Greek, μηχανὴ, *Machine, Invention, Art*.—And hence in ſtrictneſs, a *Machine* is ſomething that conſiſts more in art and invention, than in the ſtrength and ſolidity of the materials; and for this reaſon it is that the inventors of *Machines* are called *Ingenieurs* or *Ingeneers*. See ENGINE.

Machines are divided into *ſimple* and *compound*.

Simple MACHINES are thoſe otherwiſe called mechanical powers. See MECHANICAL POWER.

There are ſix ſimple *Machines*, to which all others may be reduced; *viz.* the balance, lever, wheel, pulley, wedge, and ſcrew. ——For the doctrine of which, ſee BALANCE, LEVER, &c.

Compound MACHINE is that which is compoſed of ſeveral ſimple ones combined together.

The number of compound *Machines* is now almoſt infinite; and yet the ancients ſeem to have out-done the moderns in this reſpect; their *Machines* of war, architecture, &c. being deſcribed as vaſtly ſuperiour to ours.

Architectonical MACHINE, is an aſſemblage of pieces of wood ſo diſpoſed, as that by means of ropes and pulleys, a ſmall number of men may raiſe vaſt loads, and lay them in their places. Such are cranes, &c.

It is hard to conceive what *Machines* the ancients muſt have uſed to raiſe thoſe immenſe ſtones found in ſome of the antique buildings.

Hydraulic, or *Water*-MACHINE, is either uſed to ſignify a ſimple *Machine*, ſerving to conduct or raiſe water; as a ſluice, pump, &c. or ſeveral of theſe acting together, to produce ſome extraordinary effect; as the

MACHINE of *Marly*, the primum mobile whereof, is an arm of the river Seine, which by its ſtream turns ſeveral large wheels, which work the handles, and theſe with piſtons raiſe the water into the pumps, and with other piſtons force it up in pipes againſt the aſcent of a hill to a reſervoir in a ſtone tower, 62 fathom higher than the river; ſufficient to ſupply Verſailles with a conſtant ſtream of 200 inches.

Military MACHINES, among the ancients were of three kinds; the firſt ſerving to launch arrows, as the ſcorpion; javelins, as the catapulta; ſtones, as the baliſta; or fiery darts, as the pyraboli: the ſecond ſerving to beat down walls, as the battering ram and terebra: and the third to ſhelter thoſe who approached the enemies wall; as the tortoiſe or teſtudo, the vinea, and the towers of wood. See SCORPION, ARIES, &c.

The *Machines of War* now in uſe, conſiſt in artillery, bombs, petards, &c. See ARTILLERY, GUN, CANNON, &c.

MACHINE, in dramatic poetry, is when the poet brings ſome divinity or ſupernatural being upon the ſtage; to perform ſome exploit, or ſolve ſome difficulty out of the reach of human power.

The *Machines* of the drama are gods, angels, ghoſts, &c. which are ſo called from the *Machines* or contrivances by which they are repreſented upon the ſtage, and afterwards removed again.

Hence, the uſe of the word *Machine* has alſo paſſed into the epic poem; though the reaſon of its name be there wanting: it denotes in both caſes, the intervention, or miniſtry of ſome divinity: but as the occaſion of *Machines*, in the one and the other, are ſomewhat different, the rules and laws of managing them are different likewiſe.

The ancient dramatic poets never brought any *Machine* on the ſtage, but where there was an abſolute neceſſity for the preſence of a god; and were generally laughed at for ſuffering themſelves to be reduced to ſuch a neceſſity. Accordingly *Ariſtotle* lays it down as an expreſs law, that the unravelling of the piece ſhould ariſe from the fable itſelf; and not from any foreign *Machine*, as in the Medea. Horace is ſomething leſs ſevere; and contents himſelf with ſaying, that the gods ſhould never appear, unleſs where the *Nodus*, or knot, is worthy of their preſence; *Nec Deus interſit, niſi dignus Vindice Nodus,—Inciderit.* See INTREAGUE, CATASTROPHE, &c.

But it is quite otherwiſe with the Epopea; there muſt be *Machines* every where, and in every part. Homer and Virgil do nothing without them. Petronius, with his uſual fire, maintains, that the poet ſhould deal more with the gods than with men; that he ſhould every where leave marks of his prophetic raptures, and of the divine fury that poſſeſſes him; that his thoughts be all full of fables, that is, of allegories and figures: In fine, he will have a poem diſtinguiſhed from an hiſtory in all its parts; not ſo much by the verſes, as by that poetical fury which expreſſes itſelf wholly by allegories, and does nothing but by *Machines*, or the miniſtry of the gods.

A poet, therefore, muſt leave it to the hiſtorians to ſay, that a fleet was diſperſed by a ſtorm, and driven to foreign ſhores; and muſt himſelf ſay with Virgil, that Juno went to ſeek Æolus, and that this god, at her requeſt, turned the winds looſe againſt the Trojans.—He muſt leave the hiſtorian to write, that a young prince behaved himſelf with a great deal of prudence and diſcretion on all occaſions; and muſt ſay with Homer that Minerva led him by the hand in all his enterprizes.—Let an hiſtorian ſay, that Agamemnon, quarrelling with Achilles, had a mind to ſhew him, though miſtakenly, that he can take Troy without his aſſiſtance. The poet muſt ſay that Thetis, piqued at the affront her ſon received, flies up to heaven to demand vengeance of Jupiter; and that this god, to ſatisfy her, ſends the god Somnus, or Sleep, to Agamemnon, to deceive him, and make him believe that he ſhall take Troy that day.

It is thus that the epic poets uſed *Machines* in all parts of their works: in the Iliad, Odyſſee, and Æneid, the propoſition mentions them; the invocation is addreſſed to them; and the narration is full of them: they are the cauſe of actions; they make the knots; and at laſt they unravel them.—This laſt circumſtance is what Ariſtotle forbids in the drama; but it is what Homer and Virgil have both practiſed in the Epopea. Thus Minerva fights for Ulyſſes againſt Penelope's lovers, helps him to deſtroy them; and the next day, herſelf makes the peace between Ulyſſes and the Ithacans, which cloſes the Odyſſee.

The uſe of *Machines*, in the epic poem, is, on ſome accounts, entirely oppoſite to what Horace preſcribes for the theatre. In tragedy that critic will never have them uſed without an abſolute neceſſity; whereas in the Epopea they ſhould never be uſed but where they may be as well let alone; and where the action appears as if it did not neceſſarily require them. How many gods and *Machines* does Virgil implore to raiſe the ſtorm that drives Æneas into Carthage? which yet might eaſily have happened in the ordinary courſe of nature!

Machines, in the epic poem, therefore, are not contrivances of the poet to recover himſelf after he has made a falſe ſtep; nor to ſolve any difficulty peculiar to ſome part of the poem; but it is the preſence of a divinity, and ſome ſupernatural and extraordinary action which the poet inſerts in moſt of the incidents of his work, to render it more majeſtic and admirable; and to train his readers to piety and virtue. This mixture ſhould be ſo managed, as that the *Machines* may be retrenched, without retrenching any thing from the action.

As to the manner in which the *Machines* are to act; it may be obſerved, that in the old Mythology there are gods both good, bad, and indifferent; and that our paſſions may be converted into ſo many allegorical divinities: ſo that every thing, both good and bad, in a poem, may be attributed to theſe *Machines*, and may be tranſacted by them.—They don't however always act in the ſame manner; ſometimes they act without appearing, and by ſimple inſpirations, which have nothing in them extraordinary or miraculous; as when we ſay the devil ſuggeſted ſuch a thought, &c. The ſecond manner of acting is entirely miraculous; as when a divinity preſents itſelf viſible before men, ſo as to be known by them; or when they diſguiſe themſelves under ſome human form without diſcovering themſelves. The third manner partakes of each of the two, and conſiſts in oracles, dreams, and extraordinary inſpirations; which Boſſu calls *Demi Machines*.

All theſe manners ought to be ſo managed, as to carry a veriſimilitude; and though veriſimilitude be of a vaſt extent in *Machines*, as being founded on the divine power; yet it has its bounds. See PROBABILITY.

Horace propoſes three kinds of *Machines* for the ſtage; the firſt is a god viſibly preſent among the actors, which, he ſays, ſhould never be introduc'd but on a great occaſion. The ſecond contains more incredible and extraordinary *Machines*; as the metamorphoſis of Progne into a ſwallow, or of Cadmus into a ſerpent: and even theſe *Machines* he does not abſolutely condemn, or exclude them out of the poem, but only out of the ſcene and the ſight of the ſpectators: they are not to be repreſented, but may be recited. The third kind of *Machines* is abſolutely abſurd; and he rejects it entirely: the inſtance he gives, is that of a child taken alive out of the belly of a monſter that had devoured it. The other two manners are allowed indifferently in the Epopea; and without that diſtinction of Horace, which only ſuits the ſtage; it being in the drama alone, that a difference may be made between what paſſes in the ſcene, or the ſight of the ſpectators, and what behind the curtain.

MACROCEPHALUS*, ΜΑΚΡΟΚΕΦΑΛΟΣ, denotes a perſon with a head larger or longer than the natural ſize. See HEAD.

* The word is compounded of the Greek μακρος, long, large, and κεφαλη head.

MACROCOSM*, ΜΑΚΡΟΚΟΣΜΟΣ, denotes the great world; that is the univerſe. See WORLD, and UNIVERSE.

* The word is compounded of the Greek μακρος, great, and κοσμος, world.

In which ſenſe it ſtands contra-diſtinguiſhed from *microcoſm*. See MICROCOSM.

MACULÆ, in aſtronomy, dark ſpots appearing on the luminous faces of the ſun, moon, and even ſome of the planets. See SPOT, MOON, PLANET, PHASES, &c.

In which ſenſe *Maculæ* ſtands contra-diſtinguiſhed from *Faculæ*. See FACULÆ.

Solar MACULÆ are dark ſpots, of an irregular, changeable figure, obſerved in the face of the ſun; firſt taken notice of by Scheiner in 1611, and afterwards accurately obſerved by Galileus, Hevelius, Mr. Flamſtead, Caſſini, Kirch, &c. See SUN.

Many of theſe *Maculæ* appear to conſiſt of heterogeneous parts; whereof the darker and more denſe are called by Hevelius, nuclei, and are incompaſſed, as it were, with atmoſpheres, ſomewhat rarer and leſs obſcure: but the figure both of the nuclei and entire *Maculæ* are variable.—In 1644, Hevelius obſerved a ſmall thin *Macula*, which in two days time grew to ten times its bulk; appearing withal much darker, and with a larger nucleus: and ſuch ſudden mutations are frequent. The nucleus, he obſerved, began to fail ſenſibly ere the ſpot diſappeared, and that ere it quite vaniſhed, broke into four, which in two days reunited. Some *Maculæ* have laſted 2, 3, 10, 15, 20, 30, ſeldom 40 days, tho' Kirchius obſerved one in 1681, from April 26 to the 17th of July.—The ſpots move over the ſun's diſk, with a motion ſomewhat ſlacker near the limb than near the centre; that obſerved by Kirch was twelve days viſible on the ſun's diſk; for fifteen days more it lay behind it; it being the uſual rule to return to the limb whence they departed in 27, ſometimes in 28 days.

Laſtly, it muſt be obſerved, that the *Maculæ* contract themſelves near the limb, and in the middle of the diſk appear much larger; thoſe often running into one in the diſk, which in the limb were ſeparate; that many of them ariſe in the middle of the diſk, and many diſappear in the ſame: and that none of them are obſerved to deviate from their path near the horizon; whereas Hevelius obſerving Mercury in the ſun, near the horizon, found him too low, being thruſt 27 ſeconds beneath his former path.

From theſe phænomena we collect, 1°. that ſince Mercury's depreſſion below his path ariſes from his parallax, the *Maculæ* having no parallax from the ſun, are nearer him than the planet:—but ſince they are hid behind the ſun three days longer than they are in the hemiſphere viſible to us, it follows alſo, that they do not adhere to the ſurface of the ſun, but are at ſome diſtance from it.

2°. That ſince they ariſe and diſappear in the middle of the ſun's diſk, and undergo various alterations with regard both to bulk, figure and denſity, they muſt be formed *de novo*, and again diſſolved about the ſun; and are therefore, in all probability, a kind of ſolar clouds formed out of its exhalations.

3°. Since then the ſolar exhalations riſe over his body, and are ſuſpended at a certain height from it; it appears, from the laws of hydroſtatics, that the ſun muſt be incompaſſed with ſome fluid to derive thoſe exhalations upwards; which fluid muſt be denſer, as it is lower; and rarer, as higher, like our atmoſphere: And ſince the *Maculæ* diſſolve and diſappear in the very middle of the ſun's diſk, the matter thereof, *i. e.* the ſolar exhalations, muſt fall back again to the ſun; whence there muſt ariſe changes in the ſun's atmoſphere, and conſequently in the ſun itſelf.

4°. Since the revolution of the *Maculæ* round the ſun is very regular; and ſince their diſtance from the ſun is very ſmall, it is not properly the *Maculæ* that move round the ſun: but it is himſelf, together with his atmoſphere wherein the *Maculæ* ſwim, that in the ſpace of 27 days, moves round his axis: and hence it is that the *Maculæ*, being viewed obliquely near the limb, appear narrow and oblong.

5°. Since the ſun appears with a circular diſk in every ſituation; his figure, as to ſenſe, muſt be ſpherical. See SUN.

MADDER, a red, bitter, aſtringent root of a plant, call'd by botaniſts, *Rubia Tinctorum*; much uſed by dyers to give a ſtrong and rich red colour. See RED.

It has its uſes too in medicine, being found of ſervice in obſtructions of the viſcera, and cachectic conſtitutions; and is generally made up in form of decoctions, diet-drinks, and medicated ales.

MADNESS, MANIA, in medicine. See MANIA.

MADRIER, in the military art, a thick plank, ſometimes armed with iron plates, having a cavity ſufficient to receive the mouth of a petard when charged; with which it is applied againſt a gate, or other body deſigned to be broke down. See PETARD.

MADRIER alſo denotes a long and broad plank, uſed for ſupporting the earth in mining, carrying on ſaps, making caponiers, galleries, and the like.

There are alſo *Madriers* lined with tin, and covered with earth; ſerving as defences againſt artificial fires, in lodgments, *&c.* where there is need of being covered over head.

MADRIGAL*, in the modern Italian, Spaniſh, and French poetry, denotes a little amorous piece, containing a certain number of free unequal verſes, not tied either to the ſcrupulous regularity of a ſonnet, or the ſubtlety of an epigram; but conſiſting of ſome tender, delicate, yet ſimple thought, ſuitably expreſſed.

* Menage derives the work from *Mandra*, which, in Latin and Greek, ſignifies a ſheepfold; imagining it to have been originally a kind of paſtoral or ſhepherd's ſong; whence the Italians formed their *Madrigale*, and we *Madrigal*. Others rather chuſe to derive the word from *Madrugar*, which, in the Spaniſh ſignifies to riſe in the morning, the *Madrigales* being formerly ſung early in the morning, by thoſe who had a mind to ſerenade their miſtreſſes. See SERENADE.

The *Madrigal*, according to M. le Brun, is an epigram without any thing very briſk and ſprightly in its fall or cloſe: ſomething very tender and gallant is uſually the ſubject of it; and a certain beautiful, noble, yet chaſte, ſimplicity, forms its character.

The *Madrigal* is uſually looked on as the ſhorteſt of all the leſſer kinds of poems, and may conſiſt of fewer verſes than either the ſonnet or roundelay. There is no other rule regarded in mingling the rimes, and verſes of different kinds, but the fancy and convenience of the author. This poem, however, really allows of leſs licence than any other; whether we regard the rime, the meaſures, or the purity of expreſſion.

MAGAS, MAGADIS, the name of a muſical inſtrument in uſe among the ancients. See MUSIC.

There were two kinds of *Magades*; the one a ſtring inſtrument, the invention whereof is aſcribed by ſome to Sappho, by others to the Lydians, and by others to Timotheus of Miletus.

The other was a kind of flute, which at the ſame time yielded very high and very low notes.—The former kind was much improved by Timotheus of Miletus, who is ſaid to have been impeached of a crime; for that by increaſing the number of chords, he ſpoiled and diſcredited the ancient muſic.

MAGAZINE, in the military art, a place in fortified towns, where all ſorts of ſtores are kept, and where carpenters, wheelwrights, ſmiths, *&c.* are employ'd in making things needful to furniſh out the train of artillery. See ARSENAL.

MAGDALEN.—*Religious of St.* MAGDALEN, is a denomination given to divers communities of nuns, conſiſting generally of penitent courtezans; ſometimes alſo call'd *Magdalanettes.*

Such are thoſe at Metz, eſtabliſhed in 1452; thoſe at Paris in 1492; thoſe at Naples, firſt eſtabliſhed in 1324, and endowed by queen Sancha, to ſerve as a retreat for publick courtezans, who ſhould quit their trade, and betake themſelves to repentance; and thoſe of Rouen and Bourdeaux, which had their original among thoſe of Paris.

In each of theſe monaſteries there are three kinds of perſons and congregations; the firſt conſiſts of thoſe who are admitted to make vows; and theſe bear the name of St. *Magdalen*: the congregation of St. Martha is the ſecond, and is compoſed of thoſe whom it is not judged proper to admit to vows: the congregation of St. Lazarus is compoſed of ſuch as are detained there by force.

The Religious of St. Magdalen at Rome, were eſtabliſhed by Pope Leo X. Clement VIII. ſettled a revenue on them, and further appointed, that the effects of all public proſtitutes, dying inteſtate, ſhould fall to them; and that the teſtaments of the reſt ſhould be invalid, unleſs they bequeathed a portion of their effects, which was to be at leaſt a fifth part, to them.

MAGI, or MAGIANS*, a title which the ancient Perſians gave to their wiſemen, or philoſophers. See PHILOSOPHER.

* The learned are in great perplexity about the original of the word *Magus*, Μαγος. Plato, Xenophon, Herodotus, Strabo, *&c.* fetch it from the Perſian language, in which it ſignified a *Prieſt*, or perſon appointed to officiate in holy things, as *Druid* among the Gauls, *Gymnoſophiſt* among the Indians, and *Levite* among the Hebrews. Others derive it from the Greek μεγας, great, which being borrowed of the Greeks by the Perſians, was returned in the form of μαγος; but Voſſius, with more probability, brings it from the Hebrew הגה, *haga*, to meditate; whence מהגים, *maaghim*, in Latin *Meditabundi*, q. d. *People addicted to meditation.*

Magi, among the Perſians, anſwered to σοφοι, or φιλοσοφοι, among the Greeks, *Sapientes* among the Latins, *Druids* and *Brachmans* among the Gauls, *Gymnoſophiſts* among the Indians, and *Prophets* or *Prieſts* among the Egyptians. See DRUID, BRACHMAN, *&c.*

The ancient *Magi*, according to Ariſtotle and Laertius, were the authors and conſervators of the Perſian philoſophy: and the philoſophy principally cultivated among them was theology, and politics; they being always eſteemed as the interpreters of all laws both divine and human, on which account they were wonderfully revered by the people.—Hence Cicero obſerves, that none were admitted to the crown of Perſia, but ſuch as were well inſtructed in the diſcipline of the *Magi*, who taught the τα βασιλικα, and ſhew'd princes how to govern.

Plato, Apuleius, Laertius, and others, agree, that the philoſophy of the *Magi* related principally to the worſhip of the gods: they were the perſons who were to offer prayers, ſupplications, and ſacrifices, as if the gods would be heard by them alone.

According to Lucian, Suidas, *&c.* the theology, or worſhip of the gods, about which the *Magi* were employ'd, was little more than the diabolical art of divination. So that μαγεια, ſtrictly taken, ſignifies divination. See MAGIC.

Porphyry defines the *Magi* well, *Cicero divina ſapientes & in iiſdem miniſtrantes*; adding, that the word *Magus* implied as much in the Perſian tongue.—Theſe people, ſays he, are held in ſuch veneration among the Perſians, that Darius the ſon of Hyſtaſpes, among other things, had it engraven on his monument, that he was the maſter of the *Magi*.

Philo-Judæus deſcribes the *Magi* to be diligent inquirers into nature, out of the love they bear to truth; and who ſetting themſelves apart for thoſe things, contemplate the divine virtues the more clearly, and initiate others in the ſame myſteries.

Their deſcendants, the modern *Magi*, or fire-worſhippers, are divided into three claſſes; whereof the firſt, and moſt learned, neither eat, nor kill animals, but adhere to the old inſtitution of abſtaining from living creatures. The *Magi* of the ſecond claſs refrain only from tame animals: nor do the laſt kill all indifferently; it being the firm and diſtinguiſhing dogma of them all, την μετεμψυχωσιν ειναι, *that there is a tranſmigration of ſouls.* See METEMPSYCHOSIS.

To intimate the ſimilitude between animals and men, they uſe to call the latter by the name of the former; thus their fellow-prieſts they call'd lions, the prieſteſſes lioneſſes, the ſervants crows, *&c.*

MAGIC, MAGIA, ΜΑΓΕΙΑ, in its antient ſenſe, the ſcience, or diſcipline and doctrine of the *Magi*, or wiſe-men of Perſia. See MAGI.

The origin of *Magic* and the *Magi* is aſcribed to Zoroaſter: Salmaſius derives the very name from Zoroaſter, who, he ſays, was ſurnam'd *Mog*, whence *Magus*. Others, inſtead of making him the author of the Perſian philoſophy, make him only the reſtorer and improver thereof; alledging, that many of the Perſian rites, in uſe among the *Magi*, were borrowed from the Zabii among the Chaldeans, who agreed in many things with the *Magi* of the Perſians; whence ſome make the name *Magus* common both to the Chaldeans and Perſians. Thus Plutarch mentions, that Zoroaſter inſtituted *Magi* among the Chaldeans, in imitation whereof the Perſians had theirs too.

MAGIC, in a more modern ſenſe, is a ſcience which teaches to perform wonderful and ſurprizing effects.

The word *Magic* originally carried with it a very innocent, nay laudable, meaning; being uſed purely to ſignify the ſtudy of wiſdom, and the more ſublime parts of knowledge: but in regard the ancient *Magi* engaged themſelves in aſtrology, divination, ſorcery, *&c.* the term *Magic* in time became odious, and was only uſed to ſignify an unlawful and diabolical kind of ſcience, depending on the aſſiſtance of the devil, and departed ſouls. See NECROMANCY, WITCHCRAFT, FASCINATION, *&c.*

If any wonder how ſo vain and deceitful a ſcience ſhould gain ſo much credit and authority over mens minds, Pliny gives the reaſon of it. It is, ſays he, becauſe it has poſſeſſed itſelf of three ſciences of the moſt eſteem among men; taking from each, all that is great and marvellous in it. Nobody doubts but it had its firſt origin in medicine, and that it inſinuated itſelf into the minds of the people, under pretence of affording extraordinary remedies. To theſe fine promiſes it added every thing in religion that is pompous and ſplendid, and that appears calculated to blind and captivate mankind. Laſtly, it mingled judiciary aſtrology with the reſt; perſuading people, curious of futurity, that it ſaw every thing to come in the heavens. See MAGIC, ASTROLOGY, *&c.*

Agrippa divides *Magic* into three kinds; *natural*, *celeſtial*, and *ceremonial* or *ſuperſtitious*.

Natural MAGIC is no more than the application of natural active cauſes to paſſive cauſes or ſubjects; by means whereof many ſurprizing, but yet natural, effects are produced. See PHYSICS and PHILOSOPHY.

Baptiſta Porta has a treatiſe of natural *Magic*, or of ſecrets for performing very extraordinary things by natural cauſes. The natural *Magic* of the Chaldeans was nothing but the knowledge of the powers of ſimples, and minerals. The *Magic*, which they called *Theurgia*, conſiſted wholly in the knowledge of the ceremonies, to be obſerved in the worſhip of the Gods, in order to be acceptable. By virtue of theſe ceremonies they believed they could converſe with ſpiritual beings, and cure diſeaſes. See THEURGY.

Celeſtial MAGIC borders nearly on judiciary aſtrology: It attributes to ſpirits a kind of rule or dominion over the planets; and to the planets a dominion over men; and on thoſe principles builds a ridiculous kind of ſyſtem. See ASTROLOGY.

Superſtitious or *Goetic* MAGIC conſiſts in the invocation of devils. Its effects are uſually evil and wicked, though very ſtrange and ſeemingly ſurpaſſing the powers of nature; ſuppoſed to be produced, by virtue of ſome compact, either tacit or expreſs, with evil ſpirits: but the truth is, theſe have not all the power that is uſually imagined, nor do they produce half thoſe effects ordinarily aſcribed to them.

Naude has publiſhed an apology for all the great men ſuſpected of *Magic*.—Agrippa ſays, that the words uſed by thoſe in compact with the devil, to invoke him, and to ſucceed in what they undertake, are *Dies, mies, jeſquet, benedoefet, douvima, enitemaus*. There are an hundred other ſuperſtitious formulas of words compoſed at pleaſure, or gathered from ſeveral different languages, or patch'd from the Hebrew, or formed in imitation of it.

MAGIC *Lantern*, an optic machine, by means whereof little painted images are repreſented on an oppoſite wall of a dark room, magnified to any bigneſs at pleaſure. See LANTERN.

Conſtruction of the MAGIC *Lantern*.—Suppoſe A B C D (*Tab. Opticks, Fig.* 10.) a common tin lantern, to which is added a tube to draw out, F G. In H is fixed a metallic concave ſpeculum of a foot diameter at moſt, or four inches at leaſt; or, in lieu thereof, near the extremity of the tube is placed a convex lens, conſiſting of a ſegment of a ſmall ſphere, its diameter not exceeding a few inches. In the focus of the concave ſpeculum, or lens, is placed a lamp L; within the tube, where it is ſoldered to the ſide of the lantern, is placed a ſmall lens, convex on both ſides, being a portion of a ſmall ſphere, having its focus about the diſtance of three inches. The extreme part of the tube F M is ſquare, and has an aperture quite thro'; ſo as to receive an oblong frame N O, paſſed through it; in this frame are round holes an inch or two in diameter. According to the bigneſs of theſe holes, are drawn circles on a plain thin glaſs; and in theſe circles are painted any figures or images at pleaſure, with tranſparent water-colours. Theſe images fitted into the frame, and placed invertedly, at a little diſtance from the focus of the lens I; will be projected on an oppoſite white wall of a dark room, prodigiouſly magnified in all their colours, and an erect ſituation.

Or thus:—Every thing being managed as in the former; into the ſliding tube F G, inſert another convex-lens K, the ſegment of a ſphere ſomewhat larger than I; now if the picture be brought nearer to I, than the diſtance of the focus, diverging rays will be propagated as if they proceeded from P: wherefore if the lens K be ſo placed, as that P is very near its focus, the image will be exhibited on the wall exceedingly magnified.

Theory of the MAGIC *Lantern*.—The lamp being placed in the focus of the concave ſpeculum, or any convex glaſs, the rays will be propagated parallel to each other, and the image will be ſtrongly illumined, and will therefore emit a great number of rays upon the lens I. But being ſuppoſed to be placed near the lens I, the inverted image of the picture inverted muſt be formed on the oppoſite wall, exceedingly magnified after its refraction through the lens; and it will be ſtill the more magnified as the lens is a ſegment of a leſs ſphere, and as the picture is placed nearer the focus of the lens; in a dark place therefore the picture will be repreſented prodigiouſly large and extremely vivid. See LENS.

To heighten the light, ſpecula are preferred to lens's; the focus of a ſpeculum being nearer than that of a lens.

De Chales orders the diameter of the lens I to be two, four, or five digits, and in a ſubduple proportion to the other K; *i. e.* if I be five digits, K muſt be 10; and the diameter of the ſpeculum, according to the ſame, is to be two digits. Zahnius chuſes to have the diameter of I $\frac{8}{10}$ of a foot, and that of K one foot and $\frac{5}{1}$, *&c.*

Little animals being included in the *magic lantern*, in the manner obſerved in ſpeaking of the microſcope; or any littil tranſparent objects faſtned to a ſlice of talc or glaſs, and ſubſtituted inſtead of images; the *magic lantern* will become a microſcope. See MICROSCOPE.

MAGIC *Square*, a ſquare figure formed of a ſeries of numbers in arithmetical proportion, ſo diſpoſed in parallel and equal ranks, as that the ſums of each row, taken either perpendicularly, horizontally, or diagonally, are equal.

The ſeveral numbers which compoſe any ſquare number; (for inſtance, 1, 2, 3, 4, 5, *&c.* to 25 incluſive, which compoſe the ſquare number 25) being diſpoſed after each other in a ſquare figure of 25 cells, each in its cell: if then you change the order of theſe numbers, and diſpoſe them in the cells, in ſuch manner, as that the five numbers which fill an horizontal rank of cells, being added together, ſhall make the ſame ſum with the five numbers in any other rank of cells, whether horizontal or vertical; and even the ſame number with the five in each of the two diagonal ranks; this diſpoſition of numbers is called a *Magic ſquare*, in oppoſition to the former diſpoſition, which is called a *Natural ſquare*. See the figures following.

Natural Square.

1	2	3	4	5

7	5	21	19	13

One would imagine that *Magic ſquares* had that name given them in regard this property of all their ranks, which, taken any way, make always the ſame ſum, appeared extremely ſurprizing, eſpecially in certain ignorant ages, when mathematicks paſſed for *Magic*. But there is a great deal of reaſon to ſuſpect, that theſe ſquares merited their name ſtill further by the ſuperſtitious operations they were imployed in, as the conſtruction of taliſmans, *&c.* For according to the childiſh philoſophy of thoſe days, which attributed virtues to numbers, what virtues might not be expected from numbers ſo wonderful? See NUMBER, TALISMAN, *&c.*

However, what was at firſt the vain practice of makers of taliſmans and conjurers, has ſince become the ſubject of a ſerious reſearch among mathematicians; not that they imagine it will lead them to any thing of ſolid uſe, or advantage. *Magic ſquares* ſavour too much of their original, to be of much uſe. But only as it is a kind of play, where the difficulty makes the merit; and as it may chance to produce ſome new views of numbers which mathematicians will not loſe the occaſion of.

Eman. Moſchopulus, a Greek author of no great antiquity, is the firſt that appears to have ſpoke of *Magic ſquares*; and by the age wherein he lived, there is reaſon to imagine he did not look on them merely as a mathematician. However, he has left us ſome rules for their conſtruction.—In the treatiſe of Cor. Agrippa ſo much accuſed of *Magic*, we find the ſquares of ſeven numbers, *viz.* from three to nine incluſive, diſpoſed *magically*; and it muſt not be ſuppoſed that thoſe ſeven numbers were preferred to all the others without a very good reaſon. In effect, it is becauſe their ſquares, according to the ſyſtem of Agrippa and his followers, are planetary. The ſquare of 3, for inſtance, belongs to Saturn, that of 4 to Jupiter, that of 5 to Mars, that of 6 to the Sun, that of 7 to Venus, that of 8 to Mercury, and that of 9 to the Moon. M. Bachet applied himſelf to the ſtudy of *Magic ſquares*, on the hint he had taken from the planetary ſquares of Agrippa; as being unacquainted with the work of Moſchopulus, which is only in manuſcript in the French king's library; and, without the aſſiſtance of any other author, found out a new method for thoſe ſquares whoſe root is uneven, for inſtance 25, 49, *&c.* but could not make any thing of thoſe whoſe root is even.

After him came M. Frenicle, who took the ſame ſubject in hand. A great algebraiſt was of opinion, that whereas the ſixteen numbers, which compoſe the ſquare, might be diſpoſed 20922789888000 different ways in a natural ſquare (as from the rules of combination it is certain they may) they could not be diſpoſed in a *Magic ſquare* above ſixteen different ways. But M. Frenicle ſhewed, that they might be diſpoſed 878 different ways; whence it appears how much his method exceeds the former, which only yielded the 55th part of *Magic ſquares* of that of M. Frenicle.

To this enquiry he thought fit to add a difficulty, that had not yet been conſidered: The *Magic ſquare* of 7, for inſtance, being conſtructed, and its 49 cells filled, if the two horizontal ranks of cells, and at the ſame time the two vertical ones, the moſt remote from the middle, be retrenched, that is, if the whole border or circumference of the ſquare be taken away; there will remain a ſquare, whoſe root will be 5, and which will only conſiſt of twenty five cells.—Now it is not at all ſurprizing that the ſquare ſhould be no longer *magical*, in regard the ranks of the large one were not intended to make the ſame ſum, excepting when taken entire with all the ſeven numbers that fill their ſeven cells; ſo that being mutilated each of two cells, and having loſt two of their numbers, it may be well expected, that their remainders will not any longer make the ſame ſum. But M. Frenicle would not be ſatisfied, unleſs when the circumference or border of the *Magic Square* was taken away, and even any circumference at pleaſure, or in fine, ſeveral circumferences at once, the remaining ſquare were ſtill *magical:* which laſt condition, no doubt, made theſe *Squares* vaſtly more *magical* than ever.

Again, he inverted that condition, and required that any circumference taken at pleaſure, or even ſeveral circumferences ſhould be inſeparable from the ſquare; that is, it ſhould ceaſe to be *magical* when they were removed, and yet continue *magical* after the removal of any of the reſt. M. Frenicle, however, gives no general demonſtration of his methods, and frequently ſeems to have no other guide but his groping. It is true, his book was not publiſhed by himſelf, nor did it appear till after his death, *viz.* in 1693.

In 1703, M. Poignard, Canon of Bruſſels, publiſhed a treatiſe of ſublime *Magic Squares.* Before him there had been no *Magic Squares* made but for ſeries's of natural numbers that formed a ſquare; but M. Poignard made two very conſiderable improvements; 1°. Inſtead of taking all the numbers that fill a ſquare, for inſtance, the thirty ſix ſucceſſive numbers which would fill all the cells of a natural ſquare whoſe ſide is 6, he only takes as many ſucceſſive numbers as there are units in the ſide of the ſquare, which in this caſe are ſix; and theſe ſix numbers alone he diſpoſes in ſuch manner, in the thirty ſix cells, that none of them are repeated twice in the ſame rank, whether it be horizontal, vertical or diagonal: whence it follows, that all the ranks, taken all the ways poſſible, muſt always make the ſame ſum, which M. Poignard calls repeated progreſſion. 2°. Inſtead of being confined to take theſe numbers according to the ſeries and ſucceſſion of the natural numbers, that is, in an arithmetical progreſſion, he takes them likewiſe in a geometrical progreſſion, and even an harmonical progreſſion.—But with theſe two laſt progreſſions the *Magic* muſt neceſſarily be different from what it was: In the ſquares, filled with numbers in geometrical progreſſion, it conſiſts in this, that the products of all the ranks are equal, and in the harmonical progreſſion, the numbers of all the ranks continually follow that progreſſion: he makes ſquares of each of theſe three progreſſions repeated.

This book of M. Poignard gave occaſion to M. de la Hire to turn his thoughts the ſame way, which he did with ſuch ſucceſs, that he ſeems to have well nigh compleated the theory of *Magic Squares*—He firſt conſiders uneven *Squares:* all his predeceſſors on the ſubject having found the conſtruction of even ones by much the moſt difficult; for which reaſon M. de la Hire reſerves thoſe for the laſt. This exceſs of difficulty may ariſe partly from hence, that the numbers are taken in arithmetical progreſſion. Now in that progreſſion, if the number of terms be uneven, that in the middle has ſome properties, which may be of ſervice; for inſtance, being multiplied by the number of terms in the progreſſion, the product is equal to the ſum of all the terms.

M. de la Hire propoſes a general method for uneven ſquares, which has ſome ſimilitude with the theory of compound motions, ſo uſeful and fertile in mechanics. As that conſiſts in decompounding motions, and reſolving them into others more ſimple, ſo does M. de la Hire's method conſiſt in reſolving the ſquare that is to be conſtructed, into two ſimple and primitive ſquares. It muſt be owned, however, it is not quite ſo eaſy to conceive thoſe two ſimple and primitive ſquares in the compound or perfect ſquare, as in an oblique motion to imagine a parallel and perpendicular one.

Suppoſe a ſquare of cells, whoſe root is uneven; for inſtance 7, and that its forty nine cells are to be filled magically with numbers, for inſtance, the firſt 7. M. de la Hire, on the one ſide, takes the firſt ſeven numbers, beginning with unity, and ending with the root 7; and on the other, 7, and all its multiples to 49 excluſively; and as theſe only make ſix numbers, he adds 0, which makes this an arithmetical progreſſion of ſeven terms as well as the other. 0. 7. 14. 21. 28. 35. 42. This done, with the firſt progreſſion repeated, he fills the ſquare of the root 7 magically. In order to this, he writes in the firſt ſeven cells of the firſt horizontal rank, the ſeven numbers propoſed, in what order he pleaſes, for that is abſolutely indifferent; and it is proper to obſerve here, that thoſe ſeven numbers may be ranged in 5040 different manners in the ſame rank. The order in which they are placed in the firſt horizontal rank, be it what it will, is that which determines their order in all the reſt. For the ſecond horizontal rank, he places in its firſt cell, either the third, the fourth, the fifth, or the ſixth number, from the firſt number of the firſt rank, and after that writes the ſix others in the order as they follow. For the third horizontal rank, he obſerves the ſame method with regard to the ſecond, that he obſerved in the ſecond with regard to the firſt, and ſo of the reſt. For inſtance, ſuppoſe the firſt horizontal rank filled with the ſeven numbers in their natural order, 1. 2. 3. 4. 5. 6. 7. the ſecond horizontal rank may either commence with 3, with 4, with 5, or with 6; but in this inſtance it commences with 3, the third rank therefore muſt commence with 5, the fourth with 7, the fifth with 2, the ſixth with 4, and the ſeventh with 6. The commencement of the ranks which follow the firſt being thus determined, the other numbers, as we have already obſerved, muſt be written down in the order wherein they ſtand in the firſt, going on to 5, 6, and 7, and returning to 1, 2, &c. till every number in the firſt rank be found in every rank underneath, according to the order arbitrarily pitched upon at firſt. By this means, it is evident, no number whatever can be repeated twice in the ſame rank, and by conſequence that the ſeven numbers 1. 2. 3. 4. 5. 6. 7. being in each rank, they muſt of neceſſity make the ſame ſum.

1	2	3	4	5	6	7
3	4	5	6	7	1	2
5	6	7	1	2	3	4
7	1	2	3	4	5	6
2	3	4	5	6	7	1
4	5	6	7	1	2	3
6	7	1	2	3	4	5

It appears, from this example, that the arrangement of the numbers in the firſt rank being choſen at pleaſure, the other ranks may be continued in four different manners; and ſince the firſt rank may have 5040 different arrangements, there are no leſs than 20160 different manners of conſtructing the *Magic Square* of ſeven numbers repeated.

1	2	3	4	5	6	7
2	3	4	5	6	7	1
3	4	5	6	7	1	2
4	5	6	7	1	2	3
5	6	7	1	2	3	4
6	7	1	2	3	4	5
7	1	2	3	4	5	6

1	2	3	4	5	6	7
7	1	2	3	4	5	6
6	7	1	2	3	4	5
5	6	7	1	2	3	4
4	5	6	7	1	2	3
3	4	5	6	7	1	2
2	3	4	5	6	7	1

The order of the numbers in the firſt rank being determined; if in beginning with the ſecond rank, the ſecond number 2, or the laſt number 7 ſhould be pitched upon; in one of thoſe caſes one of the diagonal ranks would have the ſame number conſtantly repeated; and, in the other caſe, the other diagonal would have it repeated; of conſequence therefore, either the one or the other diagonal would be falſe, unleſs the number repeated ſeven times ſhould happen to be 4, for four times ſeven is equal to the ſum of 1. 2. 3. 4. 5. 6. 7. and, in general, in every ſquare conſiſting of an uneven number of terms, in arithmetical progreſſion, one of the diagonals would be falſe according to thoſe two conſtructions, unleſs the term, always repeated in that diagonal, were the middle term of the progreſſion.

It is not however at all neceſſary to take the terms in an arithmetical progreſſion; for, according to this method, one may conſtruct a *Magic Square* of any numbers at pleaſure, whether they be according to any certain progreſſion or not. If they be in an arithmetical progreſſion, it will be proper, out of the general method, to except thoſe two conſtructions, which produce a continual repetition of the ſame term, in one of the two diagonals; and only take in the caſe, wherein that repetition would prevent the diagonal from being juſt. Which caſe being abſolutely diſregarded, when we computed that the ſquare of 7 might have 20160 different conſtructions; it is evident, that by taking that caſe in, it muſt have vaſtly more. To begin the ſecond rank with any other number beſides the ſecond and the laſt, muſt not however be looked on as an univerſal rule. It holds good for the ſquare of 7, but if the ſquare of 9, for inſtance, were to be conſtructed, and the fourth figure of the firſt horizontal rank were pitched on for the firſt of the ſecond, the conſequence would be, that the fifth and eighth horizontal ranks would likewiſe commence with the ſame number, which would therefore be repeated three times in the ſame vertical rank, and occaſion other repetitions in all the reſt. The general rule therefore muſt be conceived thus: Let the number in the firſt rank pitched on, for the commencement of the ſecond, have ſuch an exponent of its quota, that is, let the order of its place be ſuch, as that if an unit be taken from it, the remainder will not be any juſt quota part of the root of the ſquare; that is, cannot divide it equally. If, for example, in the ſquare of 7, the third number of the firſt horizontal rank be pitched on for the firſt of the ſecond, ſuch conſtruction will be juſt; becauſe the exponent of the place of that number, *viz.* 3, ſubſtracting 1, that is 2, cannot divide 7. Thus alſo might the fourth number of the ſame firſt rank be choſen, becauſe 4—1, *viz.* 3. cannot divide 7, and for the ſame reaſon the fifth or ſixth number might be taken: But in the ſquare of 9, the fourth number of the firſt rank muſt not be taken, becauſe 4—1, *viz.* 3, does divide 9. The reaſon of this rule will appear very evidently, by conſidering in what manner the returns of the ſame numbers do or do not happen, taking them always in the ſame manner in any given ſeries. And hence it follows, that the fewer diviſions the root of any ſquare to be conſtructed has, the more different manners of conſtructing it there are; and that the prime numbers, that is, thoſe which have no diviſions, as 5. 7. 11. 13. &c. are thoſe whoſe ſquares will admit of the moſt variations in proportion to their quantities.

The ſquares conſtructed, according to this method, have ſome particular properties not required in the problem: For the numbers that compoſe any rank parallel to one of the two diagonals, are ranged in the ſame order with the numbers that compoſe the diagonal, to which they are parallel. And as any rank parallel to a diagonal muſt neceſſarily be ſhorter, and have fewer cells than the diagonal itſelf, by adding to it the correſponding parallel which has the number of cells the other falls ſhort of the diagonal; the numbers of thoſe two parallels, placed, as it were, end to end, ſtill follow the ſame order with thoſe of the diagonal: beſides, that their ſums are likewiſe equal; ſo that they are magical on another account.

Firſt Primitive.

1	2	3	4	5	6	7
3	4	5	6	7	1	2
5	6	7	1	2	3	4
7	1	2	3	4	5	6
2	3	4	5	6	7	1
4	5	6	7	1	2	3
6	7	1	2	3	4	5

Inſtead of the ſquares, which we have hitherto formed by horizontal ranks, one might alſo form them by vertical ones; the caſe is the ſame in both.

All we have hitherto ſaid regards only the firſt primitive ſquare, whoſe numbers, in the propoſed example, were 1. 2. 3. 4. 5. 6. 7; here ſtill remains the ſecond primitive, whoſe numbers are 0. 7. 14. 21. 28. 35. 42. M. de la Hire proceeds in the ſame manner here as in the former; and this may likewiſe be conſtructed in 20160 different manners, as containing the ſame number of terms with the firſt. Its conſtruction being made, and of conſequence all its ranks making the ſame ſum, it is evident, that if we bring the two into one, by adding together the numbers of the two correſponding cells of the two ſquares, that is, the two numbers of the firſt of each, the two numbers of the ſecond, of the third, &c. and diſpoſe them in the forty nine correſponding cells of a third ſquare; it will likewiſe be *magical*, in regard its ranks, formed by the addition of equal ſums to equal ſums muſt of neceſſity be equal among themſelves. All that remains in doubt is, whether or no, by the addition of the correſponding cells of the two firſt ſquares, all the cells of the third will be filled in ſuch manner, as that each not only contain one of the numbers of the progreſſion from 1 to 49, but alſo that this number be different from that of any of the reſt, which is the end and deſign of the whole operation.

Second Primitive.

0	7	14	21	28	35	42
21	28	35	42	0	7	14
42	0	7	14	21	28	35
14	21	28	35	42	0	7
35	42	0	7	14	21	28
7	14	21	28	35	42	0
28	35	42	0	7	14	21

As to this, it muſt be obſerved, that if in the conſtruction of the ſecond *Primitive Square*, care have been taken in the commencement of the ſecond horizontal rank, to obſerve an order with regard to the firſt, different from what was obſerved in the conſtruction of the firſt ſquare; for inſtance, if the ſecond rank of the firſt ſquare begun with the third term of the firſt rank, and the ſecond rank of the ſecond ſquare commence with the fourth of the firſt rank, as in the example it actually does; each number of the firſt ſquare may be combined once, and only once, by addition with all the numbers of the ſecond. And as the numbers of the firſt are here 1. 2. 3. 4. 5. 6. 7. and thoſe of the ſecond 0. 7. 14. 21. 28. 35. 42. by combining them in this manner, we have all the numbers in the progreſſion from 1 to 49, without having any of them repeated; which is the *Perfect Magic Square* propoſed.

Perfect Square.

1	9	17	25	33	41	49
24	32	40	48	7	8	16
47	6	14	15	23	31	39
21	22	31	38	46	5	13
37	47	4	12	20	28	29
11	19	27	35	36	46	3
34	42	43	2	10	18	26

The neceſſity of conſtructing the two *Primitive Squares* in a different manner, does not at all hinder but that each of the 20160 conſtructions of the one may be combined with all the 20160 conſtructions of the other: of conſequence therefore 20160 multiplied by itſelf, which makes 406425600, is the number of different conſtructions that may be made of the *Perfect Square*, which here conſiſts of the 49 numbers of the natural progreſſion. But as we have already obſerved, that a *Primitive Square* of ſeven numbers repeated may have above 20160 ſeveral conſtructions, the number 406425600 muſt come vaſtly ſhort of expreſſing all the poſſible conſtructions of a perfect *Magic Square* of the forty nine firſt numbers.

As to the *Even Squares*, he conſtructs them like the *Uneven* ones, by two *Primitive Squares*; but the conſtruction of *Primitives* is different in the general, and may be ſo a great number of ways: and thoſe general differences admit of a great number of particular variations, which give as many different conſtructions for the ſame even ſquare. It ſcarce ſeems poſſible to determine exactly, either how many general differences there may be between the conſtruction of the primitive ſquares of an even ſquare and an uneven one; nor how many particular variations each general difference may admit of: and of conſequence we are ſtill far from being able to determine the number of different conſtructions of all thoſe that may be made by the primitive ſquares.

MAGISTER, **Master**, a title frequently found in old writings; noting the perſon who bore it to have attained ſome degree of eminency *in ſcientia aliqua præſertim literaria*.

In old times, thoſe we now call *Doctors*, were called *Magiſtri*. See Doctor, Degree, and Master.

MAGISTERY, **Magisterium**, in Chymiſtry, a very fine powder made by ſolution and precipitation; or, a precipitate of ſome ſolution made by a ſalt, or other body, which breaks the force of the diſſolvent. See Precipitate.

Magistery *of Biſmuth* is a fine powder, made by diſſolving biſmuth in ſpirit of nitre, and pouring on it ſalt water, which precipitates the *Magiſtery* to the bottom. See Bismuth.

Magistery *of Lead* is a fine powder, made by diſſolving ſaccharum Saturni in diſtilled vinegar, and then precipitating it with oil of tartar *per deliquium*. See Lead.

Magistery is alſo uſed in ſpeaking of reſins, or reſinous extracts of ſcammony, jalap, turbith, &c. which are made by diſſolving the matter in ſpirit of wine, and precipitating it with water. See Resin.

Mr. Boyle takes the proper notion of a *Magiſtery* to conſiſt in a preparation of a body, whereby it is wholly, or at leaſt in great meaſure, by means of ſome extraneous additament, converted into a body of a different kind: as when iron or copper is turned into cryſtals of Mars and Venus.

MAGMA, ΜΑΓΜΑ, among chymiſts, &c. the dregs or recrement of an unguent, remaining after all the more fluid parts are expreſſed.

MAGNA *Arteria*, the ſame with aorta. See Aorta.

MAGNA *Charta* *, the *Great Charter* of liberties, granted in the ninth year of Henry the third, and confirmed by Edward the firſt. See Charter.

* The reaſon of its being termed *magna* or great, is either becauſe of the excellency of the laws and liberties therein contained; or becauſe there was another charter, called *Charta de foreſta*, eſtabliſhed with it, which was the leſſer of the two; or becauſe it contained more than any other charters; or in regard of the wars and troubles in the obtaining of it; or of the great and remarkable ſolemnity in the denouncing excommunications againſt the infringers of it.

Magna Charta may be ſaid to derive its origin from king Edward the confeſſor, who granted divers liberties and privileges both civil and eccleſiaſtical by charter: The ſame, with ſome others, were alſo granted and confirmed by king Henry I, by a celebrated great charter now loſt. And his ſucceſſors king Stephen, king Henry II, and king John, confirmed or reenacted the ſame; but that laſt prince violating his charter, the barons took up arms, and his reign ended in blood. Henry III. who ſucceeded him, after having procured an inquiſition to be made by twelve men in each county, what the liberties of England were in the time of Henry I, granted a new charter, being the preſent *Magna Charta*; which he ſeveral times confirmed, and as often broke again: till, in the thirty ſeventh year of his reign, he came to Weſtminſter-hall; where in the preſence of the nobility and biſhops, with lighted candles in their hands, *Magna Charta* was read, the king all the while laying his hand on his breaſt, and at laſt ſolemnly ſwearing faithfully and inviolably to obſerve all the things therein contained, as he was a man, a chriſtian, a ſoldier, and a king. Then the biſhops extinguiſhed their candles, throwing them on the ground, crying, thus let him be extinguiſhed and ſtink in hell who violates this charter.

Magna Charta is the baſis of the Engliſh laws and liberties. See Law and Statute. It was thought to be ſo beneficial to the ſubject, and a law of ſo great equity in compariſon of thoſe which were formerly in uſe, that king Henry, for the granting it, had the fifteenth penny of all the moveable goods both temporal and ſpiritual.—Sir Edward Coke obſerves, *Magna Charta* has been above thirty times confirmed.

MAGNET, **Magnes** *, the *Loadſtone*; a ſort of ferruginous ſtone, in weight and colour reſembling iron ore, though ſomewhat harder and more heavy; endued with divers extraordinary properties, attractive, directive, inclinatory, &c. See Magnetism.

* The *Magnet* is alſo called *Lapis Heracleus*, from Heraclea, a city of Magneſia, a port of the ancient Lydia, where it is ſaid to have been firſt found, and from which it is uſually ſuppoſed to have taken its name. Though others derive the word from a ſhepherd named *Magnes*, who firſt diſcovered it with the iron of his crook on mount Ida. It is alſo called *lapis nauticus* by reaſon of its uſe in navigation; and *ſiderites*, from its attracting iron, which the Greeks call σιδηρος.

The *Magnet* is uſually found in iron mines, and ſometimes in very large pieces, half *Magnet*, half iron. Its colour is different, according to the different countries it is brought from. Norman obſerves, that the beſt are thoſe brought from China and Bengal, which are of an irony or ſanguine colour; thoſe of Arabia are reddiſh, thoſe of Macedonia blackiſh; and thoſe of Hungary, Germany, England, *&c.* the colour of unwrought iron. Neither its figure nor bulk are determined, but it is found of all forms and ſizes.

The ancients reckoned five kinds of *Magnets* different in colour and virtue: the Ethiopic, Magneſian, Bœotic, Alexandrian, and Natolian. They alſo took it to be male and female: but the chief uſe they made of it was in medicine; eſpecially for the cure of burns, and defluxions on the eyes. —The moderns, more happy, take it to conduct them in their voyages. See NAVIGATION.

The moſt diſtinguiſhing properties of the *Magnet*, are, that it attracts iron, and that it points to the poles of the world; and in other circumſtances alſo dips or inclines to a point beneath the horizon, directly under the pole; and that it communicates theſe properties by touch, to iron.—On which foundation are built the mariners needles; both horizontal, and inclinatory, or dipping needles. See NEEDLE, DIPPING, *&c.*

The attractive power of the MAGNET was known to the ancients, and is mentioned even by Plato and Euripides, who call it the *Herculean Stone*; becauſe it commands iron, which ſubdues every thing elſe: but the knowledge of its directive power, whereby it diſpoſes its poles along the meridian of every place, and occaſions needles, pieces of iron, *&c.* touched with it, to point nearly north and ſouth, is of a much later date: though the exact time of its diſcovery, and the diſcoverer himſelf, are yet in the dark. The firſt tidings we hear of it, is in 1260, when Marco Polo the Venetian is ſaid by ſome to have introduced the mariners compaſs; though not as an invention of his own, but as derived from the Chineſe, who are ſaid to have had the uſe of it long before: though ſome imagine that the Chineſe rather borrowed it from the Europeans.

Flavio de Gioia a Neapolitan, who lived in the thirteenth century, is the perſon uſually ſuppoſed to have the beſt title to the diſcovery: and yet Sir G. Wheeler mentions, that he had ſeen a book of aſtronomy much older, which ſuppoſed the uſe of the needle; though not as applied to the uſes of navigation, but of aſtronomy. And in Guyot de Provins, an old French poet, who wrote about the year 1180, there is expreſs mention made of the *Loadſtone* and the compaſs; and their uſe in navigation obliquely hinted at. See COMPASS.

The variation of the MAGNET, or its declination from the pole, was firſt diſcovered by Seb. Cabot, a Venetian, in 1500; and the variation of that variation by Mr. Gellibrand, an Engliſhman, about the year 1625. See VARIATION.

Laſtly, The dip or inclination of the needle, when at liberty to play vertically, to a point beneath the horizon, was firſt diſcovered by another of our countrymen, Mr. R. Norman, about the year 1576. See the article DIPPING *Needle*.

Phænomena of the MAGNET. 1°. In every *Magnet* there are two poles, one whereof points northwards, the other ſouthwards; and if the *Magnet* be divided into ever ſo many pieces, the two poles will be found in each piece. 2°. Theſe poles in different parts of the globe, are differently inclined towards a point under the horizon. 3°. Theſe poles, though contrary to one another, do help mutually towards the *Magnet*'s attraction and ſuſpenſion of iron. 4°. If two *Magnets* be ſpherical, one will turn or conform itſelf to the other, ſo as either of them would do to the earth; and after they have ſo conformed or turned themſelves, they endeavour to approach or join each other; but if placed in a contrary poſition, they avoid each other. 5°. If a *Magnet* be cut through the axis, the parts or ſegments of the ſtone, which before were joined, will now avoid and fly each other. 6°. If the *Magnet* be cut by a ſection perpendicular to its axis, the two points, which before were conjoined, will become contrary poles; one in one, the other in the other ſegment. 7°. Iron receives virtue from the *Magnet* by application to it, or barely from an approach near it, though it do not touch it; and the iron receives this virtue variouſly, according to the parts of the ſtone it is made to touch, or even approach to. 8°. If an oblong piece of iron be any how applied to the ſtone, it receives virtue from it, only as to its length. 9°. The *Magnet* loſes none of its own virtue by communicating any to the iron; and this virtue it can communicate to the iron very ſpeedily; though the longer the iron touches or joins the ſtone, the longer will its communicated virtue hold; and a better *Magnet* will communicate more of it, and ſooner, than one not ſo good. 10°. Steel receives virtue from the *Magnet* better than iron. 11°. A needle touched by a *Magnet* will turn its ends the ſame way towards the poles of the world, as the *Magnet* itſelf does. 12°. Neither *Loadſtone* nor needles touched by it do conform their poles exactly to thoſe of the world, but have uſually ſome variation from them: and this variation is different in divers places, and at divers times in the ſame place. 13°. A *Loadſtone* will take up much more iron when armed or capped than it can alone. And though an iron ring or key be ſuſpended by the *Loadſtone*, yet the *magnetical* particles do not hinder that ring or key from turning round any way, either to the right or left. 14°. The force of a *Loadſtone* may be variouſly increaſed or leſſened by the various application of iron, or another *Loadſtone* to it. 15°. A ſtrong *Magnet* at the leaſt diſtance from a leſſer or a weaker, cannot draw to it a piece of iron adhering actually to ſuch leſſer or weaker ſtone; but if it come to touch it, it can draw it from the other: but a weaker *Magnet*, or even a little piece of iron, can draw away or ſeparate a piece of iron contiguous to a greater or ſtronger *Loadſtone*. 16°. In theſe northern parts of the world, the ſouth pole of a *Loadſtone* will raiſe up more iron than the north pole. 17°. A plate of iron only, but no other body interpoſed, can impede the operation of the *Loadſtone*, either as to its attractive or directive quality. Mr. Boyle found it true in glaſſes ſealed hermetically; and glaſs is a body, as impervious as moſt are, to any effluvia. 18°. The power or virtue of a *Loadſtone* may be impaired by lying long in a wrong poſition, as alſo by ruſt, wet, *&c.* and may be quite deſtroyed by fire. 19°. A piece of iron wire well touched, will, upon being bent round in a ring, or coyled round on a ſtick, *&c.* generally, quite loſe its directive virtue; but always have it much diminiſhed: and yet if the whole length of the wire were not entirely bent, ſo that the ends of it, though but for the length of one tenth of an inch, were left ſtrait, the virtue will not be deſtroyed in thoſe parts; though it will in all the reſt. This was firſt obſerved by Grimaldi and de la Hire; and is confirmed by the experiments of Mr. Derham; who adds further, that though coyling or bending the wire as above, would always deſtroy its virtue by day, yet it would not do it in the evening. 20°. The ſphere of the activity of *Magnets* is greater and leſs at different times: in particular, that reſerved in the repoſitory of the Royal Society will keep a key or other body ſuſpended to another, ſometimes, at the height of eight or ten feet; and at others, not above four feet. To which we may add, that the variation of the *magnetical* needle from the meridian, varies at various times of the day; as appears from ſome new experiments of Mr. Graham. See VARIATION. 21°. By twiſting a piece of wire touched with a *Magnet*, its virtue is exceedingly diminiſhed, and ſometimes ſo diſordered and confuſed, that in ſome parts it will attract, and in others repel; and even in ſome places, one ſide of the wire ſeems to be attracted, and the other ſide repelled by one and the ſame pole of the ſtone. 22°. A piece of wire that has been touched, being ſplit, or cleft in two; the poles are ſometimes changed, as in a cleft *Magnet*; the north becoming the ſouth, and the ſouth the north: and yet ſometimes one half of the wire will retain its former poles, and the other half have them changed. To which it may be added, that laying one or other ſide of the half uppermoſt, cauſes a great alteration in its tendency or averſion to the poles of the *Magnet*. 23°. A wire being touched from end to end with the ſame pole of the *Magnet*, the end whereat you begin will always turn contrary to the pole which touched it: If it be again touched the ſame way with the other pole of the *Magnet*, it will then be turned the contrary way. 24°. If a piece of wire be touched in the middle with only one pole of the *Magnet*, without moving it backwards or forwards; in that place will be the pole of the wire, and the two ends will be the other pole. 25°. If a *Magnet* be heated red-hot, and again cooled either with its ſouth pole towards the north in a horizontal poſition, or with its ſouth pole downwards in a perpendicular poſition; its poles will be changed. 26°. Mr. Boyle (to whom we are indebted for the following *magnetical* phænomena) found he could preſently change the poles of a ſmall fragment of a *Loadſtone*, by applying them to the oppoſite vigorous ones of a large *Magnet*. 27°. Hard iron tools well tempered, when heated by a briſk attrition, as filing, turning, *&c.* will, while warm, attract thin filings or chips of iron, ſteel, *&c.* but not when cold; though there are not wanting ſome inſtances of their retaining the virtue when quite cold. 28°. The iron bars of windows, *&c.* which have a long time ſtood in an erect poſition, grow permanently *magnetical*; the lower ends of ſuch bars being the north pole, and the upper the ſouthern. 29°. A bar of iron that has not ſtood long in an erect poſture, if it be only held perpendicularly, will become *magnetical*; and its lower end the north pole; as appears from its attracting the ſouth pole of a needle: but then this virtue is tranſient, and by inverting the bar, the poles will ſhift their places. In order therefore to render the quality permanent in an iron bar, it muſt continue a long time in a proper poſition. But the fire will produce the effect in a ſhort time: for as it will immediately deprive a *Loadſtone* of its attractive virtue; ſo, it ſoon gives a verticity to a bar of iron, if being heated red-hot, it be cooled in an erect poſture, or directly north and ſouth. Nay, tongs and fire-forks, by being often heated and ſet to cool again in a poſture nearly erect, have gained this *magnetical* property. 30°. Mr. Boyle found, that by heating a piece of Engliſh oker red-hot, and placing it to cool in a proper poſture, it manifeſtly acquired a *magnetic* virtue. And an excellent *Magnet* of the ſame ingenious gentleman's man's having lain near a year in an inconvenient poſture, had its virtue ſurprizingly impaired; as if it had been by fire. 31°. A needle well touched, it is known, will point north and ſouth: if it have one contrary touch of the ſame ſtone, it will be deprived of its faculty; and by another ſuch touch will have its poles quite changed. 32°. If a bar of iron have gained a verticity by being heated red-hot and cooled again, north and ſouth, and then hammered at the two ends; its virtue will be deſtroyed by two or three ſmart blows on the middle. 33°. By drawing the back of a knife, or long piece of ſteel wire, *&c.* leiſurely over the pole of a *Loadſtone*; carrying the motion from the middle of the ſtone to the pole; the knife or wire will accordingly attract one end of a needle: but if the knife or wire be paſſed from the ſaid pole to the middle of the ſtone, it will repel that end of the needle which in the other caſe it attracts. 34°. Either a *Magnet* or a piece of iron being laid on a piece of cork, ſo as to ſwim freely in water; it will be found, that which ſoever of the two is held in the hand, the other will be drawn to it: ſo that iron attracts the *Magnet* as much as it is attracted by it; action and re-action being always equal. In this experiment, if the *Magnet* be ſet afloat, it will direct its two poles to the poles of the world. 35°. A knife, *&c.* touched with a *Magnet*, acquires a greater or leſs degree of virtue, according to the part it is touched on. It receives the ſtrongeſt touch, when it is drawn leiſurely from the handle towards the point over one of the poles: And if the ſame knife thus touched, and thus in poſſeſſion of a ſtrong attractive power, be retouched in a contrary direction, *viz.* by drawing it from the point towards the handle over the ſame pole, it immediately loſes all its virtue. Laſtly, a *Magnet* acts with equal force *in vacuo*, and in the open air.—See farther under the article MAGNETISM.

MAGNET, in chymiſtry. MAGNES *Arſenicalis*, denotes a mixture of equal parts of arſenic, ſulphur, and antimony, melted together over the fire, and condenſed in manner of a ſtone.

It is a very gentle cauſtic, and was firſt invented by Angelus Sala.—It has its name *Magnet*, becauſe being wore during malignant diſeaſes, it is ſuppoſed to preſerve the wearer from infection, by a *magnetical* power.

MAGNETISM, MAGNETISMUS, the quality, or conſtitution of a body, and its pores, whereby it is rendered *magnetical*, or a *Magnet*. See MAGNET.

Magnetiſm is found to be a tranſient power, capable of being produced and deſtroyed again. See POLE.

The *laws of* MAGNETISM are laid down by Mr. Whiſton in the following propoſitions.—1°. The *Loadſtone* has both an attractive and a directive power united together; whereas iron touched by it has only the former; *i. e.* the *Magnet* not only attnacts needles or filings of ſteel, but directs them to certain different angles, with reſpect to its own ſurface and axis: whereas iron touched with it, does little or nothing more than attract them; ſtill ſuffering them to lie along or ſtand perpendicular to its ſurface and edges in all places; without any ſuch ſpecial direction.

2°. Neither the ſtrongeſt nor the large *Magnets* give a better directive touch to needles than thoſe of a leſs ſize or virtue: to which it may be added, that whereas there are two qualities in all *Magnets*, an attractive and a directive one; neither of them depend on, or are any argument of the ſtrength of the other.

3°. The attractive power of *Magnets* and of iron, will greatly increaſe or diminiſh the weight of needles on the balance: nay, will overcome that weight, and ſuſtain other additional weights too: while the directive power has much ſmaller effect. Gaſſendus indeed, as well as Merſennus and Dr. Gilbert, maintain it has none at all; but by miſtake: for Mr. Whiſton found from repeated trials on large needles, that after the touch they weighed leſs than before. One of 4584$\frac{1}{8}$ grains loſt 2$\frac{5}{8}$ grains by the touch; and another of 65726 grains weight, no leſs than 14 grains.

4°. It is probable that iron conſiſts almoſt wholly of the attractive particles; and the *Magnet* of the attractive and directive together; mixed probably with other heterogeneous matter; as having never been purged by the fire, which iron has: And hence may ariſe the reaſon why iron, after it has been touched, will lift up much greater weights than the *Loadſtone* that touched it.

5°. The quantity and direction of *magnetic* powers, communicated to needles, is not properly, after ſuch communication, owing to the *Magnet* which gave the touch; but to the goodneſs of the ſteel that receives it, and to the ſtrength and poſition of the terreſtrial *Loadſtone*, whoſe influence alone thoſe needles are afterwards ſubject to, and directed by: ſo that all ſuch needles, if good, move with the ſame ſtrength and point to the ſame angle; what *Loadſtone* ſoever (provided it be good) they were excited by. Nor does the touch ſeem to do much more in *magnetical*, than attrition in electrical caſes; *i. e.* it ſerves to rub off ſome obſtructing particles, that adhere to the ſurface of the ſteel, and open the pores of the bodies touched, and ſo make way for the entrance and exit of ſuch effluvia as occaſion or aſſiſt the powers we are ſpeaking of. Hence Mr. Whiſton takes occaſion to obſerve, that the directive power of the *Loadſtone* ſeems to be mechanical; and to be derived from *magnetic* effluvia, circulating continually round it.

6°. The abſolute attractive power of different armed *Loadſtones*, is, *cæteris paribus*, according to the quantity, not of their diameters or ſolidities, but of the ſurfaces of the *Loadſtones*; or in a duplicate proportion of their diameters.

7°. The power of good *Magnets* unarmed, not ſenſibly different in ſtrength, ſimilar in figure and poſition, but unequal in magnitude, is ſometimes a little greater, ſometimes a little leſs than in the proportion of their ſimilar diameters.

8°. The *Loadſtone* attracts needles that have been touched, and others that have not been touched with equal force, at diſtances unequal, *viz.* where the diſtances are to one another as 5 to 2.

9°. Both poles of a *Loadſtone* equally attract needles, till they be, though roughly, touched; then it is, and then only, that one pole begins to attract one end, and repel the other: though the repelling pole will ſtill attract upon contact, nay at very ſmall diſtances, notwithſtanding.

10°. The attractive power of *Loadſtones*, in their ſimilar poſition to, but different diſtances from *magnetic* needles, is in the ſeſquiduplicate proportion of the diſtances of their ſurfaces from their needles reciprocally; or as the mean proportionals between the ſquares and the cubes of thoſe diſtances reciprocally; or as the ſquare roots of the fifth powers of thoſe diſtances reciprocally. Thus the *magnetic* power of attraction, at twice the diſtance from the ſurface of the *Loadſtone*, is between a fifth and ſixth part of that power at the firſt diſtance. At thrice the diſtance the power is between the fifteenth and ſixteenth part, at four times the diſtance the power is thirty two times as ſmall, and at ſix times the diſtance eighty eight times as ſmall. Where it is to be noted, that the diſtances are not taken, as in the law of gravity, from the center; but from the ſurface: all experience aſſuring us, that the *magnetic* power reſides chiefly, if not wholly, in the ſurfaces of the *Loadſtones* and iron; without any particular relation to any center at all. The proportion here laid down was determined by Mr. Whiſton, from a great number of experiments of Mr. Haukſbee, Dr. Brook Taylor, and himſelf. The force they meaſured by the chords of thoſe arcs, by which the *Magnet*, at ſeveral diſtances, draws the needle out of its natural direction, to which chords (as he has demonſtrated) it is ever proportional. The numbers in ſome of their moſt accurate trials he gives us in the following table, ſetting down half the chords, or the ſines of half thoſe arches of declination, as the true meaſures of the power of *Magnetiſm*.

Diſtances in inches.	*Degrees of inclination.*	*Sines of $\frac{1}{2}$ arcs.*	*Rat. ſeſquidupl.*
20	2	175	466
14 $\frac{8}{9}$	4	349	216
13 $\frac{5}{8}$	6	523	170
12 $\frac{3}{8}$	8	697	138
11 $\frac{1}{8}$	10	871	105
10 $\frac{1}{4}$	12	1045	87
9 $\frac{1}{4}$	14	1219	70

11°. An inclinatory, or dipping-needle, of ſix inches radius, and of a priſmatic or cylindric figure, when it oſcillates along the *magnetic* meridian, performs here, every mean vibration in about 6″ or 360‴; and every ſmall oſcillation in about 5″ $\frac{1}{2}$, or 330‴; and the ſame kind of needle, four foot long, makes every mean oſcillation in about 24″, and every ſmall one in about 22″.

12°. The entire power of *Magnetiſm* in this country, as it affects needles a foot long, is to that of gravity nearly as 1 to 300; and as it affects needles four foot long, as 1 to 600.

13°. The quantity of *magnetic* power accelerating the ſame dipping-needle, as it oſcillates in different vertical planes, is ever as the coſines of the angles made by thoſe planes, and the *magnetic* meridian, taken on the horizon.

Thus if we would eſtimate the quantity of forces in the horizontal and vertical ſituations of needles at London; we ſhall find that the latter in needles a foot long, is, to the entire force along the *magnetic* meridian, as 96 to 100; and in needles four foot long, as 9667 to 10000: whereas in the former, the entire force in needles a foot long, is as 28 to 100; and in thoſe four foot long, as 2560 to 10000. Whence it follows, that the power by which horizontal needles are governed in theſe parts of the world, is but one quarter of the power by which the dipping needle is moved.

Hence alſo, ſince the horizontal needle is moved only by a part of the power which moves the dipping needle; and that it only points to a certain place in the horizon, becauſe that place is the neareſt its original tendency of any its ſituation will allow it to tend to: whenever the dipping-needle ſtands exactly perpendicular to the horizon, the horizontal needle will not reſpect one point of the compaſs more than another, but will wheel about every way uncertainly.

14°. The time of oſcillation and vibration, both in dipping and horizontal needles equally good, is as their length directly; and the actual velocity of their points along their arcs always equal.

Hence *magnetic* needles are, *cæteris paribus*, ſtill better the longer they are; and that in the ſame proportion with their length. See NEEDLE.

15°. The earth, on which we live, includes within it a vaſt ſpherical *Magnet*, concentrical thereto, having its own poles, meridians, equator and parallels; and all much of the ſame general nature with thoſe of ſmall *terrellæ*, or ſpherical *Loadſtones*, in the poſſeſſion of the curious among us.

16°. The power of a good *terrella*, or a ſpherical *Loadſtone*, as it affects a needle a foot long, is equal to the *magnetic* power of that internal *Loadſtone* about two and an half, or three diameters of ſuch *Loadſtone*. From which conſideration, the quantity of *magnetic* attraction, at all diſtances from the internal *Loadſtone*, for needles a foot long, may be determined; and from the ſame conſideration it appears, that the diameter of this internal *Loadſtone* is about eleven hundred and fifty miles. To which we may add, that, in regard Sir Iſaac Newton has demonſtrated, that the power of gravity diminiſhes within the earth, and is leſſer there than at its ſurface, nearly in the proportion of its greater nearneſs to the center; the *magnetic* power at two thouſand nine hundred miles diſtance from us, and nearly one thouſand and ſixty from the earth's center, which is $\frac{10}{24}$ of the power of gravity here, will be ſomewhat greater than the power of gravity there: Which limit is worth our attention, gravity being ſtronger than *Magnetiſm* on the one ſide of it, and weaker on the other; we mean as it affects needles of one foot diameter. At that limit therefore, at leaſt near the *magnetic* poles, iron a foot long, will be twice as heavy, and fall twice as faſt as any other natural body, *viz.* by the union of thoſe two equal powers, gravity and *Magnetiſm*; and of conſequence, above that limit, ſuch an iron will be leſs than twice as heavy; below it, more than twice as heavy as any other natural body. See GRAVITY, WEIGHT, *&c.*

17°. The earth's internal *Loadſtone* is not fixed to our upper parts, but is moveable with reſpect thereto, and actually revolves on the earth's axis from eaſt to weſt in a certain long period of time; as appears, beyond contradiction, from the conſtant variation of the horizontal needle weſtward; as well as the regular increaſe of inclination of the dipping needle.

The only way to render this motion, *i. e.* the variation, poſſible and intelligible (to uſe Dr. Halley's words) is to ſuppoſe it to turn about the center of the globe, having its center of gravity fixed and immoveable in the ſame common center of the earth. This moveable internal ſurface muſt likewiſe be looſe, and detached from the external parts of the globe, which may be reckoned the ſhell, and the other the nucleus, or inner globe, included within it, with a fluid medium between. Now from the variation's moving weſtwards, it is plain, that the foreſaid nucleus has not preciſely attained the ſame degree of velocity with the exterior parts in their diurnal revolution; but ſo nearly equals it, that in three hundred and ſixty-five revolves, the difference is ſcarce ſenſible; and muſt probably have riſen from hence, that the impulſe, whereby the diurnal motion was impreſſed on the earth, was given to the external parts, and thence communicated to the internal.

18°. This internal *Magnet* has one central pole northwards, in the nature of the poles of our common *Loadſtones*; but its ſouthern pole appears not to be central, but rather circular; and that at a great diſtance from the ſouthern pole of the earth.

19°. The northern *magnetic* pole is now ſituate about the latitude of 76 degrees ½; *i. e.* 13 degrees ½ from the north pole of the earth, and about 30 degrees eaſtward from the meridian of London.

20°. The ſouthern *magnetic* circular pole has its center, or central pole, nearly in the parallel of 60 degrees; and in a meridian paſſing along the eaſt coaſt of Borneo, about 117 degrees eaſtward of London: its radius is alſo an arc of a great circle of about 44 degrees.

21°. The reſpective motion of the internal *Magnet*, or the velocity, *v. g.* of its north-pole, appears to be 27 deg. 0 min. in 144 years, *i. e.* upwards of one degree in five years; ſo that it makes an intire revolution in 1920 years.

Hence, as the number of degrees in the upper earth's diurnal revolution, is to the number of days in the revolution of the internal *Magnet*, *i. e.* as 1 is to 700000, ſo is the reſpective motion of this *Magnet* from eaſt to weſt to the real motion of the upper earth from weſt to eaſt; or to ſpeak ſtrictly, ſo is the difference of their motions from weſt to eaſt, to the entire motion of the upper earth the ſame way. This external fixed earth has therefore communicated almoſt all its motion already to the internal *Magnet*, and can communicate no more than this difference of their motion, and that only in an infinite term of years; or, in other words, this real internal motion can never be the ſeven hundred thouſandth part ſwifter than it is at preſent. This internal motion therefore began with the commencement of the diurnal motion of the upper earth; and has gone on ſtill faſter and faſter by the communication of that motion through the intermediate fluid. Since therefore action and re-action are equal, and tend to contrary parts, this internal *Loadſtone*, thus accelerated by the upper part, muſt have all along retarded that upper earth, and made the diurnal rotation ſtill ſlower and ſlower. This acceleration on one ſide, and retardation on the other, muſt have been very great at the firſt beginning of the diurnal motion, when the difference of their motion was equal to the entire motion itſelf, and muſt have been diminiſhing ever ſince. To which cauſe is probably owing that acceleration of the moon's motion with reſpect to that of the earth, ſince the time of the old aſtronomers firſt taken notice of by Dr. Halley, and embraced by Sir Iſaac Newton. And the ſame conſideration ſeems to ſuggeſt a method for determining the age of the world; for were the proportions of the quantity of matter in the upper earth to the internal *Magnet*, with the tenacity of the intermediate fluid, *&c.* known, one might go back from the known difference of their velocity now, and find thoſe differences and quantities of motion themſelves, *à priori*, in all paſt ages; or were the velocity of the firſt diurnal rotation of the upper earth known, we might geometrically determine, *à priori*, how long ago that rotation began, or how ancient our earth is. See EARTH, WORLD, *&c.*

22°. The variation of *magnetic* needles from the azimuth of the meridians of the internal *Magnet*, is derived from the difference of the ſtrength of the ſeveral parts of the internal *Magnet*'s ſurface; which as it is only to be known by experience, that variation cannot be determined beforehand, unleſs where there are good accounts how much it had formerly been; it being probable that it returns round, and will be the ſame in any year of the next revolution of the internal *Magnet*, that it has been in the like year of any former revolution, or will itſelf have a revolution in about 1920 years.

23°. The two fixed *magnetic* poles, in our upper earth, firſt introduced by Dr. Halley, as neceſſary to ſolve the irregularity of the variation of the horizontal needle from the meridians of the moveable internal *Magnet*, ſeem not to have any juſt foundation in nature; the like irregularities being found in the common *terrellæ* or ſpherical *Loadſtones*; and being beſt accounted for from the compoſition of the *Magnets*, which are found to have parts of different degrees of purity, ſtrength, and perfection; ſo that where the parts are weaker than ordinary, the ſtronger neighbouring parts prevail, and draw the needle that way: not but Dr. Gilbert's notion of prominent and depreſſed parts on *Magnets* may have ſome room, and be allowed to contribute ſomewhat to ſuch variations. See VARIATION.

For the cauſes of MAGNETISM, or the manner in which theſe phænomena of the *Magnet* are produced, we have yet no hypotheſis that will ſatisfactorily account for them.—Plutarch tells us, the *Magnet* attracts iron, by emitting ſome ſpiritual effluvia, whereby the contiguous air being opened and driven on either ſide, does again drive that contiguous to it; and thus the action being communicated round, the iron is thereby protruded: but this is contradicted by the equally vigorous action of the *Loadſtone* in vacuo, and in the open air.—Others of the ancients aſcribe the action of the *Magnet* to a ſoul that animates it; and others to I know not what ſympathy between the effluvia of the iron and thoſe of the *Magnet*.

The opinion that principally prevails among the moderns, is that of Des Cartes, maintained by Malebranche, Rohault, Regis, *&c.* and even admitted, and confirmed by Mr. Boyle, *&c.* In this it is ſuppoſed there is continually flowing, from the poles of the world, a ſubtle, impalpable, and inviſible matter, channelled or ſtriated: which matter circulating round the earth, in the plains of the meridians, re-enters at the pole oppoſite to that from which it iſſued, and paſſes again through the poles parallel to its axis: That the *Magnet* has two poles anſwerable to thoſe of the earth, and that out of theſe there iſſues a matter like that juſt mentioned: That this matter, entering in at one of the poles, gives the impulſe whereby iron tends to the *Magnet*, and produces what we call *attraction*.—Now beſides the *magnetical* matter re-entering the poles of the *Magnet*, there is always a certain quantity thereof circulating round the *Magnet*; compoſing a kind of vortex about it. The ſpace wherein this matter moves, is the ſphere of activity of the *Magnet*, within which its attractive faculty is confined.

As to its directive faculty, or the inclination of a needle touched with it to the poles of the world, and its dip to a point beneath the horizon, they follow from the ſame principle; ſince were the *Magnet* or needle to have any other ſituation, the *magnetic* matter would ſtrike on its other ſurface in vain; and not being able to get admiſſion, would, by degrees, change its ſituation, till ſuch times as its pores correſponded to the courſe of the *magnetical* matter; which ſituation having once acquired, it would ceaſe to move; the *magnetical* matter then ceaſing to diſturb it.

The form or eſſence of a *Magnet* therefore is ſuppoſed to conſiſt in its being perforated by an infinite number of parallel pores; ſome whereof are diſpoſed to admit the ſtriated matter from the north pole of the world, others that of the ſouth; hence the north and ſouth poles of the *Magnet*. See POLE.

M. Hartſoeker maintains, that the *Magnet* is no more than a common ſtone, full of an infinite number of hollow priſms, which, by the diurnal motion of the earth, are ranged parallel to each other, and nearly parallel to the axis of the earth. Theſe priſms have their cavities filled with an extremely ſubtle matter, which, by the diurnal motion of the earth, is paſſed from priſm to priſm; thus making a circulation, and returning into the priſms where it firſt began: from theſe principles he deduces all the phænomena of the *Magnet*; and M. Andry does the ſame, from the doctrine of alkali and acid.

For the directive power of the *Magnet*, Mr. Whiſton, from the firſt, ſecond, third, &c. laws of *Magnetiſm*, inclines to think it mechanical; and aſcribes it to *magnetic* effluvia circulating continually round the *Loadſtone*; of which circulations he thinks there are evident indications in *magnetic* experiments; as Mr. Boyle thinks there are of the *Magnetiſm* or *magnetic* effluvia of the earth; though thoſe effluvia were never yet rendered ſenſible, as electric effluvia begin to be.—But the attractive power, Mr. Whiſton thinks entirely immechanical, as the power of gravity is; not being able to deviſe any ſuch motion of a ſubtle fluid belonging to the *Loadſtone*, as will account for the attractive power in the ſeſquiduplicate proportion of the diſtances reciprocally; though if he could, yet would that be no more than to remove the immediate power of the Supreme Being one ſtep further; the laſt reſort of all mechanical principles whatever, being into the immechanical power and efficiency of the Deity. See CAUSE, &c.

MAGNETISM, is alſo uſed by ſome chymiſts, to ſignify a certain virtue, whereby one thing becomes affected at the ſame time with another, either, in the ſame or a different manner. This amounts to the ſame with what they otherwiſe call *ſympathy*. See SYMPATHY.

MAGNETICAL *Amplitude*, an arch of the horizon, contained between the ſun, at his riſing and ſetting, and the eaſt or weſt point of the compaſs. See AMPLITUDE, and COMPASS.

MAGNETICAL *Azimuth*. See the article AZIMUTH.

MAGNIFYING, among philoſophers, is chiefly uſed in ſpeaking of microſcopes, which are ſaid to *magnify* objects, that is, make them appear bigger than they really are: though in reality, they do not, nor cannot, *magnify* any object, but only ſhew it nearer, and more of its parts, than before were taken notice of. See MICROSCOPE, VISION, &c.

Magnifying GLASS, in optics, denotes a little ſpherical convex lens; which, in tranſmitting the rays of light, inflects them ſo, as that the parallel ones become converging, and thoſe which were diverging become parallel; by means whereof, objects viewed through them appear larger than when viewed by the naked eye. See LENS, MICROSCOPE, REFRACTION, &c.

MAGNITUDE, any thing that has parts without (or *extra* to) parts, connected together by ſome common term. See PART.

Magnitude is any thing locally extended, or continued; or that has ſeveral dimenſions. See EXTENSION, DIMENSION, &c.

The origin of all *Magnitude* is a point, which, though void of parts itſelf, yet its flux forms a line, the flux of that a ſurface, and of that a body. See POINT, LINE, &c.

Magnitude amounts to much the ſame with what is otherwiſe called *quantity*. See QUANTITY.

Literal MAGNITUDE, denotes a *Magnitude* expreſſed by letters. See SPECIOUS.

Numerical MAGNITUDE is that expreſſed by numbers.

Broken MAGNITUDE denotes a fraction. See FRACTION.

Complex MAGNITUDE is that formed by multiplication.

Incommenſurable MAGNITUDE is that which has no proportion to unity. See INCOMMENSURABLE.

Apparent MAGNITUDE of a body, in optics, is that meaſured by the optic or viſual angle, intercepted between rays drawn from its extremes to the center of the pupil of the eye.

It is one of the fundamental maxims in this ſcience, that whatever things are ſeen under the ſame or equal angles, appear equal; and on the contrary. See VISION.

The *apparent Magnitudes* of an object at different diſtances, are in a ratio leſs than that of their diſtances reciprocally. See DISTANCE.

The *Apparent Magnitudes* of the two great luminaries, the ſun and moon, at riſing and ſetting, is a phænomenon that has extremely embaraſſed the modern philoſophers. According to the ordinary laws of viſion, they ſhould appear the leaſt when neareſt the horizon, as being then furtheſt diſtant from the eye; and yet we find the contrary true in fact.—Ptolemy in his Almageſt. l. 1. c. 3. aſcribed this appearance to a refraction of the rays by vapours, which actually enlarge the angle under which the moon appears, juſt as the angle is enlarged by which an object is ſeen from under water: And his commentator Theon explains diſtinctly how the dilatation of the angle in the object immerſed in water is cauſed.—But it was afterwards diſcovered, that there is no alteration in the angle: upon which another ſolution was ſtarted by the Arab Alhazen; and followed and improved by Vitellio, Kepler, Peckham, Rog. Bacon, and others. According to Alhazen, the ſight apprehends the ſurface of the heavens as flat, and judges of the ſtars as it would of ordinary viſible objects extended upon a wide plain; that the eye ſees them under equal angles, but withal perceives a difference in their diſtances, and (on account of the ſemidiameter of the earth which is interpoſed in one caſe and not in the other) that it is hence induced to judge thoſe which appear more remote to be greater. See *Robin's Remarks on Smith's Optics*.

Des Cartes, and from him Dr. Wallis, and moſt other authors, account for the appearance of a different diſtance under the ſame angle from the long ſeries of objects interpoſed between the eye and the extremity of the ſenſible horizon, which make us imagine it more remote than when in the meridian, where the eye ſees nothing in the way between the object and itſelf. This idea of a great diſtance, makes us imagine the luminary the bigger: For any object being ſeen under any certain angle, and believed, at the ſame time, very remote, we naturally judge it muſt be very large, to appear under ſuch an angle at ſuch a diſtance. And thus a pure judgment of the mind makes us ſee the ſun or the moon bigger in the horizon, than in the meridian; notwithſtanding their images painted on the retina are leſs in the former ſituation than the latter.

This hypotheſis, F. Gouye deſtroys, by obſerving that the narrower and more confined the ſenſible horizon is, the greater does the ſun or moon appear; the contrary of which ſhould happen on the principle laid down.

Gaſſendus is of opinion, that the pupil of the eye, which is always more open as the place is more dark; being more ſo in the morning and evening than at other times, by reaſon the earth is covered with groſs vapours; and beſides, being obliged to paſs through a longer column or ſeries of vapours, to reach the horizon; the image of the luminary enters the eye at a greater angle, and is really painted there larger at the former times, than the latter. See PUPIL, and VISION.

In anſwer to which, it may be ſaid, that notwithſtanding this dilatation of the pupil, occaſioned by the obſcurity; if the moon be viewed through a little pin-hole made in a paper, ſhe appears leſs when in the horizon, than in the meridian.

F. Gouye finding both the conjectures falſe, advances a third; which is, that when the luminaries are in the horizon, the neighbourhood of the earth, and the groſs vapours wherewith they then appear inveloped, have the ſame effect with regard to us, as a wall, or other denſe body placed behind a column; which in that caſe appears bigger than when inſulate, and incompaſſed on all ſides with an illumined air.—Further, it is obſerved that a column when fluted, appears bigger than before, when it was plain; the flutes being ſo many particular objects, which by their multitude occaſion the mind to imagine the whole object whereof they are compoſed of a larger extent.—The ſame thing may be ſaid of the ſeveral objects ſeen towards the horizon, to which the ſun or moon correſpond at their riſing and ſetting.—And hence it is that they appear larger ſtill, when they riſe or ſet between trees; the narrow, yet diſtinct intervals whereof have the ſame effect with regard to the apparent diameter of the luminary, as a greater number of flutes with regard to the ſhaft of a column.

MAGOPHONIA*, the name of a feaſt among the ancient Perſians held in memory of the expulſion of the magians.

* The word is formed from Μαγος, magus, and φονος, ſlaughter.

The magus Smerdis having uſurped the throne of Perſia, upon the death of Cambyſes, 521 years before Jeſus Chriſt, ſeven of the principal lords of the court conſpired to drive him out of it. Their deſign was executed with good ſucceſs; Smerdis and his brother, another magus, called Pitizithes, were killed. Upon which, the people alſo roſe, and put all the magi to the ſword; inſomuch that there would not one have eſcaped, had not night come upon them. Darius, ſon of Hyſtaſpes, was then elected king. In memory of this maſſacre of the magi, a feaſt was inſtituted, ſays Herodotus, called *Magophonia*. See MAGI.

MAHIM, MAHEM, MAIHEM, or MAYHEM*, in law, a *Maim*, or corporal hurt, whereby a man loſeth the uſe of any member, that is, or may be, of defence to him in battle; as the eye, hand, foot, ſcalp of the head, fore-tooth, or, as ſome ſay, a finger or toe. See MEMBER, and MUTILATION.

* The word comes from the French, *Mehain*, of *Mehaigner*, to mutilate: the canoniſts call it *membri mutilatio*; and all agree, it conſiſts in the loſs of a member or the uſe thereof.

If any one ſhall of malice, or forethought, cut or diſable any limb or member of another perſon, with intention, in ſo doing, to *maim*, or diſfigure him; it is felony without benefit of clergy: and when the caſe is difficult to judge, whether it be a *Mahim* or not, the judges commonly view the party wounded, and ſometimes take the opinion of chirurgeons.

MAHOMETANISM, or MAHOMETISM, the ſyſtem of religion broached by *Mahomet*, and ſtill adhered to by his followers.

Mahometaniſm is embraced by the Turks, Perſians, and ſeveral nations among the Africans, and many among the Eaſt-Indians.

The ſyſtem of *Mahometaniſm*, is contained in the Koran, commonly called the Alcoran. See ALCORAN.

The firſt and chief article of the *Mahometan* creed, is, that *there is no other God but God*; which they have from the alcoran, where theſe words are repeated inceſſantly: *There is no other God but him. Your God is the only God. I am God, and* *there is no other God but me.*—This grand axiom of their theology ſeems to have been taken from the Jews, who were continually rehearſing thoſe words of Deuteronomy, *Hear, O Iſrael, the Lord our God is One.* See GOD.

For this reaſon, the *Mahometans* account all ſuch as own any thing of number in the divinity, to be infidels or idolaters: And accordingly, one of the firſt leſſons they teach their children, is, That God is neither male nor female, and conſequently can have no children. See SON, GENERATION, TRINITY, &c.

The ſecond article of *Mahometaniſm*, conſiſts in this, *That Mahomet was ſent from God.* By which they exclude all other religions; under pretence that their prophet was the laſt and greateſt of all the prophets that God would ever ſend; and that as the Jewiſh religion ceaſed with the coming of the Meſſiah, ſo likewiſe the Chriſtian religion was to be abrogated with the coming of *Mahomet*. Not but that they own Moſes and Jeſus Chriſt to have been great prophets; but *Mahomet* they hold to be *The Prophet*, by way of excellence; and the paraclet or comforter promiſed in ſcripture. See JUDAISM, &c.

Theſe are the two fundamentals of *Mahometaniſm*; ſo that when any is to make profeſſion of that faith, they content themſelves with his rehearſing theſe words, *There is no other God but God, and Mahomet is his envoy, or prophet.*

To theſe articles the *Mahometans* have added that of bathing or purification, in imitation of the Jews. And ſuch an opinion have they of theſe purifications, that it is purely on that account they ſeem to have retained the practice of circumciſion. For they pretend, with the Jews, that if the leaſt part of the body remained unwaſhed, the bathing is of no effect. Hence they find themſelves under a neceſſity of being circumciſed; that the part covered by the prepuce may alſo have its ſhare in the lotion. See ABLUTION, CIRCUMCISION, &c.

Prayer is alſo one of the things to which the *Mahometans* are obliged; and they perform it five times a day, to diſtinguiſh themſelves from the Jews, who only do it thrice. Some of their periods or hours of prayer they hold to be neceſſary, and of divine obligation; others they eſteem convenient and prudential. That at nine a-clock in the morning, they do not eſteem neceſſary: but thoſe at noon and in the afternoon are held to be *jure divino*. They are obliged to obſerve an infinity of things in order to be heard: If they ſpeak or ſmile in praying, their prayers are vain; and it is the ſame thing if they weep, unleſs it be with the thought of paradiſe or hell. In many of their prayers they uſe beads.

The *Mahometans* believe with the Chriſtians and Jews, a reſurrection of the dead: they hold, that ere that time, an *Anti-Mahomet* will come; and that Jeſus Chriſt will deſcend from heaven to kill him, and eſtabliſh *Mahometaniſm*. To which they add a great many more chimæras, relating to Gog and Magog; and the beaſt that is to come out of Mecca. The mountains are to fly in the air like birds, and at laſt the heavens will melt and drop down upon the earth. They add however, that ſome time after, God will renew and re-eſtabliſh the earth; that then the dead will be raiſed, &c. See further under ALCORAN.

MAIDEN, an edged inſtrument uſed in ſome countries, particularly Scotland, for the beheading of criminals.

The *Maiden* is a broad piece of iron, a foot ſquare, ſharp on the lower part, and loaded above with lead, ſo as ſcarce to be lifted: At the time of execution, it is pulled up to the top of a narrow wooden frame ten foot high, with a groove on each ſide for the *Maiden* to ſlide in.—The priſoner's neck being faſtened to a bar underneath, on a ſign given, the *Maiden* is let looſe, and the head in an inſtant ſeparated from the body.

MAJESTY, MAJESTAS*, a title or quality given to kings; and which frequently ſerves as an appellation to diſtinguiſh them by. See TITLE, QUALITY, KING, &c.

* The word ſeems compoſed of the two Latin words, *major*, greater, and *ſtatus*, ſtate.

The emperor is called, His Cæſarian or Imperial *Majeſty*; the king of Spain his Catholic *Majeſty*; the king of France, his moſt Chriſtian *Majeſty*; the king of Great-Britain, his Britannic *Majeſty*, &c. Some have alſo extended this title to the popes. See POPE.

Paſquier obſerves, that our fore-fathers uſed this quality exceeding ſparingly; and that the frequent uſe of the word which now obtains, had not its beginning before the reign of their Henry II. He inſtances ſeveral letters of St. Gregory, who writing to King Theodebert and Theodoric, only compliments them with Excellency. See EXCELLENCY.

Till the time of Charles V. the king of Spain had no title but that of Highneſs: And before our king Henry VIII. the kings of England were only addreſſed under the titles of Grace and Highneſs. See GRACE, and HIGHNESS.

At the peace of Munſter, there was a great conteſt between the miniſters of the emperor and thoſe of France: The firſt would not allow the title of Serenity to the king of France, and the latter would not give that of *Majeſty* to the emperor. At laſt it was agreed, that whenever the French king ſhould write with his own hand to the emperor, he ſhould give him the title of Imperial *Majeſty*; and reciprocally, when the emperor ſhould write to the king, he ſhould give him that of Royal *Majeſty*.

Under the Roman republick, the title *Majeſty*, *Majeſtas*, belonged to the whole body of the people, and to the principal magiſtrates; ſo that to diminiſh or wound the *Majeſty* of the commonwealth, was to be wanting in reſpect to the ſtate, or its miniſters.—But the power paſſing into the hands of a ſingle perſon, the appellation of *Majeſty* was transferred to the emperor, and the imperial family. Pliny compliments Trajan on his being contented with the title of Greatneſs; and ſpeaks very invidiouſly on thoſe who affected that of *Majeſty*. And yet *Majeſty* ſeems to be the modeſteſt and juſteſt title that can be attributed to ſovereigns, ſince it ſignifies no more at bottom, than the royalty or ſovereign power.

MAIL, MAILLE, is primarily applied to the maſhes or holes in net-work.

Coat of **MAIL**, a piece of defenſive armour, made of iron wire interwoven net-wiſe: called alſo *habergeon*. See HABERGEON. Anciently they alſo wore ſhirts of *Mail* under the doublet, to ſerve as a defence againſt ſwords and poniards. We alſo read of gloves of *Mail*.

MAIL, or MALL, alſo ſignifies a round ring of iron; whence the play of pall-mall, from *palla*, a ball, and *maille*, the round ring through which it is to paſs.

MAILED implies a thing ſpeckled, or full of ſpecks; as the feathers of hawks, partridges, &c. or the furs of ſome wild beaſts.

MAIN-MORTE, a term in ſome ancient cuſtoms, ſtill obtaining in Burgundy, ſignifying a right which the lord has, on the death of the chief of a family that is *Mainmortable*, of taking the beſt moveable in the houſe; or in default of that, the right hand of the deceaſed was offered him, in token that he could ſerve him no longer. See MORT-MAIN.

MAINOUR, MANOUR, or MEINOR, in law, ſignifies the thing that a thief takes away, or ſteals.

Thus, to be taken with *Mainour*, is to be taken with the thing ſtolen about him.—If the defendant were taken with the *Mainour*, and ſo caried to court, in ancient times they would arraign him on the *Mainour* without any appeal or indictment.

MAINPRISE*, in law, the taking or receiving a man into friendly cuſtody, who otherwiſe might be committed to priſon; upon ſecurity given for his forth-coming at a day aſſigned.

* The word is compounded of the French *Main*, hand, and *pris* or *prins*, taken.

They who thus undertake for any are called *Mainpernors*, becauſe they receive him into their hands; whence alſo comes the word *Mainpernable*, denoting the perſon who may be thus bailed.

Manwood makes a great difference between bail and *Mainpriſe*: he that is *mainpriſed* is already ſaid to be at large after the day he is ſet to *Mainpriſe* till the day of his appearance; but it is quite otherwiſe where a man is let to bail to four or two men, by the lord juſtice in eyre of the foreſt, or any other judge, until a certain day; for there he is always accounted by the law to be in their ward and cuſtody for the time; and they may, if they pleaſe, keep him in priſon all that time. So that he who is bailed, is not ſuppoſed to be at large, or at his own liberty: whereas under *Mainpriſe*, a man is ſuppoſed to go at large, and is not liable to be confined by his ſureties or *Mainpernors*. See BAIL.

The author of the *Mirrour of Juſtice* ſays, that pledges are thoſe who bail, or redeem any thing but the body of a man; and *Mainpernors* thoſe who free the body: on which footing, pledges belong properly to real and mixed actions, and *Mainpernors* to perſonal. See PLEDGE.

MAINTENANCE, MANUTENENTIA*, in law, an unlawful maintaining, or upholding a cauſe, or ſuit between others; either by word, writing, countenance or deed.

* The word is metaphorically taken from the ſuccouring a young child, that learns to go by one's hand; and is uſed in the evil part in ſome of our ſtatutes.

When a man's act in this kind is eſteemed *Maintenance*, and when not, ſee Brooks and Kitchin. See alſo BARRATOR.

There lies a writ againſt a *Maintainer*, called a Writ of *Maintenance*.

MAJOR, in the art of war, a name given to ſeveral officers of different qualities, and functions.—Thus,

MAJOR-*General* is a general officer who receives the general's orders, and delivers them out to the *Majors* of brigades, with whom he concerts what troops are to mount the guard, what to go on parties, what to form detachments, or to be ſent on convoys, &c.

It is his buſineſs alſo to view the ground to encamp on, and do other ſervices; being ſubordinate to the general, and lieutenant-general, and the next commanding officer to them. See GENERAL.

MAJOR *of a brigade*, either horſe or foot, is he who receives orders, and the word, from the major-general, and gives them to the particular majors of each regiment. See BRIGADE.

MAJOR *of a regiment*, is an officer, whoſe buſineſs is, to convey all orders to the regiment, to draw it up, and exerciſe it; to ſee which, by the diurnal motion of the earth, are ranged parallel to each other, and nearly parallel to the axis of the earth. Theſe priſms have their cavities filled with an extremely ſubtle matter, which, by the diurnal motion of the earth, is paſſed from priſm to priſm; thus making a circulation, and returning into the priſms where it firſt began: from theſe principles he deduces all the phænomena of the *Magnet*; and M. Andry does the ſame, from the doctrine of alkali and acid.

For the directive power of the *Magnet*, Mr. Whiſton, from the firſt, ſecond, third, *&c.* laws of *Magnetiſm*, inclines to think it mechanical; and aſcribes it to *magnetic* effluvia circulating continually round the *Loadſtone*; of which circulations he thinks there are evident indications in *magnetic* experiments; as Mr. Boyle thinks there are of the *Magnetiſm* or *magnetic* effluvia of the earth; though thoſe effluvia were never yet rendered ſenſible, as electric effluvia begin to be.—But the attractive power, Mr. Whiſton thinks entirely immechanical, as the power of gravity is; not being able to deviſe any ſuch motion of a ſubtle fluid belonging to the *Loadſtone*, as will account for the attractive power in the ſeſquiduplicate proportion of the diſtances reciprocally; though if he could, yet would that be no more than to remove the immediate power of the Supreme Being one ſtep further; the laſt reſort of all mechanical principles whatever, being into the immechanical power and efficiency of the Deity. See CAUSE, *&c.*

MAGNETISM, is alſo uſed by ſome chymiſts, to ſignify a certain virtue, whereby one thing becomes affected at the ſame time with another, either, in the ſame or a different manner. This amounts to the ſame with what they otherwiſe call *ſympathy*. See SYMPATHY.

MAGNETICAL *Amplitude*, an arch of the horizon, contained between the ſun, at his riſing and ſetting, and the eaſt or weſt point of the compaſs. See AMPLITUDE, and COMPASS.

MAGNETICAL *Azimuth*. See the article AZIMUTH.

MAGNIFYING, among philoſophers, is chiefly uſed in ſpeaking of microſcopes, which are ſaid to *magnify* objects, that is, make them appear bigger than they really are: though in reality, they do not, nor cannot, *magnify* any object, but only ſhew it nearer, and more of its parts, than before were taken notice of. See MICROSCOPE, VISION, *&c.*

Magnifying **GLASS**, in optics, denotes a little ſpherical convex lens; which, in tranſmitting the rays of light, inflects them ſo, as that the parallel ones become converging, and thoſe which were diverging become parallel; by means whereof, objects viewed through them appear larger than when viewed by the naked eye. See LENS, MICROSCOPE, REFRACTION, *&c.*

MAGNITUDE, any thing that has parts without (or *extra* to) parts, connected together by ſome common term. See PART.

Magnitude is any thing locally extended, or continued; or that has ſeveral dimenſions. See EXTENSION, DIMENSION, *&c.*

The origin of all *Magnitude* is a point, which, though void of parts itſelf, yet its flux forms a line, the flux of that a ſurface, and of that a body. See POINT, LINE, *&c.*

Magnitude amounts to much the ſame with what is otherwiſe called *quantity*. See QUANTITY.

Literal **MAGNITUDE**, denotes a *Magnitude* expreſſed by letters. See SPECIOUS.

Numerical **MAGNITUDE** is that expreſſed by numbers.

Broken **MAGNITUDE** denotes a fraction. See FRACTION.

Complex **MAGNITUDE** is that formed by multiplication.

Incommenſurable **MAGNITUDE** is that which has no proportion to unity. See INCOMMENSURABLE.

Apparent **MAGNITUDE** of a body, in optics, is that meaſured by the optic or viſual angle, intercepted between rays drawn from its extremes to the center of the pupil of the eye.

It is one of the fundamental maxims in this ſcience, that whatever things are ſeen under the ſame or equal angles, appear equal; and on the contrary. See VISION.

The *apparent Magnitudes* of an object at different diſtances, are in a ratio leſs than that of their diſtances reciprocally. See DISTANCE.

The *Apparent Magnitudes* of the two great luminaries, the ſun and moon, at riſing and ſetting, is a phænomenon that has extremely embaraſſed the modern philoſophers. According to the ordinary laws of viſion, they ſhould appear the leaſt when neareſt the horizon, as being then furtheſt diſtant from the eye; and yet we find the contrary true in fact.—Ptolemy in his Almageſt. l. 1. c. 3. aſcribed this appearance to a refraction of the rays by vapours, which actually enlarge the angle under which the moon appears, juſt as the angle is enlarged by which an object is ſeen from under water: And his commentator Theon explains diſtinctly how the dilatation of the angle in the object immerſed in water is cauſed.—But it was afterwards diſcovered, that there is no alteration in the angle: upon which another ſolution was ſtarted by the Arab Alhazen; and followed and improved by Vitellio, Kepler, Peckham, Rog. Bacon, and others. According to Alhazen, the ſight apprehends the ſurface of the heavens as flat, and judges of the ſtars as it would of ordinary viſible objects extended upon a wide plain; that the eye ſees them under equal angles, but withal perceives a difference in their diſtances, and (on account of the ſemidiameter of the earth which is interpoſed in one caſe and not in the other) that it is hence induced to judge thoſe which appear more remote to be greater. See *Robin's Remarks on Smith's Optics.*

Des Cartes, and from him Dr. Wallis, and moſt other authors, account for the appearance of a different diſtance under the ſame angle from the long ſeries of objects interpoſed between the eye and the extremity of the ſenſible horizon, which make us imagine it more remote than when in the meridian, where the eye ſees nothing in the way between the object and itſelf. This idea of a great diſtance, makes us imagine the luminary the bigger: For any object being ſeen under any certain angle, and believed, at the ſame time, very remote, we naturally judge it muſt be very large, to appear under ſuch an angle at ſuch a diſtance. And thus a pure judgment of the mind makes us ſee the ſun or the moon bigger in the horizon, than in the meridian; notwithſtanding their images painted on the retina are leſs in the former ſituation than the latter.

This hypotheſis, F. Gouye deſtroys, by obſerving that the narrower and more confined the ſenſible horizon is, the greater does the ſun or moon appear; the contrary of which ſhould happen on the principle laid down.

Gaſſendus is of opinion, that the pupil of the eye, which is always more open as the place is more dark; being more ſo in the morning and evening than at other times, by reaſon the earth is covered with groſs vapours; and beſides, being obliged to paſs through a longer column or ſeries of vapours, to reach the horizon; the image of the luminary enters the eye at a greater angle, and is really painted there larger at the former times, than the latter. See PUPIL, and VISION.

In anſwer to which, it may be ſaid, that notwithſtanding this dilatation of the pupil, occaſioned by the obſcurity; if the moon be viewed through a little pin-hole made in a paper, ſhe appears leſs when in the horizon, than in the meridian.

F. Gouye finding both the conjectures falſe, advances a third; which is, that when the luminaries are in the horizon, the neighbourhood of the earth, and the groſs vapours wherewith they then appear inveloped, have the ſame effect with regard to us, as a wall, or other denſe body placed behind a column; which in that caſe appears bigger than when inſulate, and incompaſſed on all ſides with an illumined air.—Further, it is obſerved that a column when fluted, appears bigger than before, when it was plain; the flutes being ſo many particular objects, which by their multitude occaſion the mind to imagine the whole object whereof they are compoſed of a larger extent.—The ſame thing may be ſaid of the ſeveral objects ſeen towards the horizon, to which the ſun or moon correſpond at their riſing and ſetting.—And hence it is that they appear larger ſtill, when they riſe or ſet between trees; the narrow, yet diſtinct intervals whereof have the ſame effect with regard to the apparent diameter of the luminary, as a greater number of flutes with regard to the ſhaft of a column.

MAGOPHONIA*, the name of a feaſt among the ancient Perſians held in memory of the expulſion of the magians.

* The word is formed from Μαγος, magus, and φονος, ſlaughter.

The magus Smerdis having uſurped the throne of Perſia, upon the death of Cambyſes, 521 years before Jeſus Chriſt, ſeven of the principal lords of the court conſpired to drive him out of it. Their deſign was executed with good ſucceſs; Smerdis and his brother, another magus, called Pitizithes, were killed. Upon which, the people alſo roſe, and put all the magi to the ſword; inſomuch that there would not one have eſcaped, had not night come upon them. Darius, ſon of Hyſtaſpes, was then elected king. In memory of this maſſacre of the magi, a feaſt was inſtituted, ſays Herodotus, called *Magophonia*. See MAGI.

MAHIM, **MAHEM**, **MAIHEM**, or **MAYHEM***, in law, a *Maim*, or corporal hurt, whereby a man loſeth the uſe of any member, that is, or may be, of defence to him in battle; as the eye, hand, foot, ſcalp of the head, fore-tooth, or, as ſome ſay, a finger or toe. See MEMBER, and MUTILATION.

* The word comes from the French, *Mehain*, of *Mehaigner*, to mutilate: the canoniſts call it *membri mutilatio*; and all agree, it conſiſts in the loſs of a member or the uſe thereof.

If any one ſhall of malice, or forethought, cut or diſable any limb or member of another perſon, with intention, in ſo doing, to *maim*, or disfigure him; it is felony without benefit of clergy: and when the caſe is difficult to judge, whether it be a *Mahim* or not, the judges commonly view the party wounded, and ſometimes take the opinion of chirurgeons.

MAHOMETANISM, or **MAHOMETISM**, the ſyſtem of religion broached by *Mahomet*, and ſtill adhered to by his followers.

Mahometaniſm is embraced by the Turks, Perſians, and ſeveral nations among the Africans, and many among the Eaſt-Indians.

The ſyſtem of *Mahometaniſm*, is contained in the Koran, commonly called the Alcoran. See ALCORAN.

The firſt and chief article of the *Mahometan* creed, is, that *there is no other God but God*; which they have from the alcoran, where theſe words are repeated inceſſantly: *There is no other God but him. Your God is the only God. I am God, and* *there is no other God but me.*—This grand axiom of their theology ſeems to have been taken from the Jews, who were continually rehearſing thoſe words of Deuteronomy, *Hear, O Iſrael, the Lord our God is One.* See GOD.

For this reaſon, the *Mahometans* account all ſuch as own any thing of number in the divinity, to be infidels or idolaters: And accordingly, one of the firſt leſſons they teach their children, is, That God is neither male nor female, and conſequently can have no children. See SON, GENERATION, TRINITY, *&c.*

The ſecond article of *Mahometaniſm*, conſiſts in this, *That Mahomet was ſent from God.* By which they exclude all other religions; under pretence that their prophet was the laſt and greateſt of all the prophets that God would ever ſend; and that as the Jewiſh religion ceaſed with the coming of the Meſſiah, ſo likewiſe the Chriſtian religion was to be abrogated with the coming of *Mahomet*. Not but that they own Moſes and Jeſus Chriſt to have been great prophets; but *Mahomet* they hold to be *The Prophet*, by way of excellence; and the paraclet or comforter promiſed in ſcripture. See JUDAISM, *&c.*

Theſe are the two fundamentals of *Mahometaniſm*; ſo that when any is to make profeſſion of that faith, they content themſelves with his rehearſing theſe words, *There is no other God but God, and Mahomet is his envoy, or prophet.*

To theſe articles the *Mahometans* have added that of bathing or purification, in imitation of the Jews. And ſuch an opinion have they of theſe purifications, that it is purely on that account they ſeem to have retained the practice of circumciſion. For they pretend, with the Jews, that if the leaſt part of the body remained unwaſhed, the bathing is of no effect. Hence they find themſelves under a neceſſity of being circumciſed; that the part covered by the prepuce may alſo have its ſhare in the lotion. See ABLUTION, CIRCUMCISION, *&c.*

Prayer is alſo one of the things to which the *Mahometans* are obliged; and they perform it five times a day, to diſtinguiſh themſelves from the Jews, who only do it thrice. Some of their periods or hours of prayer they hold to be neceſſary, and of divine obligation; others they eſteem convenient and prudential. That at nine a-clock in the morning, they do not eſteem neceſſary: but thoſe at noon and in the afternoon are held to be *jure divino*. They are obliged to obſerve an infinity of things in order to be heard: If they ſpeak or ſmile in praying, their prayers are vain; and it is the ſame thing if they weep, unleſs it be with the thought of paradiſe or hell. In many of their prayers they uſe beads.

The *Mahometans* believe with the Chriſtians and Jews, a reſurrection of the dead: they hold, that ere that time, an *Anti-Mahomet* will come; and that Jeſus Chriſt will deſcend from heaven to kill him, and eſtabliſh *Mahometaniſm*. To which they add a great many more chimæras, relating to Gog and Magog; and the beaſt that is to come out of Mecca. The mountains are to fly in the air like birds, and at laſt the heavens will melt and drop down upon the earth. They add however, that ſome time after, God will renew and re-eſtabliſh the earth; that then the dead will be raiſed, *&c.* See further under ALCORAN.

MAIDEN, an edged inſtrument uſed in ſome countries, particularly Scotland, for the beheading of criminals.

The *Maiden* is a broad piece of iron, a foot ſquare, ſharp on the lower part, and loaded above with lead, ſo as ſcarce to be lifted: At the time of execution, it is pulled up to the top of a narrow wooden frame ten foot high, with a groove on each ſide for the *Maiden* to ſlide in.—The priſoner's neck being faſtened to a bar underneath, on a ſign given, the *Maiden* is let looſe, and the head in an inſtant ſeparated from the body.

MAJESTY, MAJESTAS*, a title or quality given to kings; and which frequently ſerves as an appellation to diſtinguiſh them by. See TITLE, QUALITY, KING, *&c.*

* The word ſeems compoſed of the two Latin words, *major*, greater, and *ſtatus*, ſtate.

The emperor is called, His Cæſarian or Imperial *Majeſty*; the king of Spain his Catholic *Majeſty*; the king of France, his moſt Chriſtian *Majeſty*; the king of Great-Britain, his Britannic *Majeſty*, &c. Some have alſo extended this title to the popes. See POPE.

Paſquier obſerves, that our fore-fathers uſed this quality exceeding ſparingly; and that the frequent uſe of the word which now obtains, had not its beginning before the reign of their Henry II. He inſtances ſeveral letters of St. Gregory, who writing to King Theodebert and Theodoric, only compliments them with Excellency. See EXCELLENCY.

Till the time of Charles V. the king of Spain had no title but that of Highneſs: And before our king Henry VIII. the kings of England were only addreſſed under the titles of Grace and Highneſs. See GRACE, and HIGHNESS.

At the peace of Munſter, there was a great conteſt between the miniſters of the emperor and thoſe of France: The firſt would not allow the title of Serenity to the king of France, and the latter would not give that of *Majeſty* to the emperor. At laſt it was agreed, that whenever the French king ſhould write with his own hand to the emperor, he ſhould give him the title of Imperial *Majeſty*; and reciprocally, when the emperor ſhould write to the king, he ſhould give him that of Royal *Majeſty*.

Under the Roman republick, the title *Majeſty*, *Majeſtas*, belonged to the whole body of the people, and to the principal magiſtrates; ſo that to diminiſh or wound the *Majeſty* of the commonwealth, was to be wanting in reſpect to the ſtate, or its miniſters.—But the power paſſing into the hands of a ſingle perſon, the appellation of *Majeſty* was transferred to the emperor, and the imperial family. Pliny compliments Trajan on his being contented with the title of Greatneſs; and ſpeaks very invidiouſly on thoſe who affected that of *Majeſty*. And yet *Majeſty* ſeems to be the modeſteſt and juſteſt title that can be attributed to ſovereigns, ſince it ſignifies no more at bottom, than the royalty or ſovereign power.

MAIL, MAILLE, is primarily applied to the maſhes or holes in net-work.

Coat of MAIL, a piece of defenſive armour, made of iron wire interwoven net-wiſe: called alſo *habergeon*. See HABERGEON. Anciently they alſo wore ſhirts of *Mail* under the doublet, to ſerve as a defence againſt ſwords and poniards. We alſo read of gloves of *Mail*.

MAIL, or MALL, alſo ſignifies a round ring of iron; whence the play of pall-mall, from *palla*, a ball, and *maille*, the round ring through which it is to paſs.

MAILED implies a thing ſpeckled, or full of ſpecks; as the feathers of hawks, partridges, *&c.* or the furs of ſome wild beaſts.

MAIN-MORTE, a term in ſome ancient cuſtoms, ſtill obtaining in Burgundy, ſignifying a right which the lord has, on the death of the chief of a family that is *Mainmortable*, of taking the beſt moveable in the houſe; or in default of that, the right hand of the deceaſed was offered him, in token that he could ſerve him no longer. See MORT-MAIN.

MAINOUR, MANOUR, or MEINOR, in law, ſignifies the thing that a thief takes away, or ſteals.

Thus, to be taken with *Mainour*, is to be taken with the thing ſtolen about him.—If the defendant were taken with the *Mainour*, and ſo caried to court, in ancient times they would arraign him on the *Mainour* without any appeal or indictment.

MAINPRISE*, in law, the taking or receiving a man into friendly cuſtody, who otherwiſe might be committed to priſon; upon ſecurity given for his forth-coming at a day aſſigned.

* The word is compounded of the French *Main*, hand, and *pris* or *prins*, taken.

They who thus undertake for any are called *Mainpernors*, becauſe they receive him into their hands; whence alſo comes the word *Mainpernable*, denoting the perſon who may be thus bailed.

Manwood makes a great difference between bail and *Mainpriſe*: he that is *mainpriſed* is already ſaid to be at large after the day he is ſet to *Mainpriſe* till the day of his appearance; but it is quite otherwiſe where a man is let to bail to four or two men, by the lord juſtice in eyre of the foreſt, or any other judge, until a certain day; for there he is always accounted by the law to be in their ward and cuſtody for the time; and they may, if they pleaſe, keep him in priſon all that time. So that he who is bailed, is not ſuppoſed to be at large, or at his own liberty: whereas under *Mainpriſe*, a man is ſuppoſed to go at large, and is not liable to be confined by his ſureties or *Mainpernors*. See BAIL.

The author of the *Mirrour of Juſtice* ſays, that pledges are thoſe who bail, or redeem any thing but the body of a man; and *Mainpernors* thoſe who free the body: on which footing, pledges belong properly to real and mixed actions, and *Mainpernors* to perſonal. See PLEDGE.

MAINTENANCE, MANUTENENTIA*, in law, an unlawful maintaining, or upholding a cauſe, or ſuit between others; either by word, writing, countenance or deed.

* The word is metaphorically taken from the ſuccouring a young child, that learns to go by one's hand; and is uſed in the evil part in ſome of our ſtatutes.

When a man's act in this kind is eſteemed *Maintenance*, and when not, ſee Brooks and Kitchin. See alſo BARRATOR.

There lies a writ againſt a *Maintainer*, called a Writ of *Maintenance*.

MAJOR, in the art of war, a name given to ſeveral officers of different qualities, and functions.—Thus,

MAJOR-*General* is a general officer who receives the general's orders, and delivers them out to the *Majors* of brigades, with whom he concerts what troops are to mount the guard, what to go on parties, what to form detachments, or to be ſent on convoys, *&c.*

It is his buſineſs alſo to view the ground to encamp on, and do other ſervices; being ſubordinate to the general, and lieutenant-general, and the next commanding officer to them. See GENERAL.

MAJOR *of a brigade*, either horſe or foot, is he who receives orders, and the word, from the major-general, and gives them to the particular majors of each regiment. See BRIGADE.

MAJOR *of a regiment*, is an officer, whoſe buſineſs is, to convey all orders to the regiment, to draw it up, and exerciſe it; to ſee it march in good order, to look to its quarters, and to rally it, if it happen to be broke in an engagement, *&c.*

The *Major* is the only officer of a regiment of foot, who is allowed to be on horſeback in time of ſervice; but he rides that he may ſpeedily get from place to place, as occaſion ſerves. See REGIMENT.

Major of a regiment of horſe, is the firſt captain of the regiment; and commands in the abſence of the colonel.

Town-**MAJOR**, is the third officer in order in a garriſon, being next to the deputy-governour.

He ought to underſtand fortification, and hath charge of the guards, rounds, patrols, and centinels.

There are alſo *Aids-Major*, *Drums-Major*, and other officers; ſo called by reaſon of ſome ſeniority or prerogative that they have over the reſt. See AID, DRUM, *&c.*

MAJOR, in law, a perſon who is of age to manage his own affairs. See AGE.

By the civil law a man is not a *Major* till the age of twenty-five years; in England, he is a *Major* at twenty-one, and in Normandy at twenty. See MINOR.

MAJOR, in logic, is underſtood of the firſt propoſition of a regular ſyllogiſm. See SYLLOGISM.

It is called *Major*, becauſe it has a more extenſive ſenſe than the *minor* propoſition, as containing the principal term. See PROPOSITION, TERM, PREMISES, *&c.*

MAJOR *and Minor*, in muſic, are applied to concords which differ from each other by a ſemi-tone. See CONCORD.

There are *Major* and *minor* thirds, *&c.* See THIRD, *&c.*

Major tone is the difference between the fifth and fourth; and *Major* ſemi-tone the difference between the *Major* fourth and the third. The *Major* tone ſurpaſſes the *minor* by a comma. See TONE, and SEMI-TONE.

MAJOR-DOMO, an Italian term, frequently uſed to ſignify a ſteward, or maſter of the houſhold. See STEWARD.

The title *Major-Domo* was formerly given in the courts of princes to three different kinds of officers. 1°. To him who took care of what related to the prince's table, or eating, otherwiſe called *eleater*, *præfectus menſæ*, *architriclinus*, *dapiſer*, and *princeps coquorum*. 2°. *Major-Domo* was alſo applied to the ſteward of the houſhold. 3°. The title *Major-Domo* was alſo given to the chief-miniſter, or him to whom the prince deputed the adminiſtration of his affairs, foreign and domeſtic, relating to war as well as peace.—Inſtances of *Major-Domos* in the two firſt ſenſes are frequent, both in the Engliſh, French, and Norman affairs. See SENESCHAL.

MAKE, in law, ſignifies to perform, and execute.

Thus, to *make* his law, is to perform that law to which a man had formerly bound himſelf; *v. gr.* to clear himſelf of action commenced againſt him by his own oath, and the oath of his neighbours. See LAW.

So, to *make* ſervices, or cuſtoms, is nothing elſe but to perform what belongs to them. See SERVICE, *&c.*

MALACIA, ΜΑΛΑΚΙΑ*, a diſeaſe conſiſting in a depraved appetite, wherein the patient covets and longs for ſome particular kind of food with extraordinary earneſtneſs, and eats it to exceſs. See APPETITE.

Many authors confound this affection with another called *pica*, which conſiſts in a depravation of appetite leading the patient to covet things unnatural and abſurd, as lime, coals, *&c.* See PICA.

The *Malacia* ſeems to ariſe from an ill diſpoſition of the menſtruum in the ſtomach; or from ſome defect in the imagination, which determines it to ſome one thing rather than another.

MALANDERS, MALANDRIA, a diſeaſe in horſes, ſo called from the Italian, *Malandare*, to go ill.

It conſiſts in certain ulcerous chops, or chinks, appearing on the inſide of the fore-legs, juſt againſt the bending of the knee, which void a red, ſharp, and pungent humour.

MALE, the ſex which has the parts of generation without-ſide, and which has ordinarily the preheminence over the other. See SEX, GENITALS, GENERATION, MASCULINE, *&c.*

In which ſenſe *Male* ſtands oppoſed to *female*. See FEMALE.

For the proportion of *Males* to *females*, ſee MARRIAGE.

MALEBRANCHISM, the doctrine or ſentiments of father *Malebranche*, a prieſt of the oratory of France.

Malebranchiſm is in a great meaſure the ſame with Carteſianiſm. It muſt be owned however, that though F. *Malebranche* thought the ſame with Des Cartes, yet he does not ſo properly ſeem to have followed him, as to have met with him. See CARTESIANISM.

Malebranchiſm is contained in the *Recherche de la verité*; and to give a general notion of it, we need only repeat what M. Fontenelle ſays of that work. The *Enquiry after truth*, ſays he, is full of God: God is the only agent, and that too, in the ſtricteſt ſenſe. All power of acting, all actions belonging immediately to him. Second cauſes are no cauſes. They are only occaſions that determine the action of God; occaſional cauſes. See CAUSE, and OCCASIONAL.

F. *Malebranche*, however, does not here lay down his ſyſtem entire, with regard to religion, or rather the manner in which he would reconcile religion to his ſyſtem of philoſophy: That he reſerved for his *Entretiens chretiennes*, printed in 1677, where he proves the exiſtence of a God, the corruption of human nature by original ſin, the neceſſity of a mediator, and of grace.

Malebranchiſm, notwithſtanding, appears to many perſons not only ill grounded, but even dangerous and deſtructive to religion: and has accordingly been vigorouſly oppoſed by many zealous French authors. The firſt was M. Foucher. After him came M. Arnaud; and in 1715, (the year F. *Malebranche* died) F. du Tertre, a Jeſuit, publiſhed an ample confutation (as he imagines) of his whole ſyſtem.—That part which relates to our ſeeing all things in God, has been anſwered by Mr. Locke.

MALEDICTION, MALEDICTIO, in law, a curſe uſually annexed to donations of lands, *&c.* to churches and religious houſes; imprecating the moſt direful puniſhments on thoſe who ſhould infringe them. See IMPRECATION.

MALIGNANT, in medicine, that quality in a diſeaſe which renders it more than ordinarily dangerous and difficult to cure. See DISEASE.

Malignant is generally applied to ſuch fevers as are epidemical, or infectious, and are attended with ſpots and eruptions of various kinds. See FEVER, PLAGUE, *&c.*

MALLEABLE, ſomething hard and ductile, and that may be beaten, forged, and extended under the hammer without breaking. See DUCTILITY.

All metals are *Malleable*, excepting quick-ſilver; but gold in the greateſt degree of all. The chymiſts have long ſought the fixation of Mercury, to render it *Malleable*. See MERCURY.

It is a popular error, that ever the art of making glaſs *Malleable*, was known; its nature is incapable of it. For if it were ductile, its pores would not be oppoſite to each other, and of conſequence it would not be tranſparent; ſo that its principal criterion would be loſt. See GLASS, and TRANSPARENCY.

MALLEOLUS, a proceſs in the lower part of the leg juſt above the foot. See PROCESS, FOOT, *&c.*

There is one *internal*, and another *external Malleolus*.

The *internal Malleolus* is an eminence of the tibia; ſee TIBIA, FIBULA, *&c.* the *external*, of the fibula: the two together form the ancle.—See Tab. anat. (oſteol.) fig. 3. n. 23.

MALLET, a large kind of hammer, made of wood; much uſed by artificers who work with a chiſſel, as ſculptors, maſons, and ſtone-cutters, whoſe *Mallet* is ordinarily round; and by carpenters, joiners, *&c.* who uſe it ſquare. See HAMMER.

MALLEUS, in anatomy, denotes one of the bones of the ear; ſo called from its reſemblance to a hammer, or mallet; firſt diſcovered, as ſome aſſert, by Alexander Achillinus: though others have miſtakenly attributed it to Jac. Carpenſis. Vid. Douglas Bibl. Anat. p. 48. See alſo EAR.

MALMSEY, or MALVASY, a rich luſcious kind of wine brought from Greece or Candia; ſo called from Malvaſia, a city in Peloponneſus, the ancient Epidaurus, whence this celebrated liquor was firſt brought.

That brought from Candia is now eſteemed the beſt. See WINE.

MALMSEY, or MALVOISY, is alſo the name of a kind of muſcadine wine brought from Provence. See WINE.

MALT, denotes barley cured, or prepared to fit it for making a potable liquor, under the denomination of beer or ale. See BEER, and ALE.

The manner of making *Malt*, Sir Robert Murray deſcribes as follows.—Take good barley newly threſhed, *&c.* put about ſix Engliſh quarters in a ſtone trough full of water, where let it ſteep till the water be of a bright reddiſh colour; which will be in about three days, more or leſs, according to the moiſture or dryneſs, ſmallneſs or bigneſs of the grain, the ſeaſon of the year, or the temperature of the weather.—In ſummer, *Malt* never makes well; in winter it requires longer ſteeping than in ſpring or autumn. It may be known when it is ſteeped enough, by other marks beſides the colour of the water; as by the exceſſive ſwelling of the grain if it be overſteeped, and by too much ſoftneſs: being, when it is in a right temper, like the barley prepared to make broth of.

When it is ſufficiently ſteeped, take it out of the trough, and lay it on heaps, to let the water drain from it; then after two or three hours turn it over with a ſcoop, and lay it in a new heap, about twenty or twenty-four inches deep.

This is called the *coming heap*, in the right management whereof lies the principal ſkill. In this heap it may lie forty hours, more or leſs, according to the forementioned qualities of the grain, *&c.* before it come to the right temper of *Malt*; which that it may do equally, is mainly deſired.

While it lies in this heap, it muſt be carefully looked to, after the firſt fifteen or ſixteen hours; for about that time the grains begin to put forth roots: which when they have equally and fully done, the *Malt* muſt within an hour after be turned over with a ſcoop; otherwiſe the grains will begin to put forth the blade or ſpire alſo, which muſt by all means be prevented.—If all the *Malt* do not come equally, but that which lies in the middle, being warmeſt, come the ſooneſt: turn it, ſo as the outmoſt may lie inmoſt, and thus manage it till it be all alike.

---

* The word ſeems derived from the Greek μαλακος, ſoft; too lax a tone of the ſtomach being generally the occaſion of indigeſtion, and unuſual cravings.

As ſoon as the *Malt* is ſufficiently come, turn it over, and ſpread it to a depth not exceeding five or ſix inches; and by that time it is all ſpread out, begin and turn it over and over again three or four times. Afterwards, turn it over in like manner once in four or five hours, making the heap deeper by degrees: and continue ſo to do for the ſpace of forty eight hours at leaſt. —This frequent turning it over, cools, dries, and deadens the grain, whereby it becomes mellow, melts eaſily in brewing, and ſeparates entirely from the huſk.

Then throw up the *Malt* into a heap, as high as you can; where let it lie till it grow as hot as your hand can endure it, which uſually comes to paſs in about thirty hours ſpace.—This perfects the ſweetneſs and mellowneſs of the *Malt*.

After it is ſufficiently heated, throw it abroad to cool, and turn it over again about ſix or eight hours after, and then lay it on a kiln with hair-cloth or wire ſpread under it; where, after one fire, which muſt laſt for twenty-four hours, give it another more ſlow, and afterwards, if need be, a third: for if the *Malt* be not thoroughly dried, it cannot be well ground, neither will it diſſolve well in the brewing; but the ale it makes will be red, bitter, and unfit to keep.

The beſt fewel is peat or turf; the next charcoal. If there be not enough of one kind, burn the beſt firſt, for that gives the ſtrongeſt impreſſion.—Indeed, the beſt and moſt natural method of drying it is in the ſun in the months of April or May. This yields the paleſt, the moſt wholeſome, and the fineſt liquor. However this be, take care the *Malt* be not ſmoaked in the drying.—As to the complexion or colour of *Malt*, white is accounted the beſt, becauſe the moſt natural.

For *the manner of preparing liquors of* MALT, ſee BREWING.

MALT *Liquors* have different names, as well as different virtues, properties and uſes, both from the different manners of preparing the *Malt*, whence they are diſtinguiſhed into *pale* and *brown*; and from the different manners of preparing or brewing the *Liquors* themſelves; whence they are divided into *beer* and *ale*, *ſtrong* and *ſmall*, *new* and *old*. See DRINK, ALE, and BEER.

Malt drinks are either pale or brown, as the *Malt* is more or leſs dried on the kiln; that which is the ſlendereſt dried tinging the liquor leaſt in brewing, and therefore called *pale*; whereas that higher dried, and as it were roaſted, makes it of a higher colour.—A mixture of both theſe makes an amber colour, whence ſeveral of theſe *Liquors* take their name.

Now it is certain the pale *Malt* has moſt of the natural grain in it, and is therefore the moſt nouriſhing; but for the ſame reaſon, it requires a ſtronger conſtitution to digeſt it. Thoſe who drink much of it are uſually fat and ſleek in their bloom; but are often cut off with ſudden fevers; or if they avoid this, fall early into a diſtempered old age.

The brown *Malt* makes a drink much leſs viſcid, and fitter to paſs the ſeveral ſtrainers of the body; but if very ſtrong, may lead on to the ſame inconveniences with the pale; though a ſingle debauch wears off much more eaſily in the brown.

Dr. Quincy obſerves, that the beſt pale *Malt Liquors* are thoſe brewed with hard waters, as thoſe of ſprings and wells: in regard the mineral particles wherewith theſe waters are impregnated, help to prevent the coheſions of thoſe drawn from the grain, and enable them to paſs the proper ſecretions the better; as the viſcid particles of the grain do likewiſe defend theſe from doing the miſchief they might otherwiſe occaſion. —But ſofter waters, as rain and river waters, ſeem beſt ſuited to draw out the ſubſtance of high-dried *Malts*, which retain many fiery particles in their contexture, and are therefore beſt loſt in a ſmooth vehicle.

For the differences in the preparations of *Malt Liquors*, they conſiſt chiefly in the uſe of hops, as in beer; or in their omiſſion, as in ale. See HOPS.

The difference made by hops, is beſt diſcovered from the nature and qualities of the hops themſelves: Theſe are known to be a ſubtile grateful bitter; in their compoſition therefore with this *Liquor*, they add ſomewhat of an alkaline nature, *i. e.* particles that are ſublime, active, and rigid.—By which means the ropy, viſcid parts of the *Malt* are more divided and ſubtilized, and are therefore not only rendered more eaſy of digeſtion and ſecretion in the body; but alſo, while in the *Liquor*, prevent it from running into ſuch coheſions as would make it ropy, vapid, and ſour.

For want of this, in unhopped drinks, that clammy ſweetneſs which they retain after working, ſoon turns them acid, and unfit for uſe; which happens ſooner or later, in proportion to the ſtrength they receive from the *Malt*, and the comminution it has undergone by fermentation.

It is a common opinion, that ale is more diuretic than beer, that is, unhopped liquor more than that with hops in it. Which may hold in ſome conſtitutions, in regard ale being more ſmooth, ſoftening, and relaxing, where urine is to be promoted by enlarging the paſſage, as in thin dry conſtitutions, this is the moſt likely to effect it.—But where the promoting of urine is to be done by attenuating and breaking the juices, and rendering them more fluid, it is certainly beſt anſwered by thoſe drinks which are well hopped.

As to the diſpute, whether or no hops tend to breed the ſtone? it is too long to enter upon here. Dr. Quincy is of opinion, there is but little reaſon for the affirmative ſide of the queſtion; and in the general makes no ſcruple to ſay, that for one conſtitution damaged by beer, there are numbers ſpoiled by ale.—For this laſt manifeſtly fouls the glands, ſtuffs the veſſels with ſlime and viſcidity, makes the body unwieldy and corpulent, and paves the way for cachexies, jaundice, aſthmas, and at laſt incurable dropſies.—The urinary paſſages, alſo, which it is ſuppoſed to clear, will in time be filled with ſlough and matter of as ill conſequence as gravel.

The different ſtrengths of *Malt Liquors* alſo make their effects different.—The ſtronger they are, the more viſcid parts they carry into the blood; and though the ſpirituous parts make theſe imperceptible at firſt, yet when theſe are evaporated, which will be in a few hours, the other will be ſenſibly felt by pains in the head, nauſeouſneſs at the ſtomach, and laſſitude or liſtleſſneſs to motion.—This, thoſe are the moſt ſenſible of, who have experienced the extremes of drinking theſe *Liquors* and wines; for a debauch of wine they find much ſooner wore off, and they are much more lively and briſk afterwards, than after fuddling *Malt Liquors*, whoſe viſcid remains will be long ere they are ſhook off.

Malt Liquors therefore are more wholeſome for being ſmall; *i. e.* of ſuch a ſtrength as is able to carry a ſmall degree of warmth into the ſtomach, but not ſo great as to prevent their being proper diluters of the neceſſary food. Indeed in robuſt people, or thoſe who labour hard, the viſcidities of the drink may be broke into convenient nouriſhment; but in perſons of another habit and way of living, they ſerve rather to promote obſtruction and ill humours.

The age of *Malt Liquors* is the laſt thing by which they are rendered more or leſs wholeſome.—Age ſeems to do nearly the ſame thing as hops; for thoſe *Liquors* which are longeſt kept, are certainly leaſt viſcid: age breaking the viſcid parts, and by degrees rendering them ſmaller and fitter for ſecretion. But this is always determined according to their ſtrength; in proportion to which they will ſooner or later come to their full perfection as well as decay: For when ale or beer is kept till its particles are broke and comminuted as far as they are capable, then it is they are beſt; and beyond this they will be continually on the decay, till the finer ſpirits are entirely eſcaped, and the remainder becomes vapid and ſour.

MALTA.—*Knights of* MALTA, an order of military religious, who have bore various names; as, Hoſpitalers of St. John of Jeruſalem, Knights of St. John, Knights of Rhodes, order of Malta, religion of Malta, &c. See KNIGHTS, HOSPITALER, &c.

About the year 1048, ſome Neapolitan merchants founded a church after the Latin rite at Jeruſalem, giving it the name of *Santa Maria della Latina*. They alſo founded a monaſtery of religious, after the order of St. Bennet, for the reception of pilgrims; and afterwards an hoſpital near the monaſtery, to take care of the diſeaſed, under the direction of a maſter or rector, to be nominated by the abbot of Santa Maria della Latina. Beſides which, they alſo built a chapel in honour of St. John Baptiſt.

In 1099, Godfrey of Bulloign having taken Jeruſalem, endowed this hoſpital with ſome demeſnes he had in France; and others imitating his liberality, the revenues of the hoſpital became conſiderably augmented. Upon this, Gerhard Torn their rector, in concert with the Hoſpitalers, reſolved to ſeparate from the abbot and religious of *Santa Maria*, and to form a diſtinct congregation, under the name and protection of St. John Baptiſt: And hence it was, that they had the name of *Hoſpitalers*, or *brothers of St. John of Jeruſalem*.

Pope Paſchal II. by a bull in the year 1113, confirmed the donations made to this hoſpital, which he ſettled under the protection of the holy ſee; ordering that the rectors, after Gerhard's death, ſhould be choſen by the Hoſpitalers. Raymond de Puy, Gerhard's ſucceſſor, took the title of *Maſter*: he gave a rule to the Hoſpitalers, which was approved by Calixtus II. in 1120.—Such was the firſt riſe of the order of *Malta*. Their firſt grand maſter finding the revenues of the hoſpital vaſtly to exceed what was neceſſary for the entertainment of poor pilgrims and diſeaſed perſons, reſolved to employ the ſurplus againſt the infidels; and with this view offered himſelf to the king of Jeruſalem.

He divided his Hoſpitalers into three claſſes: the firſt conſiſted of nobles, whom he deſtined to the profeſſion of arms, for the defence of the faith, and the protection of pilgrims; the ſecond conſiſted of prieſts and chaplains, who were to ſay maſs; and the third of ſervitors, who were not noble, but were alſo appointed for the war.—He alſo regulated the manner of admitting knights-brothers; and had the whole confirmed by pope Innocent; who gave them for arms a white croſs in a field argent, which continues ſtill the ſtandard of this order.

After the loſs of Jeruſalem, they retired firſt to Margath, then to Acre, which they defended very vigorouſly in 1290. After the entire loſs of the Holy Land, they withdrew to Cyprus, where king Henry of Luſignan, whom they had followed thither, gave them the city of Limiſſon.—Here they continued 18 years; when taking the iſland of Rhodes from the Saracens in 1308, they ſettled there. And now it was that they firſt took the name of Knights, *viz. Knights of Rhodes.*

Andronicus, emperor of Conſtantinople, granted to their grand maſter, Fulk de Villaret, the inveſtiture of this order; and the donation was confirmed by pope Clement. The year following, with the aſſiſtance of Amadeus IV. Duke of Savoy, they defended themſelves and their iſland againſt an army of Saracens. In 1480, their grand maſter d'Aubuſſon made a vigorous defence againſt Mahomet II. and preſerved the iſland, in ſpight of a formidable army which beſieged it for the ſpace of three months.—But in 1522, it was attacked by Soliman with an army of three hundred thouſand men, and taken by him, after having been in the poſſeſſion of the Knights 213 years.

After this loſs, the grand maſter and knights retired firſt into the iſle of Candia: Some time after, pope Clement VII. gave them Viterbo: Laſtly, Charles V. in 1530, gave them the iſland of Malta, which they ſtill hold; and hence they come by the appellation of *Knights of Malta*; though their proper name is that of *Knights of the order of St. John of Jeruſalem*; and their grand maſter, among his other titles, ſtill retains that of *maſter of the hoſpital of St. John, and guardian of the poor of our Saviour Jeſus Chriſt.*

The order of *Malta* have no other denomination beſides their iſland, and ſome other little places in the neighbourhood, the chief whereof are Goza and Comino.

The government is both monarchical and ariſtocratical, the grand maſter being the ſovereign, and the chapter the ſenate.—It is monarchical with regard to the inhabitants of *Malta*, and the iſles adjacent, and even with regard to the Knights in every thing relating to the ſtatutes and rule of their order; and ariſtocratical, with regard to the deciſion of any important affairs, which are not to be diſpatched but by the grand maſter and the chapter.

There are two councils; the one ordinary, compoſed of the grand maſter, as chief, and the grand croſſes; the other compleat, conſiſting of the grand maſter, the grand croſſes, and the two ſenior Knights of each language.

By the languages of *Malta* are meant the ſeveral nations whereof the order is compoſed.—Of theſe there are eight, *viz.* Provence, Auvergne, France, Italy, Arragon, Germany, Caſtile and England. See LANGUAGE.

The pillar (as he is called) of the language of Provence is the grand commander of the order; he of Auvergne the grand marſhal; he of France the grand hoſpitaler; he of Italy grand admiral; he of Arragon grand conſervator, or draper, as he was anciently called; the pillar of the language of Germany is grand bailiff, and he of Caſtile grand chancellor: the language of England, which has been extinct ſince the time of the reformation under king Henry VIII. had for its pillar or chief, the grand turcopolier, or colonel of the cavalry. The language of Provence is the firſt, on account of Raimond de Puy, their firſt grand maſter, who was a Provencial.

In each language there are ſeveral grand priories and capital bailiages. To each language belongs a hall, where the Knights eat, and hold their ordinary aſſemblies. Each grand prior has a number of commanderies.

The commanderies are either magiſterial, by right, or by favour; the magiſterial are thoſe annexed to the grand maſterſhip, whereof there is one in each grand priory: Commanderies by right are thoſe which come by right of ſeniority; their ſeniority is computed from the time of their admiſſion, but they muſt firſt have lived five years at *Malta*, and have made four caravannes, or cruiſing voyages on the Turks and Corſairs: Commanderies by favour, are thoſe which the grand maſter, or the grand priors have a right of conferring; one of theſe they confer every five years on whom they pleaſe.

The noble Knights are called Knights by right; excepting whom, none can be bailiffs, grand priors, or grand maſters.—Knights by favour are thoſe who, not being noble of themſelves, are raiſed on account of ſome great exploit, or notable ſervice, into the rank of nobles.

The ſervitors, or ſerving-brothers, are of two kinds; 1°. The ſervitors of war, whoſe functions are the ſame with thoſe of the Knights. 2°. Servitors of religion, whoſe whole buſineſs is to ſing the praiſes of God in the conventual church, and to officiate each in his turn as chaplain on board the veſſels and gallies of the order.

The brothers of obedience are prieſts, who, without being obliged to go to *Malta*, take the habit of the order, make the vows, and attach themſelves to the ſervice of ſome of the churches of the order, under the command of a grand prior, or commander, to whom they pay obedience.

The Knights of majority are thoſe who, according to the ſtatutes, are admitted at ſixteen years of age.—The Knights of minority are thoſe who are admitted from the time of their birth; which, however, cannot be done without a diſpenſation from the pope.

The chaplains can only be admitted regularly from ten to fifteen years of age; after fifteen they muſt have a brief from the pope; till fifteen the grand maſter's letter is ſufficient. Theſe are called *diacos*, and muſt give proof of their being born of creditable families.

For the proofs of nobility to be made, ere the admiſſion of Knights, in the language of Germany, they go back ſix generations; in the reſt it is ſufficient to go back to the great grandfather on the father's or mother's ſide.

All the Knights, after their profeſſion, are obliged to wear a white croſs, or ſtar with eight points over the cloak or coat on the left ſide, which is the proper habit of the order; the golden croſs being only an ornament.

There are alſo female Hoſpitalers of the order of St. John of Jeruſalem, ſometimes alſo called *Chevalierеſſes*, or *She-Knights*, of equal antiquity with the Knights themſelves; whoſe buſineſs was to take care of the women-pilgrims, in an hoſpital apart from that of the men.

MALTHA, ΜΑΛΘΗ, in antiquity, denotes any cæment or glutinous body, which has the faculty of binding things together. See CÆMENT, LUTE, GLUE, *&c.*

Ancient writers make mention of divers ſorts of *Maltha*, native and factitious: One of the latter much in uſe was compoſed of pitch, wax, plaiſter, and greaſe.

Another kind, wherewith the Romans plaiſtered and whitened the inſides of their aquæducts, was made of lime ſlaked in wine, incorporated with melted pitch and freſh figs.

Natural *Maltha* is a kind of bitumen, wherewith the Aſiaticks plaiſter their walls.—When this is once ſet on fire, water will not quench it, but ſerves rather to make it burn more fiercely.

MAMALUKES, MAMMELUKES, or MAMMALUCKS*, the name of a dynaſty which reigned a conſiderable time in Egypt.

* The Word comes from מלך, *regere, imperare*, the Arabic participle paſſive whereof is ממלוך, *Mamluc*, which ſignifies *ſubject*, or one under the dominion of another. Scaliger holds, that the word is Arabic, but that it properly ſignifies ſomething bought with money; but others will have it ſignify any thing acquired, either as prize or purchaſe.

The *Mamalukes* were originally Turkiſh and Circaſſian ſlaves, bought of the Tartars by Melicſaleh, to the number of a thouſand; whom he bred up to arms, and raiſed ſome to the principal offices of the empire.—They killed Sultan Moadam in 1250; being affronted at his concluding a treaty with his priſoner St. Louis without their privity. This Moadam was the laſt Sultan of the Ajoubites; to whom ſucceeded the *Mamalukes*, the firſt of whom was Sultan Azeddin, or Mouz Ibec, the Turcoman.

Others ſay, that the *Mamalukes* were ordinarily choſen from among the Chriſtian ſlaves, and that they were the ſame thing in great meaſure with the janizaries among the Turks. They never married. The firſt are ſaid to have been brought from Circaſſia; and ſome add, that they firſt began to be talked of about the year 869.

MAMMÆ. See the article BREASTS.

MAMMÆANÆ. Vid. ALIMENTARY.

MAMMIFORM, MAMMIFORMIS, in anatomy, a name given to two apophyſes of the bone in the back part of the ſkull; ſo called from their reſembling a breaſt.—See MASTOIDES.

MAMMILLARY, MAMMILLARIS, in anatomy, an epithet given to two little protuberances, ſomewhat reſembling the nipples of the breaſt, found under the fore-ventricles of the brain, and ſuppoſed to be the organs of ſmelling.—See Tab. Anat. (oſteol.) fig. 7. n. 3. fig. 13. let. d. See alſo SMELL.

Theſe are called *apophyſes Mammillares.* See APOPHYSES.

There is alſo a muſcle called *Mammillaris*, or *Maſtoides*, ſerving to ſtoop the head. See MUSCLE.

MANAGE, or MANEGE*, an academy, or place for learning to ride the great horſe; as well as for breaking horſes to the proper motions and actions. See HORSE, and HORSEMANSHIP.

* The word is borrowed from the French *Manage*, and that from the Italian *Maneggio*, or, as ſome will have it, *à manu agendo*, acting with the hand.

In a *Manage* is a centre, or a place deſtined for vaulting round a pillar; a courſe or career for running the ring; and on the ſide are pillars, between which are placed the horſes intended for high airs. See CAREER, PILLAR, *&c.*

MANAGE is alſo uſed for the exerciſe itſelf, either of the horſe, or the rider. See AIR, *&c.*

MANCIPLE, MANCEPS, in old authors, denotes a caterer. There was anciently an officer in the Temple called by this name, now called the ſteward; and both name and office is ſtill retained in the colleges in both univerſities.

MANDAMUS, a writ iſſuing out of the court of king's bench; ſent by the king to the head of ſome corporation, commanding them to admit or reſtore a perſon into his place or office.

MANDAMUS was alſo a charge to the ſheriff, to take into the king's hands all the lands and tenements of the king's widow, who, againſt her oath formerly given, married without the king's conſent.

MANDARIN*, a name given by the Portugueſe to the nobility and magiſtracy of the eaſtern countries, eſpecially thoſe of China.

* The word *Mandarin* is unknown in this ſenſe among the Chineſe, who in lieu thereof call their grandees and magiſtrates *Quan*, or *Quan-fu*, q. d. ſervant, or miniſter of a prince.

There are in China nine orders of *Mandarins*; or nine degrees of nobility; which have as many different animals for their characteriſticks.—The firſt is diſtinguiſhed by a crane, the ſecond by a lion, the third by an eagle, the fourth by a peacock, &c.

There are in all thirty-two or thirty-three thouſand *Mandarins* in China. There are *Mandarins* of letters, and *Mandarins* of arms; both the one and the other of which paſs ſeveral examinations: beſides civil *Mandarins*, or of juſtice.

Since the time that the Tartars have rendered themſelves maſters of China, moſt of the tribunals, or courts of juſtice, &c. inſtead of one *Mandarin* for a preſident, have two; the one a Tartar, the other a Chineſe.

The *Mandarinate* is not hereditary, nor are any raiſed to it but men of letters. See LITERATI.

MANDARIN is alſo a name which the Chineſe give to the learned language of the country. See LANGUAGE.

Beſides the proper and peculiar language of each nation and province, they have one common to all the learned men in the empire; and which is that in China which the Latin is in Europe.—This they call the *Mandarin* tongue, or the language of the court.—Their publick officers, as notaries, lawyers, judges, and chief magiſtrates, write and ſpeak the *Mandarin*. See CHINESE.

MANDATE, MANDATUM, in the canon law, denotes a reſcript of the pope, by which he commands ſome ordinary, collator, or preſenter, to put the perſon there nominated in poſſeſſion of the firſt benefice vacant in his collation.

An Apoſtolical *Mandate* for the proviſion of benefices, is a monitorial and comminatory letter from the pope to a biſhop, by which he is enjoined to provide a ſubſiſtence for thoſe who have been ordained by him, or his predeceſſors, from the tonſure to ſacred orders incluſively; and to allow them this ſubſiſtence till they be provided of a benefice; which practice was occaſioned by the biſhop's laying hands on great numbers, and afterwards abandoning them to miſery and want.

At firſt the popes only gave monitory *Mandates*, which were no more than ſimple prayers and requeſts, that did not bind the ordinary; afterwards they gave preceptory *Mandates*, which did not annul the proviſions of the ordinary; at laſt they ſet up executory *Mandates*, by which the proviſions made by the ordinary, in prejudice of the *Mandate*, were declared null; and the executor of the *Mandate*, in default of the ordinary, conferred the benefice on the mandatory: but the pope's power in iſſuing theſe *Mandates* is now very much reſtrained.

MANDIBULA, the jaw. See MAXILLA. Hence MANDIBULARES, or *manducatorii muſculi*. See MASSETERS.

MANDIL, the name of a kind of cap, or turban wore by the Perſians. See CAP, and TURBAN.

The *Mandil* is formed, by firſt wrapping round the head a piece of fine white linnen five or ſix ells long; over this they wrap, in the ſame manner, a piece of ſilk of the ſame length, and oftentimes of great value.—To make the *Mandil* genteel, care muſt be taken, that in wrapping the ſilk, it be ſo managed, as that the ſeveral colours found in the ſeveral folds, make a kind of waves, ſomewhat like what we ſee in marbled paper.

This dreſs is extremely majeſtic, but at the ſame time very heavy: It ſerves either as a ſhelter to the head from cold, or as a ſkreen from the exceſſive heat of the ſun; it is ſaid the cutlaſs will not penetrate it.—In rainy weather they cover it up with a kind of caſe or hood, made of red cloth.

The mode of the *Mandil* has been altered of late: during the time of Schah-Abbas II. it was round at top; in the time of Schah-Soliman, they brought one end of the ſilk out of the middle of the *Mandil* over the Head; and, laſtly, in the reign of Schah-Huſſein, the end of the ſilk, in lieu of its being gathered as before, was plaited in manner of a roſe; and this the Perſians account extremely graceful, and uſe it to this day.

MANDRAGORA, or MANDRAGORAS, MANDRAKE, a medicinal plant, which makes a principal ingredient in the unguentum populneum. See POPULNEUM.

There are two kinds of *Mandragora: male* and *female*; each bearing a kind of apples: thoſe of the male, as well as the leaves, roots, &c. being twice as large as thoſe of the female; but the juice of each is a narcotic poiſon, equally violent.

Naturaliſts tell ſtrange ſtories of this plant; but, ſetting aſide its ſoporiferous virtue, the modern botaniſts will ſcarce warrant any of them, not even that human figure ordinarily aſcribed to its roots, eſpecially ſince the diſcovery of the artifice of Charletans in faſhioning it, to ſurprize the credulity of the people.

Chineſe MANDRAGORAS is the plant ginſeng. See GINSENG.

MANDREL, a kind of wooden pulley, making a member of the turner's lathe.

Of theſe there are ſeveral kinds; as

Flat MANDRELS, which have three or more little pegs or points near the verge, and are uſed for turning flat boards on.

Pin MANDRELS, which have a long wooden ſhank to fit into a round hole made in the work to be turned.

Hollow MANDRELS, which are hollow of themſelves, and uſed for turning hollow work.

Screw MANDRELS, for turning ſcrews, &c. See TURNING, and LATHE.

MANDUCATION, the action of *chewing*, otherwiſe called *Maſtication*. See MASTICATION.

Manducation is a term ſeldom uſed but in ſpeaking of the euchariſt. — The Catholics maintain a real *Manducation* of the body of Chriſt; the Reformed, on the contrary, take this *Manducation* to be only figurative and by faith.—St. Auguſtine calls it *ſpiritual Manducation*.

MANEQUIN, among painters. See LAYMAN.

MANES, a poetical term, ſignifying the ſhades, or ſouls of the deceaſed. See SOUL.

The heathens uſed a world of ceremonies and ſacrifices to appeaſe the *Manes* of thoſe who died without burial. See LEMURES and LEMURIA.

Dii MANES were the ſame with *Inferi*, or the infernal gods who tormented men; and to theſe the heathens offered ſacrifices to aſſuage their indignation. See GOD.

The heathen theology is a little obſcure with regard to theſe Gods *Manes*: Some hold that they were the ſouls of the dead, others that they were the genii of men; which laſt opinion ſuits beſt with the etymology of the word. See GENIUS.

The heathens, it is pretty evident, uſed the word *Manes* in both theſe ſenſes; ſo that it ſometimes ſignified the ghoſts of the departed, and ſometimes the infernal or ſubterraneous deities, and in general all divinities that preſided over tombs.

The evocation of the *Manes* of the dead ſeems to have been very frequent among the Theſſalians, but was expreſly prohibited by the Romans. See NECROMANCY.

MANIA, in medicine, MADNESS; a vehement kind of delirium without a fever. See DELIRIUM.

The cauſe of the *Mania* is thus accounted for by Dr. Quincy.—As often as the ſpecies of things wherewith we have been acquainted, are hurried together, we may be ſaid to dream; and thence in ſleep theſe ſpecies are added with other things, and variouſly compounded, from the manifold repercuſſions of the animal ſpirits which ariſe from the cauſe producing ſleep, and preſſing the nerves, ſo as to revert the fluctuation of their juice. A delirium is therefore the dreams of waking perſons, wherein ideas are excited without order or coherence, and the animal ſpirits are drove into irregular fluctuations. See DELIRIUM.

If then the cauſe inducing a delirium be of that nature, that it can excite ideas or motions of a conſiderable impetus, without any regularity or order; ſuch a delirium will be attended with boldneſs or rage, and violent motions of the body; that is, a *Mania* will be produced. See PASSION.

Now it is plain, that all the known cauſes of this diſtemper give a greater diſpoſition to the blood for motion, and render it fluxile, but not conſiſtent, and uniformly thick enough; and therefore that they diſpoſe perſons likewiſe to continued fevers, ſince they occaſion the blood to be thrown out of the heart with an increaſed force, unleſs ſome other cauſe intervenes, whereby the efficacies of theſe are interrupted in diſpoſing the blood into febrile motions; and the blood is ſo diſpoſed, as often as it can be rarified into its minuteſt parts; that is, ſo uniformly rarified, that it can eaſily, with any force by the motion received from the heart, go into parts diviſible at the occurſions of thoſe orifices, into which it ought to be diſtributed: for then the coheſion of the parts, which can be but very ſmall, will not be any obſtruction to the increaſe and propagation of the blood's velocity. But if it happen that the efficient cauſe, or the heart, throws the blood with a greater force, or that the blood can be more eaſily propelled in any given time, it will occaſion, at the ſame time, that ſome parts of the blood will be more nearly united, ſo as to form moleculæ, conſiſting of cohering particles; which moleculæ will cohere to one another, and not ſo eaſily obey the direction of the heart's propelling force. The blood hereupon cannot be uniformly rarified, nor enter ſo eaſily into the ſmall orifices of the veſſels, and ſo ſoon travel through them, and therefore there will no fever ariſe, but a delirium without a fever, wherein the heat of the blood will be greater, and the preſſure in the brain uncertain: whence uncertain recurſions of the ſpirits, inordinate undulations, confuſed vibrations of the nerves, and a remarkable energy of imagination; whence will proceed audacity and paſſion beyond meaſure.—It is a diſeaſe very hard to cure, and is generally found to baffle the phyſician.

MANICHEES, or MANICHEANS, MANICHÆI, a ſect of antient heretics, who aſſerted two principles; ſo called from their author *Manes*, or *Manicheus*, a Perſian by nation. See PRINCIPLE.

This hereſy had its firſt riſe about the year 277, and ſpread itſelf principally in Arabia, Egypt, and Africa. St. Epiphanius, who treats of it at large, obſerves, that the true name of this hereſiarch was Cubricus; and that he changed it for *Manes*, which in the Perſian or Babyloniſh language ſignifies veſſel. A rich widow, whoſe ſervant he had been, dying without iſſue, left him ſtore of wealth; after which he aſſumed the title of apoſtle or envoy of Jeſus Chriſt.

He eſtabliſhed two principles, *viz.* a good one and an evil one: The firſt, which he called *Light*, did nothing but good; and the ſecond, which he called *Darkneſs*, nothing but evil.—This philoſophy is very ancient; and Plutarch treats of it at large in his Iſis and Oſiris. See GOOD and EVIL.

Our ſouls, according to *Manes*, were made by the good principle, and our bodies by the evil one; thoſe two principles being co-eternal and independent of each other. He borrowed many things from the ancient Gnoſtics; on which account many authors conſider the *Manicheans* as a branch of the Gnoſtics. See GNOSTIC.

In truth, the *Manichean* doctrine was a ſyſtem of philoſophy, rather than of religion. They made uſe of amulets, in imitation of the Baſilidians; and are ſaid to have made profeſſion of aſtronomy and aſtrology. See BASILIDIAN. They denied that Jeſus Chriſt aſſumed a true human body, and maintained it was only imaginary. They pretended that the law of Moſes did not come from God, or the good principle, but from the evil one; and that for this reaſon it was abrogated. They abſtained entirely from eating the fleſh of any animal; following herein the doctrine of the ancient Pythagoreans.—The reſt of their errors may be ſeen in St. Epiphanius and St. Auguſtine; which laſt having been of their ſect, may be preſumed to have been thoroughly acquainted with them.

Though the *Manichees* profeſſed to receive the books of the New Teſtament, yet, in effect, they only took ſo much of them as ſuited with their opinions. The firſt formed to themſelves a certain idea or ſcheme of Chriſtianity; and to this adjuſted the writings of the Apoſtles; pretending that whatever was inconſiſtent with this, had been foiſted into the New Teſtament by latter writers, who were half Jews.—On the other hand, they made fables and apocryphal books paſs for apoſtolical writings; and even are ſuſpected to have forged ſeveral others, the better to maintain their errors. St. Epiphanius gives a catalogue of ſeveral pieces publiſhed by *Manes*, and adds extracts of ſome of them.

Manes was not contented with the quality of Apoſtle of Jeſus Chriſt, but alſo aſſumed that of the Paraclete, whom Chriſt had promiſed to ſend. He left ſeveral diſciples, and among others, Addas, Thomas, and Hermas. Theſe he ſent, in his life-time, into ſeveral provinces to preach his doctrine.—*Manes* having undertaken to cure the king of Perſia's ſon, and not ſucceeding, was clapt into priſon upon the young prince's death; whence he made his eſcape, but was apprehended ſoon after, and burnt alive.

Towards the middle of the twelfth century the ſect of *Manichees* took a new face, on occaſion of one Conſtantine, an Armenian and adherer to it; who took upon him to ſuppreſs the reading of all other books beſides the evangeliſts and the epiſtles of St. Paul, which he explained in ſuch manner as to make them contain a new ſyſtem of *Manicheiſm.* He entirely diſcarded all the writings of his predeceſſors, rejected the chimæra's of the Valentinians and their thirty Æons; the fable of *Manes*, with regard to the origin of rain, which he made to be the ſweat of a young man in hot purſuit after a maid; and other dreams: but ſtill retained the impurities of Baſilides. In this manner he reformed *Manicheiſm*, inſomuch that his followers made no ſcruple of anathematizing Scythian, Buddas, and even *Manes* himſelf; Conſtantine being now their great apoſtle. After he had ſeduced an infinite number of people, he was at laſt ſtoned by order of the emperor.

MANICORDION *, a muſical inſtrument, in form of a ſpinett. See SPINETT.

* Du Cange derives the word from *Monochord,* on a ſuppoſition this inſtrument has but one cord; but he is miſtaken, it has fifty, or more. See MONOCHORD.

Its ſtrings are covered with pieces of ſcarlet cloth, to deaden, as well as ſoften, the ſound; whence it is alſo called the *dumb Spinett*, and is much uſed in nunneries for the religious to learn to play on; ſo as not to diſturb the ſilence of the dormitory.—Scaliger makes the *Manichord* more ancient than the ſpinett or harpſicord.

MANIFESTO, an apology, or public declaration in writing, made by a prince, ſhewing his intentions in any enterprize, the motives that induced him to it, and the reaſons on which his right and pretenſions are founded.

MANILLE, or MENILLE, in commerce, one of the principal commodities carried by the Europeans to the coaſt of Africa, to traffick with the Negroes in exchange for ſlaves; conſiſting of a large braſs ring, in form of a bracelet, either flat or round, plain or engraven; which the natives uſed to deck themſelves withal, putting them on the ſmall of the leg, and the thick of the arm above the elbow.

The better ſort among the Negroes wear ſilver and gold *Manilles*; but theſe are of their own manufacture; moſt of the money they receive for their other merchandizes being melted into *Manilles*.

MANIPULATION, a term uſed in the mines, to ſignify the manner of digging the ſilver, &c. out of the earth. See SILVER.

MANIPULUS, MANIPULE *, among the Romans was a little body of infantry, which, in the time of Romulus, conſiſted of an hundred men; and in the time of the conſuls and firſt Cæſars, of two hundred.

* The word properly ſignifies a handful; and, according to ſome authors, was firſt given to the handful of hay which they bore at the end of a pole to diſtinguiſh themſelves by, ere the cuſtom was introduced of bearing an eagle for their enſign; and hence alſo the phraſe, an handful of men. But Vegetius, Modeſtus, and Varro, give other etymologies of the word: The laſt derives it from *manus,* a little body of men following the ſame ſtandard. According to the former, this corps was called *Manipulus,* becauſe they fought hand in hand, or all together: *Contubernium autem Manipulus vocabatur ab eo quod conjunctis manibus pariter dimicabant.*

Each *Manipule* had two centurions, or captains, called *manipularii*, to command it; one whereof was lieutenant to the other.—Each cohort was divided into three *Manipules*, and each *Manipule* into two centuries. See COHORT, and CENTURY.

Aulus Gellius quotes an old author, one Cincius, who lived in the time of Hannibal, (whoſe priſoner he was) and who, writing on the art of war, obſerves, that then each legion conſiſted of ſixty centuries, of thirty *Manipules*, and of ten cohorts.—And again, Varro and Vegetius mention it as the leaſt diviſion in the army, only conſiſting of the tenth part of a century; and Spartian adds, that it contained no more than ten men: which ſhews, that the *Manipulus* was not always the ſame thing. See LEGION, &c.

MANIPULUS is alſo an eccleſiaſtical ornament, wore by the prieſts, deacons, and ſub-deacons in the Romiſh Church. It conſiſts of a little fillet in form of a ſtole, three or four inches broad, and made of the ſame ſtuff with the chaſuble; ſignifying and repreſenting an handkerchief, which the prieſts in the primitive church wore on the arm, to wipe off the tears they were continually ſhedding for the ſins of the people.—There ſtill remains a mark of this uſage in a prayer rehearſed by thoſe who wear it; *Merear, Domine, portare Manipulum fletus & doloris.*

The Greeks and Maronites wear two *Manipules*, one on each arm.

MANIPULUS, in phyſic, denotes a meaſure, or fixed quantity of herbs, or leaves, *viz.* an handful, or ſo much as the whole hand can graſp: generally mark'd in preſcription with *M.*

MANNA, in pharmacy, a medicinal drug, of great uſe in the modern practice, as a gentle purgative, and cleanſer of the firſt paſſages. See PURGATIVE, &c.

Manna is a white ſweet juice oozing from the branches and leaves of the aſh-tree, chiefly in Calabria, during the heats of ſummer.

Manna has been commonly held a kind of *mel aërium*, or honey-dew, which falling in the night, gathers on certain trees, and even on rocks, and the earth itſelf; where it hardens with the ſun. But what refutes this opinion, is, that ſuch dews melt in the ſun; whereas *Manna* whitens and hardens in it. Add, that ſuch dews are only found on the tops and extremes of the leaves; whereas *Manna* is chiefly found to lodge near the trunks of the branches: and that the honey-dew falls only on trees open to the air; whereas *Manna* is found on trees which are under cover: as was experienced by Dr. Cornelius, who gathered *Manna* from branches covered on purpoſe with cloth; and Lobelius aſſures, that *Manna* had been gathered from branches of the aſh which had been thrown the day before into a cellar. See HONEY-DEW.

It is much more rational to rank *Manna* amongſt the number of gums, which exuding from the juice of the tree, and mixing with ſome ſaline particles of the air, is condenſed into thoſe flakes in which we ſee it. See GUM.

The Italians gather three kinds of *Manna*:—*Manna di corpo*, which oozes ſpontaneouſly from the branches of the tree in the month of July.—*Manna forzata*, or *forzatella*, which is not gathered till Auguſt, after an inciſion of the tree, when the flux of the firſt has ceaſed.—*Manna di fronda*, which iſſues of itſelf, in little drops, like a kind of ſweat from the nervous part of the leaves of the aſh, and gathers into grains about the bigneſs of thoſe of wheat, which are hardened by the ſun in Auguſt. The leaves are frequently found ſo loaden with theſe grains, that they ſeem covered with ſnow.

Manna is a gentle, and ſafe purge; and is alſo uſed in broths: Altimarus, a phyſician of Naples, has written a treatiſe expreſsly upon it; and Donzelli another.—*Manna*, though accounted a kind of honey, purges the bile; whereas common honey increaſes it. Formerly the Syrian was in the moſt repute, but now it gives way to the Calabrian. Fuchſius obſerves, that the peaſants of mount Libanus eat *Manna* ordinarily as others do honey. At Mexico they are ſaid to have a *Manna* which they eat as we do cheeſe.

The *Manna* moſt eſteemed, is that in tears; which many take to be factitious, and the work of the Jews at Leghorn; but it is certainly natural: And what gives it this figure is, that they put ſtraws and ſlips of wood in the inciſions, along which the *Manna* gliding, is condenſed as it comes out, and aſſumes this form.

Manna, is alſo a ſcripture-term, ſignifying a miraculous kind of food which fell from heaven for the ſupport of the Iſraelites in their paſſage through the wilderneſs: being in form of coriander-ſeeds; its colour like that of bdellium, and its taſte like honey.

They called it *Manna*, either from the Hebrew word *manah*, a gift, to intimate its being a gift from heaven; or from *minnah*, which ſignifies to prepare, becauſe the *Manna* came to them ready for eating, and needed no preparation but gathering; or from the Egyptian word, *Man*, what is it? which laſt etymology ſeems the more probable, in regard the ſcripture takes notice of the ſurprize they were under when they firſt ſaw this new food deſcend.

Salmaſius, however, prefers another: According to him, the Arabs and Chaldeans uſed the word *Man* to ſignify a kind of dew or honey that fell on the trees, and was gathered in great abundance on mount Libanus. On which footing the Iſraelites did not uſe the term *Manna* out of ſurprize, but becauſe they found this food fall with the dew, in the ſame manner as the honey ſo well known to them under the name of *Man*.

Salmaſius adds, that the *Manna* of the Iſraelites was in reality no other than that honey, or dew condenſed; and that the one and the other were the ſame with the wild honey wherewith St. John was fed in the wilderneſs. So that the miracle did not conſiſt in the formation of any new ſubſtance in favour of the Iſraelites; but in the punctual manner in which it was diſpenſed by providence for the ſuſtenance of ſo vaſt a multitude.

MANNER, in painting, &c. expreſſes that particular character obſervable in the works of painters, poets, and other artiſts, by which their pencil, hand, or ſtyle, are diſtinguiſhed.

The curious in pictures know the *Manners* of the painters; and diſtinguiſh readily between the *Manners* of Rubens, Titian, or Da Vinci; between the ancient, and the new *Manner* of the ſame painter; the Flemiſh, and the Italian *Manner*.

Manner is uſed with reſpect both to the invention, the deſign, and the colouring. The *Manner* of Michael Angelo, or Raphael, may alſo be known in their ſcholars. Thus we ſay, ſuch a piece is of Raphael's ſchool, &c.

MANNERS, in poetry, denote the inclinations, genius, and humour, which the poet gives to his perſons, and whereby he diſtinguiſhes his characters. See CHARACTER.

Ariſtotle defines *Manners*, to be that which diſcovers the inclination of him who ſpeaks, and ſhews what he will reſolve upon, or what reject, before he has actually determined: whence he concludes, that *Manners* are not always, and in all kinds of diſcourſes: *Non quælibet oratio eſt morata*.

One inſtance will make this definition clear. In the firſt book of Virgil, Æneas is repreſented extremely pious, and determined to execute the will of the gods at all adventures. In the fourth book, he has a difficult choice propoſed; being engaged on the one hand, out of a principle of love, gratitude, and honour, not to quit Dido; and having, on the other hand, an expreſs order from the gods to depart for Italy.—Now, before it appears on which ſide he has determined, what he has before ſaid, ſhould ſhew his will and inclinations, and which party he will take.—And thoſe preceding diſcourſes, which diſcover his future reſolution, make what we call the poetical *Manners*.

Thoſe make it paſt doubt he will abandon Dido, to obey the gods: This he does in effect; the *Manners* therefore are good, and well conducted.—Had he diſobeyed the orders of Jupiter, to ſtay with Dido, the manners had been ill; in regard they would have foretold a reſolution contrary to what he was really to take.—But had there been nothing to make us foreſee any reſolution of Æneas at all, neither that which he actually took, nor the contrary, in that caſe there had been no *Manners* at all.

It is the *Manners*, as before obſerved, that diſtinguiſh the characters: and, unleſs the *Manners* be well expreſſed, we ſhall never be acquainted with the perſons at all; nor, conſequently, ſhall we be either terrified with foreſeeing their dangers, nor melted into pity by ſeeing their ſufferings. See CHARACTER.

The *Manners* ſhould have four qualities; they ſhould be *good*, *like*, *ſuitable*, and *equal*.

The *Manners* are *good* when they are well marked or expreſſed; that is, when the diſcourſe of the perſons makes us clearly and diſtinctly ſee their inclinations, and what good or evil reſolutions they will take.—*Likeneſs* of *Manners* only relates to known and public perſons, whoſe characters are in hiſtory, with which the poetic characters muſt agree; that is, the poet muſt not give a perſon any quality contrary to any of thoſe which hiſtory has given him. And here it may be obſerved, that the evil qualities given to princes and great men, ought to be omitted by the poets, if they be contrary to the character of a prince, &c. but the virtues oppoſite to thoſe known vices ought not to be impoſed, by making him generous and liberal in the poem, who was avaritious in the hiſtory.

The *Manners* muſt likewiſe be *ſuitable*; that is, they muſt be agreeable to the age, ſex, rank, climate, and condition of the perſon that has them. Horace obſerves, *Intererit multum Davuſne loquatur an heros*.—Again, the manners muſt be *equal*; that is, they muſt be conſtant, or conſiſtent through the whole character; or the variety or inequality of the *Manners*, as in nature, ſo in the drama, muſt be equal. The fearful muſt never be brave, nor the brave timorous; the avaritious muſt never be liberal, nor *vice verſa*. In this part, Shakeſpear's *Manners* are admirable.

Beſides theſe four qualities above-mentioned, there is a fifth eſſential to their beauty; which is, that they be neceſſary; that is, that no vicious quality, or inclination, be given to any poetic perſon, unleſs it appear to be abſolutely neceſſary, or requiſite to the carrying on of the action.

MANOMETER, or **MANOSCOPE***, an inſtrument to ſhew, or meaſure, the alterations in the rarity, or denſity of the air. See AIR, RARE, and DENSITY.

* The word is formed from the Greek μανος, rarus, and μετρον, menſura, &c.

The *Manometer* differs from the barometer, in that the latter only meaſures the weight of the atmoſphere, or of the column of air over it; but the former the denſity of the air in which it is found; which denſity depends not only on the weight of the atmoſphere, but on the action of heat and cold, &c.—Authors, however, generally confound the two together; and Mr. Boyle himſelf gives us a very good *Manometer* of his contrivance, under the title of a *ſtatical barometer*; the ſtructure whereof ſee under the word BAROMETER.

MANOR, or **MANNOR***, an antient lordſhip, or royalty; conſiſting of demeſnes and ſervices, and of a court-baron, as incident thereto. See LORD, and DEMAIN.

* The word is formed from the French *Manoir*, a manſion-houſe; and that from the Latin, *Manere*, to remain, or dwell, as being the lord's uſual place of reſidence. See MANSION.

Manor is the ſame with what was formerly called *baronia*, *barony*. See BARONY.

A *Manor* is a kind of noble fee granted out partly to tenants for certain ſervices to be performed, and partly reſerved to the uſe of the lord's family, with juriſdiction over his tenant for the lands or eſtates held of him. See FEE.

For the original of *Manors*,—we are told there was antiently a certain compaſs of ground, granted by the king to ſome man of worth, for him and his heirs to dwell upon, and to exerciſe ſome juriſdiction, more or leſs, within that circuit, ſuch as he thought good to grant; but performing, withal, ſuch ſervices, and paying ſuch yearly rent, as by this grant was required. Now, the lord afterwards, parcelling the ſame to other meaner men, received rent and ſervices from them, and by that means, as he became tenant to the king, the inferiors became tenants to him.

But at this time a *Manor* rather ſignifies a juriſdiction, and royalty incorporeal, than the land and ſuit: For a man may have a *Manor* in groſs, *i. e.* the right and intereſt of a court-baron, with the perquiſites, and another enjoy every foot of land belonging to it.

A *Manor* may be compounded of divers things, as of an houſe, arable land, paſture, meadow, wood, rent, advowſon, court-baron, &c. And this ought to be, by long continuance of time, beyond man's memory.

It is held by ſome, that a *Manor* cannot now be made, ſince a court-baron cannot be made; and without a court-baron, and at leaſt two ſuitors, there can be no *Manor*. See COURT.

MANSE, **MANSUS**, **MANSA**, or **MANSUM***, in ancient law-books, denotes an houſe, or habitation; either with or without land. See HOUSE, and MANSION.

* The word is formed *à Manendo*, abiding; as being the place of dwelling or reſidence.

Capital **MANSE**, *Manſum capitale*, denotes the manor-houſe, or lord's court. See MANOR, and COURT.

MANSUS *Presbyteri*, is a parſonage, or vicarage-houſe, for the incumbent to reſide in.

This was originally, and ſtill remains, an eſſential part of the endowment of a pariſh-church, together with the glebe and tythes.—It is ſometimes called *Presbyterium*. See PRESBYTERY.

MANSION, **MANSIO**, a dwelling-houſe or habitation, eſpecially in the country. See MANSE.

MANSION is more particularly uſed for the lord's chief dwelling-houſe within his fee, otherwiſe called the *capital meſſuage*, or chief *manor* place. See MANOR.

MANSIO, or **MANSUS**, was ſometimes alſo uſed in the ſame ſenſe with *hide*; that is, for as much land as one plow could till in a year. See HIDE.

MAN-SLAUGHTER, **HOMICIDE**; the unlawful killing a man, without any prepenſed malice. See HOMICIDE.

As, when two perſons who before meant no harm to one another, falling out on ſome ſudden occaſion, the one kills the other.

Man-ſlaughter differs from murder, as not being done with foregoing malice; and from chance-medley, becauſe it hath a preſent intent to kill.—It is eſteemed felony, but admitted to the benefit of the clergy, for the firſt time. See MURDER, CHANCE-MEDLEY, and SE-DEFENDENDO.

By a law of king Canutus, if a man is killed openly and premeditatedly,

meditatedly, the murderer ſhall be committed to the relations of the deceaſed: but if, on his trial, the fact be proved, but not wilful, the biſhop is to judge him.

MANSORII *Muſculi*, the ſame with *maſſeters*. See MASSETER.

MANTELETS, in war, a kind of moveable parapets made of planks, about three inches thick, nailed one over another, to the height of almoſt ſix feet, generally caſed with tin, and ſet upon little wheels; ſo that in a ſiege, they may be driven before the pioneers, and ſerve as blinds, to ſhelter them from the enemy's ſmall ſhot. See BLINDS.

There are other ſorts of *Mantelets*, covered on the top, whereof the miners make uſe, to approach the walls of a town, or caſtle.—See *Tab. Fortif. fig.* 17.

It appears from Vegetius, that theſe were in uſe among the ancients, under the name of vineæ; but they were built ſlighter, and yet larger than ours, being eight or nine feet high, as many broad, and ſixteen long: They were defended by a double covering, the one of boards, the other of faggots, with the ribs of oſiers, and caſed without with ſkins ſteeped in water, to prevent fire.

MANTLE, or MANTLE-*tree*, in architecture, is the lower part of a chimney; or that piece of timber which is laid acroſs the jaumbs, and ſuſtains the compartiment of the chimney-piece. See CHIMNEY.

MANTLE, or MANTLING, in heraldry, that appearance of folding of cloth, flouriſhing, or drapery, that is in any atchievement, drawn about the coat of arms.

It is ſuppoſed originally to have been the repreſentation of a *Mantle*, or military habit worn by antient cavaliers over their armour, to preſerve it from ruſt; or, as others hold, a ſhort covering only worn over the helmet; which in after-times was lengthened, and made to hang from the helmet below the whole ſhield. See *Tab. Herald. fig.* 29.

The *Mantle* is always ſaid in blazon to be doubled, that is, lined throughout with one of the furs, as ermin, pean, vairy, *&c.* See COAT.

MANTLE is likewiſe a term uſed in falconry.—They ſay, the hawk *mantles*, that is, ſpreads her wings after her legs.

MANUCAPTIO, in law, a writ which lies for a man, who, being taken on ſuſpicion of felony, and offering ſufficient bail for his appearance, is refuſed to be admitted thereto by the ſheriff, or other having power to let to mainpriſe.

MANUDUCTOR *, a name given to an ancient officer in the church, who, from the middle of the choir where he was placed, gave the ſignal for the choriſters to ſing, marked the meaſure, beat time, and regulated the muſic. See CHOIR, *&c.*

* The Greeks called him *Meſachoros*, becauſe ſeated in the middle of the choir: But in the Latin church, he was called *Manuductor*, from *manus* and *duco*, I lead; becauſe he led and guided the choir by the motions and geſture of the hand.

MANUFACTURE *, a place where ſeveral artiſts and workmen are employed in the ſame kind of work; or make a commodity of the ſame kind. See COMMERCE, *&c.*

* The word comes from the Latin, *Manufactus*, q. d. made with hands.

MANUFACTURE is alſo popularly uſed to ſignify the work itſelf; and by extenſion, the like work carried on independently in different parts of a country.

In this ſenſe, we ſay the woollen *Manufacture*, ſilk *Manufacture*, velvet *Manufacture*, tapeſtry *Manufacture*, muſlin *Manufacture*, &c. *Manufacture* of hats, ſtockings, *&c.* See WOOL, SILK, VELVET, TAPESTRY, MUSLIN, *&c.*

MANUMISSION, MANUMISSIO *, an act whereby a ſlave, or villain, is ſet at liberty, or out of bondage. See SLAVE, *&c.*

* The word comes from the Latin *manus*, hand, and *mittere*, to ſend; *quia ſervus mittebatur extra manum, ſeu poteſtatem domini ſui.*

Some authors define *Manumiſſion* an act by which a lord enfranchiſes his tenants, who till that time had been his vaſſals, and in a ſtate of ſlavery, inconſiſtent with the ſanctity of the chriſtian faith. See VILLAIN, VASSAL, *&c.*

Among the Romans, the *Manumiſſion* of ſlaves was performed three ſeveral ways. 1°. When, with his maſter's conſent, a ſlave had his name entered in the cenſus, or public regiſter of the citizens. 2°. When the ſlave was led before the prætor, and that magiſtrate laid his wand, called *Vindicta*, on his head. 3°. When the maſter gave the ſlave his freedom by his teſtament.—Servius Tullus is ſaid to have firſt ſet on foot the firſt manner; and P. Valerius Publicola the ſecond: A particular account is given of the third in the *Inſtitutes* of Juſtinian.

It was not neceſſary, that the prætor ſhould be on his tribunal to perform the ceremony of *Manumiſſion*: he did it any where indifferently, in his houſe, in the ſtreet, going to bathe, *&c.* He laid the rod on the ſlave's head, pronouncing theſe words, *Dico eum liberum eſſe more Quiritum*; I declare him a freeman after the manner of the Romans. This done, he gave the rod to the lictor, who ſtruck the ſlave with it on the head, and afterwards with his fiſt on his face and back: And the notary, or ſcribe, entered the name of the new-freed man in the regiſter, with the reaſons of his *Manumiſſion*. See LIBERTIN.

The ſlave had likewiſe his head ſhaved, and a cup given him by his maſter, as a token of freedom. Tertullian adds, that he had then alſo a third name given him: If this were ſo, three names were not a token of nobility, but of freedom. See NAME.

The emperor Conſtantine ordered the *Manumiſſions* at Rome to be performed in the churches.

Of *Manumiſſion* there have alſo been various forms in England: In the time of the conqueror, villains were *manumitted* by the maſter's delivering them by the right hand to the vicount in full court, ſhewing them the door, giving them a launce, and a ſword, and proclaiming them free.

Others were *manumitted* by charter.—There was alſo an implicit *manumiſſion*; as when the lord made an obligation for payment of money to the bondman at a certain day; or ſued him, where he might enter without ſuit; and the like.

MANURING *of ground*, the application of a matter proper for meliorating the ſoil, and rendering it more fertile. See COMPOST, VEGETATION, *&c.*

The matters uſed for *Manure* are various in various countries: The moſt ordinary are dung, lime, and marl. See LIME and MARL.

In ſome parts of Ireland they uſe ſea-ſhells, as thoſe of cockles, periwinkles, *&c.* which are found to agree well with boggy, heathy, clayey, wet or ſtiff land; as they ſeem to give it a kind of ferment, as barm does to bread, opening and looſening the clods, and by that means making way for the roots to penetrate, and the moiſture to enter into the fibres of the roots.—This kind of *Manure* continues a long time ere its effects are exhauſted; whereas lime, *&c.* ſpend themſelves at once. The ſhells being hard, melt away very ſlowly, ſo that the operation needs not be repeated for twenty or thirty years.

In the weſt of England, they *manure* their land with a brackiſh ſea-ſand; which Dr. Bury obſerves, quickens dead land: ſo that what would otherwiſe be the barreneſt part of that country, is now the richeſt. The ſea-ſalt, he obſerves, is too luſty and active of itſelf, and that it does beſt when mingled with lime. Glauber orders the mixture to be made up and burnt like bricks, and then applied.

In ſome counties they burn the ſurface of their heathy ground, inſtead of *manuring* it; which others think but ill huſbandry, inaſmuch as it impoveriſhes it; and by deſtroying the ſap of the earth, and roots of the graſs, and other vegetables, renders it uſeleſs for ſeveral years after the third, when it is plowed. See DENSHIRING, and ASHES.

Dr. Jackſon obſerves, that all the ground about Nantwich, where ſalt or brine is ſpilt, is, when dug up, an excellent *Manure* for grazing ground; and even bricks, thoroughly tinged with it, diſſolve and fertilize land very conſiderably. See SALT.

Dr. Beal ſays, it is a common obſervation of gardeners and ſkilful huſbandmen, that froſt and ſnow improve and fertilize the land both more ſpeedily and more effectually than the influence and warmth of the ſun. See SNOW, *&c.*

Dr. Liſter tells us, that in ſome parts of the north-riding of Yorkſhire the ſoil is ſandy, and the people *manure* it with clay. The ſoil, with any other *Manure*, bears nothing but rye; but with clay, bears oats, barley, *&c.* This clay *Manuring* will, by certain experience, laſt forty-five years in the ground ere it need be repeated.—The bogs in Ireland are ſaid to be beſt improved by ſandy, or other gravelly *Manures*.

MANUSCRIPT, a book, or paper, written with the hand. See WRITING.

By which it ſtands oppoſed to a printed book, or paper. See PRINTING.

A *Manuſcript* is uſually denoted by the two letters MS, and in the plural by MSS, or MMSS.—What makes public libraries valuable, is the number of antient *Manuſcripts* repoſited in them. See LIBRARY.

MANWORTH, in old law-books, denotes the price, or value of a man's head. See GELD, and WERGELD.

In antient times, every man, according to his degree, was rated at a certain price: according to which, ſatisfaction was made to his lord, if any one killed him. See ÆSTIMATIO.

MANZEL. See the article CARAVANSERA.

MAP, a plain figure, repreſenting the ſurface of the earth, or a part thereof, according to the laws of perſpective. See EARTH, and PERSPECTIVE.

A *Map* is a projection of the ſurface of the globe, or a part thereof, on a plane ſurface; repreſenting the forms and dimenſions of the ſeveral countries and rivers; with the ſituations of cities, mountains, and other places. See PROJECTION.

Maps are either *univerſal*, or *particular*.

Univerſal MAPS are thoſe which exhibit the whole ſurface of the earth; or the two hemiſpheres.

Particular MAPS are thoſe which exhibit ſome particular region, or part thereof.

Each kind are frequently called *Geographical*, or *Land-Maps*, in contra-diſtinction to *Hydrographical*, or *Sea-Maps*, repreſenting only the ſeas and ſea-coaſts; properly called *Charts*. See CHART.

There are three qualifications required in a *Map*. 1°. That all places have their juſt ſituation with regard to the chief circles of the earth, as the equator, parallels, meridians, *&c.* becauſe on theſe depend many properties of regions, as well as celeſtial phænomena. 2°. That the magnitudes of the ſeveral countries have the ſame proportion as on the ſurface of the earth. 3°. That the ſeveral places have the ſame diſtance and ſituation with regard to each other, as on the earth itſelf.

For the foundation of MAPS, and the laws of projection, ſee PERSPECTIVE, and PROJECTION *of the Sphere.*—*The application thereof, in the conſtruction of* MAPS, is as follows.

Conſtruction of a MAP, *the eye being placed in the axis.*—Suppoſe, *v. g.* the northern hemiſphere to be repreſented with the eye in a point of the axis, *v. g.* the ſouth pole: For the plane, whereon the repreſentation is to be made, we take the plane of the equator, and from all the points of the ſurface of the northern hemiſphere, conceive lines paſſing through the plane to the eye; which points connected together, conſtitute the *Map* required.

Here the equator will be the limit of the projection; the pole, the centre. The meridians will be right lines paſſing from the pole to the equator: the parallels of latitude, *&c.* circles concentric with the equator; and all the other circles, and arches of circles, as the horizon, vertical circles, *&c.* ecliptic, *&c.* conceived in that hemiſphere, will be ellipſes, or arches of ellipſes.

The better to apprehend the projection of the circles on the plane, conceive a radiant cone, whoſe vertex is the eye, its baſe the circle to be repreſented, and its ſides the rays paſſing between the circle and the eye. Suppoſe this cone cut by the plane. It is obvious, that, according to the various poſition of the cone, there will be a different ſection, and conſequently a different line of repreſentation.

For the application of this doctrine in practice:—In a plane, *v. g.* a paper, take the middle point *P* (*Tab. geography, fig.* 2.) for the pole; and from this, as a centre, deſcribe a circle, of the intended bigneſs of your *Map*, to repreſent the equator. Theſe two may be pitched on at pleaſure, and from theſe all the other points and circles are to be determined. Divide the equator into 360°, and drawing right lines from the centre to the beginning of each degree, theſe will be meridians; whereof that drawn to the beginning of the firſt degree, we ſuppoſe the firſt meridian. See MERIDIAN.

For the parallels.—There are four quadrants of the equator; the firſt 0,90; the ſecond, 90,180; the third, 180,270; the fourth, 270,0; which, for the better diſtinction, we will note with the letters AB, BC, CD, DE. Taking one of theſe, *v. g.* BC, from the ſeveral degrees thereof, as alſo from 23°, 30′, and 66″, 30′ thereof, draw occult right lines to the point *D*, marking where theſe lines cut the ſemidiameter *BPC*; and from *P*, as a centre, deſcribe arches paſſing through the ſeveral points in *PC*.—Theſe arches will be parallels of latitude. The parallel at 23° 30′, will be the tropic of Cancer, and that at 66° 30′, the arctic circle. See PARALLEL and TROPIC.

The meridians and parallels thus deſcribed, from a table of longitudes and latitudes, lay down the places; reckoning the longitude of each place on the equator, commencing at the firſt meridian, and proceeding to the meridian of the place; and for the latitude of the place, chuſing a parallel of the ſame latitude: the point where this meridian and parallel interſect, repreſents the place: And in the ſame manner all the other places may be determined, till the *Map* be compleat.

For the ecliptic, half of which comes in this hemiſphere; we have obſerved, that it makes an ellipſis; ſo that the points through which it paſſes are to be found. The firſt point, or that wherein the ecliptic cuts the equator, is the ſame with that wherein the firſt meridian cuts the equator, which is therefore diſtinguiſhed by the ſign of Aries: the laſt point of this half ellipſis, or the other interſection of the equator and ecliptic, *viz.* the end of Virgo, will be in the oppoſite point of the equator, *viz.* at 180°. The middle point of the ellipſis is that wherein the meridian 90 cuts the tropic of Cancer. Thus we have three points of the ecliptic determined: for the reſt, *viz.* for 1° and 15° of Taurus, 1° and 15° of Gemini, 1° of Leo, 1° of Virgo, the declinations of thoſe points from the equator muſt be taken from a table, and ſet off in the *Map*. See DECLINATION, *&c.*

—Thus where the meridian of 13° cuts the parallel of 5°, that point will be 15° of Aries. Where the meridian 27° cuts the parallel, 11′ will be the firſt degree of Taurus; and ſo of the reſt. Theſe points being all joined by a curve line, will be a portion of an ellipſis repreſenting the ecliptic.

Maps of this projection have the firſt qualification above required; but are defective in the ſecond: the ſurface being ſtretched further, as it approaches nearer the equator. For the third, they are ſtill further out.

By this method may almoſt the whole earth be repreſented in one *Map*, placing the eye, *v. g.* in the antarctic pole, and aſſuming for the plane of projection that of ſome circle near it, *v. g.* the antarctic circle.—Nothing is here required beſides the former projection, but to continue the meridian, draw parallels on the other ſide of the equator, and compleat the ecliptic; but this diſtorts too much for practice.

This projection is of all others the eaſieſt; but that, where the eye is placed in the plane of the equator, is preferred for uſe. It is, in effect, of the latter kind that *Maps* are ordinarily made. The former are added to them, in ſmall, by way of ſupplement, to repreſent the intermediate ſpaces left between the two hemiſpheres.—Further, as the ſituation of the ecliptic, with regard to the earth, is continually changing; ſtrictly ſpeaking, it has no place on the earth's ſurface; but is uſed to be repreſented according to its ſituation ſome certain moment; *viz.* ſo as the beginning of Aries and Libra may be in the interſections of the firſt meridian and equator.]

Conſtruction of MAPS, *with the eye in the plane of the equator.*—This method of projection, though more difficult, is yet much juſter, more natural and commodious, than the former. To conceive it, we ſuppoſe the ſurface of the earth cut into two hemiſpheres by the entire periphery of the firſt meridian, each of which hemiſpheres we repreſent in a diſtinct *Map*. The eye is placed in the point of the equator 90° diſtant from the firſt meridian; and for the tranſparent plane, wherein the repreſentation is to be, we take the plane of the firſt meridian. In this projection, the equator is a right line, and the meridian 90° diſtant from the firſt, is alſo a right line; but the other meridians, and all the parallels of the equator, are arches of circles, and the ecliptic an ellipſis.

The method is thus. From a point *E*, as a centre, (fig. 3.) deſcribe a circle according to the intended bigneſs of the *Map*. This repreſents the firſt meridian, and is oppoſite; for, drawing the diameter *B D*, there ariſe two ſemi-circles, the one whereof *B A D* is the firſt meridian, the other *B C D* its oppoſite, or the meridian of 180°. This diameter *B D* repreſents the meridian of 90 degrees, whereof the point *B* is the arctic pole, and the point *D* the antarctic. The diameter *A C*, perpendicular to that *B D*, is the equator. Divide the quadrants *A B*, *B C*, *C D*, *D A*, each into 90 degrees; and to find the arches of the meridians and parallels, proceed thus. Divide the equator into its degrees, *viz:* 180. (as being indeed only half the equator;) through theſe ſeveral diviſions, and the two poles, deſcribe arches of circles, repreſenting meridians, as *B* 1 *D*, *B* 2 *D*, &c.—How to find centres for deſcribing thoſe arches, ſee under the word CIRCLE. Indeed, the operation will be both more eaſy and accurate, if performed by a canon of tangents.

To deſcribe the parallels, the meridian *B D* muſt be in like manner divided into 180 degrees; then through each of theſe diviſions, and the correſponding diviſions of the quadrants *A B*, *CB*, deſcribe arches of circles. Thus ſhall we have parallels of all degrees, with tropics, polars, and meridians.

The ecliptic may be deſigned two ways: For its ſituation over the earth may either be ſuch, as that its interſection with the equator may be over the place *A*; in which caſe, the projection of its ſemi-circles, from the firſt degree of Cancer, to the firſt of Capricorn, will be a ſtrait line, to be determined by numbering 23° 30′ from *A* towards *B*, and from the extreme of that numeration drawing a diameter through *E*; which line will be half the ecliptic in this ſituation, and may be divided, as before, into degrees, to which the numbers, ſigns, *&c.* are to be affixed.—But if the ecliptic be ſo placed, as that its interſection with the equator is over the place *A*, in the firſt meridian, its projection in that caſe will be a ſegment of an ellipſis; whereof two of the points are *A*, *C*; a third that wherein the meridian 90 cuts the tropic of Cancer.—The other points muſt be determined in the manner laid down above, *viz.* by taking the declinations and right aſcenſions of 15° of Aries, 1° of Taurus, 15° of Gemini, *&c.* For where the parallels, according to their ſeveral degrees of declination, cut the meridians, taken according to the ſeveral right aſcenſions; thoſe points of interſection are the points of the 15° of Aries, *&c.* A curve line therefore being drawn, theſe will give the projection of the ecliptic.

Nothing remains to compleat the *Map*, but to take the longitudes and latitudes of places from a table; and to ſet them off on the *Map*, as was directed under the former method.

In this projection the whole ſurface of the earth may be repreſented in one *Map*; if inſtead of the plane of the firſt meridian, ſome other plane parallel to it, but very near the eye, be taken; for by this means the entire parallels and meridians will be deſcribed.—But as this diſtorts the face of the earth too much, it is ſeldom uſed; and we rather make the two hemiſpheres in two diſtinct tables.

One great advantage in this projection is, that it repreſents the longitudes and latitudes of places, their diſtance from the pole and from the equator, almoſt the ſame as they are on the earth.—Its inconveniences are, that it makes the degrees of the equator unequal; being the greater as they are nearer the firſt meridian D A B, or its oppoſite B C D; and for this reaſon equal tracts of the earth are repreſented unequal; which defect may be in ſome meaſure remedied by removing the eye far from the earth. Laſtly, the diſtances of places, and ſituation with regard to each other, cannot be well determined in *Maps* of this projection.

Conſtruction of MAPS *on the plane of the horizon*, or wherein any given place ſhall be the centre, or middle.—Suppoſe, for inſtance,

ſtance, it is deſired to have London the centre of the *Map*. Its latitude we will ſuppoſe to be 51 degrees, 32 minutes. The eye is placed in the nadir. The tranſparent table is the plane of the horizon, or ſome other plane, if it is deſired to repreſent more than an hemiſphere.—Take then the point E (fig. 4.) for London; and from this, as a centre, deſcribe the circle A B C D to repreſent the horizon, which you are then to divide into four quadrants, and each of theſe into 90 degrees. Let the diameter B D be the meridian, B the northern quarter, D the ſouthern; the line of equinoctial eaſt and weſt ſhews the firſt vertical, A the weſt, C the eaſt, or a place of 90 degrees from the zenith in the firſt vertical. All the verticals are repreſented by right lines drawn from the centre E to the ſeveral degrees of the horizon. Divide B D into 180 degrees, as in the former methods; the point in E B repreſenting 51 deg. 32 min. of the arch B C, will be the projection of the north pole, which note with the letter P. The point in E D repreſenting 51 deg. 32 min. of the arch D C, (reckoning from C towards D) will be the projection of the interſection of the equator and meridian of London, which note with the letter Q; and from this, towards P, write the numbers of the degrees, 1, 2, 3, *&c.* As alſo from Q towards D, and from B towards P, *viz.* 51, 52, 53, *&c.*

Then taking the correſponding points of equal degrees, *viz.* 99 and 99, 88 and 88, *&c.* about thoſe, as diameters, deſcribe circles, which will repreſent parallels, or circles of latitude, with the equator, tropics, and polar circles. For the meridians, firſt deſcribe a circle through the three points A, P, C. This will repreſent the meridian 90 degrees from London. Let its centre be M in B D, (continued to the point N, which repreſents the ſouth pole) P N being the diameter, through M draw a parallel to A C, *viz.* F H, continued each way to K and L. Divide the circle P H N F into 360 degrees, and from the point P draw right lines to the ſeveral degrees, cutting K F H L; through the ſeveral points of interſection, and the two poles P, N, as through three given points, deſcribe circles repreſenting all the meridians. The centres for deſcribing the arches, will be in the ſame K L, as being the ſame that are found by the former interſection; but are to be taken with this caution, that for the meridian next B D N towards A, the moſt remote centre towards L, be taken for the ſecond, the ſecond from this, *&c.*—The circles of longitude and latitude thus drawn, inſert the places from a table as before directed.

Conſtruction of MAPS *on the plane of the meridian.*—This projection is taught by Ptolemy, and recommended by him as proper for that part of the earth then known. In this, the equator and parallels are arches of circles, and the meridians arches of ellipſes; the eye hanging over the plane of that meridian which paſſes over the middle of the inhabited world.—But in regard the deſcription of theſe ellipſes is ſomewhat perplexing, and becauſe this method ſeems calculated only for a part of the earth, it is not now uſed.

There is a ſecond method ſomething a-kin to it, which repreſents the circles of latitude by right lines, and the meridians by arches of ellipſes; as muſt be the caſe, if lines be conceived to fall from the ſeveral points of each hemiſphere, perpendicularly on the plane of the firſt meridian, and the eye be ſuppoſed at an infinite diſtance from the earth; ſo that all the rays emitted from the places of the earth to it, may be accounted parallels, as well as perpendiculars to the plane of the firſt meridian.

Rectilinear MAPS are thoſe wherein both the meridians and parallels are repreſented by right lines, which by the laws of perſpective is impoſſible; in regard there can no ſuch poſition be aſſigned the eye and the plane, as that the circles both of longitude and latitude ſhall be right lines.

In the firſt method above laid down, the meridians are right lines, but the parallels are circles: in the fifth, the parallels are right lines, and the meridians ellipſes. In all other perſpective methods, both kinds of circles are curve: one method indeed muſt be excepted, wherein the meridians are right lines, and the parallels hyperbola's; as when the eye is placed in the centre of the earth, and the plane, through which it is viewed, is parallel to the firſt meridian: but this method is rather pretty than uſeful.

Rectilinear Maps are chiefly uſed in navigation, to facilitate the eſtimation of the ſhip's way. See CHART.

Conſtruction of particular MAPS.—*Particular Maps of large tracts*, as Europe, Aſia, Africa, and America, are projected after the ſame manner as general ones; only let it be obſerved, that for different parts, different methods may be choſen. Africa and America, for inſtance, in regard the equator paſſes through them, cannot be conveniently projected by the firſt method, but much better by the ſecond. Europe and Aſia are moſt conveniently repreſented by the third; and the polar parts, or the frigid zones, by the firſt.

To begin then, draw a right line on your plane or paper, for the meridian of the place over which the eye is conceived to hang, and divide it into degrees, as before, which will be degrees of latitude. Then from the tables take the latitude of the two parallels, which terminate each extreme. The degrees of theſe latitudes are to be noted in the meridian; and through them draw perpendiculars, bounding the *Map* towards north and ſouth. This done, meridians and parallels are to be drawn to the ſeveral degrees, and the places to be inſerted, till the *Map* is compleat.

For particular MAPS *of leſs extent.*—In *Maps* of ſmaller portions of the earth, the geographers take another method. Firſt, a tranſverſe line is drawn at the bottom of the plane, to repreſent the latitude, wherein the ſouthermoſt part of the country to be exhibited, terminates. In this line, ſo many equal parts are taken, as that country is extended in longitude. On the middle of this ſame line erect a perpendicular, having ſo many parts as there are degrees of latitude between the northern and ſouthern limits of the country. How big theſe parts are to be, may be determined by the proportion of a degree of a great circle to a degree of the parallel repreſented by the tranſverſe line at bottom. Through the other extreme of this perpendicular, draw another perpendicular, or a parallel to the line at bottom, in which are to be ſeen as many degrees of longitude, as in the lower line, and theſe too, equal to thoſe other, unleſs the latitudes happen to be remote from each other, or from the equator. But if the loweſt parallel be at a conſiderable diſtance from the equinoctial, or if the latitude of the northern limit go much beyond that of the ſouthern; the parts or degrees of the upper line muſt not be equal to thoſe of the lower, but leſs, according to the proportion which a degree of the more northern parallel has to a degree of the more ſouthern.

After parts have been thus determined, both on the upper and lower line, for the degrees of longitude; right lines muſt be drawn through the beginning and end of the ſame number, which lines repreſent meridians: then, through the ſeveral degrees of the perpendicular erected on the middle of the firſt tranſverſe line, draw lines parallel to that tranſverſe line. Theſe will repreſent parallels of latitude. Laſtly, at the points wherein the meridians of longitude and the parallels of latitude concur, inſert the places from a table, as before directed.

For MAPS *of provinces*, or ſmall tracts, as pariſhes, manors, *&c.* we uſe another method, more ſure and accurate than any of the former. In this, the angles of poſition, or the bearings of the ſeveral places, with regard to one another, are determined by proper inſtruments, and transferred to paper.—This conſtitutes an art apart, called *ſurveying*. See SURVEYING.

The uſe of MAPS is obvious from their conſtruction. The degrees of the meridians and parallels ſhew the longitudes and latitudes of places, and the ſcale of miles annexed, their diſtances; the ſituation of places, with regard to each other, as well as to the cardinal points, appears by inſpection, the top of the *Map* being always the north, the bottom the ſouth, the right-hand the eaſt, and the left the weſt; unleſs the compaſs, uſually annexed, ſhew the contrary.

MAPPARIUS, an officer among the Romans, who in the public games, as thoſe of the circus and the gladiators, gave the ſignal for their beginning, by throwing an handkerchief (*Mappa*) which he had before received from the emperor, conſul, prætor, or other ſupreme officer then preſent. See ACACIA.

MARASMUS, ΜΑΡΑΣΜΟΣ*, in medicine; an extreme waſting, or conſumption of the whole body. See CONSUMPTION.

* The word is Greek, being derived from the verb μαραινειν, to waſte.

A *Maraſmus* is an extreme degree of atrophy; as a hectic fever is an extreme degree of *Maraſmus*. See ATROPHY, and HECTIC.

MARAVEDI*, a little Spaniſh copper coin, worth ſomewhat more than a French denier, or half a farthing Engliſh.

* The word is Arabic, and took its riſe from the *Almoravides*, a dynaſty of Moors, who paſſing out of Africa into Spain, impoſed their own name on this coin, which by corruption was afterwards changed into *Maravedi*.—Mention is made of it in the decretals, as well as other Latin writers, under the name of *Marabitini*.

The Spaniards always count by *Maravedis*, both in commerce, their finances, *&c.* though the coin itſelf is no longer current among them.—Sixty-three *Maravedis* are equivalent to a rial of ſilver: ſo that the piaſter, or piece of eight rials, contains five hundred and four; and the piſtole of four pieces of eight, two thouſand and ſixteen *Maravedis*. See COIN, and MONEY.

This ſmallneſs of the coin produces vaſt numbers in the Spaniſh accounts and calculation; inſomuch that a ſtranger or correſpondent would think himſelf indebted ſeveral millions for a commodity that coſts but a few pounds.

In the laws of Spain, we meet with ſeveral kinds of *Maravedis*; Alphonſine *Maravedis*, white *Maravedis*, *Maravedis* of good money, *Maravedis* Combrenos, black *Maravedis*, old *Maravedis*.—When we find *Maravedis* alone, and without any addition, it is to be underſtood of thoſe mentioned above. The reſt were different in value, fineneſs of metal, time, *&c.* Mariana aſſerts, that this coin is older than the Moors; that it came from the Goths; that it was anciently equal to a third part of the rial, and conſequently twelve times the value of the preſent *Maravedi*. Under Alphonſus XI. the *Maravedi* was ſeventeen times, under Henry II. ten times, and under Henry III. five times, and under John II. two times and a half the value of the preſent *Maravedi*.

MARBLE, **Marmor** *, a precious kind of ſtone found in great maſſes, dug out of pits or quarries; being of a conſtitution ſo hard and compact, and again ſo fine as readily to take a beautiful poliſh: much uſed in ornaments of buildings, as columns, ſtatues, altars, tombs, chimney-pieces, tables, and the like. See Stone.

* The word comes from the French *Marbre*, and that from the Latin *Marmor*, of the Greek μαρμαιρειν, to ſhine or glitter.

There are an infinite number of different kinds of *Marble*, uſually denominated either from their colour, their age, their country, their grain, their degree of hardneſs, their weight, or their defects: ſome are of one ſimple colour, as white or black, others ſtreaked or variegated with ſtains, clouds, waves, veins, *&c.* but all opake, excepting the white, which, when cut into thin ſlices, becomes tranſparent.

Some, under the genus of *Marble*, comprehend alſo porphyry, ſerpentine, granite, alabaſter, *&c.* See Porphyry, Serpentine, Granite, Alabaster, *&c.*

Ancient Marbles are thoſe whoſe quarries are loſt, or inacceſſible to us, and whereof we have only ſome pieces remaining.

Modern Marbles are thoſe, whoſe quarries are ſtill open, and out of which blocks continue to be dug.

African Marble is either of a reddiſh brown, ſtreaked with veins of white; or of a carnation, with veins of green.

Engliſh white Marble is veined with red.

Derbyſhire Marble is variouſly clouded and diverſified with brown, red, yellow, *&c.*

Marble of *Auvergne* in France, is of a pale red, mingled with violet, green, and yellow.

Marble of *Brabançon* in Hainault, is black, veined with white.

Marble of *Breſſe* in Italy, is yellow, with ſpots of white.

Brocatella Marble is mingled with little ſhades of Iſabella, yellow, pale, and grey. It comes from Tortoſa in Spain, where it is dug out of an ancient quarry: There is alſo another kind of ancient *Brocatella* dug near Adrianople.

Marble of *Carrara*, on the coaſts of Genoa, is very white, and the fitteſt of all others for works of ſculpture.

Marble of *Champagne*, reſembles the Brocatella, being mixed with blue in round ſtains like partridges eyes.

Cipollino, or *Cipollin* Marble, is of a ſea-green colour, mixed with large waves or clouds of white or pale green.—Scamozzi takes this to be the ſame with that which the ancients called *Auguſtum & Tiberium marmor*; becauſe diſcovered in Egypt in the times of Auguſtus and Tiberius.

Marble of *Dinan*, near Liege, is of a pure black, very beautiful, and very common.

Marble of *Guachenet*, near Dinan, is of a reddiſh brown, with white ſpots and veins.

Marble of *Languedoc*, is of a vivid red, with large white veins or ſtains, and is very common; there is ſome, whoſe white borders pretty much on the blue, but this is of leſs value.

Lumachello Marble, is ſo called, becauſe mingled with ſpots, brown, black, and white, wreathed ſomewhat like periwinkle-ſhells.—This is ancient, and its quarry is loſt.

Marble of *Margoſſa*, in the Milaneze, has a white ground with browniſh veins, reſembling the colour of iron-ruſt. This is very common, and extremely hard.

Marble of *Lavee*, in Maine, has a black ground, with little narrow veins of white; there is another kind of it red, with veins of a dirty white.

Marble of *Namur* is black, like that of Dinan, but leſs beautiful, as inclining a little to the blue, and traverſed with little ſtreaks of grey.—This is very common, and is frequently uſed in paving.

Parian Marble is antique, and much celebrated in authors; it is of a beautiful white: The greateſt part of the Grecian ſtatues were made of it. Varro calls it *Lychnites* becauſe the workmen dug it out of the quarry by lamp-light.

Marble of *Porta Santa*, at Rome called *Serna*, is mingled with large clouds and veins of red, yellow, and grey.

Portor Marble has a black ground, with clouds and veins of yellow. It is dug out of the foot of the Alps towards Carrara.

Marble of *Rance*, in Hainault, is of a dirty red, mixed with blue and white clouds and veins: this is pretty common, but is different in degree of beauty.

Marble of *Savoy*, is a deep red mixed with other colours; each piece whereof ſeems cemented on to the reſt.

Marble of *Sicily*, is a browniſh red, ſtained with oblong ſquares of white and Iſabella, like ſtriped taffaty. The ancient has very vivid colours, and the modern comes pretty near it.

Marble of *Signam*, in the Pyreneans, is ordinarily of a greeniſh brown, with red ſtains; though this is ſomewhat various in its colours.

Marble of *Theu*, near Namur in Liege, is a pure black, ſoft and eaſy to work, and receives a more beautiful poliſh than thoſe of Namur and Dinan.

Marble *Bigio Nero*, or black-grey, is antique.

White veined Marble has large veins, with grey and blue ſtains on a white ground. It comes from Carrara.

White Marble, that dug out of the Pyreneans on the ſide of Bayonne, is inferiour to that of Carrara, its grain being coarſer, and ſhining, like a kind of ſalt. It is ſomething like the ancient white Greek *Marble*, whereof their ſtatues were made, but is not ſo hard or beautiful.

Ancient black and white Marble is now very rare; its quarries being entirely loſt; it is divided between a pure white and a bright black in laminæ.

Blue Turquin Marble is mixed with a dirty kind of white, and comes from the coaſt of Genoa.

Marble *Fior di perſica*, comes from Italy, conſiſts of red and white ſtains, ſomewhat yellowiſh.

Yellow Marble, is a kind of yellow Iſabella without veins; it is antique, and now very rare.

Black Antique Marble is of a pure black, without ſtains, and ſofter than the modern black. There was ſome of it brought from Greece called *Marmor Luculleum*; but this was not ſo much prized as that which the Egyptians brought from Æthiopia, approaching to an iron colour, and called *Baſaltes*, or touch-ſtone, becauſe it ſerved them for the trial of metals. See Basaltes.

White and black Marble, has a pure black ground, with ſome very white veins.

Marble *Occhio di pavone*, or peacock's eye, is mingled with red, white, and bluiſh clouds, ſomewhat reſembling the eyes at the end of a peacock's tail.

Green Marble *antique*, is a mixture of graſs-green, and black, in clouds of unequal forms and bigneſs, and is very rare, the quarries being loſt.

Modern Green Marble, improperly called Egyptian, is brought from Carrara, on the coaſt of Genoa; it is a deep green ſpotted with grey.

Rigid Marble, is that which, being too hard, works with difficulty, and is liable to ſplinter, as the black of Namur.

Fibrous Marble, is that full of threads or filaments.

Brittle Marble, is that which crumbles under the inſtrument, as the white Greek *Marble*, that of the Pyreneans, *&c.*

Terracy Marble, that with ſoft places in it, which muſt be filled up with cement as that of Languedoc.

There are two defects frequent in *Marbles*, which augment the difficulty in cutting and poliſhing them. The one, what they ſometimes call *nails*, anſwering to the knots in wood; the other called *emeril*, is a mixture of copper or other metals, forming black ſtains in the *Marble*. The knots are common to all *Marbles*: the emeril peculiar to the white.

Artificial Marbles.—The ſtucco whereof they make ſtatues, buſts, baſſo-relievos, and other ornaments of architecture, is only *Marble* pulverized, mixed in a certain proportion with plaiſter; the whole well ſifted, worked up with water, and uſed like common plaiſter. See Stucco.

There is alſo a kind of artificial *Marble* made of gypſum, or a tranſparent ſtone reſembling plaiſter; which becomes very hard, receives a tolerable poliſh, and may deceive the eye. See Gypsum.

There is another ſort of artificial *Marble* formed by corroſive tinctures, which penetrating into white *Marble*, to the depth of a line, imitates the various colours of other *Marbles*.

Poliſhed Marble, is that which, being well rubbed with free-ſtone, and afterwards with pumice-ſtone, is at laſt poliſhed with emery, if the *Marble* be of ſeveral colours; and with calcined tin, if it be white. In Italy they poliſh with a piece of lead and emery.

There are various ways of poliſhing *Marble*. Some lay three or four blocks in a row, and with another, fixed to a broad beetle, and an handle fixed at oblique angles, with ſand and water between, work the upper ſtone backwards and forwards on the lower ones, till the ſtrokes of the ax are wore off; after which they poliſh them with emery and putty.

Father Kircher ſhews the manner of applying colours on *Marble*, ſo as to make them penetrate its whole ſubſtance; inſomuch that if the *Marble* be ſlit into ſeveral parallel tables or ſlabs, the ſame figure will be found on each, that was painted on the firſt.

Spots of oil ſtain white *Marble* ſo as they cannot be taken out.

Arundel Marbles, Marmora *Arundeliana*, or the *Oxford* Marbles, are ancient ſtones, whereon is inſcribed a chronicle of the city of Athens, engraven in capital letters in the iſland of Paros one of the Cyclades, 263 years before Jeſus Chriſt.

They take the name from Thomas earl of Arundel, who procured them out of the eaſt, or from Henry his grandſon, who preſented them to the univerſity of Oxford.—An account of all their inſcriptions were publiſhed in 1676, by Dr. Prideaux.

MARBLED, ſomething veined, or clouded, reſembling marble.

Marbled paper, is a paper ſtained with various clouds and ſhades, reſembling, in ſome meaſure, the divers veins of marble; the method of making which, ſee under Paper.

MARBLING, the art or act of painting or diſpoſing colours in ſuch a manner, as that they may repreſent *Marble*.—Thus we *marble* books, paper, wood, *&c.* See Paper.

Marbling *of books*, among binders, denotes the ſprinkling over the cover of a book with black, by means of a black pencil ſtruck gently againſt the finger, or on a ſtick held for that purpoſe.

Marbling is not uſed, except for books bound in calf; after it is finiſhed, the cover is glazed over with beaten whites of eggs, then ſmoothed with a poliſhing iron.

They alſo *marble* books on the edges; but in this *Marbling* there is no black uſed; in lieu thereof red, blue, *&c.* See Book-Binding.

MARCASITE, Marcasita, a ſort of metallic mineral, making, as it were, the ſeed or firſt matter of metals. See Mineral, and Metal.

On this principle, there ſhould be as many different *Marcaſites* as metals, which is true in effect; the name being applied to every mineral body that has metallic particles in its compoſition; though not enough to make it worth working: in which caſe it would be called *ore*. See Ore.

There are only three kinds in the ſhops, *viz.* *Marcaſite* of gold, of ſilver, and of copper: though ſome repute the loadſtone, *Marcaſite* of iron; biſmuth, *Marcaſite* of tin; and zink, or ſpelter, *Marcaſite* of lead: but this we leave to the chymiſts. See Magnet, Bismuth, and Zink.

Marcaſite of gold is in little balls or nodules about the bigneſs of nuts, nearly round, heavy, of a brown colour without. *Marcaſite* of ſilver is like that of gold, only paler coloured; within the colour differs much, the one having a gold colour, and the other a ſilver colour, both ſhining and brilliant. The *Marcaſite* of copper is about the bigneſs of a ſmall apple, round or oblong, brown without, yellow and cryſtaline within, brilliant and ſhining.

Marcaſites are found in mines of metals; they all contain ſulphur and a vitriolic ſalt, eſpecially that of copper: ſome of them alſo contain antimony and biſmuth.

MARCELLIANISM, the doctrine and opinions of the *Marcellians*, a ſect of ancient heretics; ſo called from *Marcellus* of Ancyra, their leader, who was accuſed of reviving the errors of Sabellius. See Sabellians.

Some, however, are of opinion, that *Marcellus* was orthodox, and that it was his enemies the Arians, who fathered their errors upon him.—St. Epiphanius obſerves, that there was a great deal of diſpute with regard to the real tenets of *Marcellus*; but that as to his followers, it is evident they did not own the three hypoſtaſes: ſo that *Marcellianiſm* is no imaginary hereſy.

MARCGRAVE, or Margrave *, a kind of dignity in Germany, anſwering to our marquis. See Marquis.

* The word is derived from the German *Marche*, or *Marcke*, which ſignifies a frontier; and *Graffe*, count, governour; *Marcgraves* being originally governours of cities lying on the frontiers of a country or ſtate. See Frontier.

MARCH, Martius, the third month of the year, according to the common way of computing. See Month, and Year.

Among the Romans, *March* was the firſt month; and in ſome eccleſiaſtical computations, that order is ſtill preſerved; as particularly in reckoning the number of years from the incarnation of our Saviour; that is, from the 25th of *March*.

In England, *March*, properly ſpeaking is the firſt month in order; the new year commencing from the 25th; though in compliance to the cuſtoms of our neighbours, we uſually rank it as the third; but in this reſpect, we ſpeak one way, and write another. See Incarnation.

Till the year 1564, the French reckoned the beginning of their year from Eaſter; ſo that there were two months of *March* in one year, one of which they called *March before Eaſter*, and the other *March after Eaſter*. When *Eaſter* fell within the month of *March*, the beginning of the month was in one year, and the end in another.

It was Romulus who divided the year into months; to the firſt of which he gave the name of his ſuppoſed father *Mars*. Ovid, however, obſerves, that the people of Italy had the month of *March* before Romulus's time; but that they placed it very differently, ſome making it the third, ſome the fourth, ſome the fifth, and others the tenth month of the year.

In this month it was that the Romans ſacrificed to Anna Perenna, that they begun their comitia, that they adjudged their public farms and leaſes; that the miſtreſſes ſerved the ſlaves and ſervants at table, as the maſters did in the Saturnalia; and that the veſtals renewed the ſacred fire.

The month of *March* was always under the protection of Minerva, and always conſiſted of thirty one days.—The ancients held it an unhappy month for marriage, as well as the month of May.

MARCHET, or Marchetta, a pecuniary fine anciently paid by the tenant to his lord, for the marriage of one of the tenant's daughters.

This cuſtom obtained, with ſome difference, throughout all England and Wales, as alſo in Scotland, and ſtill continues to obtain in ſome places.—According to the cuſtom of the mannor of Dinover in Carmarthenſhire, every tenant, at the marriage of his daughter, pays ten ſhillings to the lord; which, in the Britiſh language, is called *Gwabr-Merched*, i. e. *Maid's-Fee*. See Amabyr.

In Scotland, and the north parts of England, the cuſtom was, for the lord to lie the firſt night with the bride of his tenant: but this uſage was abrogated by king Malcolm III. at the inſtance of his queen; and inſtead thereof, a mark was paid by the bridegroom to the lord. Whence it is called *Marcheta mulieris*. See Deflowering.

MARCIONITES, or Marcionists, Marcionistæ, a very ancient and popular ſect of hereticks, who in the time of St. Epiphanius, were ſpread over Italy, Egypt, Paleſtine, Syria, Arabia, Perſia, and other countries; denominated from their author *Marcion*.

Marcion was of Pontus, the ſon of a biſhop, and at firſt made profeſſion of the monaſtical life; but having had a criminal affair with a maid, was excommunicated by his own father, who would never admit him again into the communion of the church, not even on his repentance. On this he abandoned his own country, and retired to Rome, where he began to broach his doctrines.

He laid down two principles, the one good, the other evil; he denied the real birth, incarnation and paſſion of Jeſus Chriſt, and held them all to be apparent only. He taught two Chriſts; one who had been ſent by an unknown God for the ſalvation of all the world; another, whom the creator would one day ſend to re-eſtabliſh the Jews. He denied the reſurrection of the body, and allowed none to be baptized, but thoſe who preſerved their continence; but theſe he granted might be baptized three times.

In many things he followed the ſentiments of the heretic Cerdon, and rejected the law and the prophets. He pretended the goſpel had been corrupted by falſe prophets, and allowed none of the Evangeliſts but St. Luke, whom he altered in many places, as well as the epiſtles of St. Paul, a great many things in which he threw out. In his own copy of St. Luke, he threw out the two firſt chapters entire.

MARCITES, Marcitæ, a ſect of heretics in the ſecond century, who alſo called themſelves the *Perfecti*, and made profeſſion of doing every thing with a great deal of liberty, and without any fear.

This doctrine they borrowed from Simon Magus, who, however, was not their chief; for they were called *Marcites* from one *Marcus*, who conferred the prieſthood, and the adminiſtration of the ſacraments, on women.

MARCOSIANS, an ancient ſect in the church; making a branch of the Gnoſtics. See Gnostic.

St. Irenæus ſpeaks at large of the leader of this ſect, *Marcus*, who, it ſeems was reputed a great magician: He relates ſeveral things touching the prayers and invocation of the ancient Gnoſtics and *Marcoſians*, wherein we find the traces of the ancient Jewiſh cabala on the letters of the alphabet, and their properties, as well as on the myſteries of numbers, which the Jews and Gnoſtics had borrowed from the philoſophy of Plato and Pythagoras.

Marcus was an Egyptian, and there it was he became acquainted with magic: to impoſe more eaſily on his followers, he made uſe of certain Hebrew, or rather Chaldee words, much uſed by the enchanters of thoſe times.

The *Marcoſians* had a great number of apocryphal books, which they held for canonical, and of the ſame authority with ours. Out of theſe they picked ſeveral idle fables, touching the infancy of Jeſus Chriſt, which they put off for true hiſtories. Many of theſe fables are ſtill in uſe and credit among the Greek monks.

MARGARITÆ. See the article Pearls.

MARK, in matters of commerce and manufacture, a certain character ſtruck or impreſſed on various kinds of commodities, either to ſhew the place where they were made, and the perſons who made them; or to witneſs they have been viewed, and examined by the officers or magiſtrates charged with the inſpection of that manufacture; or laſtly, to ſhew the duties impoſed thereon have been regularly acquitted.

Thus are cloths, leathers, cutlery-ware, paper, plate, weights, meaſures, *&c.* to be *marked*.

Mark, in horſemanſhip. See Age.

Mark, is alſo a particular ſign or character known only to the trader who pitches on it; whereby being fixed to any commodity, he recollects the price it coſt him.

Theſe *Marks*, otherwiſe called *numeros*, are taken according to the fancy of thoſe who uſe them; but ordinarily, are choſen from among the letters of the alphabet, each having a relation to ſome particular number of figures.—They are of ſo much uſe in trade, that the reader will not take it amiſs, if we inſert a little table, to ſerve as a model for their conſtruction.

A	B	C	D	E	F	G	H	I	K	L	M
0	1	2	3	4	5	6	7	8	9	10	20

One example will give the whole uſe of this table. Suppoſe, *v. g.* I would put on a piece of ſtuff, that it coſt 37 *s.* 6 *d.* *per* ell. I put an M for 20 *s.* an L for 10 *s.* an H for 7 *s.* and a G for 6 *d.* So that the ſeveral letters wrote after each other (obſerving always to ſeparate ſhillings from pounds and from pence by points) will make this *Mark* M. LH. G. equal to 37 *s.* 6 *d.*

Note, the *Mark* may be diverſified infinitely, by adding other figures to the letters in lieu of theſe.

Letters of MARK. See the article MARQUE.

MARK, in a monaſtic ſenſe.—*Canons of St.* MARK, a congregation of regular canons, founded at Mantua by Albert Spinola, a prieſt, towards the end of the twelfth century. See CANON.

Spinola made a rule for them, which was approved, corrected, and confirmed by ſeveral ſucceeding popes. About the year 1450, they were reformed, and followed only the rule of St. Auguſtin.

This congregation, which at firſt conſiſted of eighteen or twenty houſes of men, and of ſome of women, ſituate in Lombardy and the ſtate of Venice; having flouriſhed for the ſpace of four hundred years, declined by little and little, and was, at length reduced to two convents; and in 1584, that of St. *Mark* at Mantua, which was the chief, was given with the conſent of pope Gregory XIII. to the Camaldulians, and ſo the congregation became extinct. See CAMALDULIAN.

Knights of St. MARK, an order of knighthood in the republick of Venice, under the protection of St. *Mark* the evangeliſt.

The arms of the order are, a lion winged gules, with this device, *Pax tibi, Marce evangeliſta.* This order is never conferred but on thoſe who have done ſignal ſervices to the commonwealth.

MARK, or MARC, alſo denotes a weight uſed in ſeveral ſtates of Europe, and for ſeveral commodities, eſpecially gold and ſilver in France. See WEIGHT.

The *Mark* is divided into eight ounces, or ſixty four drachms, or an hundred and ninety two deniers or penny-weights, or an hundred and ſixty eſterlins, or three hundred mailles, or ſix hundred and forty felins, or four thouſand ſix hundred and eight grains. See OUNCE, DRACHM, *&c.*

In Holland the *Marc* weight is alſo called troy-weight, and is equal to that of France.—When gold and ſilver are ſold by the *Marc*, it is divided into twenty four carats, the carat into eight penny-weights, the penny-weight into twenty four grains, and the grain into twenty four primes. See CARACT.

MARK is alſo uſed among us for money of account; and in ſome other countries for a coin. See MONEY, *&c.*

The Engliſh *Mark* is two thirds of a pound ſterling, or 13 *s.* 4 *d.* and Matthew Paris obſerves, it was of the ſame value in 1194. The ancient Saxons called the *Mark*, *Mancus*, or *Mancuſa*, and *Mearc*; among them it was equivalent to thirty pence, *i. e.* to ſeven ſhillings and ſix-pence of our money.

The *Mark-Lubs*, or *Lubec Mark*, uſed at Hamburgh, is alſo a money of account, equal to one third of the rixdollar, or to the French livre.—Each *Mark* is divided into ſixteen ſols-lubs.

Mark-Lubs, or *danſch*, is alſo a Daniſh coin, equal to ſixteen ſols-lubs, or twenty French ſols.

Laſtly, *Mark* is a copper-coin in Sweden, equal to two pence farthing ſterling; it is divided into eight rouſtiqs, and each rouſtiq into two alleveures. See COIN.

The Swediſh ſilver *Mark* is a money of account, equal to three copper *Marks*; though ſome make it a real coin.

MARKET*, a publick place in a city or town where proviſions are expoſed to ſale. See BUTCHER, and FORUM.

* The word is formed from the French *Marché*, which ſignifies the ſame.

MARKET is alſo uſed for a liberty or privilege either by grant or preſcription, whereby a town is enabled to keep a *Market*.

Bracton obſerves, that one *Market* ought to be diſtant from all others at leaſt ſix miles and a half, and a third of a half.

In former times it was cuſtomary to have moſt fairs and *Markets* kept on ſundays, and in the church-yard; ſo that matters of buſineſs and devotion were tranſacted under one. Which cuſtom, though prohibited by ſeveral kings, was yet held up till the reign of king Henry the ſixth, when it was effectually ſuppreſſed.—In many places they are ſtill kept in the church-yard.

MARLE*, MARGA, a kind of dry, ſoft, foſſile earth, harſh to the touch; uſed to be caſt on land, to make it more fruitful. See MANURING.

* The word comes from the ancient Celtic *Marga*, mentioned by Pliny: it was afterwards called *Margila*.

There are ſeveral ſorts of *Marle*, of different colours, and qualities; the principal are *white* and *red*. Too much *Marle* thrown on the earth, is found to burn it. *Marle* is alſo of uſe in making lime, and is burnt like other ſtone. See LIME.

MARMALADE, a confection made of the juice or pulp of ſome fruit, as plumbs, apricocks, quinces, *&c.* boiled with ſugar into a conſiſtence See CONFECTION.

The *Marmadale* of quinces is ſub-aſtringent, and grateful to the ſtomach.

MARONITES, a ſect of eaſtern Chriſtians, who follow the Syrian rite, and are ſubject to the pope; their principal habitation being on mount Libanus.

The learned are divided about their origin and founder. Morin and cardinal Bona take *Maronite* for the name of a ſect, as well as Neſtorian and Jacobite. But the *Maronites* themſelves pretend, they are deſcended from one *Maron*, who lived in the beginning of the fifth century, and whoſe life is written by Theodoret. And the Jeſuit Sacchini is of the ſame opinion: he thinks, that they never ſeparated from the catholic church; and adds, that what has given occaſion to their being judged in a ſchiſm, is their re-union with the Romiſh church, which ſome take for a return to the catholic faith.

The former opinion is founded on the teſtimonies of Eutychius, James de Vitri, and ſeveral others, who expreſly aſſert the *Maronites* to have been formerly a part of the Monothelite Jacobites: According to their account, *Maron*, whom the *Maronites* qualify a ſaint, was in truth a heretic. Towards the year 1182, Aimeri, third Latin patriarch of Antioch, united the *Maronites* to that church. From that time they have uſed the mitre, ring, croſier, and other of the Latin epiſcopalia; but their ſervice is ſtill performed in the Chaldee language.

Fauſtus Nairon, a *Maronite* ſettled at Rome, has publiſhed an apology for *Maron* and the reſt of his nation. His tenet is, that they really took their name from the *Maron* who lived about the year 400, and whereof mention is made in Chryſoſtom, Theodoret, and the Menologium of the Greeks. He adds, that the diſciples of this *Maron* ſpread themſelves throughout all Syria; that they built ſeveral monaſteries, and among others, one that bore the name of their leader; that all the Syrians who were not tainted with hereſy, took refuge among them: and that, for this reaſon, the heretics of thoſe times called them *Maronites*.

The *Maronites* have a patriarch who reſides in the monaſtery of Cannubin on mount Libanus, and aſſumes the title of patriarch of Antioch He is elected by the clergy and the people, according to the ancient cuſtom; but ſince their re-union with the church of Rome, he is obliged to have a bull of confirmation from the pope.—He keeps a perpetual celibate, as well as the reſt of the biſhops his ſuffragans: For the reſt of the eccleſiaſtics, they are allowed to marry before ordination; and yet the monaſtic life is in great eſteem among them.—Their monks are of the order of St. Anthony, and live in the moſt obſcure places in mountains, far from the commerce of the world.

As to their faith, they agree in the main with the reſt of the eaſtern church. Their prieſts do not ſay maſs ſingly; but all ſay it together, ſtanding round the altar. They communicate in unleavened bread; and the laity have hitherto partook in both kinds, though the practice of communicating in one has of late been getting footing, introduced by little and little—In Lent they eat nothing, unleſs it be two or three hours before ſun-riſing: Their other faſtings are very numerous. See LENT, and FAST.

MAROTIC *Style*, in the French poetry, denotes a peculiarly gay, pleaſant, yet ſimple and natural manner of writing, introduced by Clement Marot, and ſince imitated by other authors, but with moſt ſucceſs by Voiture, and De la Fontaine.

The difference between the *Marotic* and the burleſque ſtyle is thus aſſigned: The *Marotic* makes a choice, the burleſque admits of all. The firſt is the moſt ſimple, but its ſimplicity has its nobleneſs; and where its own age will not furniſh natural expreſſions, it borrows them from former times.—The latter is low and groveling, and borrows falſe and fulſome ornaments from the croud, which people of taſte deſpiſe. The one reſigns itſelf to nature, but examines firſt of all whether the objects ſhe preſents be fit for its paintings, and takes nothing but what carries with it ſomewhat of delicacy and mirth; the other runs headlong into buffoonery, and affects every thing that is extravagant and groteſque. See BURLESQUE.

MARQUE.—*Letters of* MARQUE*, are letters of repriſal, granted by a king or parliament, whereby the ſubjects of one country are licenſed to make repriſals on thoſe of another; by reaſon application has been made for redreſs to the government whereto the aggreſſor belongs, three times without effect. See LAW, and LETTER.

* They are ſo called from the German *Marcke*, limit, frontier; as being *jus conceſſum in alterius principis marchas ſeu limites tranſeundi, ſibique jus faciendi*; as being a right of paſſing the limits or frontiers of another prince, and doing one's ſelf juſtice. See REPRISALS.

MARQUETRY, *In-laid work*; a curious kind of work compoſed of pieces of hard fine wood of different colours, faſtened, in thin ſlices, on a ground, and ſometimes enriched with other matters, as tortoiſe-ſhell, ivory, tin, and braſs.

There is another kind of *Marquetry* made inſtead of wood, of glaſſes of various colours; and a third, where nothing but precious ſtones, and the richeſt marbles, are uſed: but theſe are more properly called *Moſaic* work. See MOSAIC.

The art of inlaying is very ancient, and is ſuppoſed to have paſſed from the eaſt to the weſt, as one of the ſpoils brought by the Romans from Aſia. Indeed it was then but a ſimple thing; nor did it arrive at any tolerable perfection, till the fifteenth century, among the Italians: it ſeems however to have arrived at its height in the ſeventeenth century, among the French.

Till John of Verona, a cotemporary with Raphael, the fineſt works of this kind were only black and white, which are what we now call *Moreſco's*; but that religious, who had a genius for painting, ſtained his woods with dyes or boiled oils, which penetrated them. But he went no further, than the repreſenting buildings and perſpectives, which require no great variety of colours. Thoſe who ſucceeded him, not only improved on the invention of dying the woods, by a ſecret which they found of burning them without conſuming, which ſerved exceedingly well for the ſhadows; but had alſo the advantage of a number of fine new woods of naturally bright colours, by the diſcovery of America.—With theſe aſſiſtances the art is now capable of imitating any thing; whence ſome call it the *art of painting in wood*. See PAINTING.

The ground whereon the pieces are to be ranged and glued, is ordinarily of oak or fir well dried; and to prevent warping, is compoſed of ſeveral pieces glued together. The wood to be uſed being reduced into leaves, of the thickneſs of a line, is either ſtained with ſome colour, or made black for ſhadow; which ſome effect by putting it in ſand extremely heated over the fire, others by ſteeping it in lime-water and ſublimate, and others in oil of ſulphur.—Thus coloured, the contours of the pieces are formed, according to the parts of the deſign they are to repreſent.

The laſt is the moſt difficult part of *Marquetry*, and that wherein moſt patience and attention are required. The two chief inſtruments uſed herein, are the ſaw and the vice; the one, to hold the matters to be formed; the other, to take off from the extremes, according to occaſion.—The vice is of wood, having one of its chaps fixed, the other moveable, and is opened and ſhut by the foot, by means of a cord faſtened to a treadle. Its ſtructure is very ingenious, yet ſimple enough, and will be eaſily conceived from the figure. *Tab. Miſcellany*, *fig.* 1. The leaves to be formed (for there are frequently three or four of the ſame kind formed together) are put within the chaps of the vice, after being glued on the outermoſt part of the deſign whoſe profile they are to follow; then the workman preſſing the treadle, and thus holding faſt the piece, with his ſaw runs over all the out-lines of the deſign.—By thus joining and forming three or four pieces together, they not only gain time, but the matter is likewiſe the better enabled to ſuſtain the effort of the ſaw; which, how delicate ſoever it may be, and how lightly ſoever the workman may conduct it, without ſuch a precaution, would be apt to raiſe ſplinters, to the ruin of the beauty of the work.

When the work is to conſiſt of one ſingle kind of wood, or of tortoiſe-ſhell, on a copper or tin ground, or *vice verſa*; they only form two leaves on one another, *i. e.* a leaf of metal, and a leaf of wood or ſhell: This they call ſawing in counterparts; for by filling the vacuities of one of the leaves by the pieces coming out of the other, the metal may ſerve as a ground to the wood, and the wood to the metal.

All the pieces thus formed with the ſaw, and marked, to know them again, and the ſhadow given in the manner already mentioned; they vaneer or faſten each in its place on the common ground; uſing for that purpoſe the beſt Engliſh glue.

The whole is put in a preſs to dry, planed over, and poliſhed with the ſkin of the ſea-dog, wax, and ſhave-graſs, as in ſimple *Vaneering*; with this difference, however, that in *Marquetry* the fine branches, and ſeveral of the more delicate parts of the figures, are touched up and finiſhed with a graver. See VENEERING.

It is the cabinet-makers, joiners, and toy-men among us, who work in *Marquetry*; it is the enamellers and ſtone-cutters, who deal in Moſaic work: The inſtruments uſed in the former are moſtly the ſame with thoſe uſed by the eboniſts. See EBONY, ſee alſo MOSAIC.

MARQUIS, or MARQUESS *, MARCHIO, a title given to a perſon in poſſeſſion of a conſiderable demeſne erected into a *Marquiſate* by letters patent; holding a middle place between the dignity of a duke, and that of an earl or count. See NOBILITY, PEER, &c.

Marqueſſes were anciently governors of frontier cities or provinces, called *Marches*.—In Germany they are called *Marcgraves*. See MARCGRAVE.

Marquis is originally a French title; the Romans were unacquainted with it: In the Notitia Imperii they are called *Comites limitanei*. The firſt time we hear of *Marquiſſes*, *Marchiones*, is under Charlemaign, who created governors in Gaſcony under this denomination.

Alciat has ſtarted a queſtion, Whether a *Marquis* or count ſhould have the precedence? To decide it, he goes back to the ancient function of counts, and obſerves, that counts who are governors of provinces, are above *Marqueſſes* who are only governors of frontiers; and that *Marqueſſes* who are governors of frontier-cities, are above counts who are governors of ſmall towns. He adds, that in conſequence of this diſtinction, the book of fiefs ſometimes places *Marqueſſes* above counts, and ſometimes counts above *Marqueſſes*.

Froiſſart obſerves, that the *Marquiſate* of Juliers was erected into a county: But now-a-days, neither *Marqueſſes* nor counts are any longer governors; and as they are mere titles of honour, the counts make no ſcruple of reſigning the precedency.

King Richard the ſecond was the firſt who introduced the dignity of *Marquis* among us; by creating Robert de Vere earl of Oxford, *Marqueſs* of Dublin: But this was a title without office; the frontiers being governed by lords marchers. See COUNT, DUKE, &c.

MARRIAGE, a civil and religious contract, whereby a man is joined and united to a woman, for the ends of procreation.

The eſſence of *Marriage* conſiſts in the mutual conſent of the parties. *Marriage* is part of the law of nations, and is in uſe among all people. The Romaniſts account it a ſacrament.

The woman, with all her moveable goods, immediately upon *Marriage*, paſſes wholly *in poteſtatem viri*, into the power and diſpoſal of the huſband. See WIFE, AFFINITY, DEGREE, &c.

In Germany they have a kind of *Marriage* called *morganatic*, wherein a man of quality contracting with a woman of inferiour rank, he gives her the left hand in lieu of the right, and ſtipulates in the contract, that the wife ſhall continue in her former rank or condition, and that the children born of them ſhall be of the ſame; ſo that they become baſtards as to matters of inheritance, though legitimate in effect: They cannot bear the name, or arms of the family.

None but princes, and great lords of Germany, are allowed this kind of *Marriage*.—The univerſities of Leipſic and Jena have declared againſt the validity of ſuch contracts; maintaining, that they cannot prejudice the children, eſpecially when the emperor's conſent intervenes in the *Marriage*.

The Turks have three kinds of *Marriages*, and three ſorts of wives; *legitimate*, *wives in kebin*, and *ſlaves*. They marry the firſt, hire the ſecond, and buy the third. See CONCUBINE, and CONCUBINAGE.

The Roman laws ſpeak of ſecond *Marriages* in very hard and odious terms. *Matre jam ſecundis nuptiis funeſtata*, l. 3. C. de ſec. nuptiis. By theſe laws it was enacted, that the effects of the huſband or wife deceaſed ſhould paſs over to the children, if the ſurvivor ſhould *marry* a ſecond time. By the law *Huc edictali*, Cod. de ſec. nupt. the ſurvivor, upon *marrying* a ſecond time, could not give the perſon he *married*, a portion more than equal to that of each of the children. In the primitive church, the reſpect to chaſtity was carried ſo high, that a ſecond *Marriage* was accounted no other than a lawful whoredom, or a ſpecies of bigamy. There are ſome ancient canons which forbid the eccleſiaſtics from being preſent at ſecond *Marriages*. See BIGAMY.

For the proportions which *Marriages* bear to births, aud births to burials, in ſeveral parts of *Europe*, Mr. Derham gives us the following table.

Names of Places.	*Marriages to Births, as*	*Births to Burials, as*
England in general	1 to 4.63	1.12 to 1
London	1 to 4.	1 to 1.1
Hantſhire, from 1569 to 1658	1 to 4.	1.2 to 1
Tiverton in Devon. from 1656 to 1664	1 to 3.7	1.26 to 1
Cranbrook in Kent, 1560 to 1649	1 to 3.9	1.6 to 1
Aynho in Northamp. for 118 years	1 to 6.	1.6 to 1
Upminſter in Eſſex, for 100 years	1 to 4.6	1.8 to 1
Frankfort on the Maine in 1695	1 to 3.7	1.2 to 1
Old, Middle, and Lower Marck, in 1698	1 to 3.7	1.9 to 1
Dominions of Elect. of Branden. 1698	1 to 3.7	1.5 to 1
Breſlaw in Sileſia, from 1687 to 1691		1.6 to 1
Paris in 1670, 1671, 1672.	1 to 4.7	1.6 to 1

---

* The word, according to ſome authors, comes from the *Marcomanni*, an ancient people who inhabited the marches of Brandenbourg: Others derive it from the German *Marcke*, limit; and others from *Marciſia*, which in the Celtic language ſignified a wing of cavalry: Nicod derives it from the corrupt Greek νομαρχια, province: Alciat and Fauchet bring it from *Mark*, horſe, taking a *Marquis* to be properly an officer of horſe: Menage derives it from *Marca*, frontier; and Selden, Krantzius, and Hottoman do the ſame: Laſtly, Paſquier fetches *Marquis* from the old French *Marcke*, limit, or from *marchir*, to confine; the guard of the frontiers being committed to them.

From which table it appears, that *Marriages*, one with another, do each produce about four births, both in England and other parts of Europe. And by Mr. King's computation, about one in a hundred and four perſons *marry*; the number of people in England being eſtimated at five millions and a half, whereof about forty-one thouſand annually *marry*.

Major Graunt and Mr. King diſagree in the proportions between males and females, the latter making ten males to thirteen females in London; in other cities and towns, and in the villages and hamlets, a hundred males to ninety-nine females. But major Graunt, both from the London and country bills, computes that there are in England fourteen males to thirteen females; whence he juſtly infers, that the Chriſtian religion, prohibiting polygamy, is more agreeable to the law of nature than Mahometaniſm, and others that allow it. See POLYGAMY.

This proportion of males to females Mr. *Derham* thinks pretty juſt, being agreeable to what he had obſerved himſelf.—In the hundred years, for inſtance, of his own pariſh regiſter of Upminſter, though the burials of males and females were nearly equal, being ſix hundred and thirty-three males, and ſix hundred and twenty-three females in all that time; yet there were baptized ſeven hundred and nine males, and but ſix hundred and ſeventy-five females, which is 13 females to 13.7 males. From which inequality it appears, that one man ought to have but one wife, and yet that every woman, without polygamy, may have a huſband; this ſurpluſage of males above females being ſpent in the ſupplies of war, the ſeas, &c. from which the women are exempt.

That this is a work of providence, and not of chance, is well made out by the very laws of chance, by Dr. Arbuthnot: who ſuppoſes Thomas to lay againſt John, that for eighty-two years running, more males ſhall be born than females; and giving all allowances in the computation to Thomas's ſide, he makes the odds againſt Thomas, that it does not ſo happen, to be near five millions of millions of millions of millions to one; but for ages of ages, according to the world's age, to be near an infinite number to one.

MARRIAGE, MARITAGIUM, in law, ſignifies not only the lawful joining of man and wife, but alſo the right of beſtowing a ward, or a widow in *Marriage*; as well as the land given in *Marriage*. See WARD, and WIDOW.

Duty of MARRIAGE, is a term uſed in ſome ancient cuſtoms, ſignifying an obligation on women to *marry*.

To underſtand this, it muſt be obſerved, that old maids, and widows about ſixty, who held fees in body, or were charged with any perſonal or military ſervices, were anciently obliged to *marry*, to render thoſe ſervices to the lord by their huſbands; or to indemnify the lord, for what they could not do in perſon.—And this was called *Duty* or *Service of Marriage*.

MARROQUIN, vulgarly MOROCCO-*Leather*. See MOROCCO.

MARROW, a ſoft oleaginous ſubſtance contained in the cavities of the bones. See BONE.

All the bones of the body, which have any conſiderable thickneſs, have either a large cavity, or are ſpongeous, and full of little cells; in both the one and the other, is an oleaginous ſubſtance, called *Marrow*, contained in proper veſicles or membranes, which open into one another.

In the larger bones, this fine oil, by the gentle heat of the body, is exhaled through the pores of its ſmall bladders, and enters ſome narrow paſſages, which lead to certain fine canals excavated in the ſubſtance of the bone, according to its length; and from theſe, other croſs paſſages (not directly oppoſite to the former, leſt they ſhould weaken the bone too much in one place) carry the *Marrow* ſtill farther into more longitudinal canals placed nearer the ſurface of the bone: All this contrivance is, that the *Marrow* may ſupple the fibres of the bones, and render them leſs apt to break.

The ancients imagined, that *Marrow* ſerved for nouriſhment to the bones: but later obſervations have found blood-veſſels in the bones; ſo that it appears the bones are nouriſhed in the ſame manner as the other parts of the body. Beſides, we find many bones which grow, and yet have no *Marrow* in them; witneſs the horns of the deer, lobſters claws, &c. See MEDULLA.

MARS, in aſtronomy, one of the five planets, and of the three ſuperior ones; its place being between the Sun and Jupiter. See PLANET, and SYSTEM.

Its character is ♂. Its mean diſtance from the ſun is 1524 of thoſe parts, whereof the diſtance of the ſun from the earth is 1000. Its excentricity 141. The inclination of its orbit, that is, the angle formed by the plane of its orbit with the plane of the ecliptic, 1 degree 52 minutes. The periodical time, in which it makes its revolution round the ſun, 686 days, 23 hours. Its revolution about its own axis, is performed in 24 hours, 40 minutes.

For the diameter of *Mars*, ſee DIAMETER, and SEMI-DIAMETER.—For its denſity, ſee DENSITY.—For the force of gravity on its ſurface, ſee GRAVITY.

Its parallax, according to Dr. Hook and Mr. Flamſtead, is ſcarce 30 ſeconds. See PARALLAX.

In the acronical riſing of this planet, that is, when it is in oppoſition to the ſun, it is found twice as near the earth as the ſun; which is a phænomenon that has extremely diſcredited the Ptolemaic hypotheſis. See ACRONICAL.

Dr. Hook, in 1665, obſerved ſeveral ſpots in *Mars*, which having a motion, he concluded the planet to turn round its centre. In 1666, M. Caſſini obſerved ſeveral ſpots in the two faces or hemiſpheres of *Mars*, which, by continuing his different obſervations very diligently, he found to move by little and little from eaſt to weſt, and to return in the ſpace of 24 hours 40 minutes to their former ſituation.—Whence both the motion and period, or natural day of that planet, was determined. See MACULÆ, and SPOTS.

Mars always appears with a ruddy, troubled light; whence we conclude it is encompaſſed with a thick, cloudy atmoſphere, which, by diſturbing the rays of light in their paſſage and repaſſage through it, occaſion that appearance.

Mars having his light from the ſun, and revolving round it, has an increaſe and decreaſe like the moon. It may alſo be obſerved, almoſt biſſected, when in its quadratures with the ſun, or in his perigæon, but never corniculated or falcated, as the inferior planets. See PHASES.

This planet's diſtance from the ſun, is to the diſtance of the earth and ſun, as $1\frac{1}{2}$ to 1. So that a man placed in *Mars*, would ſee the ſun's diameter leſs by one third than it appears to us, and conſequently the degree of light and heat, which *Mars* receives from the ſun, is leſs by one third than that received by the earth.—This proportion, however, will admit of a ſenſible variation, on account of the great excentricity of this planet.

Though the period or year of this planet, as has been already obſerved, is nearly twice as long as ours, and his natural day, or the time in which the ſun appears above his horizon (ſetting aſide the conſideration of twilight) is almoſt every where equal to his night; yet it appears, that in one and the ſame place on his ſurface, there will be but very little variety of ſeaſons, ſcarce any difference of ſummer and winter. And the reaſon is, that the axis of his diurnal rotation is nearly at right angles with the plane of his orbit. It will be found notwithſtanding, that places ſituate in different latitudes, that is, at different diſtances from his equator, will have very different degrees of heat, on account of the different inclination of the ſun's rays to the horizon; as it is with us, when the ſun is in the equinoxes.

From this conſideration, Dr. Gregory endeavours to account for the appearance of the Faſciæ in *Mars*; which are certain ſwathes or fillets ſeen in this planet, and poſited parallel to his equator. For, as among us, the ſame climate has at different ſeaſons very unequal degrees of heat; but in *Mars* it is otherwiſe, the ſame parallel having always a pretty equable degree of heat: it follows, that theſe ſpots may probably be formed in *Mars*, or his atmoſphere, as ſnow and clouds are in ours; *viz.* by the conſtant different intenſions of heat and cold in the different parallels; and ſo come to be extended in circles or belts parallel to his equator, or the circle of his diurnal revolution. And this ſame principle may, perhaps, ſolve the phænomenon of Jupiter's belts; that planet, like *Mars*, having a perpetual equinox. See JUPITER.

Beſides the ruddy colour of *Mars*, we have another argument of his being incompaſſed with an atmoſphere, and it is this; that when any of the fixed ſtars are ſeen near his body, they appear extremely obſcured, and almoſt extinct. If this be the caſe, an eye placed in *Mars* would ſcarce ever ſee Mercury, unleſs perhaps in the ſun at the time of conjunction, when Mercury paſſes over his diſk, as he ſometimes appears to us in form of a ſpot. A ſpectator in *Mars* will ſee Venus about the ſame diſtance from the ſun as Mercury appears to us; and the earth about the ſame diſtance from the ſun, that to us Venus appears. And when the earth is found in conjunction with, and very near the ſun, he will ſee in *Mars* what Caſſini ſaw on the earth, *viz.* the earth appear horned or falcated, and its attendant the moon of the ſame figure, and at its utmoſt diſtance from the earth, not above 15 minutes of a degree.

MARS, among chymiſts, ſignifies iron; becauſe imagined under the influence of that planet. See IRON.

Phyſical writers hold iron preferable for all medicinal purpoſes to ſteel, which is only a more hardened, compact iron, made ſo by art; whereby it is rendered more unfit to yield thoſe principles or parts in preparation, which the phyſician requires to be drawn out. See STEEL, and CHALYBEAT.

Crocus MARTIS, ruſt of iron. See CROCUS *Martis*.

Cryſtals of MARS. See the article CRYSTAL.

Tree of MARS, *arbor Martis*. See ARBOR.

Games of MARS, were combats inſtituted at Rome in honour of the god *Mars*.

They were held twice in the year; once in the Circus, on the 4th of the ides of May; and a ſecond time on the 1ſt of Auguſt. Theſe latter were eſtabliſhed ſome time after the other; in memory of the dedication of the temple of *Mars* on that day. Theſe games conſiſted in courſes of horſes, and combats with wild beaſts. Germanicus is ſaid to have killed two hundred lions in the Circus on theſe occaſions. See FIELD *of Mars*.

MARSHAL *, or MARESCHAL, MARESCALLUS, primarily denotes an officer who has the care, or the command of horſes.

* Nicod derives the word from *Polemarchus*, maſter of the camp: Matthew Paris from *Martis Seneſchallus*. In the old Gauliſh language, *March* ſignified horſe, whence *Marechal* might ſignify him who commanded the cavalry. Spelman, Skinner, and Menage derive it from the German *Maer*, *Marre*, a mare, or even a horſe, and *Schalk*, ſervant: which makes ſome imagine, the title was firſt given to farriers, or thoſe who ſhoed and bled horſes; and that in ſucceſſion of time, it paſſed to thoſe who commanded them. Paſquier makes four ſeveral deriativons for the four ſeveral kinds of *Marſhals* in uſe among the French, *viz.* *Marſhals* of France, *Marſhals de camp*, *Marſhals de logis* or quarter-maſters, and farriers, who are called by the name of *Marſhals*. The third he derives from *Marche* or *Marchir*, to mark, limit; and the laſt from *Maire*, maſter, and *Chal*, horſe.

Earl-MARSHAL *of England*, one of the great officers of the crown, who takes cognizance of all matters touching honour and arms, determines contracts relating to deeds of arms out of the realm upon land, and matters concerning war within the realm, which cannot be determined by common law, in which he uſually proceeds according to the civil law. This office is hereditary, having been for many ages in the houſe of Norfolk. It is diſcharged by deputy on account of the religion of the duke of Norfolk, hereditary *Earl-Marſhal*, which renders him incapable of adminiſtrating it in perſon. See EARL.

The *Earl-Marſhal* had anciently ſeveral courts under him, but hath now only the *Marſhalſea*, where he may ſit in judgment againſt criminals offending within the verge of the court.

Knight-MARSHAL, or MARSHAL *of the king's houſe*, is an officer whoſe buſineſs, according to Fleta, is to execute the commands and decrees of the lord-ſteward, and to have the cuſtody of priſoners committed by the court of verge.—Under him are ſix *Marſhal's* men, who are properly the king's bayliffs, and arreſt in the verge of the court, when a warrant is backed by the board of green-cloth. The court where cauſes of this kind, between man and man, are tried, is called the *Marſhalſea*, and is under the *Knight-Marſhal*. See KNIGHT.

There are ſome other inferior officers of this name; as

MARSHAL of the juſtices in eyre;

MARSHAL of the king's bench, who has cuſtody of the priſon called the *king's bench*, in Southwark.

In Fleta mention is alſo made of a *Marſhal of the exchequer*; to whom the court commits the cuſtody of the king's debtors, &c.

MARSHAL, or MARESCHAL, of France, is the higheſt dignity, or preferment in the French armies. The dignity of *Marſhal* is now for life, though at its firſt inſtitution it was otherwiſe. They were then only the king's firſt ecuyers under the conſtable, but in time they became the conſtable's lieutenants in the command of the army, the conſtable himſelf being then become captain-general. At firſt they were but two in number, and their allowance was but 500 livres *per annum* in time of war, and nothing in time of peace. In the reign of Francis the firſt, their number was increaſed to five; ſince him it has been various: the late king increaſed it at pleaſure; and it is now eleven. Their office at firſt was to *marſhal* the army under the conſtable, and to command in his abſence.

They did then what the *Marſhals de camp* do now; to which laſt they have given their title, and the leaſt conſiderable part of their authority.

The firſt *Marſhal* does the office of conſtable in an aſſembly of the *Marſhals*.

Arch-MARSHAL.	See the Article	ARCH.
Clerk-MARSHAL.		CLERK.
Provoſt-MARSHAL.		PROVOST.

MARSHALLING, a coat, in heraldry, ſignifies the due and proper joining of ſeveral coats of arms belonging to diſtinct families in one and the ſame ſhield or eſcutcheon; together with their ornaments, parts, and appurtenances. See ARMS.

MART.—Letters of MART. See LETTERS.

MARTIAL, is ſometimes uſed to expreſs preparation of iron, or ſuch as are impregnated therewith; as the *Martial* regulus of antimony, &c. See IRON, REGULUS, and ANTIMONY.

MARTIALE *Bezoardicum*. See BEZOARDICUM.

MARTIAL *Law*, is the law of war, depending upon the arbitrary but juſt power and pleaſure of the king or his lieutenants. The king, though in times of peace he make no laws, but by common conſent in parliament; yet in war he uſes abſolute power over the ſoldiery:—though even this power hath been veſted of late years in the king, or his generals of the army, by act of parliament, and under particular reſtrictions too. See LAW.

MARTII *Campus*. See the articles CAMPUS, and FIELD.

MARTINGALE, a thong of leather faſtened at one end to the girths under the belly of a horſe, and at the other end to the noſeband, to hinder him from rearing, or toſſing up his head.

MARTINS,—*St.* MARTIN's *cope*. See COPE.

MARTLET, in heraldry, a little bird repreſented without feet, and properly alſo without beak.

It is uſed as a difference or mark of diſtinction of a younger brother; ſome ſay, more peculiarly of the fourth brother, of family. See DIFFERENCE.

MARTYR *, a perſon who ſuffers torments, and even death, in defence of the truth of the goſpel.

* The word is Greek, μαρτυρ, and properly ſignifies a witneſs. It is applied, by way of eminence, to thoſe who ſuffer in witneſs of the truth of the goſpel.

Anciently thoſe who were baniſhed for the faith, were called *Martyrs*, as well as thoſe who periſhed in the holy wars. In the time of St. Auguſtin, the title of *Martyr* was given to confeſſors, or thoſe who were tortured for the faith without loſing their lives.—It is Tertullian's thought, in his apologetic; *Plures efficimur, quoties metimur*; *ſemen eſt ſanguis chriſtianus.* St. Stephen is called the *Proto-Martyr*, or firſt *Martyr*.—Nineteen thouſand ſeven hundred are computed to have ſuffered *Martyrdom* with St. Irenæus at Lions, under the empire of Severus. Six thouſand ſix hundred and ſixty ſix ſoldiers of the Theban legion are ſaid to have been *martyred* in Gaul. Father Papebroch reckons ſixteen thouſand Abyſſinian *Martyrs*, and an hundred and fifty thouſand others under Diocletian alone.

Mr. Dodwell endeavours to prove, in a diſſertation expreſs, that the number of *Martyrs* who ſuffered under the Roman emperors, was very moderate; alledging, that thoſe we have accounts of in the fathers, come within a very ſmall compaſs; and that, excepting Nero and Domitian, the reſt of the emperors made ſcarce any.— F. Ruinart, on the contrary, endeavours to prove, that the catalogue of *Martyrs* is not at all ſwelled; that the carnage was immenſe under the firſt emperors, and eſpecially in that of Diocletian.—F. Papebroch, in his *Acta ſanctorum*, makes the number of *Martyrs* infinite.

Scarce any faith or religion but pretends to its *Martyrs*. Mahometans, heathens, idolaters, &c. See SAINTS.

In the ancient church, the acts, ſufferings, and deaths of the *Martyrs* were preſerved with a world of care; and yet, maugre all this diligence, we have but very little left of them. Euſebius indeed compoſed a martyrology, but it never reached down to us; and thoſe ſince compiled, are extremely ſuſpected. See MARTYROLOGY.

Æra of MARTYRS, is an æra followed in Egypt, and Abyſſinia; and which even the Mahometans, ſince their becoming maſters of Egypt, frequently obſerve. It is fixed to the beginning of the perſecution of Diocletian, *A. D.* 302 or 303.

The æra of *Martyrs* is alſo called the æra of Diocletian. See EPOCHA.

MARTYROLOGY *, a regiſter or catalogue of martyrs. See MARTYR.

* The word comes from the Greek μαρτυρ, witneſs, and λεγω, *dico*, I ſpeak, or λεγω, *colligo*, I gather.

A *Martyrology*, properly ſpeaking, ſhould contain no more than the name, place, and day of martyrdom of each ſaint; but the term is frequently extended to the hiſtories of martyrs. The cuſtom of collecting *Martyrologies*, is borrowed from the heathens, who inſerted the names of their heroes into their *Faſti*, to preſerve to poſterity the memory and example of their noble actions. Baronius gives pope Clement the credit of being the firſt who introduced the cuſtom of collecting the acts of the martyrs. See ACTS.

The *Martyrology* of Euſebius of Cæſarea was the moſt celebrated in the ancient church; it was tranſlated into Latin by St. Jerom: but the learned agree, that it is not now extant.—That attributed to Beda in the eighth century, is of very doubtful authority; the names of ſeveral ſaints being there found, who did not live till after the time of Beda.—The ninth century was very fertile in *Martyrologies*. Then appeared that of Florus, ſub-deacon of the church at Lions, who, however, only filled up the chaſms in Beda. This was publiſhed about the year 830; and was followed by that of Waldenbertus, monk of the dioceſe of Treves, written in verſe about the year 848: That of Uſuard, a French monk, and wrote by command of Charles the Bald, in 875; which laſt is the *Martyrology* now ordinarily uſed in the Romiſh church: That of Rabanus Maurus, which is an improvement on Beda and Florus, written about the year 845: That of Notker, monk of St. Gal, written about the year 894.

The *Martyrology* of Ado, monk of Ferrieres in the dioceſe of Treves, afterwards archbiſhop of Vienne, is a deſcendant of the *Roman*, if we may ſo call it; for Du Sollier gives its genealogy thus: The *Martyrology* of St. Jerom is the great Roman *Martyrology*; from this was made the little Roman, printed by Roſweyd. Of this little Roman *Martyrology*, was that of Beda, augmented by Florus; Ado compiled his in the year 858. The *Martyrology* of Nevelon, monk of Corbie, written about the year 1089, is little more than an abridgment of that of Ado. Father Kircher makes mention of a Coptic *Martyrology*, preſerved by the Maronites at Rome.

We have alſo ſeveral proteſtant *Martyrologies*, containing the ſufferings of the reformed under the papiſts; *viz.* an Engliſh *Martyrology*, by J. Fox; with others by Clark, Bray, &c.

MARTYROLOGY, is alſo uſed in the Romiſh church for a roll or regiſter kept in the veſtry of each church, containing the names of all the ſaints and martyrs, both of the univerſal church, and of the particular ones of that city, or monaſtery.

MARTYROLOGY, is alſo applied to the painted or written catalogues in churches, containing the foundations, obits, prayers, and maſſes, to be ſaid each day.

MARY.—*Knights of St.* MARY, is a name by which ſeveral orders of knighthood are diſtinguiſhed.—As, *St. Mary of the thiſtle.* See THISTLE. *St. Mary of the conception.* See CONCEPTION. *St. Mary of the elephant.* See ELEPHANT. *St. Mary and Jeſus. St. Mary of Loretto. St. Mary of mount Carmel.* See CARMEL. *St. Mary of the Teutonics.* See TEUTONIC, *&c.*

MASBOTHÆI *, or MESBOTHÆI, the name of a ſect, or rather of two ſects; for Euſebius, or rather Hegeſippus, whom he cites, makes mention of two different ſects of *Masbothæans.* The firſt are one of the ſeven ſects that aroſe out of Judaiſm, and proved very troubleſome to the church: The others were one of the ſeven Jewiſh ſects before the coming of Jeſus Chriſt.

* The word is derived from the Hebrew שבת *Schabat*, to reſt, or repoſe, and ſignifies idle, eaſy, indolent people. Euſebius ſpeaks of them, as if they had been ſo called from one *Maſbotheus*, their chief; but it is much more probable, that their name is Hebrew, or at leaſt Chaldaic, ſignifying the ſame thing with a Sabbatarian in our language, that is, one who makes profeſſion of keeping ſabbath.

Valeſius will not allow the two ſects to be confounded together: the laſt being a ſect of Jews before, or at leaſt cotemporary with Chriſt; and the former a ſect of heretics deſcended from them. Rufinus diſtinguiſhes them in their names: The Jewiſh ſect he calls *Masbuthæi*, and the heretics *Masbuthæani.*—The *Masbuthæans* were a branch of the Simonians.

MASCLE, or MACLE, in heraldry, a bearing in form of a lozenge, and voided of the field, that is, its inner part being cut out.—See *Tab. Herald. fig.* 34.

He bears gules a chevron ermin between three *Maſcles* argent, by the name of *Bellgrave.*

According to Guillim, the *Maſcle* repreſents the maſh of a net, and is an honourable bearing. It only differs from a lozenge, by being voided. See LOZENGE.

MASCULINE, ſomething belonging to the male, or the ſtronger of the two ſexes. See MALE.

MASCULINE, is more ordinarily uſed in grammar to ſignify the firſt and worthieſt of the genders of nouns. See GENDER.

The *Maſculine* gender is that which belongs to the male kind, or ſomething analogous to it.

Moſt ſubſtantives are ranged under the heads of *Maſculine* or feminine.—This, in ſome caſes, is done with a ſhew of reaſon, but in others is merely arbitrary; and for that reaſon, is found to vary according to the languages, and even according to the words introduced from one language into another.—Thus the names of trees are generally feminine in Latin, and *Maſculine* in the French.

Farther, the genders of the ſame word are ſometimes varied in the ſame language. Thus *alvus*, according to Priſcian, was anciently *Maſculine*, but is now become feminine. And *navire*, a ſhip, in French, was anciently feminine, but is now *Maſculine.*

MASCULINE *rime*, in the French poetry, is that made with a word which has a ſtrong, open, and accented pronunciation; as all words have, excepting thoſe which have an *e* feminine in their laſt ſyllable. See RIME.

For inſtance, *amour* and *jour*, *mort* and *ſort*, are *Maſculine* rimes;—and *pere* and *mere*, *gloire* and *memoire* are feminine. Hence alſo verſes ending with a *Maſculine* rime, are called *Maſculine* verſes, and thoſe ending with a feminine rime, feminine verſes. See VERSE.

It is now a rule eſtabliſhed among the French poets, never to uſe above two *Maſculine*, or two feminine verſes ſucceſſively, except in the looſer kinds of poetry.

Marot was the firſt who introduced this mixture of *Maſculine* and feminine verſes, and Ronſard was the firſt who practiſed it with ſucceſs. The *Maſculine* verſes ſhould always have a ſyllable leſs than the feminine ones.

MASCULINE *Signs.*—Aſtrologers divide the ſigns into *Maſculine* and feminine; by reaſon of their qualities, which are either active, and hot, or cold, accounted *Maſculine*; or paſſive, dry, and moiſt, which are feminine.

On this principle they call the Sun, Jupiter, Saturn, and Mars, *Maſculine*: and the Moon and Venus, feminine. Mercury, they ſuppoſe, partakes of the two. Among the ſigns, Aries, Libra, Gemini, Leo, Sagittarius, Aquarius, are *Maſculine*: Cancer, Capricornus, Taurus, Virgo, Scorpio, and Piſces, are feminine.

MASK, or MASQUE. See the article MASQUE.

MASON *, a perſon employed uſually under the direction of an architect, in the raiſing of a ſtone building. See MASONRY.

* The word comes from the French *Maçon*, which ſignifies the ſame. Some derive this further from the barbarous Latin *Machio*, a machiniſt, in regard theſe artificers are obliged to uſe machines for raiſing walls. Du Cange derives it from *Maceria*, a name given to the long fence-walls which incloſe vineyards, *&c.* in which *Maſons* are ſuppoſed to have been firſt employed: *Maſon eſt Maceriarum conſtructor.* M. Huet derives it from *Mas*, an old word, ſignifying houſe; hence *Maſon* is a perſon who makes *Mas's*, that is, houſes. In the corrupt Latin, a *Maſon* was called *magiſter comacinus*, which Lindenbroeck derives from Comacina, an iſland in Romania, where, in the time of the Lombards, the beſt architects were found.

The chief buſineſs of a *Maſon*, is to prepare the mortar, raiſe the walls from the foundation to the top, with the neceſſary retreats and perpendiculars, from the vaults, and employ the ſtones as delivered to him.

When the ſtones are large, the buſineſs of hewing or cutting them belong to the ſtone-cutters; though theſe are frequently confounded with the *Maſons.*—The ornaments of ſculpture are performed by carvers in ſtone, or ſculptors.—The tools or implements principally uſed by *Maſons* are, the ſquare, level, plumb-line, bevel, compaſs, hammer, chiſſel, mallet, ſaw, trowel, *&c.* See SQUARE, LEVEL, *&c.*

Beſides the common inſtruments uſed in the hand, they have likewiſe machines for the raiſing of great burdens, the conducting of large ſtones, *&c.* The principal of theſe are the lever, wheel, pully, *&c.* See WHEEL, *&c.*

Free, or *Accepted* **MASONS**, a very ancient ſociety, or body of men, ſo called either from ſome extraordinary knowledge of maſonry or building, which they are ſuppoſed to be maſters of, or becauſe the firſt founders of the ſociety were perſons of that profeſſion.

They are now very conſiderable both for numbers and character; being found in every country in Europe, and conſiſting principally of perſons of merit and conſideration. As to antiquity, they lay claim to a ſtanding of ſome thouſand years; and, it is ſaid, can trace up their original as early as the building of Solomon's temple.

What the end of their inſtitution is, ſeems ſtill, in ſome meaſure, a ſecret; though ſo much of it as is known, appears laudable enough, as it tends to promote friendſhip, ſociety, mutual aſſiſtance, and good fellowſhip.

The brothers of this family are ſaid to be poſſeſſed of a great number of ſecrets, which have been religiouſly obſerved from age to age.—Be their other virtues therefore what they will, it is plain they are maſters of one in a very great degree, *viz.* ſecrecy.

MASONRY, a branch of architecture, conſiſting in the art of hewing, or ſquaring ſtones, and cutting them level, and perpendicular, for the uſes of building. See ARCHITECTURE.

MASONRY, in a more limited ſenſe of the word, is the art of aſſembling and joining ſtones together with mortar. See COLUMN.

Hence there ariſe as many different kinds of *Maſonry*, as there are different forms and manners of laying, or joining the ſtones. Vitruvius makes mention of ſeven kinds of *Maſonry* among the ancients; three of hewed ſtone, *viz.* that in form of a *net*, that in *binding*, and that called the *Greek Maſonry*: and three of unhewed ſtones, *viz.* that of an *equal courſe*, that of an *unequal courſe*, and that *filled up in the middle.* The ſeventh was a compoſition of all the reſt.—See *Tab. Architect. fig.* 13. *to* 19.

Net **MASONRY**, called by Vitruvius, *reticulatum*, from its reſemblance of the maſhes of a net, conſiſts of ſtones ſquared in their courſes, and ſo diſpoſed, as that their joints go obliquely, and the diagonals are, the one perpendicular, and the other level. This is the moſt agreeable *Maſonry* to the eye, but is apt to crack.—See *fig.* 13.

Bound **MASONRY**, *Inſerta*, is that wherein the ſtones were placed one over another, like tiles; the joints of the beds being level, and the mounters perpendicular. So that the joint that mounts and ſeparates two ſtones, falls directly over the middle of the ſtone below.—This is leſs beautiful than the net-work, but more ſolid and durable.—See *fig.* 15.

Greek **MASONRY**, according to Vitruvius, is that where, after we have laid two ſtones, each of which makes a courſe, another is laid at the end, which makes two courſes; and the ſame order obſerved throughout the building.—This may be called *double binding*, in regard the binding is not only of ſtones of the ſame courſe with one another, but likewiſe of one courſe with another courſe.—See *fig.* 14.

MASONRY *by equal courſes*, by the ancients called *iſodomum*, differs in nothing from the bound *Maſonry*, but only in this, that its ſtones are not hewn.—See *fig.* 16.

MASONRY *by unequal courſes*, called *pſeudiſodomum*, is alſo made of unhewed ſtones, and laid in bound work: but then they are not of the ſame thickneſs, nor is there any equality obſerved, excepting in the ſeveral courſes; the courſes themſelves being unequal to each other.—See *fig.* 17.

MASONRY *filled up in the middle*, called by the ancients *emplecton*, is likewiſe made of unhewed ſtone, and by courſes; but the ſtones are only ſet in order as to the courſes, the middle being filled up with ſtones thrown in at random among the mortar.—See *fig.* 18.

Compound **MASONRY**, is of Vitruvius's propoſing; ſo called, as being formed of all the reſt. In this, the courſes are of hewen ſtone, and the middle being left void, is filled up with mortar and pebbles thrown in together. After this the ſtones of one courſe are bound to thoſe of another courſe, with cramp-irons faſtened with melted lead.—See *fig.* 19.

All the kinds of *Maſonry* now in uſe may be reduced to theſe five, *viz. Bound Maſonry*; that of *Brick-work*, where the bodies and projections of the ſtones incloſe ſquare ſpaces or pannels, *&c.* ſet with bricks: That *de moilon*, or ſmall work, where the courſes are equal, well ſquared, and their edges or beds ruſticated: That where the *courſes* are *unequal*; and that *filled up in the middle* with little ſtones and mortar.

MASONRY, is ſometimes alſo uſed in a more general and unlimited ſenſe; ſo as, beſides proper *Maſonry*, to include the hewing or ſawing of larger ſtones to fit them for building, properly called *Stone-cutting*; and the carving of the ornaments on the members and mouldings, properly called *ſculpture*. See SCULPTURE.

MASQUE, or **MASK**, a cover for the face, contrived with apertures for the eyes and mouth; worn chiefly by women of condition, either to preſerve their complection from the weather, or out of modeſty, to prevent their being known.

Poppæa, wife of Nero, is ſaid to be the firſt inventer of the *Maſque*; which ſhe did to guard her complection from the ſun and weather, as being the moſt delicate woman, with regard to her perſon, that has been known.—Brantome obſerves, that the common uſe of *Maſques* was not introduced till towards the end of the ſixteenth century.

MASQUE, is alſo uſed to ſignify any thing uſed to cover the eyes, and prevent a perſon's being known.

The penitents of Lyons and Avignon hide their faces with large white veils, which ſerve them for *Maſques*. See VEIL.

MASQUE, in architecture, is applied to certain pieces of ſculpture, repreſenting ſome hideous forms, groteſque, or ſatyrs faces, *&c.* uſed to fill up and adorn vacant places, as in freezes, the pannels of doors, keys of arches, *&c.* but particularly in grottos.

MASQUERADE *, or **MASCARADE**, an aſſembly of perſons, maſked, or diſguiſed; meeting to dance, and divert themſelves. This is a very common practice abroad, eſpecially in carnival time. See CARNIVAL.

* The word comes from the Italian *Maſcarata*, and that from the Arabic *Maſcâra*, which ſignifies raillery, buffoonery.

MASS, **MASSA**, in mechanics, the matter of any body cohering with it, *i. e.* moving and gravitating along with it. See BODY.

In which ſenſe, *Maſs* is diſtinguiſhed from bulk, or volume, which is the expanſion of a body in length, breadth, and thickneſs. See MATTER.

The *Maſs* of any body is rightly eſtimated by its weight. And the *Maſſes* of two bodies of the ſame weight are in a reciprocal ratio of their bulks. See MOTION, WEIGHT, MOMENT, and MEASURE.

MASS *, or **MESSE**, **MISSA**, in a religious ſenſe, denotes the office, or public prayers made in the Romiſh church, at the celebration of the euchariſt. See EUCHARIST.

* Nicod, after Baronius, obſerves that the word comes from the Hebrew, *Miſſach, oblatum*; or from the Latin *Miſſa, Miſſorum*; becauſe in the former times, the catechumens and excommunicated were ſent out of the church, when the deacon ſaid, *Ite, miſſa eſt*, after ſermon, and reading of the epiſtle and goſpel; they not being allowed to aſſiſt at the conſecration. See CATECHUMEN. Menage derives the word from *Miſſio*, diſmiſſing: Others from *Miſſa*, miſſion, ſending; becauſe in the *Maſs*, the prayers of men on earth are ſent up to heaven.

Romiſh divines define the *Maſs*, an oblation made to God, wherein, by the change of a ſenſible object by virtue of a divine inſtitution, the ſovereign dominion of God over all things is acknowledged.

This they eſteem the greateſt and moſt auguſt ceremony in uſe in the church; as being the ſacrifice of the new law, wherein the body and blood of Jeſus Chriſt are offered up to God.

They are divided about the queſtion, Whether or no it be proper or allowable for the ſame perſon to celebrate *Maſs* ſeveral times in one day? having the authority of pope Leo in his letter to Dioſcorus for the affirmative ſide of the queſtion, and that of ſeveral of the councils for the negative.

There are a great variety of *Maſſes* in the Romiſh church; the thing acquiring new titles, and appellations, according to the different rites, intentions, and manners, in which it is performed as well as other circumſtances.—Thus they have an

Ambroſian MASS, celebrated according to the rite of St. *Ambroſe*; particularly uſed in Milan.

Engliſh MASS, was the form which anciently obtained in *England*.

Gallican MASS, is the rite that formerly obtained in the churches of *France*.

Greek MASS, is that rehearſed according to the *Greek* rites, in the *Greek* language, and by *Greek* prieſts.

Latin MASS, is that uſed in the *Latin* church, in the *Latin* tongue, and according to the rites of the *Latin* church.

High MASS, called alſo *Grand* MASS, is that ſung by the choriſters, and celebrated with the aſſiſtance of a deacon and ſubdeacon.

Low MASS, is that wherein the prayers are all barely rehearſed without any ſinging, and performed without much ceremony, or the aſſiſtance of any deacon and ſubdeacon.

MASS *of the Beata*, or *our lady*, is that offered to God by the means, and through the interceſſion of the *virgin*.

Beau MASS, is a *Maſs* rehearſed every day, at which the ladies and *Beau-monde* of the place attend.—This is alſo called the *perfumed Maſs*.

Common MASS, or MASS *of the community*, in a monaſtery, is that celebrated at certain hours, whereat the whole body aſſiſts.

MASS *of the Holy Ghoſt*, is that celebrated at the beginning of any ſolemnity or church-aſſembly, commencing with an invocation of the *Holy Ghoſt*.

Holy-day MASS, is that wherein certain prayers, or leſſons are read ſuitable to the day.

MASS *of Judgment*, was that wherein a perſon cleared himſelf of any calumny by ſome proof agreed upon. See JUDGMENT.

MASS *for the death of our enemies*, was a form that obtained a long time in Spain, but was at length aboliſhed as inconſiſtent with Chriſtian charity.

MASS *of the dead*, or *requiem*, is that performed at the requeſt of the deceaſed: the introit whereof begins with *requiem*.—

In the thirteenth century, it was the cuſtom, ere criminals were carried out to execution, to make them attend at a *Maſs of the dead*, rehearſed for the repoſe of their ſouls.

Pariſh MASS, or *Great* MASS, is that which the parſon is obliged to rehearſe to his pariſhioners on ſundays and holy-days.

Little MASS is that ſaid at private altars with leſs ceremony.

The firſt *Maſs* is that ſaid at break of day.

MASS *of a ſaint*, is that wherein God is invoked by the interceſſion of ſome ſaint.

Thus there are alſo *Maſſes* of apoſtles, martyrs, pontiffs, virgins, *&c.*

MASS *of ſcrutiny*, was formerly rehearſed at the examination of catechumens, when enquiry was made as to their diſpoſition for baptiſm.

Dry MASS, is that where there is no conſecration; as that, according to Durandus, where the prieſt cannot conſecrate, by reaſon of his having ſaid *Maſs* before on the ſame day: or that uſed by the candidates of the prieſthood, in order to their becoming acquainted with the ceremonies; as Eckius will have it.

Votive MASS, is an extraordinary *Maſs* beſides that of the day, rehearſed on ſome extraordinary occaſion.

Candle-MASS.	See the article	CANDLE-*maſs*.
Childer-MASS.		CHILDER-*maſs*.
Chriſt-MASS.		CHRIST-*maſs*.

MASSES, in painting, denote thoſe parts of a picture which contain great lights or great ſhadows. See CLAIROBSCURE.

When it is almoſt dark, we only ſee the *Maſſes* of a picture; *i. e.* the places of the greateſt lights and ſhadows.

MASSALIANS, **MASSALIANI**, certain ſectaries, ſo called from a Hebrew word, ſignifying prayer; it being their diſtinguiſhing tenet, that a man is to be continually in prayer.

The Greeks call them *Euchitæ*, ευχιται, which in their language ſignified the ſame thing. See EUCHITÆ.

St. Epiphanius diſtinguiſhes two kinds of *Maſſalians*, the *ancient* and the *new*.

The *ancient*, according to him, are neither Jews, Chriſtians, nor Samaritans, but pure Gentiles; who owning ſeveral gods, adore only one, whom they call Almighty. They had oratories like our churches, where they uſed to meet, to pray and ſing hymns in honour of God; their oratories being finely illuminated with lamps and flambeaux.—This deſcription of St. Epiphanius comes ſo near the practice of the Eſſeni, that Scaliger thinks the two ſects ought not by any means to be diſtinguiſhed. See ESSENI.

For the *New Maſſalians*, who were by profeſſion Chriſtians, their riſe was not till about the time of St. Epiphanius. Their doctrine was, that prayer alone was ſufficient to ſalvation.—Many monks, who loved a life of lazineſs, and were averſe to labour, joined the *Maſſalians*.

MASSETER, in anatomy, a triangular two-headed muſcle, which ſurrounds the lower jaw, and helps to pull it upwards in eating. See MAXILLA.

The *Maſſeter* is thick and ſhort, ariſing from the Zygoma, and from the firſt bone of the upper jaw, and is inſerted into the lower edge of the lower jaw, from its external angle to its middle. Its fibres run in three directions; thoſe from the Zygoma obliquely to the middle of the jaw, and thoſe from the upper bone of the firſt jaw croſs the former, and run to the angle of the lower jaw; and the fibres that are in its middle, run perpendicularly from their origin to their inſertion.—See *Tab. anat.* (*myol.*) *fig.* 1. *n.* 11. *fig.* 6. *n.* 6. *fig.* 7. *n.* 3.

MASSIVE, ſomething heavy and ſolid; in oppoſition to tenderneſs, and delicacy. See SOLIDITY.

Thus we ſay, a building is too *maſſive*, that is, its walls are too thick; a wall is *maſſive*; that is, the lights and openings are too ſmall in proportion.

Maſſive column, is that which is too ſhort for the order whoſe capital it bears. See COLUMN.

MASSORA, a term in the Jewiſh theology, ſignifying a work on the bible performed by ſeveral learned rabbins, to ſecure it from any alterations which might otherwiſe happen; and to ſerve, according to their expreſſion, as a *hedge to the law*. See BIBLE.

Buxtorf defines the *Maſſora* a critique on the Hebrew text, contrived by the ancient Jewiſh doctors, in which they have numbered the verſes, works, and letters of the text, and marked all the variations of it.

The text of the ſacred books, it is to be obſerved, was originally written without any breaks, or diviſions into chapters, or verſes, or even into words: ſo that a whole book, in the ancient manner, was but one continued word; of which kind we have ſtill ſeveral ancient manuſcripts both Greek and Latin. In regard therefore the ſacred writings had undergone an infinite number of alterations, whence various readings had ariſen; and the original was become much mangled, and diſguiſed; the Jews had recourſe to a canon, which they judge infallible, to fix and aſcertain the reading of the Hebrew text: and this rule they call *Maſſora*, tradition; as if this critique were nothing but a tradition, which they had received from their forefathers.

According to Elias Levita, it was the Jews of a famous ſchool at Tiberias, who compoſed, or at leaſt begun the *Maſſora*, whence they are called *Maſſoretes*, and *Maſſoretic doctors*. Aben Eſra makes them the authors of the points and accents in the Hebrew text, as we now find it, and which ſerve for vowels. See POINT, and ACCENT.

The Arabs have done the ſame thing by their alcoran, that the *Maſſoretes* have done to the bible: Nor do the Jews deny their having borrowed this expedient from the Arabs, who firſt put it in practice in the ſeventh century. See ALCORAN.

There is a *great*, and a *little Maſſora*, printed at Venice, and at Baſil, with the Hebrew text in a different character.—Buxtorf has written a *Maſſoretic* commentary, which he calls *Tiberias*.

MASSORETES, Jewiſh doctors, authors of the Maſſora. See MASSORA.

MAST *of a foreſt*, the fruit of a ſpecies of trees, called *Glandiferous*, or *Maſt-bearing*; as beech, oak, cheſnut, &c. See GLANDIFEROUS.

MAST *, in navigation, a large pole, or long piece of round wood, raiſed in veſſels, for the yards and ſails to be faſtened to, in order to their receiving the wind neceſſary for navigation. See SHIP, SAIL, YARD, NAVIGATION, &c.

* The word *Maſt* ſignifies the ſame thing in French, High-Dutch, Flemiſh, and Engliſh: The Italians ſay *albero*, and the Spaniards *maſtil*.

In large veſſels, the number of *Maſts* is four. Their names are, the *Main-Maſt*, the *Fore-Maſt*, the *Mizen-Maſt*, and the *Boltſprit*. To which ſome add a fifth, *viz.* a *Counter-Mizen*.

Main-Maſt, is the chief *Maſt*, ſtanding upright in the middle, or waiſt of the veſſel; it bears the main-yard and main-ſail.

Fore-Maſt is between the *Main-Maſt* and the head. See FORE-MAST.

Mizen-Maſt is between the *Main-Maſt* and the ſtern. See MISSEN.

The *Boltſprit* lies upon the beak, in the prow, or head of the ſhip. See BOLTSPRIT.

The *Counter-Mizen*, in large veſſels and gallions, is in the ſtern.—See *Tab. Ship, fig.* 1. *n.* 1, 19, 38, 81.

We alſo uſe the word *Maſt* to ſignify thoſe diviſions, or additional pieces in the *Maſts*, placed over one another. The *Main-Maſt*, and *Fore-Maſt*, have each of them two, *viz.* the *Main-Maſt*, *Main-Top-Maſt*, *Main-Gallant-Maſt*; the *Fore-Maſt*, *Fore-Top-Maſt*, *Fore-Top-Gallant-Maſt*. The *Mizen-Maſt* has one, *viz.* the *Mizen-Top-Maſt*.

For the proportion of *Maſts*, Sir H. Manwaring gives theſe rules: Whatever the breadth of a ſhip be in feet, multiply $\frac{4}{5}$ of that breadth by 3, the product is the length of her *Main-Maſt* in feet. Thus if a ſhip be 30 feet at the midſhip-beam, $\frac{4}{5}$ of 30 is 24; therefore that ſhip's *Main-Maſt* muſt be 24 yards, or 72 feet in length. Then for its bigneſs, he allows an inch to every yard in length, and therefore this *Maſt* muſt be 24 inches through, or thick. The *Fore-Maſt* of a ſhip muſt be $\frac{4}{5}$ of the length of the *Main-Maſt*, that is, in this caſe, 19 yards $\frac{1}{5}$, and thick or through it muſt be near 20 inches. The *Boltſprit* is always the ſame length and bigneſs with the *Fore-Maſt*; and the *Mizen-Maſt* muſt be juſt half the length of the *Main-Maſt*, and half as thick.

Heel of a MAST. See the article HEEL.
Jury-MAST. See the article JURY.
Spring a MAST. See the article SPRING.

MASTER, a title given to ſeveral officers, and perſons of authority, and command: particularly, to the chiefs of the orders of knighthood, &c.

Thus we ſay, the grand *Maſter* of Malta, of St. Lazarus, of the golden fleece, of the free maſons, &c. See MALTA, LAZARUS, &c.

MASTER, MAGISTER, was a title frequent among the Romans: They had their *Maſter* of the people, *Magiſter populi*, who was the dictator.—*Maſter* of the cavalry, *Magiſter equitum*, who held the ſecond poſt in an army after the dictator.—Under the later emperors, there were alſo *Maſters* of the infantry, *Magiſtri peditum*.—A *Maſter* of the cenſus, *Magiſter cenſus*, who had nothing of the charge of a cenſor, or ſubcenſor, as the name ſeems to intimate; but was the ſame with the *Præpoſitus frumentariorum*.

MASTER *of the militia*, *Magiſter militiæ*, was an officer in the lower empire, created, as it is urged, by Dioclετian, who had the inſpection and government of all the forces, with power to puniſh, &c. ſomewhat like a conſtable of France.

At firſt there were two of theſe officers inſtituted; the one for the infantry, and the other for the cavalry; but the two were united into one under Conſtantine. Afterwards, as their power was increaſed, ſo was their number too; and there was one appointed for the court, another for Thrace, another for the Eaſt, and another for Illyria. They were afterwards called *Comites*, counts, and *Clariſſimi*. Their power was only a branch of that of the *Præfectus prætorii*, who by that means became a civil officer.

MASTER *of arms*, *Magiſter armorum*, was an officer or comptroller under the *Maſter* of the militia.

MASTER *of the offices*, *Magiſter officiorum*, had the ſuperintendance of all the officers of the court. He was alſo called *Magiſter officii palatini*, ſimply *Magiſter*, and his poſt *Magiſteria*.—This officer was the ſame in the weſtern empire with the Curopalates in the eaſtern.

MASTER, in fine, in the Roman hiſtory and laws, is uſed for every officer, who is the chief of his kind; and has others of the ſame ſpecies, or that have the ſame functions, under him.—In Latin, *Magiſter*, and oftentimes *Proximus*, or *Primicerius*. See PRIMICERIUS.

MASTER *of the Armory*, is an officer who has the care and overſight of his majeſty's arms, and armory. See ARMS, and ARMORY.

MASTER *of Arts*, the firſt degree taken up in foreign univerſities, but the ſecond in ours; candidates not being admitted to it till they have ſtudied in the univerſity ſeven years. See DEGREE, BATCHELOR, DOCTOR, &c.

MASTER *of the Ceremonies*, is an officer inſtituted by king James the firſt, for the more ſolemn and honourable reception of embaſſadors, and ſtrangers of quality, whom he introduces into the preſence.

The badge of his office is a gold chain and medal, having on one ſide an emblem of peace, with king James's motto; and on the reverſe the emblem of war, with *Dieu & mon droit*. He is always ſuppoſed to be a perſon of good addreſs, and maſter of languages: He is conſtantly attending at court, and hath under him an aſſiſtant *Maſter*, or deputy, who holds his place during the king's pleaſure.

There is alſo a third officer, called *Marſhal of the Ceremonies*, whoſe buſineſs is to receive and diſtribute the *Maſter*'s orders, or the deputy's, for the ſervice; but without their order he can do nothing.—This is in the king's gift. See MARSHAL.

MASTERS *of Chancery*, are uſually choſen out of the barriſters of the common law, and ſit in chancery, or at the rolls, as aſſiſtants to the lord chancellor, and maſter of the rolls.

To them is alſo committed interlocutory reports, ſtating of accounts, taxing coſts, &c. And ſometimes, by way of reference, they are empowered to make a final determination of cauſes.

They have, time out of mind, had the honour to ſit in the lords houſe, though they have neither writs, nor patent to empower them; but as aſſiſtants to the lord chancellor, and maſter of the rolls. They had anciently the care of inſpecting all writs of ſummons, which is now performed by the clerk of the petty-bag. When any meſſage is ſent from the lords to the commons, it is carried by the *Maſters of Chancery*. Before them affidavits are made, and deeds and recognizances acknowledged. See CHANCERY.

Beſides theſe, who may be called *Maſters of Chancery ordinary*, (being twelve in number, whereof the maſter of the rolls is reputed the chief) there are alſo *Maſters of Chancery extraordinary*, appointed to act in the ſeveral counties of England beyond ten miles diſtance from London, by taking affidavits, recognizances, &c. for the eaſe of the ſuitors of the court.

MASTER *of the court of Wards and Liveries*, was the chief officer, and judge of that court, who kept the ſeal of it, and was named and aſſigned by the king.

But this court, and all its officers, members, power, and appurtenances, is taken away by a ſtatute made 12 Car. II. c. 24. See WARD.

MASTER *of the Faculties*, an officer under the archbiſhop of Canterbury, who grants licences and diſpenſations: he is mentioned in the ſtatute 22, 23 Car. II. See the article FACULTY.

MASTER-*Gunner of* England. See the article GUNNER.

MASTER *of the Horſe*, a great officer of the crown, to whom is committed the charge of ordering and diſpoſing all matters relating to the king's ſtables, races, and breed of horſes, as he had anciently of all the poſts in England.

He hath a power of commanding the equerries, and all the other officers and tradeſmen employed in the king's ſtables; to all which he gives, by his warrant to the avener, the oath of allegiance, &c. for the faithful diſcharge of their duty. He has the peculiar privilege of making uſe of any horſes, pages, or footmen, belonging to the king's ſtables; ſo that his coaches, horſes, and attendants, are the king's, and have the king's arms and liveries.

MASTER *of the Houſhold*, is an officer under the lord-ſteward of the houſhold, and in the king's gift: His buſineſs is to ſurvey the acounts of the houſhold. See Houshold.

Anciently the lord-ſteward himſelf was called *Grand Maſter of the Houſhold.* See Steward.

Master *of the Jewel-houſe*, is an officer of the king's houſhold, who has charge of all the gold and ſilver plat[illegible]d at the king's table, or at that of any officer attending the court; and of all plate remaining in the tower of London; as alſo of chains and looſe jewels, not fixed to any garment. See Jewel.

Master *of the Mint*, was anciently the title of him who is now called *Warden of the Mint*; whoſe office is to receive the ſilver and bullion, which comes to the mint to be coined, and to take care thereof. See Mint.

Master *of the Ordnance*, a great officer, to whoſe care all the king's ordnance and artillery is committed. See Ordnance.

Master *of the Revels*, an officer, whoſe buſineſs is to order all things relating to the performance of plays, maſks, balls, *&c.* at court. Formerly he had alſo a juriſdiction of granting licences to all who travel to act plays, puppet-ſhews, or the like diverſions: neither could any new play be acted at either of the two houſes, till it had paſſed his peruſal and licence. But theſe powers are much abridged, not to ſay annihilated, by a late ſtatute for regulating play-houſes.

Master *of the Robes.* See the article Robes.

Master *of the Rolls*, a patent officer for life; who has the cuſtody of the rolls and patents which paſs the great ſeal, and of the records of the chancery. See Chancery.

In the abſence of the lord-chancellor, or keeper, he alſo ſits as judge in the court of chancery; and is, by Sir Edward Coke, called his *aſſiſtant*. See Chancellor.

At other times he hears cauſes in the rolls chapel, and makes orders and decrees.—He is alſo the firſt of the maſters of chancery, and hath their aſſiſtance at the rolls: but all hearings before him are appealable to the lord-chancellor.

He hath alſo his writ of ſummons to parliament, and ſits next to the lord chief juſtice of England, on the ſecond woolpack. He hath the keeping of the parliament rolls, and the rolls houſe for his habitation; as alſo the cuſtody of all charters, patents, commiſſions, deeds, recognizances, which being made of rolls of parchment, gave riſe to the name. Anciently he was called *Clerk of the Rolls.*

In his gift are the ſix clerks in chancery, the examiners, three clerks of the petty-bag, and the ſix clerks of the rolls chapel, where the rolls are kept. See Rolls, Clerk, *&c.*

Master *of a Ship*, an officer, to whom is committed the direction of a merchant-veſſel; who commands it in chief, and is charged with the merchandizes aboard.

In the Mediterranean, the *Maſter* is frequently called *Patron*, and in long voyages *Captain*. See Captain.

It is the proprietor of the veſſel that appoints the *Maſter*; and it is the *Maſter* provides the equipage, hires the pilots, ſailors, *&c.*—The maſter is obliged to keep a regiſter of the ſeamen and officers, the terms of their contract, the receipts and payments, and in general, every thing relating to his commiſſion. See Ship.

Master *of the Temple.*—The founder of the order of the Templars, and all his ſucceſſors, were called *Magni Templi Magiſtri*; and ever ſince the diſſolution of the order, the ſpiritual guide and director of the houſe is called by that name. See Temple, Templar.

Master *of the Wardrobe*, an office in the lord-chamberlain's diſtrict, who has the direction of all the royal robes; as thoſe of the coronation, St. George's feaſt, the parliament-robes: as well as of the wearing apparel, collar of SS's, George and garter, *&c.*

He has alſo the charge and cuſtody of all former kings and queens robes, remaining in the Tower; all hangings, bedding, *&c.* for the king's houſe; the charge and delivery of velvet and ſcarlet allowed for liveries.

He has under him a clerk of the robes, and wardrobe-keeper, a yeoman, *&c.* See Wardrobe.

Burgher-Master.	See the article	Burgher.
Fire-Master.		Fire.
Quarter-Master.		Quarter.

Master-*Arch.* See the article Arch.

Master-*Vault.* See the article Vault.

MASTER-PIECE, an exquiſite, or extraordinary work or performance, in any art or ſcience.

Master-piece, *Chef d'œuvre*, is particularly uſed among the French, for a work, which thoſe who aſpire to be admitted maſter in any art or trade, are to perform in preſence of the maſters or jurands of that company, by way of ſpecimen of their capacity.

The *Maſter-Piece* of a carpenter, is a rampant curve of a ſtair-caſe, the ſpiral well adjuſted with the deſcent: That of a joiner, a flat-bottom cheſt, or a door-caſe, or a mantle-tree: That of a tiler, a luthern well conducted in the fourchette, with a ridge: That of a plumber, a little ciſtern *a cul de lampe:* That of a glazier, a pair of compartiments of glaſſes of ſeveral colours, hollowed, incaſtrated: That of paviors, a roſe in a free-ſtone or flint-pavement: That of a cordwainer, a turn-up ſhoe, *&c.*

MASTIC*, or Mastick, ΜΑΣΤΙΧΗ, a clear and ſweet reſinous gum, iſſuing from the trunk and large branches of the *Maſtic-tree*, or lentiſcus, either without, or with, inciſion. See Lentiscus.

* It has its name *Maſtic* from *maſticare*, to chew, by reaſon of its being continually chewed by the Turks, eſpecially the women.

Maſtic is temperate in heat, and of a dry, binding quality; ſo that it ſtrengthens the ſtomach, ſtays vomiting, ſtops iſſues of blood, and tickling coughs and catarrhs. It ſtrengthens the reins, and is a good cleanſer, and is for that reaſon preſcribed in ſeminal weakneſſes.

The jewellers mix *Maſtic* with turpentine and black ivory, and lay it under their diamonds, to give them a luſtre.

Maſtic is chiefly the product of Chio: the trees that yield it are cultivated with as much care as the vines. It brings in a revenue of eighty thouſand ducats *per annum* to the Grand Signior.—There is alſo a kind of black *Maſtic* brought from Egypt, which ſerves to ſophiſticate camphor. The gum *Maſtic* is in ſmall granules, and white if good; though age makes it turn yellowiſh.

MASTICATION, Masticatio, in medicine, the action of chewing; or of agitating the ſolid parts of our food between the teeth, by means of the motion of the jaws, the tongue, and the lips; whereby it is broke into ſmall pieces, impregnated with ſaliva, and ſo fitted for deglutition, and a more eaſy digeſtion in the ſtomach. See Digestion, Chylification, Deglutition, *&c.*

The mixture of ſaliva with the food, is of abſolute neceſſity; for the ſaliva imbibed within the parts, diſſolves the ſalts hid in them; and by ſo doing, prepares the food for fermentation in the ſtomach: The food therefore has the beginning of its digeſtion from the ſaliva, and its concluſion from the ferment in the ſtomach. See Saliva, Fermentation, *&c.*

MASTICATORIES, Masticatoria, in medicine, are ſuch remedies as are taken in at the mouth, and chewed; in order to promote the evacuation of the ſalival humour; as tobacco, ginger, pepper, ſage, roſemary, thyme, maſtic, *&c.*

MASTOIDES*, ΜΑΣΤΟΕΙΔΗΣ, in anatomy, the ſame with *Mammillaris.* See Mammillaris.

* The word comes from the Greek μαϛος, nipple, dug, and ειδος, *imago*, figure.

Mastoides is applied to ſuch proceſſes in the body, as have the appearance of breaſts or dugs; ariſing from a broad baſis, and terminating in an obtuſe top.

Mastoides is ſometimes alſo applied to thoſe muſcles which ſtoop the head; proceeding from the neck-bone, and breaſt-bone, and terminating in the proceſs mammiformis.

MATCH, a kind of rope ſlightly twiſted, and prepared to retain fire, for the uſes of artillery, mines, fire-works, *&c.*

It is made of hempen tow, ſpun on the wheel like cord, but very ſlack; and is compoſed of three twiſts, which are afterwards again covered with tow; ſo that the twiſts do not appear: laſtly, it is boiled in lees of old wines; whence its colour.—This, when once lighted at the end, burns on gradually and regularly, without ever going out, till the whole be conſumed.

Since fuſees have been introduced in lieu of *Match*-lock muſkets, the conſumption of *Match* has been much leſs conſiderable than before.

MATER *Tenuis*, or *Pia* Mater. See Meninges, and Pia.

Mater *Dura.* See alſo Meninges, and Dura.

MATERIA, Matter. See the article Matter.

Materia *ſubtilis*, denotes a fine ſubtile matter, which the Carteſians ſuppoſe to pervade and penetrate, freely, the pores of all bodies, and to fill up all their pores, ſo as not to leave the leaſt vacuity or interſtice between them. See Cartesianism.

This machine they have recourſe to, to ſupport the doctrine of an abſolute plenum, and to make it conſiſtent with the phænomena of motion, *&c.* and accordingly make it act and move at pleaſure; but in vain: for were there any ſuch matter, in order for it to be able to fill up the vacuities of other bodies, it muſt, itſelf, be entirely void of any, *i. e.* be perfectly ſolid, (ſee Solidity) vaſtly more ſolid than gold, and therefore more ponderous, and reſiſt vaſtly more: (ſee Resistance.) which is inconſiſtent with phænomena. See Vacuum and Plenum. Yet Sir Iſaac Newton allows of the exiſtence of a *ſubtile Matter*, or medium, vaſtly finer than air, penetrating the cloſeſt bodies, and contributing to the production of many of the phænomena of nature.—The exiſtence of ſuch a matter he argues from the experiment of two thermometers, which being incloſed in glaſs veſſels, 'one of them exhauſted of its 'air, and both carried from a cold to a warm place, the ther'mometer *in vacuo* grows warm, and riſes, almoſt as ſoon as 'that in the air; and if returned into the cold place, both 'cool and fall about the ſame.—Hence, ſays he, is not the 'heat of the warm room conveyed through the vacuum by the 'vibrations of a much ſubtiler medium than air, which re'mained *in vacuo*, after the exhauſtion of the air? And is not 'this medium the ſame with that whereby light is refracted, 'reflected, *&c.*? See Medium.

MATERIAL, denotes ſomething compoſed of matter. See Matter.

In which ſenſe the word ſtands oppoſed to immaterial. See IMMATERIAL.

The Epicureans, Spinoſiſts, &c. own no other but *material* ſubſtances: See SUBSTANCE. Among cauſes, ſome are *material*, others formal. See CAUSE.

Material cauſes, having no underſtanding or liberty, muſt always act in the ſame manner, when under the ſame circumſtances. Philoſophers and divines diſpute, whether or no there be any *material* forms really diſtinct from matter? See FORM.

The Valentinians formerly applied the term *material* to all people but thoſe of their own ſect; aſſerting, that their ſouls periſhed with their bodies.—Thus alſo the Stoics maintained, that none but the ſoul of their wiſe men ſurvived the body. See GNOSTICS, STOICS, SOUL, IMMORTAL, &c.

MATERIAL *Circle*. See the article CIRCLE.

MATERIAL *Object*. See the article *Object*.

MATERIALISTS, a ſect in the ancient church, compoſed of perſons, who, being prepoſſeſſed with that maxim in the ancient philoſophy, *Ex nihilo nihil fit, Out of nothing nothing can ariſe*, had recourſe to an eternal matter, on which they ſuppoſed God wrought in the creation; inſtead of admitting God alone as the ſole cauſe of the exiſtence of all things. See WORLD, and MATTER.

Tertullian vigorouſly oppoſes the doctrine of the *Materialiſts*, in his treatiſe againſt Hermogenes, one of their number.

MATHEMATICAL *Points*. See the article POINT.

MATHEMATICS*, the ſcience of quantity; or a ſcience that conſiders magnitudes either as computable, or meaſurable. See QUANTITY, and MAGNITUDE.

* The word in its original μαθησις, ſignifies *diſcipline*, or *ſcience* in the general; and ſeems to have been applied to the doctrine of quantity, either by way of eminence, or by reaſon this having the ſtart of all other ſciences, the reſt took their common name therefrom. See SCIENCE.

For the origin of the *Mathematics*, Joſephus dates it before the flood, and makes the ſons of Seth obſervers of the courſe and order of the heavenly bodies: he adds, that to perpetuate their diſcoveries, and ſecure them from the injuries either of a deluge or a conflagration, they had them engraven on two pillars, the one of ſtone, the other of brick; the former of which, he ſays, was ſtanding in Syria in his days. See ASTRONOMY.

The firſt who cultivated *Mathematics* after the flood, were the Aſſyrians and Chaldeans; from whom, the ſame Joſephus adds, they were carried by Abraham to the Egyptians; who proved ſuch notable proficients, that Ariſtotle makes no ſcruple to fix the firſt riſe of *Mathematics* among them. From Egypt, five hundred eighty-four years before Chriſt, they paſſed into Greece through the hands of Thales, who having learnt geometry of the Egyptian prieſts, taught it in his own country.

After Thales, comes Pythagoras; who, among other mathematical arts, paid a peculiar regard to arithmetic; fetching the greateſt part of his philoſophy from numbers: He was the firſt, as Laertius tells us, who abſtracted geometry from matter; and to him we owe the doctrine of incommenſurable magnitude, and the five regular bodies, beſides the firſt principles of muſic and aſtronomy. Pythagoras was ſucceeded by Anaxagoras, Oenopides, Briſo, Antipho, and Hippocrates of Scio; who all applied themſelves particularly to the quadrature of the circle, the duplicature of the cube, &c. but the laſt with moſt ſucceſs: This laſt is alſo mentioned by Proclus, as the firſt who compiled elements of *Mathematics*.

Democritus excelled in *Mathematics* as well as phyſics; though none of his works in either kind are extant: the deſtruction of which, ſome authors lay at Ariſtotle's door. The next in order is Plato, who not only improved geometry, but introduced it into phyſics, and ſo laid the foundation of a ſolid philoſophy.—Out of his ſchool proceeded a croud of *Mathematicians*. Proclus mentions thirteen of note; among whom was Leodamus, who improved the analyſis firſt invented by Plato; Theætetus, who wrote elements; and Archytas, who has the credit of being the firſt who applied *Mathematics* to uſe in life. Theſe were ſucceeded by Neocles and Theon, the laſt of whom contributed to the elements. Eudoxus excelled in arithmetic and geometry, and was the firſt founder of a ſyſtem of aſtronomy. Menechmus invented the conic ſections, and Theudius and Hermotimus improved the elements.

For Ariſtotle, his works are ſo ſtored with *Mathematics*, that Blancanus compiled a whole book of them: Out of his ſchool came Eudemus and Theophraſtus; the firſt of whom wrote of numbers, geometry, and inviſible lines; the latter a mathematical hiſtory. To Ariſteus, Iſidorus, and Hypſicles, we owe the books of ſolids; which, with the other books of elements, were improved, collected and methodized by Euclid, who died 284 years before Chriſt.

An hundred years after Euclid, came Eratoſthenes and Archimedes. Cotemporary with the latter was Conon, a geometrician and aſtronomer. Soon after came Apollonius Pergæus; whoſe conics are ſtill extant. To him are likewiſe aſcribed the fourteenth and fifteenth books of Euclid, which are ſaid to have been contracted by Hypſicles. Hipparchus and Menelaus wrote on the ſubtenſes in a circle, the latter alſo on ſpherical triangles: Theodoſius's three books of ſphericks are ſtill extant. And all theſe, Menelaus excepted, lived before Chriſt.

A. D. 70. Ptolemy of Alexandria was born; the prince of aſtronomers, and no mean geometrician: He was ſucceeded by the philoſopher Plutarch, of whom we have ſtill extant ſome mathematical problems. After him came Eutocius, who commented on Archimedes, and occaſionally mentions the inventions of Philo, Diocles, Nicomedes, Sporus, and Heron, on the duplicature of the cube. To Cteſebes of Alexandria, we owe our pumps; and Geminus, who came ſoon after, is preferred by Proclus to Euclid himſelf.

Diophantus of Alexandria was a great maſter of numbers, and the firſt inventor of algebra: Among others of the ancients, Nicomachus is celebrated for his arithmetical, geometrical, and muſical works, Serenus for his books on the ſection of the cylinder; Proclus, for his comments on Euclid; and Theon has the credit, among ſome, of being author of the books of *Elements* aſcribed to Euclid. The laſt to be named among the ancients, is Pappus of Alexandria, who flouriſhed *A. D.* 400, and is celebrated for his books of *mathematical* collections ſtill extant.

See the progreſs of each branch of *Mathematics*, with the authors who have wrote on it, under the reſpective heads; as GEOMETRY, ALGEBRA, ASTRONOMY, &c.

Mathematics are diſtinguiſhed with regard to their end, into

Speculative MATHEMATICS, which reſt in the bare contemplation of the properties of things; and

Practical MATHEMATICS, which apply the knowledge of thoſe properties to ſome uſes in life.

With regard to their object, *Mathematics* are divided into *pure* or *abſtract*; and *mixed*.

Pure MATHEMATICS conſider quantity, abſtractedly; and without any relation to matter or bodies.

Mixed MATHEMATICS, conſider quantity as ſubſiſting in material being:—*e. gr.* length in a road, breadth in a river, height in a ſtar, or the like.

Purer Mathematics again, either conſider quantity as diſcrete, and ſo computable, as arithmetic; or as concrete, or continued, and ſo meaſurable, as geometry, and trigonometry. See ARITHMETIC, GEOMETRY, &c.

Mixed Mathematics are very extenſive, and are diſtinguiſhed by various names, as the ſubjects they conſider, and the views wherein they take them, vary: it being ſufficient to determine an art to be a branch of *mixed Mathematics*, that pure *Mathematics* are applicable thereto, *i. e.* that it may be explained and demonſtrated from the principles of arithmetic and geometry. Such are

Mechanics, which conſider motion, or the laws of moving bodies. See MOTION.—Hydroſtatics, which conſider the laws of fluids, or of bodies gravitating in fluids. See FLUID.—Pneumatics, the air, with regard to the laws and menſuration thereof. See AIR.—Hydraulics, the motion of fluids. See FLUIDS.—Optics, direct light or viſion. See VISION.—Catoptrics, reflected viſion. See REFLECTION.—Dioptrics, refracted viſion. See REFRACTION.—Perſpective, the images of objects, in order to delineate or repreſent them. See PERSPECTIVE.—Aſtronomy, the univerſe, and the phænomena of the heavens. See SPHERE, and STAR.—Geography, the earth, both as in itſelf, and in its affections. See EARTH.—Hydrography, the ſea, principally as navigable. See NAVIGATION.—Chronology, time, with regard to the meaſuring and diſtinguiſhiug thereof. See TIME, YEAR, EPOCHA, &c.—Gnomonics, or Dialling, ſhadows, in order for determining the hour of the day. See DIAL, and SHADOW.—Pyrotechny, artificial fires, with regard both to diverſion, and to the uſes of war. See FIRE, ROCKETS, &c.—Military architecture, the ſtrength of places, with regard to their defence againſt an enemy. See FORTIFICATION.—Civil architecture (now become a branch of *Mathematics*) buildings. See BUILDING.—Muſic, ſounds, and their effects on the ear. See SOUND, TUNE, &c.

For the elements of each, ſee the reſpective heads: For an accurate ſyſtem of all the parts above-mentioned (Muſic alone excepted) orderly digeſted, and clearly demonſtrated, ſee the excellent Wolfius's *Elementa Matheſeos univerſæ*.

MATHURINS. See the article TRINITARIANS.

MATRASS, MATRACIUM, or BOLT-HEAD, a glaſs veſſel, uſed by chymiſts in diſtillation and other operations.

The *Matraſs* is made in form of a bottle, ſomewhat bellied in the middle, with a long narrow neck: It is luted with earth, when it is to be placed on a very hot fire. When it is required it ſhould be ſtopped very cloſe, they ſeal it hermetically. See BOLT-HEAD.

MATRICE, or MATRIX. See the article MATRIX.

MATRICE, or MATRIX, in dying, is applied to the five ſimple colours, whence all the reſt are derived or compoſed. Theſe are, the black, white, blue, red, and fallow or root colour. See COLOURS, and DYING.

MATRICES, or MATRIX's, uſed by the letter-founders are thoſe little pieces of copper or braſs, at one end whereof are engraven, dent-wiſe, or *en creux*, the ſeveral characters uſed in the compoſing of books.

Each character, virgula, and even point, in diſcourſe, has its ſeveral *Matrix*, and of conſequence its ſeveral puncheon to ſtrike it. It is the engravers on metal that cut or grave the *Matrices*. See ENGRAVING.

When types are to be caſt, the *Matrice* is faſtened to the end of a mould, ſo diſpoſed, as that when the metal is poured on it, it may fall into the creux or cavity of the *Matrice*, and take the figure and impreſſion thereof. See *Letter*-FOUNDERY, and PRINTING.

MATRICES uſed in coining, are pieces of ſteel in form of dyes: whereon are engraven the ſeveral figures, arms, characters, legends, *&c.* wherewith the ſpecies are to be ſtamped.

The engraving is performed with ſeveral puncheons, which being formed in relievo, or prominent, when ſtruck on the metal, make an indented impreſſion, which the French call *en creux*. See the manner hereof under ENGRAVING *on ſteel.* See alſo COINING.

MATRICULA, a regiſter kept of the admiſſion of officers, and perſons entered into any body, or ſociety, whereof a liſt is made. See REGISTER.

Among eccleſiaſtical authors, we find mention made of two kinds of *Matricula's:* the one containing a liſt of the eccleſiaſtics, called *Matricula clericorum*; the other of the poor ſubſiſted at the expence of the church, called *Matricula pauperum.*

MATRICULA was alſo applied to a kind of alms-houſe, where the poor were provided for. It had certain revenues appropriated to it, and was uſually built near the church; whence the name was alſo frequently given to the church itſelf.

MATRIX *, in anatomy, the *womb*; or that part of the female of any kind, wherein the fœtus is conceived and nouriſhed till the time of its delivery. See FOETUS, CONCEPTION, GENERATION, *&c.*

* The ancient Greeks called the *Matrix*, μητρη, from μητηρ, mother: whence, diſorders of the womb are frequently called *Fits of the mother.* They alſo called it ὑϛηρα, as being the laſt of the entrails, by its ſituation. Sometimes they alſo called it φυσις, or *natura*; and *vulva*, from *volvo*, to fold or envelop, or *valvæ*, doors.

Plato and Pythagoras took the *Matrix* for a diſtinct animal within another. P. Ægineta obſerves, that the *Matrix* may be taken away from a woman, without her death; and there have been inſtances of people, who have lived a long time after the loſs of the *Matrix*. Rhaſis and Paræus obſerve, that ſome perſons have been cured of diſeaſes, by having the *Matrix* extirpated. In 1669, a child was produced at the French academy, which had been conceived out of the *Matrix*, and which nevertheleſs had grown to the length of ſix inches. See EMBRYO, FOETUS, *&c.*

The *Matrix* in women is ſituate in the pelvis, or capacity of the hypogaſtrium, between the urinary bladder and the inteſtinum rectum, and reaches as far as the flanks: It is ſurrounded and defended by mighty bones; before, by the os pubis; behind, by the ſacrum; on each ſide, by the ilium and iſchium. It is in figure ſomewhat like a flat flaſk, or dried pear. In women with child, it expands and receives different forms, according to the different times and circumſtances of geſtation. It has ſeveral coats, arteries, veins, nerves and ligaments, and is interwoven with ſeveral different kinds of fibres.

Anatomiſts divide the *Matrix* into the *fundus*, and *cervix*; a broad part, and a neck. It is in extent, from the extremity of the one to that of the other, about three inches in length; its breadth at the fundus is about two and a half, and its thickneſs two. It has but one cavity, unleſs we diſtinguiſh between the caviy of the uterus, and that of its neck. That of the cervix is very ſmall, ſcarce ſufficient to contain a garden-bean. At the bottom or neck, towards the fundus, it grows very narrow in virgins; the extremity of it is called the *oſculum internum:* In pregnant women it opens, more eſpecially towards the time of delivery. The other and lower orifice of the neck, towards the vagina, called *oſculum externum*, is a little prominent, reſembling, in ſome meaſure, the glands of the virile organ.—See *Tab. anat.* (*ſplanc.*) *fig.* 9.

The ſubſtance of the *Matrix* is membranous and carnous: It conſiſts of three tunics; or, according to ſome, who deny that name to the middle ſubſtance, of two only. The external tunic, called alſo *communis*, is derived from the peritonæum, and conſiſts of two lamellæ; the exterior of which is pretty ſmooth, the interior rugged and uneven. This membrane inveſts the whole *Matrix*, and connects it to the inteſtinum rectum, bladder, *&c.* The middle tunic is very thick, and compoſed of ſtrong fibres, variouſly diſpoſed: Some think it contributes to the excluſion of the fœtus; though others imagine, it ſerves only to recover the tone, after any violent diſtenſion. The inner tunic is nervous.

The *Matrix* is connected by its neck to the vagina; behind, by its outward common membrane, and before by the ſame to the bladder: Its ſides are tied to other parts; but the fundus is left looſe, that it may expand and dilate more freely. Its ligaments are four, two of which are called *broad*, and two *round*, from their figure. The broad ligaments are membranous, looſe, and ſoft; whence they have been compared by ſome to the wings of bats, and called *alæ veſpertilionum.* The round ligaments are of a firmer texture, and conſiſt of a double membrane, wrapped up in its arteries, veins, nerves, and lymphæducts. The blood-veſſels, both in theſe and the round ligaments, make a great part of what is called their *ſubſtance:* Theſe, as well as the others, ſerve to keep the womb in a right poſition; and are very liable to be injured by unſkilful midwives. See LIGAMENT.

On each ſide of the fundus of the womb, ariſes a duct, which opens into the womb with a ſmall orifice, but in its progreſs enlarges, and towards the end is contracted again: At the end next the ovaria, which is at liberty, it expands again into a kind of foliage fringed round; which expanſion Fallopius, the firſt diſcoverer, imagined like the end of a trumpet; whence he called the whole duct, *tuba.* It conſiſts of a double membrane. Both veins and arteries are very numerous here, eſpecially the latter, which, by various ramifications and contorſions, make the main ſubſtance of them. Dr. Wharton gives them valves, but the other anatomiſts diſallow it. See FALLOPIAN *Tube.*

Suffocation of the MATRIX. See SUFFOCATION.

Speculum MATRICIS. See the article SPECULUM.

MATRIX is alſo applied to places proper for the generation of vegetables, minerals, and metals.

Thus the earth is the *Matrix* wherein ſeeds ſprout; marcaſites are conſidered as the *Matrixes* of metals. See FOSSIL, MINERAL, MARCASITE, *&c.*

MATRIX is alſo applied figuratively, to ſeveral things, wherein there appears a kind of generation; and where certain things ſeem to acquire a new being, or at leaſt a new manner of being. Of which kind are the moulds wherein the printer's types or letters are caſt, and thoſe uſed in ſtriking money and medals, called alſo *coin.* See COIN and COINING.

MATRON, MATRONA, among the Romans, ſignified a married woman, and ſometimes alſo the mother of a family.

There was, however, ſome difference between *Matrona*, and *mater-familias.* Servius ſays, that ſome imagined the difference to lie in this, that *Matrona* was a woman who had one child, and *mater-familias*, ſhe that had ſeveral. But others, particularly Aulus Gellius, take the name *Matrona* to belong to a married woman, whether ſhe had any children or no; the hope and expectation of having them, being enough to warrant the title of mother, *Matrona:* and for which reaſon it is, that marriage is called *matrimony.* This opinion is ſupported by Nonius.

MATRONALIA, feaſts of the Roman ladies, or rather *matrons*, celebrated on the calends of March, in honour of the god Mars.

No men living in celibate, were allowed to aſſiſt at the feaſt.

MATROSSES, ſoldiers in the train of artillery, next below the gunners; their duty is to aſſiſt the gunners in traverſing, ſpunging, loading, and firing of guns, *&c.* See ARTILLERY, *&c.* They carry fire-locks, and march along with the ſtore waggons, both as a guard, and to help in caſe a waggon ſhould break down.

MATTADORE. See the article OMBRE.

MATTER, MATERIA, *Body*; or an extended, ſolid, diviſible, moveable, and paſſive ſubſtance, the firſt principle of all natural things, from the various arrangements and combinations whereof, all bodies are formed. See BODY.

Ariſtotle makes three principles, *Matter*, form, and privation: Which laſt the Carteſians throw out of the number; and others, the two laſt. See PRINCIPLE.

The properties of *Matter* we are pretty well acquainted with, and can reaſon about its diviſibility, ſolidity, *&c.* (See DIVISIBILITY, *&c.*) But the eſſence thereof, or the ſubject wherein theſe properties reſide, or their ſubſtratum, is ſtill a myſtery. Ariſtotle ſpeaks very darkly on the ſubject, defining *Matter* to be *nec quid, nec quantum, nec quale*, nor any certain determinate thing at all; which many of his followers interpret ſo, as to believe, that *Matter* does not at all exiſt. See BODY.

The Carteſians make the eſſence of *Matter* to conſiſt in extenſion; arguing, that ſince the properties above mentioned are all that are eſſential to *Matter*, ſome of them muſt conſtitute its eſſence: and ſince extenſion is conceived prior to all the reſt, and is that, without which none of the reſt can be conceived, extenſion is that which conſtitutes the eſſence of *Matter.* — But the concluſion here is unjuſt; for on this principle, the exiſtence of *Matter*, according to Dr. Clarke, would have he faireſt title to conſtitute its eſſence, the *το exiſtere* being conceived prior to all properties, and even to extenſion.

Since then the word extenſion appears to go further, and to be more general than *Matter*; that impenetrable ſolidity, which is eſſential to all *Matter*, and to *Matter* alone, and from which all its properties manifeſtly flow, may, with more propriety, be called the *eſſence of Matter.* See ESSENCE.

Again, if extenſion were the eſſence of *Matter*, and ſo *Matter* and ſpace the ſame thing; it would follow, that *Matter* is infinite and eternal, that it is a neceſſary being, and could neither be created nor annihilated; which is abſurd. Beſides, it appears both from the nature of gravity, the motions of comets, the vibrations of pendulums, *&c.* that ſpace is not *Matter:* and therefore it is not extenſive, but ſolid, impenetrable extenſion which has a power of reſiſting, that conſtitutes *Matter.* See VACUUM and EXTENSION.

Many among the old philoſophers maintained the eternity of *Matter*, out of which they ſuppoſed all things to be formed by the hands of nature; as being unable to conceive how any thing ſhould be formed out of nothing. Plato maintained, that *Matter* had exiſted eternally, and concurred with God in the production of all things, as a paſſive principle, or a kind of collateral cauſe. See ETERNITY.

Matter and form, the two ſimple and original principles of all things, according to the ancients, compoſed ſome ſimple natures, which they called *elements*; out of the various combinations whereof, all natural things were compoſed. See ELEMENT.

Dr. Woodward ſeems of an opinion, not very unlike it; *viz.* That *Matter* is originally and really very different, being at its firſt creation divided into ſeveral ranks, ſets or kinds of corpuſcles, differing in ſubſtance, gravity, hardneſs, flexibility, figure, ſize, &c. from the various compoſures and combinations of which, ariſe all the varieties in bodies, as to colour, hardneſs, gravity, taſte, &c.—But Sir Iſaac Newton takes all thoſe differences to reſult from the various arrangements of the ſame *Matter*; which he judges to be homogeneous and uniform in all bodies. See CORPUSCLE, and PARTICLE.

Beſides the properties of *Matter* hitherto known, Sir Iſaac Newton has diſcovered a new one, *viz.* ‘That of attraction, or that every particle of *Matter* has an attractive power, or a tendency towards every other particle: which power is ſtrongeſt in the point of contact, and ſuddenly decreaſes, inſomuch that it acts no more at the leaſt ſenſible diſtance, and at a greater diſtance is converted into a repellent force, whereby the parts fly from each other. On this principle of attraction, he accounts for the coheſion of the particles of bodies, otherwiſe inexplicable.’ See COHESION.

For he takes occaſion to obſerve, ‘That all bodies ſeem to be compounded of hard particles: even light itſelf, and all other the moſt volatile of fluids; inſomuch as hardneſs may be eſteemed a property of all incompounded *Matter*: at leaſt the hardneſs of *Matter* ſtands on as good a footing as that of its impenetrability; all the bodies we know of, being either hard themſelves, or capable of being hardened. Now if compound bodies be ſo hard, as we find ſome of them, and yet are very porous, and conſiſt of parts which are only laid together; the ſimple particles, which are void of pores, and were never yet divided, muſt be much harder. Now ſuch hard particles being heaped together, can ſcarce touch one another in more than a few points, and therefore muſt be ſeparable with much leſs force than is requiſite to break a ſolid particle, whoſe parts touch in all the ſpace, without any pores or interſtices to weaken their coheſion: How then ſhould ſuch very hard particles, only laid together, and touching only in a few points, ſtick together, and that ſo firmly as they do, without the aſſiſtance of ſomething that cauſes them to be attracted or preſſed towards each other?’

The ſame great author obſerves further, ‘That the ſmalleſt particles may cohere by the ſtrongeſt attractions, and compoſe bigger particles of weaker virtue; and many of theſe may cohere, and compoſe bigger particles, whoſe virtue is ſtill weaker, and ſo on for divers ſucceſſions, until the progreſſion end in the biggeſt particles; on which the operations in chymiſtry, and the colours of natural bodies, depend; and which, by cohering, compoſe bodies of a ſenſible magnitude. If the body is compact, and bends or yields inward to preſſion; without any ſliding of its parts; it is *hard*, and *elaſtic*; returning to its figure with a force ariſing from the mutual attraction of its parts. If the parts ſlide from one another, the body is *malleable* or *ſoft*. If they ſlip eaſily, and are of a fit ſize to be agitated by heat, and the heat is big enough to keep them in agitation, the body is *fluid*; and if it be apt to ſtick to things, it is *humid*. And the drops of every fluid affect a round figure by the mutual attraction of their parts, as the globe of the earth and ſea affects a round figure, by the mutual attraction of gravity of its parts.’ See ATTRACTION.

Again, ‘Since metals diſſolved in acids, attract but a ſmall quantity of the acid, their attractive force reaches but to a ſmall diſtance. Now, as in algebra, where affirmative quantities ceaſe, there negative ones begin; ſo in mechanics, where attraction ceaſes, there a repulſive virtue muſt ſucceed. That there really is ſuch a virtue, ſeems to follow, from the reflections and inflections of the rays of light; the rays being repelled by bodies in both theſe caſes, without the immediate contact of the reflecting or inflecting body. The ſame thing ſeems alſo to follow from the emiſſion of light; a ray, as ſoon as ſhaken off from a ſhining body by the vibrating motion of the parts of the body, and got beyond the reach of attraction, being driven away with exceeding great velocity: for that force, which is ſufficient to turn it back in reflection, may be ſufficient to emit it. It ſeems alſo to follow from the production of air and vapour; the particles, when they are ſhaken off from the body by heat or fermentation, ſo ſoon as they are beyond the reach of the attraction of the body, receding from it, and alſo from one another, with great ſtrength, and keeping at a diſtance, ſo as ſometimes to take up above a million of times more ſpace than they did before in the form of a denſe body. Which vaſt contraction and expanſion ſeems unintelligible, by feigning the particles of air to be ſpringy, and ramous, or rolled up like hoops, or by any other means than a repulſive power. The particles of fluids, which do not cohere too ſtrongly, and are of ſuch a ſmallneſs, as renders them moſt ſuſceptible of thoſe agitations which keep liquors in a fluor, are more eaſily ſeparated and rarefied into vapour, *i. e.* in the language of the chymiſts, they are *volatile*; rarefying with an eaſy heat, and condenſing with cold. But thoſe which are groſſer, and ſo leſs ſuſceptible of agitation, or cohere by a ſtronger attraction, are not ſeparated without a ſtronger heat, or perhaps not without fermentation. And theſe laſt are the bodies, which chymiſts call *fixed*, and being rarefied by fermentation, become true permanent air; thoſe particles receding with the greateſt force, and being moſt difficultly brought together, which upon contact cohere moſt ſtrongly. And becauſe the particles of permanent air are groſſer, and ariſe from denſer ſubſtances, than thoſe of vapours; thence it is that true air is more ponderous than vapour; and that a moiſt atmoſphere is lighter than a dry one, quantity for quantity. From the ſame repelling power it ſeems to be, that flies walk upon the water without wetting their feet; and that the object-glaſſes of long teleſcopes lie upon one another without touching; and that dry powders are difficultly made to touch one another ſo as to ſtick together, unleſs by melting them, or wetting them with water, which by exhaling may bring them together; and that two poliſhed marbles, which by immediate contact ſtick together, are difficultly brought ſo cloſe together, as to ſtick.’ See REPELLING, and REPULSION.

He further obſerves, ‘That all things conſidered, it ſeems probable, God, in the beginning, formed *Matter* in ſolid, maſſy, hard, impenetrable, moveable particles, of ſuch ſizes, figures, and with ſuch other properties, and in ſuch proportion to ſpace, as moſt conduced to the end for which he formed them; and that theſe primitive particles being ſolid, are incomparably harder than any porous bodies compounded of them; even ſo very hard, as never to wear, and break in pieces: no ordinary power being able to divide, what God himſelf made one in the firſt creation. While the particles continue entire, they may compoſe bodies of one and the ſame nature and texture in all ages; but ſhould they wear away, or break in pieces, the nature of things depending on them, would be changed. Water and earth, compoſed of old worn particles and fragments of particles, would not be of the ſame nature and texture now, with water and earth compoſed of entire particles in the beginning. And therefore that nature may be laſting, the changes of corporeal things are to be placed only in the various ſeparations, and new aſſociations and motions of theſe permanent particles; compound bodies being apt to break, not in the midſt of ſolid particles, but where thoſe particles are laid together, and touch in a few points.’

It ſeems farther, ‘That theſe particles have not only a *vis inertiæ*, accompanied with ſuch paſſive laws of motion, as naturally reſult from that force, but alſo that they are moved by certain active principles, ſuch as is that of gravity, and that which cauſeth fermentation, and the coheſion of bodies. Theſe principles are to be conſidered not as occult qualities, ſuppoſed to reſult from the ſpecific forms of things, but as general laws of nature, by which the things themſelves are formed; their truth appearing to us by phænomena, though their cauſes are not yet diſcovered.’ See PARTICLE; ſee alſo FERMENTATION, FIRMNESS, GRAVITATION, ELASTICITY, HARDNESS, FLUIDITY, SALT, ACID, &c.

Hobbes, Spinoſa, &c. maintain all the beings in the univerſe to be *material*, and their differences to ariſe from their different modifications, motions, &c. Thus *Matter* extremely ſubtile, and in a briſk motion, they conceive, may think; and ſo exclude all ſpirits out of the world. See SPIRIT.

Dr. Berkeley, on the contrary, argues againſt the exiſtence of *Matter*; and endeavours to prove, that it is a mere ens rationis; and has no exiſtence out of the mind: ‘Thus, ſays he, that neither our thoughts, paſſions, nor ideas, formed by the imagination, exiſt without the mind, is evident; nor is it leſs evident, that the various ſenſations or ideas imprinted on the ſenſe, however blended or combined together (that is, whatever objects they compoſe) cannot exiſt otherwiſe, than as in a mind perceiving them. This no man can doubt of, that attends to what is meant by the term *exiſt*, when applied to ſenſible things. Thus I ſay, the table I write on exiſts, *i. e.* I ſee and feel it, and if I were out of my ſtudy, I ſhould ſay it exiſted; meaning thereby, that if I were in my former ſituation, I ſhould ſee and feel it as before. Again, I ſay there was odour, *i. e.* I ſmelt it; a ſound, *i. e.* it was heard; a colour or touch, *i. e.* it was perceived by ſight or touch. This is the utmoſt that can be meant by ſuch expreſſions; for as to the abſolute exiſtence of any unthinking being, diſtinct from its being perceived, it is a chimæra. Their *eſſe* is *percipi*; nor is it poſſible they ſhould have any exiſtence out of the minds that perceive them. Again, what are hills and 'trees, *&c.* but things perceived by ſenſe; and what do we 'perceive, but our own ideas or ſenſations: and can any one of 'theſe, or any combination of them, exiſt unperceived? What 'are light and colours, heat and cold, extenſion and figure, 'but ſo many ſenſations, ideas, or impreſſions on the ſenſe? 'And is it poſſible, even in thought, to ſeparate theſe from 'perception? It is next to ſelf-evident therefore, that all the 'choir of heaven, and furniture of earth; in a word, all 'the bodies that compoſe the ſyſtem of the world, have not 'any ſubſiſtence out of a mind; their *eſſe* is nothing more 'than their being perceived: and therefore as long as they do 'not exiſt in me, *i. e.* are not perceived by me, nor any other 'created ſpirit; they have no ſhadow of exiſtence at all, un'leſs perhaps in the mind of ſome eternal ſpirit. It appears 'therefore with the light of an axiom, that there is not any 'other ſubſtance but ſpirit, *&c.*' See *Inquiry into principles of human knowledge.* See alſo EXTERNAL *World.*

Ætherial MATTER.	See the article	ÆTHERIAL.
Subtile MATTER		MATERIA *Subtilis.*
Quantity of MATTER.		QUANTITY.

MATTER *of Deed*, ſignifies a truth to be proved, though not by any record: by which it ſtands contra-diſtinguiſhed from

MATTER *of record*, which is that which may be proved by ſome *record.* See PRISONER.

If a man be ſued to an exigent, during the time he was in the king's wars; this is *Matter in deed*, and not *Matter of record:* and therefore he that will alledge this for himſelf, muſt come before the ſcire facias, or execution be awarded againſt him: for after that, nothing will ſerve but *Matter of record*; that is, ſome error upon the proceſs appearing upon record.

Foreign MATTER. See the article FOREIGN.

MATTINS*, the firſt part of the daily ſervice in the Romiſh church. See HOURS.

* The word comes from the Italian *Mattina*, or the French *Matin*, morning.

Mattins is ſometimes held early in the morning, ſometimes at midnight, and ſometimes the even before. And infirm people, even in monaſteries, are diſpenſed from attending *Mattins.*

MATULAM.—*Hydrops ad* MATULAM. See the article HYDROPS.

MATURANTIA, in medicine, *&c. ripeners*; or ſuch things as promote maturation. See RIPENERS, and SUPPURATION.

MATURATION, in pharmacy, a preparation of fruits, or other ſimples, gathered before their *Maturity*; to fit them to be eaten. See FRUIT, *&c.*

MAUNCH, the figure of an ancient ſleeve of a coat, ſo called by the heralds; and is born in many gentlemen's eſcutcheons: as in the earl of Huntingdon's.—See *Tab. Herald. fig.* 40.

MAUNDY, or MAUNDEY *Thurſday*, *Dies* MANDATI, the *Thurſday* before Eaſter; ſo called from the French *Mande*, i. e. *ſportula*; it being a cuſtom on that day to give a largeſſe or bounty to certain poor men, whoſe feet the king formerly waſhed, as a mark of humility, and in obedience to the command of Chriſt.

MAUSOLEUM*, a magnificent tomb, or funeral monument decorated with architecture and ſculpture, and inſcribed with an epitaph; erected in honour of ſome emperor, prince, or other illuſtrious perſon. See TOMB.

* The word comes from *Mauſolus*, the name of a king of Caria, to whom Artemiſia, his widow, erected a moſt ſtately monument, that has ſince been numbered among the wonders of the world; calling it from his name, *Mauſoleum.* See MONUMENT.

MAUSOLEUM, is alſo uſed to ſignify the decoration of a fictitious tomb, or catafalcha, in a funeral pomp.

MAW: See ABOMASUS.

MAXILLÆ, in anatomy, the *jaws*; or thoſe parts of an animal wherein the teeth are ſet, and which ſerve for maſticating the food. See MASTICATION, and TOOTH.

The *Maxillæ* are two in number, denominated from their ſituation, *ſuperior*, and *inferior.*

MAXILLA *ſuperior*, or the upper jaw, is immoveable in man, and all other animals we know of; excepting parrots, crocodiles, and the acus vulgaris, or gar-fiſh.—Vid. *Ray Synopſ. Piſ.* p. 109.

It conſiſts of eleven bones, joined to each other per harmoniam; five diſpoſed on each ſide, and one in the middle. Their names are the zygoma, os maxillare, os unguis, os naſi, os palati, and vomer: See ZYGOMA, *&c.* In this jaw are alveoli or ſockets for ſixteen teeth.—See *Tab. anat.* (*oſteol.*) *fig.* I. *lit. d.*

MAXILLA *inferior*, or the lower jaw, only conſiſts of two bones, which unite in the middle of the chin, by the intervention of a cartilage, which hardens as the child grows; and at length, about the age of ſeven years, becoming bony, joins the two bones into a continued one, reſembling the Greek υ.—See *Tab. anat.* (*oſteol.*) *fig.* I. *lit. e.*

It conſiſts of two tables, betwixt which is a ſpongy ſubſtance, in children medullary. The fore-part is ſhallow, juſt ſufficient to afford ſockets for ſixteen teeth. It has two proceſſes, the corone and condyloides, (which ſee) four holes or foramina for the paſſage of veſſels, and five pair of proper muſcles, *viz.* the crotaphytes or temporal, the maſſeter, biventer or digaſtricus, pterygoideus internus, and pterygoideus externus. See each in its place, CROTAPHYTES, MASSETER, *&c.*

MAXILLARY *Gland*, MAXILLARIS *Glandula*, a conſiderable gland of the conglomerate kind, ſituate on the inſide, under the lower jaw-bone, near the muſculus digaſtricus.

It diſcharges itſelf by ſeveral branches of ducts, which form one trunk that paſſes under the mylohyoideus, and meets with the *Maxillary gland* of the other ſide within the fore teeth of the lower jaw, having diſtinct orifices, with a papilla on each ſide the frænum linguæ. See GLAND, and MOUTH.

MAXIM, denotes an eſtabliſhed propoſition or principle.

In which ſenſe it amounts to much the ſame with axiom. See AXIOM.

Maxims, are a kind of propoſitions, which have paſſed for principles of ſcience; and which being ſelf-evident, have been ſuppoſed innate. See INNATE.

MAXIMUM, in mathematics, denotes the greateſt quantity attainable in any given caſe.

By which it ſtands oppoſed to *minimum.* See MINIMUM.

Methodus de MAXIMIS *&* *Minimis*, a method ſo called, in uſe among mathematicians, whereby they arrive at the greateſt or leaſt poſſible quantity attainable in any caſe.

If the ſemi-ordinates of any curve continually increaſe or decreaſe to ſome certain term, which once paſſed, they begin again to increaſe or decreaſe, the method whereby their *Maxima & minima*, i. e. their greateſt and leaſt ſtates is determined, is called the method *de Maximis & minimis*; which, it is true, may be uſed to determine other quantities that increaſe or decreaſe to any certain term; but then they muſt always be repreſented by the ſemi-ordinates of curves.

If a flowing quantity in an equation be propoſed to be determined to an extreme value—The rule is: Having put the equation into fluxions, let the fluxion of that quantity (whoſe extreme value is ſought) be ſuppoſed $=0$; by this means all thoſe members of the equation, in which it is found, will vaniſh, and the remaining ones will give the determination of the *Maximum* or *minimum* deſired.

The reaſon of the rule is, that every *Maximum* or *minimum* is in its own nature a ſtable quantity: To determine therefore any flowing quantity to a *Maximum* or *minimum*, is to make it (inſtead of a flowing) a permanent one; but the fluxion of a permanent quantity is equal to nothing.—This we ſhall illuſtrate by an example or two.

To determine the greateſt or leaſt applicate in an algebraic curve. Since in curves that have a *Maximum* and a *minimum* the tangent T M (*Tab. analyſis, fig.* 4, and *fig.* 26.) degenerates at length into D E, and becomes parallel to the axis, and ſo the perpendicular M H coincides with the greateſt or leaſt applicate C G; in the caſe of *Maximum* and *minimum*, the ſub-tangent T P becomes infinite, and the ſub-normal P H equal to nothing, but $PH=ydy:dx$. If then $ydy:dx=0$; we ſhall find $dy=0$, and becauſe of $PT=ydx:dy=\infty$ (the note of infinity) $dx=\infty$.

It is poſſible for the tangent H G (*fig.* 5.) to lie directly againſt the ſemi-ordinate G C; in which caſe the ſub-tangent P T is equal to nothing, but the ſubnormal P H infinite. But $PT=ydx:dy=0$; therefore if $ydx:dy=0$, we ſhall have $dx=0$; or becauſe of $PH=ydy:dx=\infty$, we find $dy=\infty$. both dx and y being, in reſpect of dy, infiniteſimals. From the equation of the curve therefore we are to find the value of dy, which is to be made equal either to nothing, or to infinity, that we may have the value of the abſciſſe, to which the greateſt applicate is co-ordinate.

To cut a right line A B (*fig.* 6.) in ſuch a manner in D, that the rectangle A D and D B ſhall be the greateſt that can poſſibly be thus conſtructed. Let $AB=a$, $AD=x$, then will $DB=a-x$; conſequently $AD.DB=ax-xx$ ſome *Maximum*; and hence its differential will be equal to nothing, as being conceived at a circle, to which

$$ax-xx=yy.$$

Wherefore $adx-2xdx=2ydy=0$

$$a-2x=0$$

$$\tfrac{1}{2}a=x.$$

The line A B therefore is to be cut into two equal parts; and the ſquare is the greateſt of all rectangles, whoſe altitudes and baſes, taken together, are equal to each other.

MAY*, MAIUS, the fifth month in the year, reckoning from the firſt of January; and the third, counting the year to begin with March, as the Romans anciently did. See MONTH, and YEAR.

* It was called *Maius* by Romulus, in reſpect to the ſenators and nobles of his city, who were named *Majores*; as the following month was called *Junius*, in honour of the youth of Rome, *in honorem Juniorum*, who ſerved him in the war: though others will have it to have been thus called from *Maia*, the mother of Mercury, to whom they offered ſacrifice on that day; and Papias derives it from *Madius, eo quod tunc terra madeat.*

In this month the ſun enters Gemini, and the plants of the earth begin to flower.

The month of *May* was under the protection of Apollo; and alſo they kept the feſtival of Bona Dea, that of goblins, called *Lemuria*; and the ceremony of Regifugium, or the expulſion of the kings. See LEMURIA, &c.

The vulgar have a great opinion of the virtues of *May*-dew, and *May*-butter. See DEW.

The month of *May* has ever been eſteemed favourable to love; and yet the ancients, as well as many of the moderns, look on it as an unhappy month for marriage: The reaſon may perhaps be referred to the feaſt of Lemures, which was held in it. Ovid alludes to this in the fifth of his Faſti, when he ſays,

Nec viduæ tædis eadem, nec virginis apta
Tempora; quæ nupſit, non diuturna fuit;
Hac quoque de cauſa, ſi te proverbia tangunt,
Menſe malas Maio *nubere vulgus erit.*

MAYHEM. See the article MAHIM.

Appeal of MAYHEM. See the article APPEAL.

MAYL, in falconry, ſignifies to pinion the wings of a hawk. See HAWK, and FALCON.

MAYOR*, or MAIOR, the chief magiſtrate, or governour in the cities, and moſt corporation-towns of England; choſen annually by his peers out of the number of the aldermen. See ALDERMAN.

* The word, according to Verſtegan, comes from the ancient Engliſh *maier*, able, potent, of the verb *may*, or can.

The *Mayor* of the place is the king's lieutenant, and with the aldermen and common-council, can make laws, called *Bilaws*, for the government of the place. See BILAWS. He has alſo the authority of a kind of judge, to determine matters, and to mitigate the rigour of the law.

King Richard I, *A. D.* 1189, firſt changed the bailiffs of London into *Mayors*; by whoſe example others were afterwards appointed. See PORTREVE, BAILIFF, &c.

MAYOR's *Court*. See the article COURT.

MEAD, a wholeſome, agreeable liquor, prepared of honey and water. See DRINK, HONEY, &c.

One of the beſt methods of preparing *Mead* is as follows.—Into twelve gallons of water, ſlip the whites of ſix eggs; mixing theſe well together, and to the mixture adding twenty pounds of honey. Let the liquor boil an hour, and when boiled, add cinamon, ginger, cloves, mace, and a little roſemary. As ſoon as it is cold, put a ſpoonful of yeaſt to it, and tun it up, keeping the veſſel filled as it works; when it has done working, ſtop it up cloſe, and when fine, bottle it off for uſe.

MEAN, the *Middle* between two extremes. See MEDIUM, and EXTREME.

Thus we ſay *mean* motion of a planet; its *mean* diſtance, &c. meaning a motion or diſtance, which as far exceeds the leaſt diſtance or motion, as it is exceeded by the greateſt. See MOTION, DISTANCE, ANOMALY, and APOGEE.

MEAN, in logic. See the article MEDIUM.

MEAN *proportion*. See EXTREME *Proportion*.

MEAN time. See the article TIME.

MEAN *axis*, in optics. See the article AXIS.

MEAN *diameter* in gauging. See DIAMETER.

MEAN, in law, refers either to time or dignity.—Thus in the firſt ſenſe, we ſay, his action was *mean* betwixt the diſſeiſin made to him and his recovery, *i. e.* in the interim.

In the ſecond ſenſe, we ſay, there is Lord *Mean*, or *Meſne*, that is, a lord of a manor, who has tenants that hold of him, yet himſelf holds of the king. See LORD, and MESNE.

MEASLES, *Morbilli*, in medicine, a cutaneous diſeaſe, conſiſting in a general appearance of eruptions, not tending to ſuppuration; accompanied with a fever.

This diſtemper ſeems to bear a great affinity to the ſmall-pox; the ſymptoms being in many reſpects the ſame, the cauſe nearly the ſame, and the regimen and cure not much different. See *Small*-Pox.

The eruptions uſually appear about the fourth day, like flea-bites, over the whole body; but thicker and redder, and with greater inflammation, than thoſe of the ſmall-pox, and vaniſh in four or ſix days after appearance; being, when at the height, not larger than pins heads.

The *Meaſles* is more ſickly than dangerous; though it often inclines to conſumptions by a cough which it leaves behind.

MEASNE. See the article MESNE.

MEASURE, MENSURA, in geometry, denotes any certain quantity aſſumed as one, or unity, to which the ratio of other homogeneous, or ſimilar quantities, is expreſſed. See MEASURING.

This definition is ſomewhat more agreeable to practice than that of Euclid, who defines *Meaſure* a quantity, which being repeated any number of times, becomes equal to another.—Which only anſwers to the idea of an arithmetical *Meaſure*, or quota part. See ALIQUOT-PART.

MEASURE *of an angle*, is an arch, deſcribed from the vertex *a*, (*Tab. Geomet. fig.* 10.) in any place between its legs; as at *df*. Hence, angles are diſtinguiſhed by the ratio of the arches, deſcribed from the vertex, between the legs, to the peripheries.

Angles then are diſtinguiſhed by thoſe arches; and the arches are diſtinguiſhed by their ratio to the periphery.—Thus the angle *lac* is ſaid to be of ſo many degrees, as in the arch *fd*. See ANGLE.

MEASURE *of a figure*, or plain ſurface, is a ſquare, whoſe ſide is one inch, foot, yard, or other determinate length.

Among geometricians, it is uſually a rod, called a *ſquare rod*, divided into ten ſquare feet, and the ſquare feet into ſquare digits.—Hence ſquare *Meaſures*. See SQUARE.

MEASURE *of a line*, is any right line taken at pleaſure, and conſidered as unity. See LINE.

The modern geometricians uſe a decempeda, or rod, divided into ten equal parts, called *feet*. The feet they ſubdivide into ten digits, the digit into ten lines, &c.

This decimal diviſion of the *Meaſure* was firſt introduced by Stevinus, probably from the example of Regiomontanus: The index or character of the decempedæ he made 0, that of feet 1, of digits 2, of lines 3, &c. which, in regard the *Meaſure* was ſubdivided in a decuple ratio, were the logarithms of the diviſion. Bayer, in lieu of theſe, expreſſed the logarithms by the Roman characters; *v. gr.* 5 perches, 4 feet, 3 digits, and 2 lines, he expreſſed thus; $5^{\circ}, 4', 3'', 2'''$. It is frequently moſt commodious to ſeparate the integers, or rods, from the fractions by a point; thus inſtead of $5^{\circ}, 4', 3'', 2'''$; to write 5.432. F. Noel obſerves, that among the Chineſe, the decimal diviſion obtains in their common *Meaſures*, and even in their weights. See DECIMAL, DEGREE, &c.

Line of MEASURES. See the article LINE.

MEASURE *of the maſs* or *quantity of matter*, in mechanics, is its weight; it being apparent, that all the matter which coheres and moves with a body, gravitates with it: and it being found by experiment, that the gravities of homogeneal bodies are in proportion to their bulks; hence while the maſs continues the ſame, the weight will be the ſame, whatever figure it put on: its abſolute weight, we mean; for as to its ſpecific weight, it varies as the quantity of ſurface varies. See WEIGHT, GRAVITY, &c.

MEASURE *of a number*, in arithmetic, is ſuch a number as divides another, without leaving any fraction; thus 9 is a *Meaſure* of 27. See NUMBER.

MEASURE *of a ſolid*, is a cube, whoſe ſide is one inch, foot, yard, or other determined length.

Among geometricians, it is ſometimes a rod or perch, called a *cubic perch*; divided into cubic feet, digits, &c.—Hence cubic *Meaſures*, or *Meaſures* of capacity. See CUBE, and TIMBER.

MEASURE *of velocity*, in mechanics, is the ſpace paſſed over by a moving body in any given time. See MOTION.

To *meaſure* a velocity, therefore, the ſpace muſt be divided into as many equal parts, as the time is conceived to be divided into. The quantity of ſpace anſwering to ſuch an article of time, is the *Meaſure* of the velocity. See VELOCITY.

MEASURE, in a legal, commercial, and popular ſenſe, denotes a certain quantity or proportion of any thing bought, ſold, valued, or the like.

Meaſures, then, are various, according to the various kinds, and dimenſions of the things *meaſured*. Hence ariſe

Lineal or *longitudinal* MEASURES for lines, or lengths:
Square MEASURES for areas, or ſuperficies: and
Solid or *cubic* MEASURES for bodies, and their capacities.

All which again are very different in different countries, and in different ages, and even many of them for different commodities. Whence ariſe other diviſions of *domeſtic* and *foreign Meaſures*, *ancient* and *modern* ones, *dry* and *liquid Meaſures*, &c. The buſineſs of *Meaſures* has been ſo confuſedly, and imperfectly delivered by Engliſh writers, that the reader will not be diſpleaſed with the pains we have here taken to diſembroil, and ſupply it.—Under this head he will find enumerated the various, general, ſtanding *Meaſures*, long, ſquare, and cubic, now or heretofore in uſe, with their proportions and reductions; for particulars, he muſt be contented to be referred to the particular heads; as FOOT, DIGIT, ELL, TUN, GALLON, BUSHEL, PERCH, LEAGUE, FURLONG, &c.

Long MEASURES, or MEASURES *of application.*—*The Engliſh Standard Long* MEASURE, for commerce, or that whereby the quantities of things are ordinarily eſtimated in the way of trade, is the yard; containing three Engliſh feet: equal to three Paris feet, 1 inch $\frac{3}{12}$ of an inch; or $\frac{7}{9}$ of a Paris ell.—Its diviſions are the foot, ſpan, palm, inch, and barley-corn, which ſee under their reſpective heads: FOOT, INCH, &c.—Its multiples are the pace, fathom, pole, furlong, and mile. See MILE, FURLONG, POLE, &c.—The proportions theſe ſeverally bear to each other, will be expreſſed in a table for the purpoſe.—*Aſſay of Meaſures.* See ASSAY.

The French ſtandard MEASURE, for commerce, is the aune or ell, containing 3 Paris feet, 7 inches, 8 lines; or one yard, $\frac{2}{7}$ Engliſh; the Paris foot royal exceeding the Engliſh by $\frac{68}{1000}$ parts, as in one of the following tables. This ell is divided two ways; *viz.* into halves, thirds, ſixths, and twelfths; and into quarters, half-quarters, and ſixteenths.

This ell holds throughout the greateſt part of France; excepting at Troyes in Champagne; at Arc in the Barrois; in ſome parts of Picardy and Burgundy, where the ell only contains two feet, five inches, one line; in Bretagne, where it contains four feet, two inches, eleven lines; and at St. Genoux in Berry, where it exceeds the Paris ell by eight lines. See ELL.

But in Languedoc, particularly at Marſeilles, Montpellier, Toulouſe, in Provence, Guienne, they meaſure by the canna, which at Toulouſe and in Guienne contains five Paris feet, five inches, and ſix lines; or one Paris ell and a half. At Montpellier, and throughout the lower Languedoc, as alſo in Provence and Avignon, and even Dauphine, the canna is ſix feet and nine lines; or one Paris ell, two thirds. See CANNA.

The Standard MEASURE *in Holland*, *Flanders*, *Sweden*, a good part of *Germany*, many of the Hans-towns, at *Dantzick* and *Hambourg*; and at *Geneva*, *Francfort*, &c. is likewiſe the ell: But the ell in all theſe places differs from the Paris ell. In Holland, it contains one Paris foot, eleven lines, or four ſevenths of the Paris ell. The Flanders ell contains two feet, one inch, five lines and a half line, or ſeven twelfths of the Paris ell. The ell of Germany, Brabant, *&c.* is equal to that of Flanders. See ELL.

The Italian MEASURE is the bracchio, brace, or fathom; which obtains in the ſtates of Modena, Venice, Florence, Lucca, Milan, Mantua, Bologna, *&c.* but of different lengths. At Venice it contains one Paris foot, eleven inches, three lines, or eight fifteenths of the Paris ell. At Bologna, Modena, and Mantua, the brace is the ſame as at Venice. At Lucca, it contains one Paris foot nine inches, ten lines, or half a Paris ell. At Florence, it contains one foot, nine inches, four lines, or forty nine hundredths of a Paris ell. At Milan, the brace for meaſuring of ſilks is one Paris foot, ſeven inches, four lines, or four ninths of a Paris ell: That for woollen cloths, is the ſame with the ell of Holland. Laſtly, at Bergama, the brace is one foot, ſeven inches, ſix lines, or five ninths of a Paris ell. The uſual *Meaſure* at Naples, however, is the canna, containing ſix feet, ten inches, and two lines, or one Paris ell, and fifteen ſeventeenths. See FATHOM, CANNA, *&c.*

The Spaniſh MEASURE, is the vara, or yard, in ſome places called the barra; containing ſeventeen twenty-fourths of the Paris ell.—But the *Meaſure* in Caſtile and Valencia is the pan, ſpan, or palm; which is uſed, together with the canna, at Genoa.—In Arragon, the vara is equal to a Paris ell and a half, or five feet, five inches, ſix lines.

The Portugueze MEASURE is the cavedos, containing two feet, eleven lines, or four ſevenths of the Paris ell; and the vara, an hundred and ſix whereof make an hundred Paris ells.

The Piedmonteſe MEASURE is the ras, containing one Paris foot, nine inches, ten lines, or half a Paris ell.

In Sicily, their *Meaſure* is the canna; the ſame with that of Naples.

The Muſcovite MEASURES are the cubit, equal to one Paris foot, four inches, two lines; and the arcin, two whereof are equal to three cubits.

The Turkiſh and *Levant* MEASURE, are the picq, containing two feet, two inches, and two lines; or three fifths of the Paris ell.—The Chineſe *Meaſure*, the cobre; ten whereof are equal to three Paris ells.—In Perſia, and ſome parts of the Indies, the gueze, whereof there are two kinds; the royal gueze, called alſo the *gueze monkelſer*, containing two Paris feet, ten inches, eleven lines, or four fifths of the Paris ell; and the ſhorter gueze, called ſimply *gueze*, only two thirds of the former. —At Goa and Ormus, the *Meaſure* is the vara, the ſame with that of the Portugueze, having been introduced by them.—In Pegu, and ſome other parts of the Indies, the cando or candi, equal to the ell of Venice.—At Goa and other parts, they uſe a larger cando, equal to ſeventeen Dutch ells; exceeding that of Babel and Balſora by $\frac{7}{8}$ *per centum*, and the vara by $6\frac{1}{2}$. —In Siam, they uſe the ken, ſhort of three Paris feet by one inch. The ken contains two ſoks, the ſok two keubs, the keub twelve nious, or inches; the niou to be equal to eight grains of rice, *i. e.* to about nine lines.—At Camboia, the haſter; in Japan, the tatam; and the ſpan on ſome of the coaſts of Guinea.

The Rhinland or Leyden foot (12 whereof make the Rhinland perch) ſuppoſed	696
The Engliſh foot	675½
The Paris foot	720
The Amſterdam foot, from that of Leyden by Snellius	629
The Daniſh foot (two whereof make the Daniſh ell)	701$\frac{8}{10}$
The Swediſh foot	658¼
The Bruſſels foot	609⅗
The Dantzic foot, from Hevelius's Selenographia	636
The Lyons foot, by M. Auzout	757⅔
The Bologna foot, by the ſame	843
The braccio of Florence, by the ſame, and father Merſenne	1290
The palm of the architects at Rome, according to the obſervations of Meſſ. Picard and Auzout	494¼
The Roman foot in the capitol, examined by Meſſ. Picard and Auzout	653 or 653½
The ſame from the Greek foot	652
From the vineyard Mattei	657½
From the palm	658¾
From the pavement of the Pantheon, ſuppoſed to contain 10 Roman feet	653
From a ſlip of marble in the ſame pavement, ſuppoſed to contain 3 Roman feet	650
From the pyramid of Ceſtius, ſuppoſed to contain 65 Roman feet	653½
From the diameters of the columns in the arch of Septimius Severus	653⅓
From a ſlip of porphyry in the pavement of the Pantheon	653⅓

Square or *ſuperficial* MEASURES.—*Engliſh ſquare or ſuperficial Meaſures*, are raiſed from the yard of 36 inches, multiplied into itſelf; and this producing 1296 ſquare inches in the ſquare yard, the diviſions of this are ſquare feet, and inches; and the multiples, poles, roods, and acres; as in the table.

French ſquare Meaſures, are regulated by 12 ſquare lines in the inch ſquare; 12 inches in the foot, 22 feet in the perch, and 100 perches in the arpent or acre.

*Engliſh Square-*MEASURES

Grecian ſquare Meaſures, were the plethron, or acre, by ſome ſaid to contain 1444, by others 10000 ſquare feet: and aroura, the half of the plethron. The aroura of the Egyptians was the ſquare of 100 cubits.

Roman Square-Measures *reduced to Engliſh.*

The integer was a Jugerum or acre, which they divided like the libra, or as: Thus

Cubical Measures, or Measures *of capacity for liquids.*—*Engliſh liquid Meaſures*, were originally raiſed from troy weight; it being enacted by ſeveral ſtatutes, that eight pounds troy of wheat, gathered from the middle of the ear, and well dried, ſhould weigh a gallon of wine-*Meaſure*; the diviſions and multiples whereof were to form the other *Meaſures*: At the ſame time it was ordered, that there ſhould be but one *liquid Meaſure* in the kingdom: yet cuſtom has prevailed, and there having been introduced a new weight, *viz.* the avoirdupois, we have now a ſecond ſtandard gallon adjuſted thereto, and therefore exceeding the former in the proportion of the avoirdupois weight to troy-weight. From this latter ſtandard are raiſed two ſeveral *Meaſures*, the one for ale, the other for beer.

The ſealed gallon at Guildhall, which is the ſtandard for wines, ſpirits, oils, &c. is ſuppoſed to contain 231 cubic inches; on which ſuppoſition, the other *Meaſures* raiſed therefrom, will contain as in the following tables; yet, by actual experiment made in 1688, before the lord mayor and the commiſſioners of exciſe, it was only found to contain 224 cubic inches: It was however agreed to continue the common ſuppoſed contents of 231 cubic inches; ſo that all computations ſtand on their old footing.—Hence, as 12 is to 231, ſo is 14$\frac{12}{20}$ to 281$\frac{1}{2}$ the cubic inches in the ale gallon: but in effect the ale quart contains 70$\frac{1}{2}$ cubic inches; on which principle, the ale and beer gallon will be 282 cubic inches.

The ſeveral diviſions and multiples of theſe *Meaſures*, and their proportions, are exhibited in the tables underneath.

French liquid Measures. At Paris, and in a great part of the kingdom, the *Meaſures*, to begin with the ſmalleſt, are, the poſſon, which contains ſix cubic inches; two poſſons make the demi-ſeptier; two demi-ſeptiers, the ſeptier or chopine; two chopines, a pint; two pints, the quart or pot; four quarts, the gallon, or ſeptier of eſtimation; and thirty-ſix ſeptiers, the muid, which is ſubdivided into two demi-muids, four quarter-muids, and eight half-quarter-muids. See Muid, Septier, Quart, Chopine, &c. From the quart are likewiſe raiſed the *Meaſures* uſed in other parts, as the queue uſed in Orleans, Blois, &c. containing a Paris muid and a half, or four hundred and twenty pints; the tun uſed at Bayonne and Bourdeaux, conſiſting of four bariques, and equal to three Paris muids; at Orleans, to two: ſo that the firſt tun contains eight hundred and ſixty-four pints, and the ſecond five hundred and ſeventy-ſix. See Tun. The demi-queue, uſed in Champagne, ninety-ſix quarts; the pipe, uſed in Anjou and Poictou, containing two buſſards, equal to two demi-queues of Orleans, &c. or a muid and a half of Paris, or four hundred and thirty two pints. See Pipe. The millerolle uſed in Provence, containing ſixty-ſix Paris pints; and the poincon uſed at Nantes, in Touraine and the Bleſſois, equal to half the Orleans tun. The poincon uſed at Paris, is the ſame with the demi-queue.

Dutch liquid Measures. At Amſterdam, their *Meaſures*, to begin with the diminutions, are, mengles, or bottles, equal to French pots, and containing two pounds, four ounces, marc, of an ordinary liquor. The mengle is divided into two pints, four half pints, eight muſſies, ſixteen half-muſſies, &c. Seven hundred and ſeventy mengles make their tun. The viertel, or quarter, conſiſts of five mengles, and one ſixth of a mengle. The wine viertel is juſt ſix mengles. The ſtekan, or ſtekaimen, contains ſixteen mengles. The anker contains two ſtekans; and four ankers, the awn. For oils they uſe the tun, which contains ſix awms, or ahms; equal to ſixteen hundred Paris pints. See Tun.

Spaniſh liquid Measures, are the bota, containing between thirty-ſix and thirty ſeven Dutch ſtekans, holding about a thouſand weight. The bota conſiſts of thirty arrobas, each weighing twenty-eight pounds. Each arroba is again divided into eight azumbres, and the azumbre into four quarts. The pipe conſiſts of eighteen arrobas.

Portugueſe liquid Measures, are botas, almudes, cavadas, quartas; and for oil, alqueirs or cantars. The Portugueſe bota is ſomewhat ſmaller than the Spaniſh; the latter being equal to thirty-ſix or thirty-ſeven ſtekans, and the former only to twenty-five or twenty-ſix. The quartas is one fourth of the cavadas. The cavadas, or cavado, is the ſame with the Dutch mengle. Six cavadas make an alquier, and two alquiers one almude, or almoud; twenty-ſix almudes, a bota.

Italian liquid Measure; at Rome, are the boccale, or pot, containing a little more than a Paris pint. Seven boccales and a half make the rubbo, and thirteen rubbos and a half, the brenta; ſo that the brenta contains ninety-ſix boccales.—At Florence, the ſtaro or ſtaio, containing three bariles, and the barile twenty fiaſcos or flaſks, nearly equal to Paris pints.—At Verona, they uſe the baſſa, ſixteen whereof make a brenta; the brenta contains ninety-ſix boccales, or thirteen rubbos and a half.—At Venice, the amphora, containing two bottes; the botte, four bigoncios; the bigoncio, four quarts; the quart, four tiſchaufferas. The Venetian botte is again divided into moſtachios, ſeventy-ſix whereof make the amphora.—At Ferrara, the maſtilly, containing eight ſechios.—In Iſtria, ſechios; ſix whereof make the urna. In Calabria, and Apulia, pignatolis, equal to French pints; thirty-two pignatolis make the ſtaro or ſtaio; and ten ſtaros, the ſalma.

German liquid Measures. The fuder is uſed almoſt throughout all Germany, but with ſome difference in its length, as well as its ſub-diviſions. The fuder is ſuppoſed the load of a cart with two horſes. Two fuders and a half make the roeder; ſix awms, the fuder; twenty fertels, the awm; and four maſſems, or maaſſes, the fertel: ſo that the roeder contains one thouſand two hundred maaſſes, the fuder four hundred and eighty, the awm eighty, and the fertel forty one.—At Nuremberg, the diviſion of the fuder is into twelve heemers, and the heemer into ſixty four maaſſes.—At Vienna, they divide the fuder into thirty-two heemers, the heemer into thirty-two achtelings, and the achteling into four ſelitins. The awm, there, is eighty maaſſes; the fertel, called alſo *ſchrewe*, four maaſſes; and the driclinck twenty-four heemers.—At Auſbourg, the fuder is divided into eight jez; the jez into two muids, or twelve beſons; the beſon into eighty maaſſes, which makes ſeven hundred ſixty-eight maaſſes in the fuder, as in that of Nuremberg.—At Heidelberg, the fuder is divided into ten awms; the awm into twelve vertels; and the vertel into four maaſſes.—In Wirtemberg, the fuder is divided into ſix awms; the awm into ſixteen yunes; the yune into ten maaſſes.

Liquid Measures *on the coaſts of Barbary.* At Tripoli, &c. they uſe the rotolo, or rotoli; thirty-two whereof make the matuli.—At Tunis, forty-two of the rotoli of Tripoli, make a matara, or mataro; and the other places on the ſame coaſt uſe nearly the ſame meaſures.—It may be here obſerved, that moſt, if not all the eaſtern nations, with whom the Europeans traffic, have not any ſuch thing as *Meaſures* of capacity, whether for things liquid or dry; but that they ſell every thing, even liquors, by the weight. We may, however, rank among the number of *liquid Meaſures*, the cocos and canan of Siam. The firſt are the cocos-ſhells cleared of their kernel. And ſince theſe are not all of the ſame capacity, they meaſure them with cauris, or little ſhells found in the Maldives; which alſo ſerve for money in ſome ſtates of the Indies. Some cocos hold a thouſand cauris, and ſome only five hundred. Above the cocos is the canan, a little *Meaſure* uſed in the ſame country, and called by the Portugueſe, *choup*; holding about a Paris quart.

Cubical MEASURES *of capacity for things dry.—Engliſh dry or corn* MEASURES, are raiſed from the Wincheſter gallon; which contains $272\frac{1}{4}$ ſolid inches, to hold of pure running or rain-water, nine pound, thirteen ounces. This ſeems to ſtand on the foot of the old wine gallon, of 224 cubic inches; 12 being to $14\frac{12}{25}$, as 224 to $272\frac{1}{4}$. Yet by an act of parliament, made 1697, it is decreed, that a round buſhel, eighteen inches and a half wide, and eight deep, is a legal Wincheſter buſhel. But ſuch a veſſel will only hold 2150.42 cubic inches; conſequently the gallon will contain $268\frac{4}{5}$ cubic inches. The diviſions and multiples are as in the table following.

French dry MEASURES, are the litron, buſhel, minot, mine, ſeptier, muid, and tun. The litron is divided into two demi-litrons, and four quarter litrons, and contains thirty-ſix cubic inches of Paris. By ordonnance, the litron is to be three inches and a half high; and three inches, ten lines broad. The litron for ſalt is larger, and is divided into two halves, four quarters, eight demi-quarters, and ſixteen meſurettes.—The buſhel is different in different juriſdictions. At Paris, it is divided into demi-buſhels; each demi-buſhel into two quarts; the quart into two half-quarts; and the half-quart into two litrons: ſo that the buſhel contains ſixteen litrons. By ordonnance, the Paris buſhel is to be eight inches, two lines and a half high; and ten inches broad, or in diameter, within-ſide. The minot conſiſts of three buſhels; the mine of two minots, or ſix buſhels; the ſeptier of two mines, or twelve buſhels; and the muid of twelve ſeptiers, or a hundred forty-four buſhels. *The buſhel for oats* is eſtimated double that of any other grain; ſo that there go twenty-four buſhels to make the ſeptier, and two hundred eighty-eight to make the muid. It is divided into four picotins; the picotin containing two quarts, or four litrons. *The buſhel for ſalt* is divided into two half-buſhels, four quarters, eight half-quarters, and ſixteen litrons; four buſhels make a minot, ſixteen a ſeptier, and a hundred ninety-two a muid. *The buſhel for wood* is divided into halves, quarters, and half-quarters. Eight buſhels make the minot, ſixteen a mine; twenty mines, or three hundred and twenty buſhels the muid. For *plaiſter*, twelve buſhels make a ſac, and thirty-ſix ſacs a muid. For *lime*, three buſhels make a minot, and forty-eight minots a muid. See BUSHEL.—The minot is, by ordonnance, to be eleven inches, nine lines high; and fourteen inches eight lines in diameter. The minot is compoſed of three buſhels, or ſixteen litrons; four minots make a ſeptier, and forty-eight a muid.—The mine is no real veſſel, but an eſtimation of ſeveral others. At Paris, the mine contains ſix buſhels, and twenty-four make the muid. At Rouen, the mine is four buſhels; and at Dieppe, eighteen mines make a Paris muid. See MUID.—The ſeptier differs in different places: At Paris it contains two mines, or eight buſhels; and twelve ſeptiers the muid. At Rouen, the ſeptier contains two mines, or twelve buſhels. Twelve ſeptiers make a muid at Rouen, as well as Paris; but twelve of the latter are equal to fourteen of the former. At Toulon, the ſeptier contains a mine and a half; three of which mines make the ſeptier of Paris. See SEPTIER.—The muid, or muy, of Paris, conſiſts of twelve ſeptiers; and is divided into mines, minots, buſhels, &c. That for oats is double that for other grain; *i. e.* contains twice the number of buſhels. At Orleans, the muid is divided into mines; but thoſe mines only contain two Paris ſeptiers and a half. See MUID.—In ſome places they uſe the tun in lieu of the muid; particularly at Nantes, where it contains ten ſeptiers of ſixteen buſhels each, and weighs about three thouſand three hundred pounds. Three of theſe tuns make twenty-eight Paris ſeptiers. At Rochel, &c. the tun contains forty-two buſhels, and weighs two *per cent.* leſs than that of Nantes. At Breſt, it contains twenty buſhels, is equal to ten Paris ſeptiers, and weighs about two thouſand two hundred and forty pounds. See TUN.

Dutch, *Swediſh*, *Poliſh*, *Pruſſian*, and *Muſcovite dry* MEASURES. In theſe places they eſtimate their dry things on the foot of the *laſt*, *leſt*, *leth*, or *lecht*; ſo called according to the various pronunciations of the people who uſe it.—In Holland, the laſt is equal to nineteen Paris ſeptiers, or thirty-eight Bourdeaux buſhels, and weighs about four thouſand five hundred ſixty pounds; the laſt they divide into twenty-ſeven mudes, and the mude into four ſchepels.—In Poland, the laſt is forty Bourdeaux buſhels, and weighs about four thouſand eight hundred Paris pounds.—In Pruſſia, the laſt is a hundred thirty-three Paris ſeptiers.—In Sweden and Muſcovy, they meaſure by the great and little laſt; the firſt containing twelve barrels, and the ſecond half as many. See LAST—In Muſcovy, they likewiſe uſe the chefford, which is different in various places: That of Archangel is equal to three Rouen buſhels.

Italian dry MEASURES. At Venice, Leghorn, and Lucca, they eſtimate their dry things on the foot of the ſtaro or ſtaio: the ſtaro of Leghorn weighs fifty-four pounds: an hundred and twelve ſtaros, and ſeven eighths, are equal to the Amſterdam laſt.—At Lucca, a hundred and nineteen ſtaros make the laſt of Amſterdam.—The Venetian ſtaro weighs a hundred twenty-eight Paris pounds; the ſtaro is divided into four quarters. Thirty-five ſtaros, and one fifth, or a hundred and forty quarters, and four fifths, make the laſt of Amſterdam.—At Naples, and other parts, they uſe the tomolo, or tomalo, equal to one third of the Paris ſeptier. Thirty-ſix tomoli and a half, make the carro; and a carro and a half, or fifty-four tomoli, make the laſt of Amſterdam.—At Palermo, ſixteen tomoli make the ſalma; and four mondili, the tomolo. Ten ſalmas, and three ſevenths, or a hundred and ſeventy one tomoli, and three ſevenths, make the laſt of Amſterdam.

Flemiſh dry MEASURES. At Antwerp, &c. they meaſure by the viertel; thirty-two and a half whereof, make nineteen Paris ſeptiers.—At Hambourg, the ſcheffel; ninety whereof make nineteen Paris ſeptiers.

Spaniſh and Portugueſe dry MEASURES. At Cadiz, Bilboa, and St. Sebaſtian, they uſe the fanega, twenty-three whereof make the Nantes, or Rochel tun, or nine Paris ſeptiers and a half: though the Bilboa fanega is ſomewhat larger, inſomuch that twenty-one fanegas make a Nantes tun.—At Seville, &c. they uſe the anagros, containing a little more than the Paris mine; thirty-ſix anagros make nineteen Paris ſeptiers.—At Bayonne, &c. the concha; thirty whereof are equal to nine Paris ſeptiers and a half.—At Liſbon, the alquier, a very ſmall *Meaſure*, two hundred and forty whereof make nineteen Paris ſeptiers, ſixty the Liſbon muid.

The uſual MEASURE *of wood for firing*, is the cord; four feet high, as many broad, and eight long; divided into two half cords, called *ways*, and by the French, *membrures*, from the pieces ſtuck upright to bound them; or *voyes*, as being ſuppoſed half a waggon load. See CORD.

The MEASURE *for horſes*, is the hand, or handful; which by the ſtatute contains four inches. See HAND, and HORSE.

MEASURE, is alſo uſed to ſignify the cadence, and time obſerved in poetry, dancing, and muſic, to render them regular, and agreeable. See CADENCE, &c.

The different *Meaſures* or metres, in poetry, are the different manners of ordering and combining the quantities, or the long and ſhort ſyllables. Thus hexameter, pentameter, iambic, ſapphic verſes, &c. conſiſt of different *Meaſures*. See METER, QUANTITY, VERSE, &c.

In Engliſh verſes, the *Meaſures* are extremely various and arbitrary, every poet being at liberty to introduce any new form he pleaſes.—The moſt uſual are, the heroic, generally conſiſting of five long, and five ſhort ſyllables; verſes of four feet; and of three feet, and a cæſura or ſingle ſyllable.

The ancients, by variouſly combining and tranſpoſing their quantities, made a vaſt variety of different *Meaſures*. Of words, or rather feet of two ſyllables, they formed a ſpondee, conſiſting of two long ſyllables; a pyrrhic, of two ſhort ſyllables; a trochee, of a long and a ſhort ſyllable; an iambic, of a ſhort and a long ſyllable. See SPONDEE, PYRRHICHIUS, TROCHEE, &c.

Of their feet of three ſyllables, they formed a moloſſus, conſiſting of three long ſyllables; a tribrach, of three ſhort ſyllables; a dactyl, of one long, and two ſhort ſyllables; an anapæſt, of two ſhort and one long ſyllable. See DACTYL, ANAPÆST, &c.

The Greek poets contrived a hundred and twenty-four different combinations or *Meaſures*, under as many different names, from feet of two ſyllables to thoſe of ſix. See RHYTHM, and FOOT.

MEASURE, in muſic, the interval, or ſpace of time, which the perſon who beats time takes between the raiſing and falling of his hand or foot, in order to conduct the movement, ſometimes quicker, and ſometimes ſlower, according to the kind of muſic, or the ſubject that is ſung or played. See TIME.

The *Meaſure* is that which regulates the time we are to dwell on each note. See NOTE.

The ordinary or common *Meaſure*, is one ſecond, or ſixtieth part of a minute, which is nearly the ſpace between the beats of the pulſe or heart; the ſyſtole, or contraction of the heart, anſwering to the elevation of the hand; and its diaſtole, or dilatation, to the letting it fall. The *Meaſure* uſually takes up the ſpace that a pendulum, of two feet and a half long, employs in making a ſwing or vibration. See VIBRATION.

The *Meaſure* is regulated according to the different quality or value of the notes in the piece; by which the time that each note is to take up, is expreſſed. The ſemi-breve, for inſtance, holds one riſe, and one fall; and this is called the *Meaſure*, or *whole Meaſure*; ſometimes the *Meaſure-note* or *time-note*; the minim, one riſe, or one fall; and the crotchet, half a riſe, or half a fall, there being four crotchets in a full *Meaſure*. See NOTE.

Binary, or *double* MEASURE, is that wherein the riſe and fall of the hand are equal. See BINARY.

Ternary, or *triple* MEASURE, is that wherein the fall is double to the riſe; or where two minims are played during a fall, and but one in a riſe: To this purpoſe, the number 3 is placed at the beginning of the lines, when the *Meaſure* is intended to be triple; and a *C*, when the *Meaſure* is to be common or double. This riſing and falling of the hands, was called by the Greeks *αρσις* and *ϑεσις*. St. Auguſtin calls it *plauſus*, and the Spaniard, *compas*. See ARSIS and THESIS.

MEASURING, MENSURATION, defined geometrically, is the aſſuming any certain quantity, and expreſſing the proportion of other ſimilar quantities to the ſame.

MEASURING, defined popularly, is the uſing a certain known meaſure, and determining thereby, the preciſe extent, quantity or capacity of any thing. See MEASURE.

Meaſuring in the general, makes the practical part of geometry; ſee GEOMETRY. From the various ſubjects whereon it is employed, it acquires various names, and conſtitutes various arts. Thus

MEASURING *of lines*, or quantities of one dimenſion, we call *Longimetry*. See LONGIMETRY.—And when thoſe lines are not extended parallel to the horizon, *altimetry*. (See ALTIMETRY.)—When the different altitudes of the two extremes of the line are alone regarded, *levelling*. See LEVELLING.

MEASURING *of ſuperficies*, or quantities of two dimenſions, is variouſly denominated, according to its ſubjects; when converſant about lands, it is called *geodæſia*, or *ſurveying*: in other caſes, ſimply *Meaſuring*. See GEODÆSIA and SURVEYING. The inſtruments uſed are the ten-foot rod, chain, compaſs, circumferentor, &c. See AREA, CHAIN, COMPASS, &c.

MEASURING *of ſolids*, or quantities of three dimenſions, we call *ſtereometry*; ſee STEREOMETRY: where it is converſant about the capacities of veſſels, or the liquors they contain particularly, *gauging*. See GAUGING. The inſtruments are the gauging-rod, ſliding-rule, &c. See SOLID, GAUGING-ROD, SLIDING-RULE, &c.

From the definition of *Meaſuring*, where the *Meaſure* is expreſs'd to be ſimilar or homogeneous to, *i. e.* of the ſame kind with the thing meaſured; it is evident that in the firſt caſe, or in quantities of one dimenſion, the *Meaſure* muſt be a line; in the ſecond, a ſuperficies; and in the third, a ſolid.—For a line, *v. gr.* cannot *meaſure* a ſurface; to *meaſure*, being no more than to apply the known quantity to the unknown, till the two become equal. Now a ſurface has breadth, and a line has none: And if one line have no breadth, two or a hundred have none: A line, therefore, can never be applied ſo often to a ſurface, as to be equal to it, *i. e.* to *meaſure* it.—And from the like reaſoning it is evident, a ſuperficies, which has no depth, cannot become equal to, *i. e.* cannot *meaſure* a ſolid, which has.

While a line continues ſuch, it may be meaſured by any part of itſelf: but when the line begins to flow, and to generate a new dimenſion, the *Meaſure* muſt keep pace, and flow too; *i. e.* as the one commences ſuperficies, the other muſt do ſo too: Thus we come to have *ſquare Meaſures*, and *cubic Meaſures*. See SQUARE and CUBE.

Hence we ſee why the *Meaſure of a circle* is an arch, or part of the circle; for a right line can only touch a circle in one point, but the periphery of a circle conſiſts of infinite points: The right line therefore to meaſure the circle, muſt be applied infinite times, which is impoſſible.—Again, the right line only touches the circle in a mathematical point; which has no parts or dimenſions, conſequently no magnitude; but a thing that has no magnitude or dimenſions, bears no proportion to another that has; and cannot therefore meaſure it.—Hence we ſee the reaſon of the diviſion of circles into 560 parts or arches, called *degrees*. See ARCH, CIRCLE, and DEGREE.

MEASURING *of triangles*, or from three given ſides or angles, to determine all the reſt, is called *trigonometry*. See TRIGONOMETRY.

Measuring *of the air*, its preſſure, ſpring, *&c.* is called *aërometry* or *pneumatics.* See **Aerometry**, *&c.*

MEAT, *Cibus.*	See the articles	**Food.**
Dreſſing of **Meats.**		**Dressing.**
Dry **Meats.**		**Xerophagia.**
White **Meats.**		**White.**

MEATUS *auditorius*, the entrance of the ear; a cartilaginous ſubſtance, irregularly divided with fleſhy membranous interpoſitions in ſeveral parts of it, not unlike the bronchia in the lungs, only its fleſhy fibres are here thicker. The inner part, or that next the brain, is bony. It is lined throughout with a thin membrane, derived from the ſkin, which is continued on the membrana tympani, where it becomes thinner.—See *Tab. Anat.* (*oſteol.*) *fig.* 13. *lit. f.* See alſo **Ear**, **Aquæduct.**

From the beginning of the *Meatus*, almoſt half way, ariſe a great number of ſmall hairs, at whoſe roots iſſue the ear-wax, which is intangled in thoſe hairs, the better to break the impetus of the external air, and prevent its too ſuddenly ruſhing in on the membrana tympani. See **Cerumen.**

Meatus *cyſticus*, a bilary duct, about the bigneſs of a gooſe-quill, which at about two inches diſtance from the gall-bladder, is joined to the meatus hepaticus; and theſe together form the ductus communis. See **Bile**, **Duct**, and **Cysticus.**

Meatus *urinarius*, or *urinary paſſage*, in women, is very ſhort, lined internally with a very thin membrane; next to which is a coat of a white ſubſtance. Through this coat, from ſome lacunæ in it, paſs ſeveral ducts, which convey a limpid glutinous matter, ſerving to anoint the extremity of the urethra.—See *Tab. Anat.* (*ſplanch.*) *fig.* 9. *lit. r. fig.* 11. *lit. k.* See alſo **Urinary.**

MECHANICS, **Mechanica**, **ΜΗΧΑΝΙΚΗ**, a mixed mathematical ſcience, which conſiders motion and moving powers, their nature and laws, with the effects thereof, in machines, *&c.* See **Motion** and **Power.**

That part of *Mechanics* which conſiders the motion of bodies ariſing from gravity, is by ſome called *Statics.* See **Gravity**, **Statics**, **Resistence**, *&c.*—In diſtinction from that part which conſiders the *mechanical* powers, and their application, properly called *Mechanics.* See **Mechanic Powers**, **Machine**, **Engine**, **Friction**, **Equilibrium**, *&c.*

Mechanical, ſomething that relates to *Mechanics*, or is regulated by the nature and laws of motion. See **Mechanics**, and **Motion.**

In which ſenſe we ſay, mechanical powers, mechanical properties or affections, mechanical principles, reaſoning, knowledge, *&c.*

Mechanical *affections*, are ſuch properties in matter, as reſult from their figure, bulk, and motion. See **Affection**, and **Body.**

Mechanical *cauſes* are thoſe founded on ſuch affections. See **Cause.**

Mechanical *ſolutions* are accounts of things on the ſame principles. See **Solution.**

Mechanical *Philoſophy*, is the ſame with what we otherwiſe call the *corpuſcular philoſophy*; viz. that which explains the phænomena of nature, and the operations of corporeal things, on the principles of *Mechanics*, viz. the motion, gravity, figure, arrangement, diſpoſition, greatneſs or ſmallneſs of the parts which compoſe natural bodies. See **Corpuscle**, **Corpuscular**, **Atom**, **Particle**, **Attraction**, **Gravity**, *&c.*

Mechanical *powers*, denote the ſix ſimple machines; to which all others, how complex ſoever, are reducible, and of the aſſemblage whereof they are all compounded. See **Power**, and **Machine.**

The *Mechanical powers*, are the balance, lever, wheel, pully, wedge, and ſkrew; which ſee under their proper heads: **Balance**, **Lever**, *&c.*

They may, however, be all reduced to one, *viz.* the *Lever.*

The principle whereon they depend, is the ſame in all, and may be conceived from what follows.

The momentum, impetus, or quantity of motion of any body, is the factum of its velocity, (or the ſpace it moves in a given time,) multiplied into its maſs. Hence it follows, that two unequal bodies will have equal moments, if the lines they deſcribe be in a reciprocal ratio of their maſſes.—Thus, if two bodies, faſtened to the extremities of a balance or lever, be in a reciprocal ratio of their diſtances from the fixed point; when they move, the lines they deſcribe will be in a reciprocal ratio of their maſſes.

E. gr. If the body A (*Tab. Mechanics*, *fig.* 6.) be triple the body B, and each of them be ſo fixed to the extremities of a lever A B, whoſe fulcrum, or fixed point is C, as that the diſtance of B C be triple the diſtance C A; the lever cannot be inclined on either ſide, but the ſpace B E, paſſed over by the leſs body, will be triple the ſpace A D, paſſed over by the great one. So that their motions or moments will be equal, and the two bodies in æquilibrio. See **Motion.**

Hence that noble challenge of Archimedes, *datis viribus, datum pondus movere*; for as the diſtance C B may be increaſed infinitely, the power or moment of A may be increaſed infinitely.—So that the whole of *Mechanics* is reduced to the following problem.

Any body, as A, *with its velocity* C, *and alſo any other body, as* B, *being given*; *to find the velocity neceſſary to make the moment, or quantity of motion in* B, *equal to the moment of* A, *the given body.*—Here, ſince the moment of any body is equal to the rectangle under the velocity, and the quantity of matter; as B : A : : C : to a fourth term, which will be *c*, the celerity proper to B, to make its moment equal to that of A. Wherefore in any machine or engine, if the velocity of the power be made to the velocity of the weight, reciprocally as the weight is to the power; ſuch power will always ſuſtain, or if the power be a little increaſed, move the weight.

Let, for inſtance, A B be a lever, whoſe fulcrum is at C, and let it be moved into the poſition *a* C *b.*—Here, the velocity of any point in the lever, is as the diſtance from the centre. For let the point A deſcribe the arch A *a*, and the point B the arch B *b*; then theſe arches will be the ſpaces deſcribed by the two motions: but ſince the motions are both made in the ſame time, the ſpaces will be as the velocities. But it is plain, the arches A *a* and B *b* will be to one another, as their radii A C and A B, becauſe the ſectors A C *a*, and B C *b*, are ſimilar: wherefore the velocities of the points A and B, are as their diſtances from the centre C.

Now, if any powers be applied to the ends of the lever A and B, in order to raiſe its arms up and down; their force will be expounded by the perpendiculars S *a*, and *b* N; which being as the right ſines of the former arches, *b* B and *a* A, will be to one another alſo as the radii A C and C B; wherefore the velocities of the powers, are alſo as their diſtances from the centre. And ſince the moment of any body is as its weight, or gravitating force, and its velocity conjunctly; if different powers or weights be applied to the lever, their moments will always be as the weights and the diſtances from the centre conjunctly.—Wherefore, if to the ſame lever, there be two powers or weights applied reciprocally proportional to their diſtances from the centre, their moments will be equal; and if they act contrarily, as in the caſe of a ſtilliard, the lever will remain in an horizontal poſition, or the balance will be in æquilibrio.—And thus it is eaſy to conceive how the weight of one pound may be made to equi-balance a thouſand, *&c.*

Hence alſo it is plain, that the force of the power is not at all increaſed by engines; only the velocity of the weight in either lifting or drawing, is ſo diminiſhed by the application of the inſtrument, as that the moment of the weight is not greater than the force of the power.—Thus, for inſtance; if any force can raiſe a pound weight with a given velocity, it is impoſſible by any engine to effect, that the ſame power ſhall raiſe two pound weight, with the ſame velocity: But by an engine it may be made to raiſe two pound weight, with half the velocity; or 10000 times the weight with $\frac{1}{10000}$ of the former velocity. See **Perpetual Motion.**

Mechanical is alſo applied to a kind of *reaſoning*, which of late has got great ground both in phyſics, and medicine; thus denominated, as being conformable to what is uſed in the contrivance, and accounting for the properties and operations of machines. See **Physics.**

This manner of thinking and arguing, Dr. Quincy inſiſts, is the reſult of rightly ſtudying the powers of a human mind, and the ways by which it is only fitted to get acquaintance with material beings: For conſidering an animal body as a compoſition out of the ſame matter, from which all other bodies are formed, and to have all thoſe properties which concern a phyſician's regard, only by virtue of its peculiar make and conſtructure; it naturally leads a perſon to conſider the ſeveral parts, according to their figures, contexture, and uſe; either as wheels, pullies, wedges, levers, ſkrews, chords, canals, ciſterns, ſtrainers, or the like; and throughout the whole of ſuch enquiries, to keep the mind cloſe in view of the figures, magnitudes, and mechanical powers of every part or movement; juſt in the ſame manner, as is uſed, in enquiring into the motions and properties of any other machine. For which purpoſe it is frequently found helpful to deſign, or picture out in diagrams, whatſoever is under conſideration, as it is cuſtomary in common geometrical demonſtrations.

The knowledge obtained by this procedure is called *Mechanical knowledge.* See **Knowledge.**

Mechanical is alſo uſed in mathematics, to ſignify a conſtruction or proof of ſome problem, not done in an accurate and geometrical manner, but coarſely and unartfully, or by the aſſiſtance of inſtruments; as are moſt problems relating to the duplicature of the cube, and the quadrature of the circle. See **Construction**, **Quadrature**, **Duplication**, **Demonstration**, and **Lines.**

Mechanical *arts.* See the article **Arts.**

Mechanical *curve*, a term uſed by Des Cartes for a curve, which cannot be defined by any algebraic equation.—By which it ſtands contradiſtinguiſhed from algebraic or geometrical curves. See **Algebraical**, and **Geometrical.**

M. Leibnitz and ſome others, in lieu of mechanical curves, call them *tranſcendental curves*, and diſſent from Cartes, in excluding

Fletcher Sculp.

cluding them out of geometry: Leibnitz has even found a new kind of tranſcendental equations, whereby theſe curves are defined: They are of an indefinite nature; that is, do not continue conſtantly the ſame in all points of the curve; in oppoſition to algebraic curves which do. See TRANSCENDENTAL, and CURVE.

MECHANISM *of the barometer*. See the article BAROMETER.

MECHANISM *of the double microſcope*, &c. See MICROSCOPE.

MECHOACAN, MECHOACANNA, called alſo *white jalap*, *white rhubarb*, and *American ſcammony*; a medicinal root, taking its name from a province of New Spain, from whence it is brought.

Mechoacan was known and uſed as a purgative before jalap, though the latter is now in more general uſe, as being found more efficacious. Yet *Mechoacan* is the ſweeter and more gentle of the two, and on that account preferable. See JALAP.

The ſeat of its action is chiefly in the extreme parts, for which reaſon it is accounted good in arthritic pains. It has the advantage of needing no preparation or corrective; and of purging in its own proper ſubſtance, ſuch as it grows.

M. Boulduc found by analyſing it, that it contains twelve times as much ſalt as reſin; but neither the ſaline nor reſinous extract purge ſo freely as the ſubſtance, even though taken in larger doſes; nor do they yet purge ſo gently.

In the choice of *Mechoacan*, prefer thoſe pieces which are the browneſt within, and whoſe ſubſtance is the cloſeſt, and moſt compact.

MECONIUM *, ΜΗΚΩΝΙΟΝ, in pharmacy, is the juice of the poppy, drawn by expreſſion, and dried. See POPPY.

* The word comes from the Greek μηκων, poppy.

Meconium differs from opium, in that this laſt ouzes out ſpontaneouſly after an inciſion made in the heads of the poppies, whereas the former is drawn by violence both from the heads and leaves, and even from the whole plant bruiſed and preſſed together. See OPIUM.

MECONIUM is alſo a black thick excrement, gathered in the inteſtines of a child during the time of geſtation.

In colour and conſiſtence, it reſembles pulp of caſſia. It is alſo found to reſemble *meconium*, or juice of poppy, whence it takes its name.

MEDAL *, MEDALIA, a ſmall figure, or piece of metal, in form of a coin, deſtined to preſerve to poſterity the portrait of ſome great man, or the memory of ſome illuſtrious action.

* Scaliger derives the word from the Arabic, *Methalia*, a coin whereon is impreſs'd the figure of a human head. Menage and Voſſius rather derive it from *Metallum*. Du Cange obſerves, that the obolus was anciently called *Medalia*, *quaſi Medietas nummi*, as being half of another coin.

The parts of a MEDAL, are the two ſides; one whereof is called the *face*, or *head*; the other the *reverſe*. See REVERSE.

On each ſide is the area or field, which makes the middle of the *Medal*; the rim or border; and the exergum, which is beneath the ground whereon the figures repreſented are placed. See EXERGUM. On the two ſides are diſtinguiſhed the type, and the inſcription or legend. The type or deviſe is the figures repreſented; the legend is the writing, eſpecially that around the *Medal*; though in the Greek *Medals*, the inſcription is frequently in the area. What we find in the exergum is frequently no more than ſome initial letters, whoſe meaning we are unacquainted withal; though, ſometimes too, they contain epochas, or words that may be accounted an inſcription. See LEGEND.

Some authors imagine, that the ancient *Medals* were uſed for money. M. Patin has a chapter expreſs to prove, that they had all a fixed regular price in payments; not excepting even medallions. F. Joubert is of the ſame opinion. Others, on the contrary, maintain, that we have no real monies of the ancients; and that the *Medals* we now have, never had any courſe as coins. Between theſe two extremes, there is a medium, which appears by much more reaſonable than either of them. See MONEY.

MEDALS are divided into *ancient* and *modern*.

Ancient MEDALS are either of the higher or lower antiquity. —The former claſs conſiſts of ſuch as were ſtruck before the end of the third century. The latter of ſuch as were ſtruck between the third and ninth centuries.

Modern MEDALS are thoſe ſtruck within theſe three hundred years. See COIN.

Among the ancient *Medals* ſome are Greek, others Roman. —The Greek *Medals* are the moſt ancient. That people ſtruck *Medals* in all the three metals with ſuch exquiſite art, as the Romans could never come up to. The Greek *Medals* have a deſign, accuracy, force, and a delicacy that expreſſes even the muſcles and veins, and it muſt be owned, goes infinitely beyond any thing of the Romans.

There are alſo Hebrew *Medals*, Punic, Gothic, and Arabic *Medals*; which make new claſſes in the ancient and modern ones.

Conſular MEDALS are ſo called, to diſtinguiſh them from the imperial; not that they were ſtruck by order of the conſuls, but becauſe in thoſe times the republic was governed by conſuls. Of theſe, father Joubert reckons about fifty or ſixty of gold; two hundred and fifty of copper; and near a thouſand of ſilver.—Goltzius has deſcribed them in a chronological order, according to the Faſti conſulares. Urſinus has diſpoſed them genealogically, according to the order of the Roman families. M. Patin has collected an entire ſeries of them, in the ſame order with Urſinus; and only computes one thouſand thirty-ſeven conſulars, which relate to one hundred ſeventy-eight Roman families. M. Vaillant, and M. Morel, each promiſed a new edition of the conſular *Medals*; M. Vaillant kept his word, and his Book was printed ere he died, in three volumes, folio.

The conſular *Medals* are certainly the moſt ancient *Medals* of the Romans: And yet thoſe of copper and ſilver do not go beyond the four hundred eighty fourth year of Rome; nor thoſe of gold beyond the year five hundred forty ſix. If any are produced of an older date, they are ſpurious.

Among the *Imperial* MEDALS, we diſtinguiſh between the *upper* and the *lower empire*: The upper empire commenced under Julius Cæſar, and ended about the year of Jeſus Chriſt two hundred and ſixty: The lower empire comprehends near one thouſand two hundred years, *viz.* till the taking of Conſtantinople.—It is the cuſtom, however, to account all the imperial *Medals*, till the time of the Palæologi, among the antique; and yet we have no imperial *Medals*, of any conſiderable beauty, later than the time of Heraclius, who died in 641.

After the time of Phocas and Heraclius, Italy became a prey to the Barbarians; ſo that the monuments we have remaining of thoſe two emperors, finiſh the ſet or ſeries of imperial *Medals*.—To theſe are added the *Medals* of the lower empire, and the Greek emperors; whereof a ſeries may be made as low as our time, taking in the modern ones.—M. Patin has made an ample collection of the imperial *Medals* till the time of Heraclius.

The *Gothic* MEDALS make part of the imperial ones: They are ſo called, as having been ſtruck in the time of the Goths, and in the declenſion of the empire; and ſavouring of the ignorance, and barbarity of the age.

As to *Modern* MEDALS they are ſuch as have been ſtruck in Europe, ſince the uſurpation of the Goths has been extinct; and ſculpture and engraving have begun to re-flouriſh.—The firſt was that of the famous reformer John Huſs in 1415; if any pretend to be more ancient, they are ſpurious.—In France there were none ſtruck with the king's effigy before the reign of Charles VII.

The ſtudy of modern *Medals* is ſo much the more uſeful, as they afford more light than the ancient, and mark the times and conſequences of events more preciſely: whereas the inſcriptions of the ancient *Medals* are very ſhort, and ſimple, and generally without any date.—Add to this, that the ancient *Medals* are extremely liable to be counterfeited, by reaſon of the exceſſive price they bear. But in the modern, there is not near that danger of being impoſed upon.

There are no true Hebrew *Medals*; thoſe which we ſee of the heads of Moſes, and Jeſus Chriſt, are ſpurious and modern. We have a few ſhekels of copper and ſilver, with Hebrew or Samaritan legends; but none of gold; though there is mention made of one in the king of Denmark's cabinet.—F. Souciet has a diſſertation on the Hebrew Medals, commonly called *Samaritan Medals*, where he diſtinguiſhes accurately between the genuine and ſpurious, and ſhews, that they are true Hebrew coins ſtruck by the Jews, but on the model of the ancients; and that they were current before the Babyloniſh captivity. See SAMARITAN.

Singular MEDALS, in the popular ſenſe, are ſuch as are not found in the cabinets of the curious, and are only met with by chance; but in the ſtricter ſenſe are ſuch, whereof there is not above one of a kind extant.—The Otho in large copper is a ſingular *Medal*. When a *Medal* exceeds the value of ten or twelve piſtoles, it is worth what the owner pleaſes. The Peſcennius Niger, and Pertinax, are very rare in all metals. The Didius Julianus is hardly found any where, but in large copper. Carteron, a Dutchman, and ſome others, have made mills on purpoſe to ſtrike *Medals* that never were, as thoſe of Cicero, Virgil, Priam, *&c.*

Greek MEDALS are ſuch as have either the heads of Greek emperors, or Greek inſcriptions.

Falſe or *Spurious* MEDALS, are thoſe counterfeited, and put off for antique, when they are not.

Mutilated MEDALS, are thoſe that are not entire, or are defaced.

Redintegrated MEDALS, are thoſe wherein we find the letters *Reſt.* which ſhew that they have been reſtored by the emperors.

Dipt MEDALS, are ſtruck of pure copper, and afterwards ſilvered.—This is a contrivance that the curious have frequent recourſe to, in order to compleat their ſilver ſets.

Covered or *plaited* MEDALS, are thoſe which have only a thin ſilver leaf over the copper, but which are ſtruck ſo artfully, that the cheat does not appear, without cutting them: theſe are the leaſt ſuſpected.

Grained or *indented* MEDALS, are thoſe, whoſe edges are cut or notched like teeth, which is a ſign of purity and antiquity. They are common among the conſulars, but we have none later than

Auguſtus. There are ſeveral of them, however, among thoſe of the kings of Syria.

MEDALS *countermarked*, are thoſe which have marks cut either on the ſide of the head, or of the reverſe:—Theſe countermarks ſerve to denote the change of their value; and this kind is much enquired for by the curious. There are alſo

Caſt MEDALS, which are not ſtruck, but caſt in a mould; and

MEDALS without Reverſe. See the article REVERSE.

Medals have been ſtruck in three kinds of metals, which make three ſeveral ſets, or ſeries's in the cabinets of the curious. That of gold is the leaſt numerous, as not conſiſting of above one thouſand, or twelve hundred of the imperial; that of ſilver may contain about three thouſand imperial; and that of braſs or copper, of the three ſeveral ſizes, *viz.* the great, the middle, and the ſmall, conſiſts of ſix or ſeven thouſand, all imperial. See SERIES.

It is not either the metal, or the ſize, which makes a *Medal* valuable; but the ſcarcity of the head, or of the reverſe, or the legend.—Some *Medals* are common in gold, which yet are very rare in copper; and others very rare in ſilver, which in copper and gold are very common. The reverſe is ſometimes common, where the head is ſingular; and ſome heads are common, whoſe reverſe are very ſcarce.

There are alſo *Medals* very ſcarce in ſome ſets, and yet very common in others: For inſtance, there is no Antonia in the ſets of large copper, and the middle copper is forced to ſupply its place. The Otho is very rare in all the copper ſets, and yet common in the ſilver ones. Otho's, of the large copper, are held at an immenſe price; and thoſe of the middle copper at forty or fifty piſtoles. And the Gordians Afric, are rated near as high. Singular *Medals* are invaluable.

M. Vaillant has collected all the *Medals* ſtruck by the Roman colonies; F. Hardouin thoſe of the Greek and Latin cities; F. Noris thoſe of Syria.—M. Moral has undertaken an univerſal hiſtory of *Medals*, and promiſed cuts of twenty-five thouſand. He ranges them under four claſſes: The firſt contains the *Medals* of kings, cities, and people, which have neither the name nor image of the Roman emperors. The ſecond contains the conſular *Medals*; the third the imperial *Medals*; and the fourth, the Hebrew, Punic, Parthian, French, Spaniſh, Gothic, and Arabic.—He begins with the imperial, and brings them down as low as Heraclius. He places the Latin, in order, before the Greek.

Ad. Occo, a German phyſician, and count Mezzabarba, have endeavoured to range the *Medals* in a chronological order; but that is impracticable. For in many of the imperial *Medals* there is no mark either of the conſulate, or of the year of the reign; and ſince Gallienus, there are few of the Roman imperial *Medals* that bear the leaſt footſteps of chronology.

The moſt noted *Medaliſts*, or authors on *Medals*, are, Antonius Auguſtinus, Wolf. Lazius, Ful. Urſinus a learned antiquary, Æneas Vicus, Hubert Goltzius a famous graver, Oiſelius, Seguin, Occo, Triſtan, Sirmond, Vaillant, Patin, Noris, Spanheim, Hardouin, Morel, Joubert, Mezzabarba, Beger, *&c.* For the manner of ſtriking *Medals*, ſee the article COINING.

Academy of MEDALS. See the article ACADEMY.

Repairing a MEDAL. See the article REPAIR.

Reſtitution of MEDALS. See the article RESTITUTION.

Votive MEDALS. See the article VOTIVE.

MEDALLION *, or MEDALION, a *Medal* of extraordinary bigneſs. See MEDALS.

* The word is formed from the French *Medallion*, or Italian *Medaglion*, which ſignify the ſame, and which were originally formed from *Metalliones*, a name by which theſe pieces are frequently called in ancient Latin writers.

Medallions are ordinarily a kind of *Medals* which princes uſe to preſent, as a token of honour or eſteem; for which reaſon the Romans called them *Miſſilia*.

Medallions were never any current coins, as medals probably were: They were ſtruck purely to ſerve as public monuments, or to make preſents of.

There cannot be any ſet made of them, even though the metals and ſizes ſhould be joined promiſcuouſly: The beſt cabinets do not contain above four or five hundred; though M. Morel promiſes us figures of above a thouſand.

Authors vary about the time when they firſt began to be ſtruck: Some antiquaries will have it under the empire of Theodoſius: but this muſt be a miſtake; for there were ſome ſtruck even in the upper empire: witneſs a Nero, a Trajan, and an Alexander Severus, ſtill extant.—*Medallions* of gold are very rare, as alſo thoſe of a large copper.

Medallions are diſtinguiſhed from medals by the volume, that is, by the thickneſs, and compaſs; as well as by the largeneſs, and relievo of the head.

MEDIAL *alligation*. See ALLIGATION.

MEDIANA, the name of a vein, or little veſſel, made by the union of the cephalic and baſilic, in the bend of the elbow.

It is not a particular vein, or a third vein of the arm, as ſome authors imagine; but merely a branch of the baſilica; which running into the inner part of the elbow, unites with the cephalica, and forms a common vein, called *Mediana*; and by the Arabs, the *black vein*.—See *Tab. Anat.* (*angeiol.*) *fig.* 6. *lit. p.*

MEDIANA *linea*, a line or ſeam running down the middle of the tongue, and dividing it into two equal parts; though not ſo effectually, but that the blood-veſſels of the one ſide communicate with thoſe of the other. See TONGUE.

Columnæ MEDIANÆ, in Vitruvius, are the columns in the middle of a portico; whoſe intercolumnation is to be larger than thoſe of the angular columns. See COLUMN.

MEDIASTINA, the name of a vein of the mediaſtinum. See VEIN, and MEDIASTINUM.

MEDIASTINUM, in anatomy, a double membrane, formed by a duplicature of the pleura; ſerving to divide the thorax, and the lungs into two parts; and to ſuſtain the viſcera, and prevent their falling from one ſide of the thorax to the other. See THORAX, *&c.*

It proceeds from the ſternum, and paſſing ſtrait down through the middle of the thorax to the vertebræ, divides its cavity into two. It contains the heart between its two lamellæ, and it affords a paſſage to the vena cava, the oeſophagus, and the ſtomachic nerves. The membranes of the *Mediaſtinum* are finer and thinner than the pleura, and have a little fat. It receives branches of veins and nerves from the mammillary, and diaphragmatic, particularly, one called *Mediaſtina*; its nerves come from the ſtomachic: it has alſo ſome lymphatics, which open into the thoracic duct.

The *Mediaſtinum* divides the thorax longitudinally into two parts; to the end that one lobe of the lungs may officiate, if the other be hindered by a wound on the other ſide. Sometimes there is a matter contained betwixt its membranes, immediately under the ſternum, which may occaſion the tapping of this place.

MEDIASTINUM *cerebri*, the ſame with *ſeptum tranſverſum*. See SEPTUM, *&c.*

MEDIATE, or INTERMEDIATE, a term of relation to two extremes, applied to a third, which is in the middle between them. See MEAN, and MEDIUM.

Subſtance is a genus with regard to man; but between the two there are other *mediate* genus's, as body and animal.

Mediate ſtands oppoſed to *immediate*. Thus when we ſay, that God and man concur to the production of man; God is the *Mediate* cauſe, man the *immediate*.—It is a popular queſtion in theology, whether the Holy Ghoſt convert a ſinner *mediately* or *immediately*? See IMMEDIATE, and INTERMEDIATE.

MEDIATE *modes*. } See the article { MODES.
MEDICAMENTOSUS *lapis* } { LAPIS.

MEDICINAL *hours*, are thoſe parts of the day ſuppoſed proper to take medicines in. See MEDICINE.

Of which there are uſually reckoned four, *viz.* in the morning faſting, about an hour before dinner, about four hours after dinner, and going to bed: but in acute caſes, the times are to be governed by the ſymptoms and aggravation of the diſtemper; without regard to any *Medicinal hours*.

MEDICINAL *waters*. See the article WATER.

MEDICINALIS *ſacculus*. See the article SACCULUS.

MEDICINE, MEDICINA, the art of healing. See HEALING.

Medicine, popularly called *phyſic*, conſiſts, according to Boerhaave, in the knowledge of thoſe things, by whoſe application, life is either preſerved ſound and healthy, or when diſordered, again reſtored to its priſtine healthineſs. See HEALTH, and DISEASE.

Galen defines *Medicine*, the art of preſerving preſent health, and of retrieving it when paſt: Hippocrates, the addition of what is wanting, and the retrenchment of what is redundant: Herophilus, the knowledge of things good, indifferent, and ill, with regard to health.

Medicine muſt have been nearly coeval with the world. The injuries and viciſſitudes of the air, the nature and qualities of foods, the violence of external bodies, the actions of life, and laſtly, the fabric of human compages, muſt have rendered diſeaſes almoſt as old as mankind: And the preſence of a diſeaſe, as it brings with it a painful ſenſation, or the loſs perhaps of the uſe of a limb, does, by a neceſſary mechanical impulſe, both in brutes and men, compel the diſeaſed to ſeek for help, and to apply remedies, either by mere experiment, or by inſtinct, and ſpontaneous appetite.—Hence aroſe the art of *Medicine*; which, in this ſenſe has been always, every where, among mankind.

Ancient hiſtories and fables tell us, that in a little time, from the flood, it was ſo well cultivated by the Aſſyrians, Babylonians, Chaldeans, and Magi, that they were able to remove preſent diſeaſes, and to prevent future ones.—Hence it paſſed into Egypt, Lybia, Cyrenaica, and Crotona; and thence into Greece, where it flouriſhed, principally in the iſlands of Cnidus, Rhodes, Cos, and in Epidaurus.

The firſt foundations of the art were laid by chance, natural inſtinct, and events unforeſeen: Theſe were improved by the memory of the ſucceſs of former experiments; by writing down diſeaſes, their remedies, and events, on columns, paintings, and the walls of their temples; by expoſing the ſick in the markets and public ways, that thoſe who paſſed by, might enquire into the diſeaſe, and communicate a remedy, if they knew any: and laſtly, by analogy, or reaſoning, from a compariſon of things already obſerved, with things preſent and to come.

The art at length received a much greater degree of perfection, by the appointing of phyſicians; ſome for the cure of particular diſeaſes, and others for diſeaſes in general; by an accurate obſervation of the diſeaſe, and its ſymptoms; and by an exact deſcription of the remedy, and its uſe: immediately, upon which, it got among the prieſts, and at length was confined to particular families; deſcending, by way of inheritance, from father to ſon: which, again, proved a great bar to its progreſs. The extiſpicy or inſpecting the entrails of beaſts, uſed by the prieſts; the cuſtom of embalming dead carcaſes, and even butchery itſelf, promoted the knowledge of the human fabrick, and of the cauſes both of health, diſeaſes, and death.

Laſtly, the diſſecting of live animals for philoſophical purpoſes, diſtinct narratives of the cauſe, riſe, increaſe, criſis, declenſion, end, and effect of diſeaſes, and the knowledge of *Medicines*, their choice, preparation, application, powers, and events, ſeemed to have almoſt brought the art to its perfection.

Hippocrates, who was cotemporary with Democritus, and perfectly acquainted with every thing then diſcovered, and beſides, furniſhed with a great number of obſervations of his own; collecting into one all that was valuable and uſeful; compiled a body of Greek *Medicine*; and was the firſt who deſerved the title of a true *phyſician*: for being a maſter of the ἐμπειρία, experience, as well as of analogy and reaſon, and withal well verſed in a pure philoſophy; he firſt, made phyſic rational; and laid the foundation of the dogmatical *Medicine*, which has ever ſince obtained. See DOGMATICAL, THEORETICS, *&c.*

What Hippocrates had done, continued a long time ſacred and unaltered, and was the ſtanding practice of many ages; at length Aretæus the Cappadocian digeſted it into a more orderly body: whence, in various places, at various times, and by various hands, particularly the Alexandrian ſchool, it was further altered and improved, till at length it came into the hands of Claud. Galen; who, collecting the ſcattered parts, digeſting thoſe which were confuſed, and explaining every thing by the rigid doctrines of the Peripatetics, did both a great deal of ſervice, and a great deal of miſchief, to the noble art; he being the firſt who introduced the doctrine of the elements, the cardinal qualities, and their degrees, the four humours, *&c.* into *Medicine*: and on theſe he made the whole art to depend. See GALENIC, TEMPERAMENT, HUMOUR, QUALITY, *&c.*

After the ſixth century, the arts were not only extinguiſhed, but almoſt all memory of them loſt, till the ninth; from which, to the thirteenth, *Medicine* was vigorouſly cultivated by the Arabs in Aſia, Africa, and Spain: who applying themſelves particularly to the ſtudy of the materia medica, and its preparations, and to the operations of chirurgery, rendered both more juſt and more copious at the ſame time. And yet Galen's errors became now more predominant than ever.

At length, however, they were purged out and exploded by two different means; principally indeed by the reſtoration of the pure diſcipline of Hippocrates in France; and then alſo by the experiments and diſcoveries of chymiſts and anatomiſts: till at length the immortal Harvey overturning, by his demonſtrations, the whole theory of the ancients, laid a new and certain baſis of the ſcience. Since his time, *Medicine* is become free from the tyranny of any ſect, and is improved by ſure diſcoveries in anatomy, chymiſtry, phyſics, botany, mechanics, *&c.* See MECHANICAL.

Hence it appears, that the art originally conſiſted ſolely in the faithful collecting of obſervations; and that a long time after, they began to enquire, and diſpute, and form theories: the firſt part has ever continued the ſame; but the latter always mutable. See HYPOTHESIS, *&c.*

For the ſeveral ſects that have aroſe in *Medicine*, ſee EMPIRIC, DOGMATIC, GALENIST, CHYMIST, PARACELSIST, HERMETICAL, *&c.*

Medicine is divided into five principal branches. The firſt conſiders the human body, its parts and fabric, life and health, and the effects following from them: this is called *phyſiology*, the *doctrine of the animal œconomy*, or *of the uſe of the parts*: and its objects, now enumerated, are called *res naturales*, or things according to nature, See PHYSIOLOGY, OECONOMY, NATURAL *Things*, *&c.*

The ſecond branch conſiders the diſeaſes of the human body, their differences, cauſes, and effects; and is called *Pathology*, as it conſiders the diſeaſes; *Ætiology*, as it inquires into their cauſes; *Noſology*, when it examines their differences; and laſtly, *Symptomatology*, when it explains their effects.—The objects of this part are called *res præternaturales*, or beyond nature. See PATHOLOGY, ÆTIOLOGY, *&c.*

The third branch conſiders the ſigns or ſymptoms, and how to apply them to uſe; ſo as to judge both in a ſound, and a diſeaſed body, what, which, is, will be, the degree, order, effect, of the health, or the diſeaſe: This is called *Semeiotica.*—Its objects are things both natural, non-natural, and præter-natural. See SEMEIOTICA.

The fourth branch conſiders the remedies, and their uſe, whereby life may be preſerved; whence it is called *Hygieine.* Its objects are what we ſtrictly call *Non-natural.* See HYGIEINE and NON-NATURALS.

Laſtly, The fifth furniſhes the materia medica, its preparation, and manner of exhibition, ſo as to reſtore health, and remove diſeaſes; and is called *Therapeutica*, comprehending the *Diætetica*, *Pharmaceutica*, *Chirurgica*, and *Iatrica.* See DIÆTETIC, PHARMACEUTIC, CHIRURGERY, and THERAPEUTIC.

Clinical MEDICINE, *Medicina clinica.* See CLINICA.

Characters in MEDICINE. } See the article { CHARACTERS.
Pandects of MEDICINE. } See the article { PANDECT.

MEDICINES, or MEDICAMENTS, denote any natural ſubſtances, applied to a human body, in order to anſwer ſome intention of cure. See REMEDY.

Medicines are diſtinguiſhed, with regard to the manner of application, into *internal* and *external.*

Internal MEDICINES, are thoſe taken in at the mouth.

External, or *topical* MEDICINES, are thoſe applied outwardly to any particular part. See TOPIC, *&c.*

With regard to the different manner of their operation, *Medicines* are diſtinguiſhed into *agglutinants*, *alterants*, *anaſtomatics*, *aſtringents*, *evacuants*, *incarnatives*, *ſpecifics.* See EVACUANT.

A general idea of the manner wherein *Medicines* operate on a human body, as explained by the ſect of mechanical phyſicians, may be conceived from what follows.

A few different ſorts of particles, variouſly combined, will produce great variety of fluids; ſome may have one ſort, ſome two, ſome three or more. If we ſuppoſe only five different ſorts of particles in the blood, and call them *a*, *b*, *c*, *d*, *e*; their ſeveral combinations, without varying the proportions in which they are mixed, will be theſe following: but whether more or leſs, need not be determined.

a b : *a c* : *a d* : *a e* :
b c : *b d* : *b e* : *c d* :
c e : *d e* : *a b c* : *a d c* :
a b d : *a b e* : *a c e* : *a d e* :
b d c : *b d e* : *b e c* : *d e c* :
a b c d : *a b c e* : *a c d e* : *a b d e* : *b c d e* : *a b c d e.*

No theory of ſecretion has hitherto been able to give any tolerable account of the operation of ſuch *Medicines*, as promote an evacuation. For if the humours be equally mixed with the blood, that is, if the blood be in every part of the body the ſame, and its particles be not more apt to form certain humours, in ſome certain parts of the body, than in others; or if they be not forced, by the power of ſome *Medicine*, to form ſuch humours; then the quantities of humour, ſeparated in equal times, will always be as the velocity of the blood; but the velocity of the blood is ſeldom doubled by any *Medicine*, and never tripled by the moſt acute fever. The quantity of humour, however, drawn off by evacuating *Medicines*, is often twenty times greater than the natural quantity; and therefore, upon ſuppoſition that the humours are every where equally mixed with the blood, the operation of evacuating *Medicines* can never be accounted for. See PURGATIVE.

Though this argument have the ſtrength of a demonſtration, yet there are ſome who explain the operation of purgative, and other evacuating *Medicines*, by a ſtimulating faculty; whereby the ſluggiſh juices are not only forced out, but the obſtructed canals opened, and the motion of the blood quickened. But though ſuch a power be allowed, it would remain to be explained, why certain *Medicines* do only ſtimulate certain glands? For it is evident, that evacuating *Medicines* have ſome other power, beſides the ſqueezing out ſtagnant juices; becauſe when they are all ſqueezed out, they ſtill evacuate as much, if they be repeated, as they did before: as is plain, by continuing a ſalivation for many days. 2°. We cannot ſuppoſe, that all bodies have every where, and at all times, juices ſtagnating; but theſe *Medicines* conſtantly produce their effects, more or leſs, at all times. 3°. If the veſſels be ſuppoſed to be obſtructed, an evacuating *Medicine* could but double the quantity that was evacuated, before it was taken. 4°. If theſe *Medicines* operate only theſe ways, then in a healthful body, where there were no obſtructions, they would have no effect at all. 5°. If the removing obſtructions were the cauſe of a greater quantity evacuated, then the evacuation ſhould ſtill continue in a greater degree than before the obſtruction was removed; whereas, in fact, we conſtantly find it leſs, as the *Medicine* works off. 6°. Though a *Medicine*, by ſtimulating a veſſel, may quicken the motion of the fluid in that veſſel; yet it can never increaſe the quantity of fluid running through it, in equal ſpaces of time; becauſe it quickens the motion of the fluid, only by contracting the veſſel: and therefore the faſter the fluid is made to run through the veſſel, the leſs fluid does the orifice of the veſſel admit; and conſequently, after the veſſel is contracted by the ſtimulating *Medicine*, the ſecretion will be leſs, inſtead of being greater.

That a ſtimulus cauſes the part on which it acts, to contract, is matter of fact; and that purgative *Medicines* do ſtimulate the bowels; but it may perhaps be likewiſe ſaid, they ſtimulate the heart and arteries, and increaſe their force, becauſe they not only quicken, but raiſe the pulſe: ſo that a greater quantity of blood is ſent to the glands of the guts. This may be granted; but not that it is the principal action of purgative *Medicines*; becauſe that, by the ſame force, a greater quantity of blood is ſent to all the other glands of the body, whoſe fluids are not, however, ſenſibly increaſed; and the glands of the inteſtines receive a leſs quantity, in proportion, than any others, becauſe they cannot be ſo much dilated by the greater force of the blood, as others, which are not ſo much ſtimulated by the *Medicine*.

There are others, who will have evacuating *Medicines* endued with an attenuating quality, by which they diſſolve all the coheſions of the particles of the blood, and ſo ſet the ſeveral humours at liberty, to paſs through their proper glands: but if theſe *Medicines* have a power univerſally to diſſolve all the coheſions of the blood, then every evacuating *Medicine* would equally and indifferently increaſe the quantity of every ſecretion. Mercury would as conſtantly purge as ſalivate, and nitre promote perſpiration, as well as urine; but this is repugnant to experience. If they have a power to diſſolve certain coheſions, and not others; this is but ſetting certain particles at liberty to paſs through their proper glands, which were not ſo before; and is a preparing the humours, in order to increaſe the quantity of ſecretion. Evacuating *Medicines* muſt therefore have a power to affect ſome particles, and not others; that is, to repel ſome, and attract, retain, and alter others; and this is what may be affirmed to be in all *Medicines*, and is what a thouſand chymical experiments demonſtrate.

The ſeveral humours then being formed, by the different coheſion of the particles of blood, the quantity of humour ſecerned by any gland, muſt be in a proportion compounded of the proportion that the number of the particles cohering in ſuch a manner as is proper to conſtitute the humour which paſſes through the gland, bears to the maſs of blood; and of the proportion of the quantity of blood that arrives at the gland. And hence it follows, that where there is a determinate quantity of a certain humour to be ſeparated, the number of particles that are proper to compoſe the ſecerned liquor, muſt be reciprocally proportional to the quantity of the blood that arrives at the gland: and therefore, if the quantity of the ſecretion is to be increaſed, the number of particles muſt be increaſed; if the ſecretion is to be leſſened, the number of particles, proper for ſuch a ſecretion, muſt be leſſened in the ſame proportion.

Medicines, therefore, which can alter the coheſions, and combinations of the particles, may either increaſe or diminiſh the quantity of any ſecretion. Thus, ſuppoſe the humour, which paſſes through the glands of the inteſtines, to be compoſed of three or four ſeveral ſorts of particles; that *Medicine*, which, will eaſily cohere to thoſe particles, and cohering, increaſe their mutual attractions, ſo as they may unite in greater numbers at, or before they arrive at the inteſtines, than they would have done, if the *Medicine* had not been given, muſt neceſſarily increaſe the quantity of humour which paſſes through the glands of the inteſtines; if the quantity of blood which arrives at the glands, be not diminiſhed in the ſame proportion, as the number of particles is increaſed.—After the ſame manner do diuretics, ſudorifics, and *Medicines* which promote all other ſecretions, operate. See DIURETIC, SUDORIFIC, *&c.*

Why increaſing the quantity of ſome ſecretions, ſhould diminiſh that of others, is not eaſy to explain on any other foot: for if the blood be equally mixed in every part of the body, with all the humours which are ſeparated from it; that is, if the mixture of the blood be every where alike, ſo that every humour bears the ſame proportion to the reſt of the arterial blood, in one part of the body, that it does in another; and if every humour has its own proper gland, through which it is ſeparated: then what is ſeparated by one gland, is not ſubſtracted from another; and conſequently does not diminiſh the quantity of humour which flows to this other, but does indeed rather increaſe the quantity of this other ſecretion: for the more any one humour is carried off, the greater proportion any other remaining in the blood, bears to the remaining blood: And therefore the more any one ſecretion is increaſed, the more all the reſt ſhould be increaſed likewiſe. But if all the humours be compoſed by a combination of a few different ſorts of particles, then the more apt theſe particles are to run into any one ſort of combination, the leſs all other combinations muſt be: and conſequently the increaſing any one ſecretion, muſt neceſſarily diminiſh the quantity of all others; but moſt eſpecially of that, which has the moſt of the ſame ſort of particles. See SECRETION, HUMOUR, *&c.*

Capital MEDICINES. See the article CAPITAL.

Chalaſtic MEDICINES. See the article CHALASTIC.

Hypochondriacal MEDICINES. See HYPOCHONDRIACAL.

Hyſteric MEDICINES. See the article HYSTERIC.

MEDIETAS *linguæ*, an inqueſt impanneled, whereof the one half conſiſts of natives or denizens, the other of aliens.

It is uſed in pleas, wherein the one party is a ſtranger, and the other a denizen.—Solomon de Stanford, a Jew, in the time of Edward I. had a cauſe tried before the ſheriff of Norwich, by a jury of *ſex probos & legales homines, & ſex legales Judæos de civitate Norvici*. See JURY.

MEDITATION, an act by which we conſider any thing cloſely, or wherein the ſoul is employed in the ſearch, or conſideration of any truth. See ATTENTION.

In religion, it is uſed to ſignify a conſideration of the myſteries, and grand truths of the chriſtian faith.

Myſtic divines make a great difference between *Meditation*, and *contemplation*: The former conſiſts in diſcurſive acts of the ſoul, conſidering methodically, and with attention, the myſteries of faith, and the precepts of morality; and is performed by reflections and reaſonings, which leave behind them manifeſt impreſſions in the brain.—The pure contemplative have no need of *Meditation*, as ſeeing all things in God at a glance, and without any reflection.

When a man therefore has once quitted *Meditation*, and is arrived at contemplation, he returns no more; and, according to Alvarez, never reſumes the oar of *Meditation*, except when the wind of contemplation is too weak to fill his ſails. See CONTEMPLATION.

MEDITERRANEAN, ſomething incloſed within land; or that is remote from the ocean. See EARTH, OCEAN, *&c.*

MEDITERRANEAN is more particularly uſed to ſignify that large ſea, which flows between the continents of Europe, and Africa; entring by the ſtreights of Gibraltar, and reaching into Aſia, as far as the Euxine ſea, and the Palus Mæotis. See SEA.

The Mediterranean was anciently called the *Grecian Sea*, and the *Great Sea*: It is now cantoned out into ſeveral diviſions, which bear ſeveral names. To the weſt of Italy it is called the *Liguſtic*, or *Tuſcan Sea*; near Venice, the *Adriatic*; towards Greece, *Ionic* and *Ægean*; between the Helleſpont and the Boſphorus, the *White Sea*, as being very ſafe; and beyond, the *Black Sea*, its navigation being dangerous.—The Arabs call the Mediterranean Sea, the *chamber-pot*, by reaſon, it ſeems, of its figure.

MEDITULLIUM, is uſed by anatomiſts for that ſpongy ſubſtance between the two plates of the cranium; and in the interſtices of all laminated bones. See BONE, and CRANIUM.

MEDIUM, a latin term, ſignifying *middle*, or *mean*. See MEAN and MEDIATE.

MEDIUM, in logic, or *Medium of a ſyllogiſm*, called alſo the *mean*, or *middle term*, by the Italians, *mezzo termino*; is an argument, reaſon, or conſideration, for which we affirm, or deny any thing: Or it is the cauſe, why the greater extreme is attributed to, or denied of the leſs, in the concluſion. See MAJOR, MINOR, CONCLUSION, *&c.*

Thus, in the ſyllogiſm, ‘Every good thing is to be deſired; ‘but all virtue is good; therefore all virtue is to be deſired:’ The term *good* is the *medium*; *virtue* the leſs extreme, and to be deſired the greater. See SYLLOGISM, EXTREME, PROPOSITION, TERM, PREMISSES, *&c.*

It is called *medium*, as being a kind of mediator between the ſubject and predicate; or, by reaſon the extremes are ſo diſpoſed as to affirm, or deny by means hereof.—Some call it *argumentum tertium*, a third argument; and others ſimply *argumentum*, as being the cauſe why we aſſent to the concluſion. See ARGUMENT.

Mediums, or *middle terms*, are the things principally ſought for, in diſcourſing; ſo that the invention of *Mediums* makes the moſt eſſential part of logic. But the rules commonly given by logicians for that purpoſe, are mere impertinencies.—In effect, no ſuch rules can be given: Nor have we any way of coming at ſuch *Mediums* or reaſons, but by a cloſe attention to clear ideas. See DISCOURSE, LOGIC, INVENTION, *&c.*

MEDIUM, in arithmetic, or an *arithmetical Medium*, *or mean*, called in the ſchools *Medium rei*, is that which is equally diſtant from each extreme; or, which exceeds the leſſer extreme, as much as it is exceeded by the greater; in reſpect of quantity, not of proportion.

Thus, nine is a *medium* between ſix and twelve. See *arithmetical* PROPORTION.

Geometrical MEDIUM, or *mean*, called in the ſchools *Medium perſonæ*, is that where the ſame ratio is preſerved between the firſt and ſecond, as between the ſecond and third terms; or that which exceeds in the ſame ratio, or quota of itſelf, as it is exceeded. Thus ſix is a geometrical *Medium* between four and nine. See *geometrical* PROPORTION.

This is the *Medium* which virtue is ſuppoſed to obſerve; whence ſome call it *Medium quoad nos*, as having a view to circumſtances, times, places, perſons, *&c.* Diſtributive juſtice obſerves a geometrical *Medium*; commutative juſtice, an arithmetical one. See JUSTICE.

MEDIUM *participationis*, in the ſchools, is that ſaid to be compounded of the two extremes.—Thus, man, who is partly body, partly mind, is a *Medium* by participation of the two extremes; ſo, is warmth the *Medium* of heat and cold, *&c.*

MEDIUM *negationis* or *remotionis*, is that, from which both extremes are derived; or, it is a ſubject, capable of receiving both extremes, and yet not neceſſarily poſſeſſed of either.

In which latter ſenſe, the will is a *mean* with reſpect to virtue and vice; and the underſtanding, with reſpect to knowledge and ignorance.

MEDIUM *quod*, or *Medium ſuppoſiti*, is ſomewhat between the agent and patient, which receives the action of the one, ere it arrive at the other.

In this ſenſe, air is a *Medium* between the fire, and the hand heated thereby.

MEDIUM *quo*, is the form, or faculty, whereby an agent produces an effect: in which ſenſe, heat is ſaid to be the *Medium* or *mean*, whereby fire acts on the hand.

MEDIUM *ſub quo*, is that which renders the power to act, compleat, in the general; without determining it to any particular object: In which ſenſe, light is the *Medium* under which the eye perceives any colour.

MEDIUM *in quo*, is that, by inſpection whereof, a power is produced in any thing, of knowing or perceiving another: Such, is a ſpeculum, as it ſhews an object; an image, as it repreſents the reality, &c.

MEDIUM, in mechanical philoſophy, is that ſpace or region, through which a body paſſes in its motion towards any point. See MOTION.

Thus æther is ſuppoſed to be the *Medium*, wherein the heavenly bodies move. (See ÆTHER.) Air the *Medium* wherein bodies move near our earth. (See AIR and ATMOSPHERE.) Water is the *Medium* in which fiſhes live and move. See WATER. And glaſs is alſo a *Medium* of light, as it affords it a free paſſage. See GLASS, LIGHT, RAY, &c.

That denſity or conſiſtence in the parts of the *Medium*, whereby the motion of bodies in it is retarded, is called *the reſiſtance of the Medium*; which, together with the force of gravity, is the cauſe of the ceſſation of motion of projectiles. See RESISTANCE *of the Medium*, &c.

Subtile or *ætherial* MEDIUM.—Sir Iſ. Newton makes it probable, That beſide the particular aerial *Medium*, wherein we live and breathe, there is another more univerſal one, which he calls an *ætherial Medium*; vaſtly more rare, *ſubtile*, elaſtic, and active, than air; and by that means freely permeating the pores and interſtices of all other *Mediums*, and infuſing it ſelf through the whole creation: And by the intervention hereof he thinks it is, that moſt of the great phænomena of nature are effected. See NEWTONIAN.

This *Medium* he ſeems to have recourſe to, as the firſt and moſt remote phyſical ſpring; and the ultimate of all natural cauſes. By the vibrations of this *Medium*, he takes heat to be propagated from lucid bodies; and the intenſeneſs of heat increaſed and preſerved in hot bodies, and from them communicated to cold ones. See HEAT.

By this *Medium* he takes light to be reflected, inflected, refracted, and put alternately in fits of eaſy reflection and tranſmiſſion; which effects he elſewhere aſcribes to the power of attraction: ſo that this *Medium* appears the ſource and cauſe even of attraction. See LIGHT, REFLECTION, REFRACTION, INFLECTION, and ATTRACTION.

Again, this *Medium* being much rarer within the heavenly bodies, than in the heavenly ſpaces; and growing denſer, as it recedes further from them; he ſuppoſes the cauſe of the gravitation of theſe bodies towards each other, and of the parts towards the bodies. See GRAVITATION.

Again, from the vibrations of this ſame *Medium*, excited in the bottom of the eye by the rays of light, and thence propagated through the capillaments of the optic nerves into the ſenſory, he takes viſion to be performed; ſee VISION. And ſo hearing, from the vibrations of this or ſome other *Medium*, excited in the auditory nerves, by the tremors of the air, and propagated through the capillaments of thoſe nerves into the ſenſory: and thus of the other ſenſes. See SENSATION, HEARING, &c.

And again, he conceives muſcular motion to be performed by the vibrations of the ſame *Medium*, excited in the brain at the command of the will, and thence propagated through the capillaments of the nerves into the muſcles: and thus contracting and dilating them. See MUSCLE and MUSCULAR.

The elaſtic force of this *Medium*, he ſhews, muſt be prodigious: Light moves at the rate of 70,000,000 miles in about ſeven minutes, yet the vibrations and pulſes of this *Medium*, to cauſe the fits of eaſy reflection and tranſmiſſion, muſt be ſwifter than light, which is yet 700,000 times ſwifter than ſound. The elaſtic force of this *Medium*, therefore, in proportion to its denſity, muſt be above 490,000,000,000 times greater than the elaſtic force of the air, in proportion to its denſity: The velocities and pulſes of elaſtic *Mediums* being in a ſub-duplicate ratio of the elaſticities, and the rarities of the *Mediums*, taken together. And thus may the vibrations of this *Medium* be conceived as the cauſe of the elaſticity of bodies. See ELASTICITY.

Further, the particles of this *Medium* being ſuppoſed infinitely ſmall, even ſmaller than thoſe of light; if they be likewiſe ſuppoſed, like our air, to have a repelling power, whereby they recede from each other, the ſmallneſs of the particles may exceedingly contribute to the increaſe of the repelling power, and conſequently to that of the elaſticity and rarity of the *Medium*, and ſo fit it for the free tranſmiſſion of light, and the free motions of the heavenly bodies.—In this *Medium* may the planets and comets roll without any conſiderable reſiſtance. If it be 700,000 times more elaſtic, and as many times rarer, than air; its reſiſtance will be above 600,000,000 times leſs than that of water: A reſiſtance that would make no ſenſible alteration in the motion of the planets in ten thouſand years.

And is not ſuch a *Medium* better diſpoſed for the heavenly motions, than that of the Carteſians, which fills all ſpace adequately, and without leaving pores; is vaſtly denſer than gold; and therefore muſt reſiſt more? See *ſubtile* MATTER, PLENUM, &c.

If any aſk how a *Medium* can be ſo rare, let him tell how the air, in the upper regions of the atmoſphere, can be above a hundred thouſand times rarer than gold. How an electrical body can, by friction, emit an exhalation ſo rare and ſubtile, yet ſo potent, as, though its emiſſion occaſions no ſenſible alteration in the weight of the body, yet it ſhall be diffuſed through a ſphere of two foot in diameter, and carry up leaf-copper, or leaf-gold, at the diſtance of a foot from the electrical body. Or how the effluvia of a magnet can be ſo ſubtile, as to paſs a plate of glaſs without any reſiſtance or diminution of force; yet ſo potent, as to turn a magnetick needle beyond the glaſs. See EFFLUVIA, ELECTRICITY, &c.

That the heavens are not filled with any other, but ſuch a ſubtile ætherial *Medium*, is evident from phænomena: whence elſe are thoſe laſting and regular motions of the planets and comets, in all manner of courſes, and directions? And how are ſuch motions conſiſtent with that reſiſtance, which muſt reſult from that denſe, fluid *Medium*, wherewith the Carteſians fill the heavens?

The reſiſtance of fluid *Mediums* ariſe partly from the coheſion of the parts of the *Medium*, and partly from the vis inertiæ of matter. The firſt, in a ſpherical body, is nearly as the diameter, or, at moſt, as the factum of the diameter, and the velocity of the body. The latter is as the ſquare of that factum. Thus are the two kinds of reſiſtance diſtinguiſhed in any *Medium*; and being diſtinguiſhed, it will be found that almoſt all the reſiſtance of bodies, moving in ordinary fluids, ariſes from the vis inertiæ. That part which ariſes from the tenacity of the *Medium*, may be diminiſhed, by dividing the matter into ſmaller parts, and making thoſe more ſmooth and ſlippery: But the other will ſtill be proportional to the denſity of the matter, and cannot be diminiſhed any other way, but by a diminution of the ſame. See RESISTANCE.

Thus the reſiſtance of fluid *Mediums*, is nearly proportional to their denſities; and thus the air we breathe, being about nine hundred times lighter than water, muſt reſiſt about nine hundred times leſs than water: As, in effect, the ſame author has found it does by experiments on pendulums. Bodies moving in quick-ſilver, water, or air, do not appear to meet with any other reſiſtance, but what ariſes from the denſity and tenacity of thoſe fluids; which they muſt, were their pores filled with a denſe and ſubtile fluid. See VACUUM.

Heat, it is found, diminiſhes the tenacity of bodies very much; yet does it not decreaſe the reſiſtance of water, ſenſibly. The reſiſtance of water, therefore, ariſes chiefly from its vis inertiæ; conſequently, if the heavens were as denſe as water, or as quick-ſilver, they would not reſiſt much leſs: if abſolutely denſe, without any vacuum, be the particles never ſo ſubtile and fluid, they would reſiſt much more than quick-ſilver. A ſolid globe, in ſuch a *Medium*, would loſe above half its motion, while it moves thrice the length of its own diameter; and a globe not perfectly ſolid, ſuch as the planets, would loſe more.

To make way therefore for the laſting motions of the planets and comets, the heavens muſt be empty of all matter, except, perhaps, ſome very fine effluvia, from the atmoſpheres of the earth, planets, and comets; and ſome ſuch ætherial *Medium* as we have deſcribed.—A denſe fluid can ſerve for no purpoſe, in the heavens, but to diſturb the celeſtial motions, and make the frame of nature languiſh; and in the pores of bodies, can only ſerve to check the vibrating motion of their parts, wherein their heat and activity conſiſts. Such a *Medium*, therefore, unleſs we had ſome evidence of its exiſtence, muſt be given up; and that given up, the hypotheſis of light's conſiſting in a preſſion, falls alſo to the ground. See LIGHT, PLANETS PRESSION, CARTESIANISM, &c.

MEDIUM *ſeptum*. See the article SEPTUM.

MEDIUS *venter*, in anatomy, denotes the breaſt or thorax. See THORAX and VENTER.

Glutæus MEDIUS. See the article GLUTÆUS.

MEDLEY. See the article CHANCE *medley*.

MEDULLA *oſſium*, or *Marrow of the bones*, is a ſoft fatty ſubſtance, placed in the cavities or pores of divers bones. See MARROW.

The *Medulla* is incloſed in a membrane; and is devoid of ſenſe: it is red in the greater cavities, white in the leſs, and ſoft and ſucculent in ſpungy bones. See BONE.

From this is ſecreted the medullary oil. See MEDULLARY *oil*.

MEDULLA *cerebri* and *cerebelli*, denotes the white ſoft part of the brain and *cerebellum*, covered on the outſide with the cortical ſubſtance, which is of a more dark or aſhy colour.—See the origin, ſtructure, and uſe thereof, under BRAIN and CEREBELLUM.

MEDULLA *oblongata*, is the *medullary* part of the brain and cerebellum joined in one; the fore-part of it coming from the brain, and the hind-part from the cerebellum.—See *Tab. anat.* (oſteol.) *fig.* 5. *litt. d d.*

It lies on the baſis of the ſkull, and is continued through the great perforation thereof into the hollow of the vertebræ of the neck, back, and loins: though only ſo much of it retains the name *oblongata*, as is included within the ſkull. After its exit thence, it is diſtinguiſhed by the name of *Medulla ſpinalis.* See Medulla *ſpinalis*, and Crura.

The ſubſtance of the *Medulla oblongata* being only an aggregate of thoſe of the brain and cerebellum, muſt, like them, be purely fibrous or nervous, and only an aſſemblage of minute tubes for the conveyance of the animal ſpirits. It ariſes, as it were, from four roots; whereof the two largeſt ſpring from the brain, and are called *crura*: the two leſſer from the cerebellum, which Dr. Willis calls *pedunculi.* See Brain, and Cerebellum.

Upon inverting it, the firſt thing that appears upon its trunk, is a protuberance, ſomewhat like a ring, and for that reaſon called *protuberantia annularis.* Then follow ten pair of nerves, which have their origin here, and are hence ſent to the ſeveral parts of the body. See Nerve. Immediately under the firſt pair, or olfactories, appear two ſmall arteries, or branches of the carotides. The ſecond pair, or optics, being cut off, appears the infundibulum, which ends in the glandula pituitaria, and on each ſide, the carotid arteries enter the ſkull. In the lateral ventricles of the *Medulla* are two prominences on each ſide, the one pair called *corpora ſtriata*, from the appearance of ſtripes, or nervous fibres, within them; their outer ſubſtance being cortical or glandulous, like the reſt of the ſurface of the brain, though not ſo deep. Betwixt the corpora ſtriata is a broad thin production of the *Medulla*, called *fornix*; and underneath them lie two other prominences, called *thalami nervorum opticorum.* On either ſide of theſe is a plexus of bloodveſſels, called *plexus choroides.* And under the fornix a narrow aperture, called the *rima*, which lets into the infundibulum; which is a paſſage from the third ventricle to the glandula pituitaria, through the *Medulla* of the brain; being lined with the pia mater. Under this, in the ſinus called *ſella equina*, or *turcica*, upon the os cribroſum, is the glandula pituitaria; which is ſurrounded with a plexus of veſſels, called *rete mirabile*, only viſible in brutes. See Rete, Pituitary, &c. On the hind-part of the third ventricle is a ſmall foramen, called *anus*, leading to the fourth ventricle of the cerebellum: At the orifice of this is ſeated a ſmall gland, which, from its fancied reſemblance to a pine-apple, is called *conarium*, or *glandula pinealis*; where Des Cartes and his followers imagine the ſeat of the ſoul to be. See Pineal. On the back-ſide of the *Medulla oblongata*, near the cerebellum, are four protuberances, whereof the upper and larger are called *nates*, the under and leſſer *teſtes.* See Nates, and Testes. Between theſe and the proceſſes of the cerebellum, is the fourth ventricle, from its figure called *calamus ſcriptorius.* See Calamus. On the *Medulla oblongata*, near its extremity, are four other prominences, two on each ſide; called *corpora pyramidalia*, and *olivaria.* See Olivaria, Conarium.

Medulla *ſpinalis*, or the *ſpinal Marrow*, is a continuation of the *Medulla oblongata*, or *medullary* part of the brain, without the ſkull. See Spine.

It conſiſts, as the brain does, of two parts, a white or *medullary*, and a cineritious or glandulous; the former without, and the other within. The ſubſtance of the exteriour part is much the ſame with that of the corpus calloſum, only ſomewhat tougher, and more fibrous: which difference becomes the more apparent, as it deſcends the lower; by reaſon of the ſtreightneſs of the cavity, which growing gradually more narrow, preſſes the *medullary* fibres cloſer together, and renders them more compact, and gathers them into more diſtinct faſciculi, till having deſcended the whole tract of the ſpina, they end in the cauda equina. It is the origin of moſt of the nerves of the trunk of the body: It ſends out thirty pair on each ſide to the limbs, the great cavities, and the other parts; which are nothing but faſciculi of *medullary* fibres, covered with their proper membranes. See Nerve.

The *ſpinal Marrow* is generally ſaid to be covered with four coats: The firſt, or external one, is a ſtrong nervous ligament, which ties the vertebræ together, to the inſide of which it firmly adheres. The ſecond is a production of the dura mater; it is exceedingly ſtrong, and ſerves to defend the *ſpinal Marrow* from any hurt from the flexures of the vertebræ.

The third is a production of the arytænoides, and is a thin pellucid membrane, lying between the dura and pia mater, or the ſecond and fourth membranes of the *Medulla.* This membrane gives a coat to the nerves that go out of the ſpina, which is the inner membrane of the nerves, as the dura mater gives the outer. The fourth coat is a continuation of the pia mater, and is an extemely thin, fine, tranſparent membrane; ſtrictly embracing the whole ſubſtance of the *Medulla*, dividing it in the middle into two tracts, and making, as it were, two columns of it.—See *Tab. Anat.* (oſteol.) *fig.* 6. See alſo Spine, Vertebræ, &c.

MEDULLARY *oil*, is no more than the finer and more ſubtile parts of the *Medulla*, or marrow of the bones. See Marrow, and Oil.

This, Dr. Havers obſerves, paſſes not into the bones through ducts, but by ſmall pores formed into veſicles or glandules, which are conglomerated into diſtinct lobules, contained in ſeveral membranes inveſting the whole marrow; all which veſicles or bags are propagated from the outward coat of the arteries; and by theſe it paſſes from one to another, till it arrives at the ſides, or extreme parts of the bone. That part of it which is ſupplied to the interſtices of the joints, goes into them by paſſages, penetrating through the bone into thoſe cavities, and formed for that end. The uſe of this *oil* is either common to all the bones, whoſe temper it preſerves, and keeps from being too brittle; or more peculiarly to the joints, where it is very ſerviceable, 1°. To lubricate the bones at their extremities, that they may move more eaſily and free. 2°. To keep the ends of the articulated bones from growing hot with motion. 3°. To preſerve the joints from wearing by attrition, and rubbing one againſt another: And 4°. To preſerve the ligaments of the joints from dryneſs and rigidity, and lubricate thoſe parts which ſlide upon the bones, and keep the cartilages which are joined to them, flexible.

MEETER. See the article Metre.

MEGADOMESTICUS. See Domestic.

MEGALENSIA*, or Megalesia, in antiquity, ſolemn feaſts celebrated among the Romans on the 12th of April, in honour of the great mother of the gods, that is, Cybele, or Rhea; wherein were ſports or combats held before the temple of that goddeſs. See Feast, &c.

* They were called *Megalenſia*, from the Greek μεγαλη, great; Cybele being accounted the great goddeſs.

MEI *miſerere.* See the article Miserere.

MEINOUR. See the article Mainour.

MELA, a chirurgeon's inſtrument, called alſo *ſpeculum*, and by the vulgar, *tenta*, or *probe.* See Probe.

Its uſe is to probe ulcers, or draw a ſtone out of the yard: Its form is various, according to the uſe it is intended for. See Speculum.

MELANCHOLY*, in medicine, a low kind of delirium, without a fever; uſually attended with fear, heavineſs, and ſorrow, without any apparent occaſion. See Delirium.

* The word in Greek, Μελαγχολια, formed from μελας, black; and χολη, bile.

The ancients attributed this diſeaſe to black and cloudy ſpirits, ariſing as vapours from a redundant atrabilary humour. See Atrabilis, and Choler.

Some of the moderns aſcribe it to the irregular motion of the ſpirits, and their acid conſtitution; and others, who ſeem to know it better, to too heavy and viſcid a blood, which permits not a ſufficiency of ſpirits to be ſeparated in the brain, to animate and invigorate the nerves and muſcles: laſtly, others to a dryneſs of the meninges of the brain.

This diſeaſe is varied an infinite number of ways, according to the temperament and ideas of the perſon affected with it. It is a ſpecies of madneſs, and only differs from a downright mania in degree. See Mania.

MELANOGOGUES*, ΜΕΛΑΝΟΓΩΓΑ, are ſuch *Medicines* as are ſuppoſed particularly to purge off atrabilis or black choler.

* The word is formed from μελας, *niger*, black; and αγω, *duco*, to lead, or draw.

But there is no ſuch ſpecies of choler now regarded, and conſequently this diſtinction of evacuants is but little uſed. See Purgatives, and Atrabilis.

MELASSES. See the article Molosses.

MELCHITES, a religious ſect in the Levant, who ſcarce differ from the Greeks in any thing relating either to faith, or worſhip; only that they do not ſpeak the Greek language.

The word, in the original Syriac, ſignifies *royaliſts*, and was formerly applied by the catholics to the heretics who refuſed to ſubmit to the deciſions of the council of Chalcedon: intimating by this appellation, that they were of the religion of the emperor.

Thoſe now called *Melchites*, are ſuch people, as, inhabiting among the Syrians, Cophtæ, or Egyptians, and other Levantine nations, follow the opinions of the Greeks, though no Greeks themſelves: And it is for this reaſon that Gabriel Sionita calls them indifferently by the names of *Greeks*, and *Melchites.* See Greek.

The ſame author obſerves, that they are ſpread through all the Levant; that they deny purgatory; and are declared enemies to the pope and his primacy.—For the reſt, they fall in with the Greeks, both as to articles of faith, and diſcipline.

They have tranſlated the Greek euchologium, and other books of that kind, into Arabic; and have the canons of councils in the ſame language. To thoſe of the council of Nice, they have added new canons, commonly called the *Arabic canons*; which are likewiſe received by the Jacobites and Maronites: Though moſt of the learned look on them as ſpurious.

MELCHIZEDECHIANS, or Melchisedekians, ancient ſectaries, ſo called, becauſe they raiſed *Melchiſedech* above all creatures, and even above Jeſus Chriſt.

The author of this ſect, was one Theodotus, whence the *Melchizedechians* became more commonly known by the name of *Theodotians*; all the difference between thoſe and the ſtrict *Theodotians*, conſiſting in that particular article relating to *Melchizedech*; who, according to them, was the great and ſupreme virtue.

MELICERIS, ΜΕΛΙΚΗΡΙΣ, a tumour or abſciſs incloſed in a cyſtis; conſiſting of matter not unlike honey, whence its name. The *Meliceris* is otherwiſe called *atheroma*.—It gathers without pain, and gives way upon preſſure, but returns again: It is to be cured by warm diſcutients. See ATHEROMA.

MELISMATICO *ſtylo*. See the article STYLE.

MELITITES, ΜΕΛΙΤΙΤΗΣ, a greyiſh ſtone, which, when pulverized, yields a milky liquor, of a taſte ſomewhat like honey, whence it takes its name.

It is found in mines of metals, and ſeems to partake pretty much of the nature of lead; having a ſweetneſs ſomewhat like the ſal ſaturni, but much fainter.

It only differs from the galactite, in that it is milder to the taſte. See GALACTITES. The ancients uſed it in inflammations of the eyes, and to dry ulcers.

MELIUS *inquirendum*, a writ which lieth for a ſecond inquiry to be made of what lands and tenements a man died ſeized, where partiality is ſuſpected upon the writ called *diem clauſit extremum*.

MELODY*, ΜΕΛΩΔΙΑ, in muſic, is the agreeable effect of different muſical ſounds, ranged or diſpoſed in ſucceſſion. See SOUND.

* The word is compounded of the Greek μελι, honey; and ωδη, ſinging.

Melody is the effect only of one ſingle part, voice, or inſtrument; by which it is diſtinguiſhed from *harmony*; though in common ſpeech theſe two are frequently confounded.

Harmony is the agreeable reſult of the union of two or more concording muſical ſounds heard in conſonance, *i. e.* at one and the ſame time; ſo that harmony is the effect of two parts at leaſt: As therefore a continued ſucceſſion of muſical ſounds produces *Melody*, ſo does a continued combination of theſe produce harmony. See HARMONY, CONCORD, and *muſic in* PARTS.

Though the term *Melody* be chiefly applicable to the treble, as the treble is chiefly diſtinguiſhed by its air; yet ſo far as the baſs may be made airy, and to ſing well, it may be alſo properly ſaid to be *melodious*. See TREBLE, and BASS. Of the twelve harmonical intervals of muſical ſounds, diſtinguiſhed by the names of *ſecond leſſer*, *ſecond greater*; *third leſſer*, *third greater*; *fourth*; *falſe fifth*, *fifth*; *ſixth leſſer*, *ſixth greater*; *ſeventh leſſer*, *ſeventh greater*; and *octave*; all *Melody* as well as harmony, are compoſed: For the octaves of each of theſe are but replications of the ſame ſound; and whatever is ſaid of any, or all of theſe ſounds, is to be underſtood alſo of their octaves. See OCTAVE.

For the rules of MELODY, ſee the article COMPOSITION.

MELT. See the article MILT.

MELTING-*fire*. } See the article { FIRE.
Surveyor of MELTING. } { MELTING.

MEMBERS, in anatomy, the exterior parts, ariſing from the trunk, or body of an animal, like boughs from the trunk of a tree. See BODY.

In which ſenſe, *Members*, *membra*, amount to much the ſame with *limbs*, *artus*: Though ſome make a difference between the two; reſtraining *Members* more immediately to the fleſhy parts which cover the limbs, and artus to the bones and nerves. Phyſicians divide the body into three regions or venters, the head, the breaſt, and the lower ventricle; and the extremities, which are the *Members*. See EXTREMITY.

Each *Member*, and portion of the body, was anciently devoted to ſome divinity. The head to Jupiter, the breaſt to Neptune, the navel to Mars, the ear to Memory, the forehead to the Genius, the right-hand to Faith or Fidelity, the knees to Mercy; the eye-brows, again, to Jupiter, the eyes to Cupid, or, according to others, to Minerva, the hind-part of the right ear to Nemeſis, the back to Pluto, the reins to Venus, the feet to Mercury, the heels and ſoals of the feet to Thetis, and the fingers to Minerva.

MEMBER, in architecture, denotes any part of a building; as a frieze, cornich, or the like.

MEMBER is ſometimes alſo uſed for moulding. See MOULDING.

MEMBER, in grammar, is applied to the parts of a period, or ſentence. See PERIOD, and SENTENCE.

MEMBERED, or MEMBRED, in heraldry, is where the legs or feet of an eagle, griffin, or other bird, are of a different colour from the reſt of the body.

MEMBRANA, in anatomy. }
MEMBRANA *communis muſculorum*. } See { MEMBRANE.
MEMBRANA *propria muſculorum*. }
MEMBRANA *communis vaſculorum*. }

MEMBRANA *adipoſa*. } { ADIPOSA.
MEMBRANA *carnoſa*. } { CARNOSA.
MEMBRANA *nictitans*. } See { NICTITATING. (MEN.
MEMBRANA *tympani*. } { TYMPANUM, and FORA-
MEMBRANA *urinaria*. } { ALLANTOIS.

MEMBRANE, MEMBRANA, in anatomy, a ſimilar part of an animal body; being a thin, white, flexible, expanded ſkin, formed of ſeveral ſorts of fibres interwoven together, and ſerving to cover or wrap up certain parts of the body. See BODY, and PART.

The *membranes* of the body are various; and variouſly denominated:—Such are the perioſteum, pleura, pericardium, peritonæum, *&c.* which ſee under their proper articles; PERIOSTEUM, *&c.*—Such alſo are the *Adipoſa*, *Carnoſa*, and *Nictitating*.

Thoſe *membranes* which ſerve as integuments, or covers of veſſels, are called *coats* or *tunics*; and thoſe which cover the brain, are, by a peculiar name, called *meninges*. See TUNIC, and MENINGES.

The fibres of *membranes* give them an elaſticity, whereby they can contract, and cloſely graſp the parts they contain; and their nervous fibres give them an exquiſite ſenſe, which is the cauſe of their contraction: they can therefore ſcarcely ſuffer the ſharpneſs of medicines, and they are difficultly united, when wounded. In their texture there is a number of ſmall glands, which ſeparate an humour, fit for moiſtening the parts they contain. By reaſon of the thickneſs and tranſparency of the *membranes*, the ramifications of the blood-veſſels are more apparently ſeen in them, than in any other part of the body: here the innumerable diviſions, windings and turnings, ſerpentine progreſſions, and frequent inoſculations, not only of veins and arteries together, but alſo of veins with veins, and arteries with arteries, make a moſt agreeable embroidery, and delicate net-work, covering the whole *membrane*. See VESSEL, *&c.*

The uſe of the *membranes* is to cover and wrap up the parts, and ſtrengthen them; to ſave them from external injuries; to preſerve the natural heat; to join one part to another; to ſuſtain ſmall veſſels, and the nerves which run through their duplicatures; to ſtop the returning of the humours in their veſſels, as the valves ſtop the returning of the blood in the veins and heart; of the chyle in the thoracic duct; and of the lympha in the lymphatic veſſels. See VALVE, *&c.*

Anatomiſts generally aſſert, that there is a *membrana communis muſculorum*, or *membrane* common to all the muſcles, being led into that miſtake by the aponeuroſis of ſeveral; whereas, upon ſtricter obſervation, there is no ſuch thing to be found. See MUSCLE.

The *membrana propria muſculorum*, is that which immediately covers all and every one of the fibres of a muſcle, and is cloſely tacked to them. There is another common *membrane*, called *membrana communis vaſculorum*; which is a thin *membrane*, accompanying almoſt all the veſſels of the body. See VESSEL, VEIN, ARTERY, *&c.*

All theſe *membranes* receive veins, arteries, and nerves, from the parts which are neareſt to them.

MEMBRANES *of the eyes*. } See the article { EYE.
MEMBRANOSA *armilla*. } { ARMILLA.

MEMBRANOSUS, in anatomy, a muſcle of the leg, ſo called from its large *membranous* expanſion incloſing all the muſcles of the tibia and the tarſus; whence it is alſo called *faſcia lata*.—See *Tab. Anat.* (*Myol.*) *fig.* 2. *n.* 34. *fig.* 1. *n.* 48. *fig.* 6. *n.* 34.

It hath a ſharp fleſhy beginning from the fore-part of the ſpine of the os ilium, but ſoon becomes *membranous*, and covers almoſt all the muſcles of the thigh and leg, down to the foot, where it joins with the ligamentum annulare; and in its action turns the leg outwards.

MEMBRED. See the article MEMBERED.

MEME.—*Que eſt* MEME. See the article QUE.

MEMOIRS, or MEMORIALS, a term now much in uſe for hiſtories, compoſed by perſons who had ſome ſhare, or concern in the tranſactions they relate, or who were eye-witneſſes of them; anſwering to what the Latins called *commentarii*. See COMMENTARY, and HISTORY.

The French are great dealers in this way of writing, and have an infinite number of books of *memoirs*, containing, for the generality, the lives, actions, intrigues, amours, *&c.* of the writers.

MEMOIRS is alſo uſed for a journal of the acts, and proceedings of a ſociety; or a collection of the matters debated, tranſacted, *&c.* therein.—Such are the *memoirs* of the royal academy of ſciences, *&c.* See JOURNAL, ACADEMY, *&c.*

MEMORY, ΜΝΗΜΗ, a power, or faculty of the mind, whereby it retains or recollects the ſimple ideas or images of things we have ſeen, imagined, underſtood, *&c.* See SOUL, POWER, FACULTY, *&c.*

Of all the faculties, there is none harder to account for, or that has perplex'd philoſophers more, than the *memory*. Some will have it a mere organ, as the eye, ear, *&c.*—Dr. Hook, in an *Eſſay towards a mechanical account of memory*, makes it to conſiſt in a ſtock of ideas or images, formed occaſionally by the mind out of the fine parts of the brain, and diſpoſed, or laid by in order.

Des Cartes and his followers maintain, That the animal ſpirits exciting a motion in the moſt delicate fibres of the brain, leave a kind of traces or footſteps, which occaſion our *remembrance*. Hence it happens, that by paſſing ſeveral times over the ſame things, the ſpirits becoming accuſtomed to the ſame paſſages, leave them open, and ſo make their way without any effort or labour; and in this conſiſts the eaſe wherewith we recollect ſuch ideas. Thus wine is found to ſharpen the *memory*, in regard the ſpirits of the wine put the animal ſpirits in motion, and agitate the fibres of the brain the more briſkly. See IDEA, BRAIN, TRACE, REMEMBRANCE, *&c.*

Father Malebranche expreſſes his notion of *memory* thus: ‘It ‘being granted, that all our different perceptions are owing ‘to changes happening in the fibres of the principal part of ‘the brain, wherein the ſoul more immediately reſides, the ‘nature of the *memory* is obvious: for as the leaves of a tree, ‘that have been folded for ſome time, in a certain manner, ‘preſerve a facility or diſpoſition to be folded again in the ſame ‘manner; ſo the fibres of the brain, having once received ‘certain impreſſions by the courſe of the animal ſpirits, and by ‘the action of objects, preſerve, for ſome time, a facility to ‘receive the ſame diſpoſition. Now it is in this facility that ‘*memory* conſiſts; for we think on the ſame things, when ‘the brain receives the ſame diſpoſitions.

‘Further, as the animal ſpirits act ſometimes more briſkly, ‘and ſometimes more languidly on the ſubſtance of the brain; ‘and as ſenſible objects make much deeper, and more laſting ‘impreſſions, than the imagination alone; it is eaſy, on this ‘ſcheme, to conceive why we do not remember all things ‘alike: Why a thing, for inſtance, ſeen twice, is repreſented ‘more vividly to the mind, than another ſeen but once: Why ‘things that have been ſeen, are uſually remembred more diſ‘tinctly, than thoſe that have been only imagined, *&c.*’ See HABIT.

‘Old men are defective in *memory*, and cannot learn any ‘thing without much difficulty, becauſe they want animal ‘ſpirits to make new traces, and becauſe the fibres of the brain ‘are become too hard to receive, or too moiſt to retain ſuch ‘impreſſions. For the ſame reaſon, thoſe who learn with the ‘greateſt eaſe, forget the ſooneſt; in regard when the fibres ‘are ſoft and flexible, objects make a ſlight impreſſion, which ‘the continual courſe of animal ſpirits eaſily wears off: On ‘the contrary, the fibres of thoſe who learn ſlowly, being leſs ‘flexible, and leſs ſubject to be ſhaken, the traces are more ‘deeply engraven, and laſt the longer.

‘From all which obſervations it follows, that the *memory* is ‘abſolutely dependent on the body; being impaired or ſtreng‘thened, according to the changes that befal the body; a fall, ‘the tranſports of a fever, *&c.* being frequently found to eraſe ‘or blot out all the traces, to bear away all the ideas, and to ‘cauſe an univerſal forgetfulneſs.’

The chief difficulty that clogs this doctrine of *memory*, is to conceive how ſuch an infinite number of things, as the head is ſtored withal, ſhould be ranged in ſo much order in the *memory*, as that the one ſhould not efface the other: and how in ſuch a prodigious aſſemblage of traces impreſſed on the brain, the animal ſpirits ſhould awake preciſely thoſe which the mind has occaſion for! See SPIRITS.

Seneca ſays of himſelf, that by the mere effort of his natural *memory*, he was able to repeat two thouſand words upon once hearing them, each in its order; though they had no dependence or connection on each other. After which he mentions a friend of his, Portius Latro, who retained in his memory all the declamations he had ever ſpoke, and never had his *memory* fail him, even in a ſingle word. He alſo mentions Cyneas, ambaſſador to the Romans from king Pyrrhus, who in one day had ſo well learnt the names of his ſpectators, that the next he ſaluted the whole ſenate and all the populace aſſembled, each by his name. Pliny ſays, that Cyrus knew every ſoldier in his army by name; and L. Scipio, all the people of Rome. Charmidas, or rather Carneades, when required, would repeat any volume found in the libraries, as readily as if he were reading.—Dr. Wallis tells us, that without the aſſiſtance of pen and ink, or any thing equivalent, he was able in the dark, by mere force of *memory*, to perform arithmetical operations, as multiplication, diviſion, extraction of roots, *&c.* to forty places. Particularly, that in February $167\frac{1}{2}$, at the requeſt of a foreigner, (by night, in bed) he propoſed to himſelf a number of fifty-three places, and found its ſquare root to twenty-ſeven places; and without ever writing down the number, dictated it from his *memory*, at his next viſit, twenty days afterwards.

Local or *artificial* **MEMORY**, is an art or invention, by means whereof the *memory* is ſuppoſed to be aided, ſtrengthened, and inlarged.

This art ſeems to conſiſt in nothing elſe but a certain method of coupling or aſſociating ideas of things to be remembred, with the ideas of other things, already diſpoſed orderly in the mind, or that are before the eyes.—It is of an old ſtanding, having been practiſed by many of the ancient orators; ſome whereof are ſaid to have made uſe of paintings, images, and emblems on this occaſion: Though others contented themſelves with the parts, members, ornaments, furniture, and other circumſtances of the place where they were to ſpeak. Muretus tells us, that a young man of Corſica pretending to do wonders this way, Muretus put him to the trial; and upon dictating to him two or three thouſand words, ſome Greek, ſome Latin, ſome Barbarous; all without any relation to each other, and the greateſt part without any meaning at all; the artiſt immediately, and without any heſitation, or the leaſt ſtumbling or diſplacing, repeated them all, from firſt to laſt, in the ſame order wherein they had been dictated; and this done, beginning where he ended, he repeated them all backwards, from laſt to firſt. Adding, that this was but a ſlight eſſay of his *memory*; and that he would undertake to repeat thirty-ſix thouſand words in the ſame manner.

The truth is, this art ſeems better calculated for retaining things without any coherence or dependence on one another, as mere words or ſounds, *&c.* than for things where reaſon or judgment are any way required.

Raim. Lully took ſo much pains with it, that it now goes by his name, being called *Lully's art*. See ART.

MEMPHITES, or *lapis* **MEMPHITICUS**, a ſort of ſtone mentioned by Dioſcorides, Pliny, and other natural hiſtorians; ſuppoſed to be found in Egypt not far from the city Cairo, the ancient Memphis; whence its name.

The property it is famed for, is, that being pulverized, and ſmeared on any part of the body to be cut off, it deadens it ſo, as that the patient ſhall perceive no pain from the operation.

MENANDRIANS, the moſt ancient branch of Gnoſtics; thus called from Menander their chief, a diſciple of Simon Magus, and himſelf a reputed magician. See SIMONIANS, and GNOSTICS.

He taught, that no perſon could be ſaved unleſs he were baptized in his name: He conferred a peculiar ſort of baptiſm, which would render thoſe who received it immortal in the next world. St. Irenæus repreſents him, as pretending to be, That firſt virtue hitherto unknown to the world, and to have been ſent by the angels for the ſalvation of all mankind.

He took upon him, ſays St. Epiphanius, *hær.* 2. to be greater than his maſter; which contradicts Theodoret, who makes Menander a ſubordinate virtue to Simon Magus, the great virtue of all. See SIMONIANS.

MENDICANTS, *beggars*; a term applied to ſeveral orders of religious, who live on alms, and go a begging from door to door. See MONK, and RELIGIOUS.

There are four ancient orders which paſs principally by the name of the *four mendicants*: The Carmelites, Jacobines, Franciſcans, and Auguſtins. See CARMELITES, JACOBINES, *&c.*

Among the number of *mendicants*, are alſo ranked the Capuchins, Recollects, Minims, and others, who are branches, or derivations from the former. See CAPUCHINS, RECOLLECTS, *&c.*

The *mendicants* at their firſt eſtabliſhment, were rendered incapable of having any revenues. The multitude of *mendicants* is now a heavy tax on the people.

MENIAN *column*. See the article COLUMN.

MENINGES, ΜΗΝΙΓΓΕΣ, in anatomy, the coats, or membranes, wherewith the brain is incloſed. See BRAIN.

The Arabs call them mothers; whence we alſo uſually call them in Latin the *pia*, and *dura mater*. See PIA, and DURA MATER.

There are two *meninges*, external and internal; called *meninx craſſa*, and *tenuis*.

Craſſa **MENINX**, or *dura mater*, is the external one, and the groſſeſt. It lies immediately under the cranium, and covers the whole ſubſtance of the brain, and the ſpinal marrow, and affords a coat to the trunks of the larger nerves. See NERVE, *&c.* It is connected on the upper part to the perioſteum by means of fibres, and on the under ſide to the *pia mater* by the branches of the ſinus's, and by the arteries and nerves. It conſiſts of two leſſer coats or membranes, which ſome have taken for two dura maters; the exterior, hard; and the inner, more ſmooth, ſoft, and moiſt. It deſcends double between the two hemiſpheres of the brain, which it divides as deep as the corpus calloſum, and by reaſon of its curvature, occaſioned by the convexity of the brain in that part, is called *falx*, from its reſemblance to a ſickle. See FALX. It likewiſe inſinuates itſelf between the brain and cerebellum, and ſo prevents the brain from lying too hard on the cerebellum. In the duplicatures thereof are ſeveral cavities called *ſinus's*, which are a ſort of venous canals ſerving for the conveyance of the blood. Of theſe there are four conſiderable ones, *viz.* the longitudinales and laterales. See SINUS.

MENINX *tenuis*, or *pia mater*, lies under the dura mater, immediately under the brain. It is a fine thin membrane adhering ſo cloſely, and inſinuating itſelf into all the folds and amfractuous parts of the brain, that it is ſcarce to be ſeparated from it. This membrane covers the whole brain, cerebellum, and medulla oblongata, and ſerves, together with the other, for the defence of the brain, and the ſupport of its veſſels.

Between the two, lies another fine tranſparent membrane, called *arachnoides*; but the beſt anatomiſts take this for no more than the external lamina of the pia mater. See ARACHNOIDES.

MENIPPEAN, *ſatyra* MENIPPEA, a kind of ſatyr conſiſting of proſe and verſe intermixed. See SATYR.

It is thus called from Menippus, a Cynic philoſopher, who delighted in compoſing ſatyrical letters, &c.—In imitation of him, Varro alſo wrote ſatyrs under the title of *ſatyræ Menippeæ*: Whence this ſort of compoſition is alſo denominated *Varronian ſatyr*.

Among the moderns, there is a famous piece under this title, firſt publiſhed in 1594, againſt the chiefs of the league, called alſo the *Catholicon* of Spain. It is eſteemed a maſter-piece for the time. See CATHOLICON.

MENISCUS, in optics, a glaſs, or lens, concave on one ſide, and convex on the other; ſometimes alſo called *lunula*. See LENS and OPTIC *glaſs*.

In a *meniſcus*, if the diameter of the convexity be equal to that of the concavity, a ray falling parallel to the axis, will continue parallel thereto after refraction.

Such a *meniſcus* therefore, will neither collect, nor diſperſe the rays; and is therefore of no uſe in dioptricks. See REFRACTION.

To find the focus of a *meniſcus*, the rule is, As the difference of the ſemi-diameters of the convexity and concavity, is to the ſemi-diameter of the convexity: ſo is the diameter of the concavity, to the diſtance of the focus from the *meniſcus*. Hence, If the ſemi-diameter of the concavity, be triple the ſemi-diameter of the convexity, the diſtance of the focus from the *meniſcus* will be equal to the ſemi-diameter: and therefore the *meniſcus* will be equivalent to a lens equally convex on either ſide. See CONVEX-*lens*.

Again; if the ſemi-diameter of the concavity be double that of the convexity; the diſtance of the focus will be equal to the diameter: and therefore the *meniſcus* will be equivalent to a plano-convex lens. See PLANO-*convex*.

If the ſemi-diameter of the concavity be quintuple that of the convexity, the *meniſcus* will be equivalent to a ſquare. See *ſpherical* LENS.

The ſemi-diameter therefore of the concavity being given; that of the concavity required to remove the focus to any given diſtance from the *meniſcus*, is eaſily found. See FOCUS.

MENNONITES, a ſect in the United Provinces, in moſt reſpects the ſame with thoſe in other places called *Anabaptiſts*. See ANABAPTIST.

They had their riſe in 1496, in a village in Friezeland: their founder was one Mennon, who undertook to reform the religion of the ancient Anabaptiſts, and to throw out all enthuſiaſm touching the new kingdom of Chriſt, &c.

The *Mennonites* hold, that there is no original ſin; that the firſt man was not created juſt; that in ſpeaking of the father, ſon, and holy ghoſt, we muſt not uſe the word *perſon*, nor that of *trinity*; that Jeſus Chriſt did not take his fleſh from the ſubſtance of his mother, but from the eſſence of the father; or that the word of the father became man; that he brought it from heaven, or that we do not know whence he had it: And that the union of the divine and human nature was ſo effected, as that the divine was rendered viſible, and liable to death.

The *Mennonites* teach farther, that Chriſtians are not allowed to ſwear; to exerciſe any civil magiſtrature; to uſe the ſword, not even for the puniſhment of criminals. They add, that miniſters of the word are not permitted to receive any wages for their work; that they muſt not baptize little children; and that the ſouls of men after death reſt in an unknown place till the day of judgment.

The *Mennonites* are ſub-divided into divers ſects; whereof the two principal are, the *Mennonites* of Friezeland, and thoſe of Flanders.

The latter exerciſe a very ſtrict church-diſcipline, and excommunicate for the ſlighteſt offence; nor do they hold it lawful to have any ſociety or communication with thoſe excommunicated.—Thoſe of Friezeland, on the contrary, receive into their communion ſuch as are excommunicated by the others; whence they have been called *ſtercorarii*, and *borboriſtæ*. Their diſcipline is very remiſs.

They recommend an univerſal toleration of religions very earneſtly, and receive all kinds of perſons into their aſſemblies, provided they be of good morals, and believe the ſcripture to be the word of God; however divided they may be as to the particular articles of faith.

Though the *Mennonites* uſually paſs for a ſect of Anabaptiſts, yet M. Herman Schin, a *Mennonite* miniſter, who has publiſhed their hiſtory and apology, maintains that they are not Anabaptiſts, either in principle, or by origin: He owns they baptize none but adults; but then, neither do they re-baptize any who had received it in their childhood. They ſpeak with a great deal of prudence and reſerve as to the extraordinary operations of the holy ſpirit; and are far from the fanaticiſm of the old Anabaptiſts. No people are more ſubmiſſive to magiſtrates, or carry paſſive obedience farther than they. Far from rebellion; they condemn even the moſt juſt war, &c.

MENOLOGY*, MENOLOGIUM, in the Greek church, is much the ſame with *martyrology*, or *calendar* in the Latin. See MARTYROLOGY, and CALENDAR.

* The word comes from the Greek, μην, month, and λογος, diſcourſe.

The Greek *Menologium* is divided into the ſeveral months in the year; and contains an abridgment of the lives of the ſaints; with a bare commemoration of the names of ſuch whoſe lives were never written. The Greeks have various *Menologies*. The Romans tax them with inſerting divers heretics in their *Menologies* as ſaints. Baillet treats of them at large.

MENSÆ *domeſticus*. See the article DOMESTICUS.

MENSALIA, MENSALS, ſuch parſonages, or livings as were formerly united to the tables of religious houſes; and therefore by canoniſts called *menſal* benefices. See PARSONAGE, and BENEFICE.

MENSES*, CATAMENIA, in medicine, the monthly evacuations from the uterus, of women not with child, or not giving ſuck. See MENSTRUAL.

* They are ſo called from *menſis*, month, the period wherein they return. They are alſo called *flowers*, *courſes*, &c. See FLOWERS.

The *menſes* make one of the moſt curious and difficult phænomena in the whole human body; for the explanation whereof, many hypotheſes have been framed, though the matter is yet ſcarcely aſcertained.

It is generally agreed by all, that the neceſſity women are under for ſome extraordinary ſupply to compenſate the expence, and ſupport them during the time of geſtation, was the final reaſon why this redundance at other times was given them. But this is all they agree in. Some not content with this occaſion alone, will have the *menſtruous* blood offend in quality more than in quantity; which they argue from the pain it gives many women in the evacuation.—They add, that its malignity is ſo great, that it excoriates the parts of men by mere contact; that the breath of a *menſtruous* woman will give a permanent ſtain to ivory, or a looking-glaſs; that a little of the blood dropped on any vegetable, blaſts, or renders it ſterile; that if a pregnant woman be defiled with the *menſes* of another woman, ſhe miſcarries; that if a dog taſtes them, he runs mad, and grows epileptic: All which, with many more fables of the ſame kind, though related by great authors, Dr. Drake rejects, as too ridiculous to need a refutation.

Others aſcribe this effect to an imaginary dominion of the moon over the bodies of women.—This was formerly the prevailing opinion; though the ſmalleſt reflection would have ſhewn the weakneſs of it: For had this purgation been owing to the influence of the moon, all women of the ſame age and temperament, would have found it at the ſame periods and revolutions of the moon, *i. e.* at the ſame time; which all experience ſhews to be falſe.

There are two other opinions which carry with them great probability, and are argued with a great deal of ſtrength and reaſon. In both which, the quality of the blood is allowed to be innocent; but they ſtill differ about the reaſon of its iſſue.—The former is that of Dr. Bohn and Dr. Freind, who maintain this flux to be the reſult of a plethora, or plenitude; and to be evacuated only for relief againſt the quantity. See PLETHORA.

Dr. Freind, who has maintained the cauſe of a plethora with the greateſt ſtrength and clearneſs, ſuppoſes that this plethora ariſes from a coacervation in the blood-veſſels of a ſuperfluity of aliment, which he thinks remains over and above what is expended by the ordinary ways; and that women have this plethora, and not men, becauſe their bodies are more humid, and their veſſels, eſpecially the extremities of them, more tender, and their manner of living generally more unactive than that of men; and that theſe things concurring, are the occaſion that women do not perſpire ſufficiently to carry off the ſuperfluous alimentary parts, till it be accumulated in ſuch quantity as to diſtend the veſſels, and force its way through the capillary arteries of the uterus. It is ſuppoſed to happen to women more than the females of other ſpecies, which have the ſame parts, becauſe of the erect poſture of the former; and the vagina, and other canals, being perpendicular to the horizon; ſo that the preſſure of the blood is directed towards their orifices: whereas, in brutes, they are parallel to the horizon, and the preſſure wholly on the ſides of thoſe veſſels. The diſcharge, he thinks, happens in this part rather than in any other, as being more favoured by the ſtructure of the veſſels; the arteries being very numerous, and the veins ſinuous and winding, and therefore more apt to retard the impetus of the blood; and conſequently, in a plethoric caſe, to occaſion the rupture of the extremities of the veſſels, which may laſt, till by a ſufficient diſcharge the veſſels are eaſed of their over-load.

This is the ſubſtance of Dr. Freind's theory, from whence he very mechanically, and very philoſophically, accounts for the ſymptoms.

To his argument, why women have *menſes* rather than men, we may add from Boerhaave, that in the former, the os ſacrum is wider, and ſtands farther out, and the os coccygis farther in; the oſſa innominata wider, and farther apart, and the loweſt of them, as well as the lower eminences of the os pubis, farther outwards than in the latter. Hence, in women, the latitude or expanſion about theſe bones, and the capacity of the pelvis, is vaſtly great in proportion to thoſe of men; and yet in a woman not pregnant, there is not much to fill this expanſe. Again, the fore-ſide of the thorax is ſmoother in women than in men, and the blood-veſſels, lymphatics, adipoſe and nervous veſſels, membranes and fibres, are much laxer in women than in men: whence all their cavities, cells, veſſels, *&c.* are more eaſily repleniſhed, and the humours aggregated in them; beſides, that they are found to perſpire leſs than men, and to arrive much ſooner at their maturity, or ακμη of increaſe. To which he adds the conſideration of the ſoft pulpous texture of the uterus, and the vaſt number of veins and arteries it is filled withal.

Hence, a healthy maid, being arrived at her growth, begins to prepare more nutriment than is required for the ſupport of the body; which, as there is not to be any farther accretion, muſt of neceſſity fill the veſſels, and eſpecially thoſe of the uterus, and breaſts, as being the leaſt compreſſed. Theſe will be dilated more than the others; whence the lateral vaſcules evacuating their humour into the cavity of the uterus, it will be filled, and extended: Hence, a pain, heat, heavineſs, will be felt about the loins, pubes, *&c.* the veſſels of the uterus at the ſame time will be ſo dilated, as to admit blood into the cavity of the uterus, its mouth will be lubricated and looſened, and blood iſſue out. As the quantity of blood is diminiſhed, the veſſels will be leſs preſſed, and will contract themſelves cloſer, ſo as again to retain the blood, and let paſs the groſſer part of the ſerum; till at length, only the uſual ſerum paſſes. Again there are more humours prepared, which are more eaſily lodged in veſſels once dilated; hence the *menſes* go, and return at various periods in various perſons.

This hypotheſis, however plauſible, is oppoſed by Dr. Drake, who maintains that there is no ſuch repletion, or at leaſt that it is not neceſſary to menſtruation. Arguing, that if the *menſes* were owing to a plethora ſo accumulated, the ſymptoms would ariſe gradually, and the heavineſs, ſtiffneſs, and inactivity, neceſſary ſymptoms of a plethora, would be felt long before the period were compleated, and women would begin to be heavy, and indiſpoſed ſoon after evacuation, and the ſymptoms increaſe daily: Which is contrary to all experience; many women, who have them regularly and eaſily, having no warning, nor other rule to prevent an indecent ſurprize, than the meaſure of the time; in which, ſome that have ſlipped, have been put to confuſion and ſhifts, no ways conſiſtent with the notice a plethoric body would give. He adds, that even in thoſe who are difficultly purged this way, the ſymptoms, though very vexatious and tedious, do not make ſuch regular approaches, as a gradual accumulation neceſſarily requires. If we conſider what violent ſymptoms come on in an hour, we ſhall be extremely puzzled to find the mighty acceſſion of matter which ſhould in an hour or a day's time make ſuch great alterations. According to the hypotheſis, the laſt hour contributes no more than the firſt, and of conſequence, the alteration ſhould not be greater in the one than the other; ſetting aſide the bare eruption.

This is the ſubſtance of what is argued againſt Dr. Freind's theory; which, it muſt be owned, notwithſtanding theſe objections, is ſtill the moſt rational and conſiſtent that has yet been advanced.

Thoſe who oppoſe it, give into the doctrine of fermentation, and maintain the evacuation of blood, in thoſe parts, to be the effect of an efferveſcence, or ebullition of the blood. This opinion has been maintained by many, particularly Dr. Charleton, Bale, De Graaf, and Drake. The two firſt of whom ſuppoſe a ferment peculiar to the women which produces this flux, and affects that part only, or at leaſt principally. Dr. Graaf, leſs particular in his notion, only ſuppoſes an efferveſcence of the blood raiſed by ſome ferment, without aſſigning how it acts, or what it is. The ſudden turgeſcence of the blood, occaſioned them all to think, that it aroſe from ſomething till then extraneous to the blood, and led them to the parts principally affected, to ſeek for an imaginary ferment, which no anatomical enquiry could ever ſhew, or find any receptacle for, nor any reaſoning neceſſarily infer. Again, that heat which frequently accompanies this turgeſcence, led them to think the caſe more than a plethora, and that there was ſome extraordinary inteſtine motion at that time.

Dr. Drake improves on the doctrine of a ferment; and contends not only that it is neceſſary there ſhould be a ferment, but a receptacle alſo for this ferment: Concluding from the ſuddenneſs and violence of the ſymptoms, that a great quantity muſt be conveyed into the blood in a ſhort time, and conſequently, that it muſt have been ready gathered in ſome receptacle, where, while it was lodged, its action was reſtrained. But he goes farther ſtill, and pretends to aſcertain the place, *&c.* both of the one and the other, making the gall-bladder to be the receptacle, and the bile the ferment. This liquor he thinks well adapted to raiſe a fermentation in the blood, when diſcharged into it in a quantity: And as it is contained in a receptacle that does not admit of a continual iſſue, may be there reſerved, till in a certain period of time, the bladder becoming turgid and full through the compreſſion of the incumbent viſcera, it emits the gall: which, by the way of the lacteals, inſinuating itſelf into the blood, may raiſe that efferveſcence which occaſions the aperture of the uterine arteries. See GALL.

To confirm this, he alledges, that perſons of a bilious conſtitution, have the *menſes* either more plentifully, or more frequently than others; and that diſtempers manifeſtly bilious, are attended with ſymptoms reſembling thoſe of women labouring under difficult menſtruation. If it be objected, that on this foot, men ſhould have *menſes* as well as women; he anſwers, that men do not abound in bile ſo much as women; the pores of the former being more open, and carrying off more of the ſerous part of the blood, which is the vehicle of all the other humours; and, conſequently, a greater part of each is diſcharged through them than in women; wherein the ſuperfluity muſt either continue to circulate with the blood, or be gathered in proper receptacles, which is the caſe in the bile. The ſame reaſon he gives why menſtruation ſhould not be in brutes; the pores of theſe being manifeſtly more open than thoſe of women, as appears from the crop of hair which they bear; for the vegetation whereof, a large cavity, and a wider aperture of the glands is neceſſary, than where no ſuch thing is produced. Yet there is ſome difference between the males and females even among theſe, the latter having their *menſes*, though not ſo often, nor in the ſame form and quantity, as women.

He adds, that the ſeveral phænomena of the *menſes*, whether in a natural, a regular, or diſeaſed caſe, flow naturally and readily from this hypotheſis; and that whatever may be accounted for from a plethora, or from any particular ferment, may, without any ſtraining, be applied to this.

The root of black hellebore, and ſteel, are the principal remedies for obſtructions of the *menſes*; the former is almoſt infallible, and in many caſes where the latter is not only ineffectual, but improper; as in plethoric habits, for with ſuch, ſteel will ſometimes raiſe hyſteric commotions, convulſions, and a kind of uterine furor; whereas hellebore thins the blood, and diſpoſes it for a diſcharge without making it more impetuous. So that though each provoke the *menſes*, yet they do it by different ways; ſteel by increaſing the blood's velocity, and giving it a greater moment againſt the uterine arteries; and hellebore by dividing it, and rendering it more fluid. See HELLEBORE and CHALYBEAT.

MENSIS.	See	MONTH.
MENSIS *chymicus.*		MENSTRUUM.
MENSIS *vetitus.*		FENCE *month.*

MENSTRUAL, or MENSTRUOUS, a term in medicine, applied to the blood which flows from women in their ordinary monthly purgations. See MENSES.

The *menſtrual* blood is the exceſs, or redundance of the blood in the body. It may be defined an excrement ſerving for the formation, as well as nutrition of the fœtus in the womb, and which at other times is evacuated monthly. See BLOOD.

Of all animals, there are none beſides women, and perhaps apes, which have their *menſtrual* purgations.—Hippocrates ſays, that the *menſtrual* blood gnaws and tears the earth like vinegar. Pliny and Columella add, that it burns herbs, kills plants, tarniſhes looking-glaſſes, and that dogs which taſte it, run mad. But this is all fabulous; it being certain that this blood is the ſame with that in the veins and arteries. See BLOOD.

By the Jewiſh law, a woman was unclean while the *menſtrual* blood flowed: and the man who touched her, or the moveables ſhe had touched, were declared unclean. Levit. chap. xv.

MENSTRUAL *epacts.*	See	EPACT.
MENSTRUAL *longitude of the moon.*		ARGUMENT.

MENSTRUUM*, SOLVENT, or DISSOLVENT, in chymiſtry, any liquor that will diſſolve, that is, ſeparate the parts of hard bodies. See DISSOLVENT and DISSOLUTION.

* The term takes its riſe from this, that ſome chymiſts pretend the compleat diſſolution of a mixed body cannot be effected in leſs than forty days, which period they call a *philoſophical month.*

Thus aqua regalis is a *menſtruum* for gold; aqua fortis, and ſpirit of nitre, for moſt other metals; common water for ſalts, *&c.* See GOLD, SILVER, SALT, *&c.*

Menſtruum is properly defined a body, which being applied to, or intermixed with another, does ſo diſſolve it, as that all the diſſolving parts float among the parts diſſolved; and ſo divides it into its minuteſt parts, as that the parts of the diſſolvent are intermixed with thoſe of the body diſſolved.—Whence it appears, that every *menſtruum* in diſſolving a body, is likewiſe diſſolved itſelf; ſo as with the body it diſſolves, to make up one body. A knife therefore divides bread, but is not on that account a *menſtruum*; as it does not conſtitute one body with the bread: but water boiled with the bread is a *menſtruum*, with regard to the bread, as it only makes up one body therewith. See DISSOLUTION.

MENSTRUUMS may be divided into two claſſes; the firſt conſiſts of ſuch as are fluid; the ſecond of ſuch as are ſolid; that is, they are either actually divided, or they muſt be ſo ere they act.

Fluid MENSTRUUMS are water, dew, oils, ſaline and acid ſpirits, alkali ſalts, *&c.*

Solid MENSTRUUMS, are ſuch as muſt be made fluid ere they will diſſolve; ſuch are moſt ſalts, nitre, vitriol, *&c.* See WATER, SALT, VITRIOL, *&c.*

All *menſtruums*, at the time they act as ſuch, that is, at the time they are diſſolving, act as fluids; whether ſuch *menſtruum* be a fluid or a ſolid. Thus, *e. gr.* ſilver is a *menſtruum* with regard to gold; for if you take an ounce of ſilver, melt it in the fire, and add a grain of gold; all the parts of the ſilver will intermix themſelves with the parts of the gold; ſo as that the gold and ſilver, which before were ſeparate, now make one maſs.—But gold and ſilver are only *menſtruums* as they are diſſolved by the fire; *i. e.* as they are fluid.

For the action of MENSTRUUMS, Sir Iſaac Newton accounts for it from the acids wherein they are impregnated. The particles of acids are found to be endued with a ſtrong attractive force, wherein their activity conſiſts, and by virtue whereof they diſſolve bodies. See ATTRACTION. Theſe acids he ſuppoſes of a middle nature between water and hard bodies, and to attract both. By this attraction they gather together about the particles of bodies, whether metallic, ſtony, or the like, and adhere to them very cloſe, ſo as ſcarce to be ſeparable from them by diſtillation, or ſublimation. Thus ſtrongly attracted, and gathered together on all ſides, they raiſe, disjoin, and ſhake aſunder the particles of bodies, *i. e.* they diſſolve them; and by the attractive power whereby they ruſh againſt the particles of the bodies, they move the fluid, and ſo excite heat, ſhaking ſome of the particles to that degree, as to convert them into air, and ſo generating bubbles. See ACID.

Dr. Keil gives us the theory or foundation of the action of *menſtruums*, in the following propoſitions.

1°. Two corpuſcles may be placed ſo near each other, without touching, as that the force wherewith they attract each other, ſhall eaſily exceed that of their gravity.

2°. If a corpuſcle placed in a fluid be every way equally attracted by the ambient particles, the corpuſcle will not be put in any motion; but if it be attracted more by ſome of the particles than by others, it will then tend towards that quarter where the attraction is the ſtrongeſt: and the motion thus produced will be correſpondent to the inequality of the attraction: that is, if the inequality be great, the motion will be ſo; and if little, little.

3°. Corpuſcles ſwimming in a fluid, and attracting each other more than the interpoſed particles of the fluid; thoſe particles of the fluid will be driven aſide, and the corpuſcles approach each other with a force equal to the exceſs of their mutual attraction, beyond the attraction of the particles of the fluid.

4°. If a body be placed in a fluid whoſe parts attract the particles of the fluid more ſtrongly than thoſe particles are attracted by one another; and if in the body there be ſeveral pores pervious to the particles of thoſe fluids, the fluid will preſently diffuſe itſelf through the pores; and if the connection of the parts in that body be not ſo ſtrong as that it may be exceeded by the impetus of the particles ruſhing together; the immerſed body will undergo a diſſolution.

Hence, for a *menſtruum* to be fit to diſſolve a given body, there are three things required. 1°. That the parts of the body attract the particles of the *menſtruum* more ſtrongly than thoſe are attracted by each other. 2°. That the body have pores adequate and pervious to the particles of the *menſtruum*. 3°. That the coheſion of the parts of the body be not ſo ſtrong but that it may be torn aſunder by the impetus of the particles ruſhing together. Hence alſo it follows, that the particles which conſtitute ſpirit of wine, are more ſtrongly attracted by each other, than by thoſe of a ſaline body immerged in it.

Hence we ſee the reaſons of the different effects of different *menſtruums*; why ſome bodies, for inſtance metals, diſſolve in a ſaline *menſtruum*: Others again, as reſin, in a ſulphureous one, &c. particularly why ſilver diſſolves in aqua fortis, and gold only in aqua regalis; all the varieties whereof are accountable for, from the different degrees of coheſion, *i. e.* of attraction in the parts of the body to be diſſolved, the different diameters and figures of its pores, the different degrees of attraction in the *menſtruum*, and the different diameters and figures of its parts. See COHESION.

Suppoſe, *e. gr.* the attraction of gold to that of ſilver, to be as a to b; and of ſilver to aqua fortis as b to d; but that of aqua fortis to aqua regia, as d to e; let f ſignify the magnitude of particles in aqua fortis, and r thoſe in aqua regia; c the coheſion of gold, and g the coheſion of ſilver: If the diameters of the particles f be greater than the diameters of the pores of gold, they can never diſſolve the gold, let their attractive force be ever ſo ſtrong. But if $\overline{b-fxa}$ be greater than g, then the ſilver will yield to the *menſtruum* whoſe particles are f, and leſs than the pores of the ſilver; and if $\overline{b-exr}$ be leſs than g, the ſilver will never diſſolve in the *menſtruum*, the particles whereof are r, and the attractive force e. But if $\overline{a-exr}$ be greater than c, the *menſtruum* made up of the particles r, and whoſe attractive force is e, will be able to penerate and diſſolve the gold.

How a *menſtruum* may ſuſpend bodies much heavier than itſelf, which very often happens, may be conceived by conſidering, that the parts of no fluid can be ſo eaſily ſeparated, but they will a little reſiſt, or retard the deſcent of any heavy bodies through them; and that this reſiſtance is, *cæteris paribus*, ſtill proportionable to the ſurface of the deſcending bodies: But the ſurfaces of the bodies do by no means increaſe, or decreaſe, in the ſame proportion as their ſolidities do; for the ſolidity increaſes as the cube, but the ſurface only as the ſquare of the diameter. Small bodies, therefore, will have much larger ſurfaces, in proportion to their ſolid contents, than larger bodies will; and conſequently when exceedingly diminiſhed, may eaſily be buoyed up in the liquor. See DESCENT, RESISTANCE, &c.

MENSTRUUM, in pharmacy, chiefly denotes a body that will extract the virtues of ingredients by infuſion, decoction, or the like. See EXTRACT, INFUSION, DECOCTION, &c.

MENSTRUUM *peracutum*, is a name given by Mr. Boyle to a *menſtruum* he extracted from bread only, that would prey on bodies more compact than many hard minerals, nay even on glaſs, and do many things that aqua fortis would not do.—With this he drew tinctures not only from crude corals, but alſo from the lapis hæmatites, and granates, nay from diamonds, and rubies. See DIGESTION.

MENSURATION, the act, or art of *meaſuring*. See MEASURING, and TRIANGLE.

MENTAL, ſomething that relates, or is reſtrained, to the operation of the underſtanding.

Thus, a *mental* prayer is ſuch a one as is made merely in the mind, without pronouncing one word of it. See PRAYER.

Mental reſervations are the refuge of hypocrites. See RESERVATION.

MENTUM, in anatomy, the lower part of the face, beneath the mouth; which we otherwiſe diſtinguiſh by the name of *chin*. See FACE.

MEPHITIS, or **MEPHITICAL** *exhalation*, denotes a poiſonous and noxious ſteam iſſuing out of the earth, and chiefly from a ſulphurous principle. See POISON, DAMP, EXHALATION, &c.

The moſt remarkable place of this kind is the Grotta del Cane near Puzzoli, about two miles from Naples, in Italy; the ſteams of which kill dogs, or other animals, when brought within its reach: A very curious account of which, and the manner of its efficacy, is given by Dr. Mead, in his eſſay on poiſons. See GROTTO.

MER.—*Ouſter le* MER. See the article OUSTER.

MERCATOR's *chart*, or *projection*, is a ſea-chart, or projection of the ſurface of the earth in plano, wherein the meridians, parallels and rhumb lines are all repreſented by ſtrait lines; the meridians being likewiſe parallel; though their degrees are not equal, but are continually enlarged as they approach nearer the pole, in the ſame proportion as the parallel circles on the globe decreaſe as they approach the pole: that is, in the ratio of the radius to the ſine complement of the latitude. See PROJECTION.

For the construction, uſe, advantages, &c. hereof, ſee *Mercator's* CHART.

MERCATOR's *ſailing*, is that performed loxodromically, by means of *Mercator's* charts. See *Mercator's* SAILING.

MERCHANDICE, or **MERCANTILE** *profeſſion*, the function of a merchant; or the art, method, &c. of exerciſing a wholeſale commerce. See COMMERCE.

The *mercantile* profeſſion is eſteemed noble, and independent. In France, by two arrets of Louis XIV. the one of 1669, the other of 1701, the nobility are allowed to trade, both by land and ſea, without derogating from their nobility: And we have frequent inſtances of merchants ennobled in that country, in regard of the utility of their commerce, and the manufactures they have ſet up. In Bretagne, even a retail trade does not derogate from nobility.

When the nobles of that province are diſpoſed for commerce, they let their nobility ſleep; that is, they do not loſe it, but only ceaſe to enjoy the privileges of their nobleſſe while their commerce continues, and re-aſſume it, by giving over trade, without any letters or inſtrument of re-habilitation.

In republics it is ſtill more valued; but no where more than in England, where the younger ſons and brothers of peers are frequently bred up to *merchandice*. Add to this, that many of the Italian princes are the principal merchants of their ſtates; and think it no diſcredit to make their palaces ſerve as warehouſes: And that many of the kings of Aſia, moſt of thoſe of the coaſt of Africa and Guinea, traffic with the Europeans, ſometimes by their miniſters, and ſometimes in perſon.

The qualifications requiſite for the profeſſion of a *merchant*, are, 1°. To keep books ſingle or double, *viz.* journals, ledgers, and others. 2°. To draw invoices, contracts, charter-parties, policies of aſſurance, bills of exchange, letters miſſive, &c. 3°. To know the relation between the monies, weights, and meaſures, of ſeveral countries. 4°. The places where the ſeveral kinds of *merchandice* are manufactured, in what manner made, what the materials compoſed of, and whence; the preparation the materials require before they are wrought; and the merchandices afterwards. 5°. The lengths and breadths of ſtuffs, as ſilks, wools, hairs, linens, &c. the regulations of the places where they are manufactured, and their different prices at different ſeaſons. 6°. The dying, and the ingredients for the formation of the different colours. 7°. The *merchandices* that abound, or are more rare, in one country than another; their kinds and qualities; and the manner of trafficking in them to the beſt advantage, whether by land, by ſea, or rivers. 8°. The commodities permitted or prohibited, both for the import and export of a ſtate. 9°. The price of exchange according to the courſe of ſeveral places, and what it is that raiſes or lowers it. 10°. The duties to be paid both at the import and export of wares, according to the uſage of the place, the tarifs, regulations, *&c.* 11°. The manner of packing, baling, and tunning *merchandices*, to keep them either in magazines, or in voyages, *&c.* 12°. On what terms a merchant-veſſel may be freighted and inſured. 13°. The goodneſs and value of every thing requiſite for the conſtruction or refitting of veſſels, the prices of woods, cordage, maſts, anchors, ſails, and other neceſſaries. 14°. The wages ordinarily given captains, officers, and ſailors: and the manner of contracting with them. 15°. The foreign languages, which may be reduced to three principal ones, *viz.* the Spaniſh, uſed almoſt through all the eaſt, particularly on the coaſt of Africa, from the Canaries to the cape of Good Hope; the Italian, uſed throughout the coaſts of the Mediterranean, and many places of the Levant; and the Teutonic or German, uſed throughout moſt countries of the north. 16°. The conſular juriſprudence, the laws, cuſtoms, companies, colonies, chambers of inſurance, conſulates in the ſeveral countries; and in the general, all the ordinances, regulations, and policies, relating to commerce.

MERCHANT, a perſon who carries on merchandize, or ſuſtains the mercantile profeſſion. See MERCHANDIZE.

MERCHANT-*ſhip*. See SHIP.

Law MERCHANT. See LAW.
Statute MERCHANT. See STATUTE.
Tenant per ſtatute MERCHANT. See TENANT.

MERCHENLAGE, the law of the Mercians. See LAW.

MERCURE *galant*. See the article GALANT.

MERCURIAL, ſomething that conſiſts of, or bears a relation to, *mercury*. See MERCURY.

Thus we ſay, a *mercurial* perſon, to denote a perſon of a briſk, volatile complexion; ſuch perſons being ſuppoſed by aſtrologers to be under the more immediate influence of the planet *Mercury*. So alſo, we ſay *mercurial* fumes, *mercurial* ſpirits, *&c.* with reference to the mineral *mercury*.

MERCURIAL *medicines*. See MERCURIALS.
MERCURIAL *phoſphorus*. See PHOSPHORUS.
MERCURIAL *ſalivation*. See SALIVATION.
MERCURIAL *thermometer*. See THERMOMETER.
MERCURIAL *unguents*, *frictions*, &c. See SALIVATION.
MERCURIAL *waters*. See WATER.

MERCURIALS, medicines compoſed, or prepared, of *mercury*, or quick-ſilver. See MERCURY.

The principal of the claſs of *mercurials*, are mercurius albus, or white precipitate of mercury; ſweet and corroſive ſublimate of mercury; calomel; artificial cinnabar; turbith mineral; prince's powder; æthiops mineral, *&c.* See each under its proper article, SUBLIMATE, PRECIPITATE, MERCURY, CINNABAR, TURBITH, CALOMEL, *&c.*

The medicinal efficacy of *mercury* depends on its extreme diviſibility, and fineneſs of its particles, and on their gravity, or weight. By means of the firſt, it finds a paſſage into the inmoſt receſſes of the animal ſtructure, and, when properly guarded, does not exert itſelf till it comes in the remoteſt ſcenes of action; where moſt other medicines either do not arrive, or at leaſt not till their force is rebated.—This property it has in common with camphor. See CAMPHOR.

By the latter, it is enabled to make ſtill more conſiderable alterations in the animal œconomy, by rendering the fluids thinner, and breaking open the ſecretory paſſages: But this effect it has in common with chalybeats. See CHALYBEATS.

It may be added, that the ſame property whereby it becomes ſo powerful a deobſtruent, indicates, that it is to be avoided in hectics, and all caſes where the conſtitution is drawn low by too profuſe evacuations; in regard *mercurials* tend to keep up or increaſe the exceſs of impetus in the fluids, and that overcapacity in the ſecretory orifices, wherein the defect of ſuch a conſtitution ſeems to conſiſt. See HECTIC.

MERCURY, ☿, in aſtronomy, the ſmalleſt of the inferior planets, and the neareſt the ſun. See PLANET and SYSTEM.

The mean diſtance of *Mercury* from the ſun is to that of our earth from the ſun as 387 to 1000; its excentricity 8 degrees. The inclination of its orbit, that is, the angle formed by the plane of its orbit with the plane of the ecliptic, is 6 degrees 52 minutes: Its diameter to that of the earth as 3 to 4; and therefore the globe of *Mercury* will be to that of the earth as 2 to 5. See EXCENTRICITY, INCLINATION, DIAMETER, DISTANCE, *&c.*

According to Sir Iſaac Newton, the heat and light of the ſun on the ſurface of *Mercury*, is ſeven times as intenſe as on the ſurface of our earth in the middle of ſummer:—which, as he found by experiments made for that purpoſe by a thermometer, is ſufficient to make water boil. Such a degree of heat therefore muſt render *Mercury* uninhabitable to creatures of our conſtitution. And if bodies on its ſurface be not inflamed and ſet on fire, it muſt be becauſe their degree of denſity is proportionably greater than that of ſuch bodies are with us. See HEAT.

The revolution of *Mercury* round the ſun, or his year, is performed in eighty-ſeven days, twenty-three hours; his diurnal revolution, or the length of his day, is not yet determined; nor is it certain whether he has ſuch a motion round his own axis, or not. See PERIOD, REVOLUTION, *&c.*

What variety of weather or ſeaſons it may be liable to, we are ſtill at a loſs; as not knowing the inclination of his axis to the plane of his orbit. The force of gravity on the ſurface of *Mercury*, is ſeven times as ſtrong as on the ſurface of the earth. Its denſity, and conſequently, the gravitation of bodies towards the centre, cannot be accurately determined; but no doubt it muſt exceed that of our earth, by reaſon of the exceſs of heat there. See GRAVITY, DENSITY, *&c.*

Mercury changes its phaſes like the moon, according to its ſeveral poſitions with regard to the ſun and earth. See MOON. It appears full, in its ſuperior conjunctions with the ſun, becauſe we can ſee the whole illumined hemiſphere: But in its lower conjunction, we only ſee the obſcure or unillumined hemiſphere: In his approach towards the ſun, his light is falcated or horned. See PHASES.

The ſituation of this planet proves evidently, that the hypotheſis of Ptolemy is falſe: For *Mercury* is ſometimes obſerved betwixt the earth and ſun; and ſometimes beyond the ſun. But the earth is never found between *Mercury* and the ſun; which however muſt happen, if the ſpheres of all the planets incompaſſed the earth, as a centre, according to the Ptolemaic ſcheme. See PTOLEMAIC *ſyſtem*.

The diameter of the ſun viewed from *Mercury*, would appear three times as big as it appears on our earth; that planet being thrice as near him as we are; and therefore the ſun's diſk would appear ſeven times as large as it appears to us.

Its greateſt diſtance from the ſun, with regard to us, never exceeds twenty-eight degrees, whence it is ſeldom viſible; being commonly either loſt in the ſun's light, or, when the moſt remote from the ſun, in the crepuſculum. The beſt obſervations of this planet, are thoſe made when it is ſeen on the ſun's diſk; for in its lower conjunction, it paſſes before the ſun like a little ſpot, eclipſing a ſmall part of his body, only obſervable with a teleſcope. The firſt obſervation of this kind, was that of Gaſſendi in 1632. See TRANSIT.

To an inhabitant of *Mercury*, the ſolar ſpots will appear to traverſe his diſk ſometimes in a right line from eaſt to weſt, and ſometimes elliptically. As the other five planets are above *Mercury*, their phænomena will be nearly the ſame there, as with us. Venus and the earth, when in oppoſition to the ſun, will ſhine with full orbs, and afford a noble light to that planet.

MERCURY, in chemiſtry and natural hiſtory, denotes a fluid, mineral matter, perfectly reſembling ſilver in fuſion. See MINERAL.

Mercury is known under a great number of denominations: The common name among the ancients was *hydrargyrum*, q. d. water of ſilver. The moderns commonly call it *mercury*, from ſome ſuppoſed relation it bears to the planet of that name. In Engliſh it is popularly called *quick-ſilver*, from its appearance. Many of the chymiſts call it *Proteus*, from the variety of forms, colours, *&c.* it paſſes through in their preparations.

Naturaliſts are divided what claſs of foſſils to range *mercury* under: Some make it a metal; others a ſemi-metal; and others an imperfect metal. See FOSSIL, and SEMI-METAL.

Boerhaave obſerves, that it is very improperly called a *metal*, inaſmuch as it has not all the characters of ſuch a body; nor ſcarce any thing in common with the other metals, except weight and ſimilarity of parts: Thus, for example, it is neither diſſolvable by fire, malleable, nor fixed: In effect, it ſeems to conſtitute a peculiar claſs of foſſils; and is rather the mother, or baſis of all metals, than a metal itſelf. See METAL.

Perfect metals, according to M. Homberg, *&c.* are nothing but pure *mercury* whoſe little particles are penetrated on all ſides, and filled with the matter of light, which unites and binds them together into a maſs, ſo that the parts of fluid *mercury*, which are ſuppoſed to be little ſolid globes, in their metallification are rendered rough and uneven, being pierced on all ſides, and having their pores or perforations filled with the matter of light. By ſuch means they loſe their firſt conformation, and the politure or ſmoothneſs of their ſurfaces, which is one of the principal cauſes of the fluidity of *mercury*.

The chymiſts make *mercury* one of their hypoſtatical principles: Not, as M. Homberg obſerves, that it anſwers the character of a principle, which is that whoſe ſubſtance cannot be analyſed, or reduced into matters more ſimple; but becauſe the analyſis has not yet been diſcovered: though it is poſſible it may hereafter, there being little doubt but that *mercury* is a compound. This is the more probable, in regard *mercury* may be deſtroyed, which never happens to ſimple bodies. The manner of deſtroying *mercury*, is, firſt, by changing it into a perfect metal, by introducing a ſufficient quantity of light within its ſubſtance; and then expoſing this metal to a burning-glaſs, where, in a little time, it evaporates almoſt wholly into ſmoke, leaving nothing behind but a light earthy duſt.

Characters, or properties of MERCURY, are, Firſt, That of all bodies it is the heavieſt, after gold; and ſtill the purer it is, the heavier: Nay, ſome of the philoſophers even hold, that *mercury* well purged of all its ſulphur, would be heavier than gold itſelf. The ordinary proportion is that of fourteen to nineteen. If any *mercury* be found to weigh more than according to this ratio, it may be ſafely concluded to have gold in it. See GOLD, and WEIGHT.

The ſecond character of *mercury*, is to be of all bodies the moſt fluid; that is, its parts ſeparate, and recede from each other by the ſmalleſt force.—Conſequently, of all bodies it is that whoſe parts cohere the leaſt, or are the leaſt tenacious; and therefore of all others the leaſt ductile and malleable. The parts of water do not divide ſo readily as thoſe of quick-ſilver; and the parts of oil much leſs: There is a certain tenacity even in the parts of ſpirit of wine which reſiſts ſeparation; but there is ſcarce any coheſion at all in the parts of *mercury*. See FLUIDITY, and FIRMNESS.

The third property of *mercury*, which, indeed, depends on the ſecond, is, That of all bodies it is diviſible into the minuteſt parts.—Thus, being expoſed to the fire, it reſolves into a fume ſcarce perceivable to the eye; but in whatever manner it be divided, it ſtill retains its nature, and is the ſame ſpecific fluid. For the vapours of diſtilled or volatilized *mercury* received in water, or on moiſt leather, or the like, become pure *mercury*; and if *mercury* be mixed with other bodies, in order to fix it, for it is ſcarce fixable of itſelf, it is eaſily ſeparable from them again by fire, and reducible into pure *mercury* as before. See DIVISIBILITY.

The fourth character is to be extremely volatile, being convertible into fume, even by a ſand-heat. In effect it does not ſuſtain the fire long enough either to boil, or ignite. Though it muſt be added, if the fire be at firſt very gentle, and increaſe by eaſy degrees, it may be retained therein a pretty long time, and be fixed ſo at length to become ignited in the crucible, as we learn from ſome very tedious experiments made at Paris. See VOLATILITY.

The gilders are but too well acquainted with the vapours of *mercury*, which frequently render them epileptic, and paralytic, and ſometimes ſalivate them; being of ſo penetrating a nature, as to take away any ſcirrhous tumours, though very apt to reach and deſtroy the nobler parts.

The fifth property is, that it eaſily enters, and intimately adheres to gold, leſs eaſily to the other metals, with difficulty to copper, and not at all to iron. See AMALGAMATION.

Indeed we have heard much among the adepts about making an amalgama with *mercury* and iron; but the experiment would never ſucceed with that induſtrious chymiſt, Dr. Boerhaave. It is poſſible there may be ſome way of binding thoſe two bodies together; and no doubt an amalgama might be made, if a large quantity of gold were added to the iron: But then, if the compound were beaten into duſt, in water, the iron would waſh away, and the gold remain. On this account it is, that ſuch as have occaſion to handle quick-ſilver, always make choice of iron-inſtruments for that purpoſe. We have known women, in a ſalivation, to have their ear-rings grow white and ſoft with the effluvia of the *mercury*; and hence the gilders, to lay gold on any other body, diſſolve it in hot *mercury*, which done, they apply the ſolution on the body to be gilt, ſuppoſe ſilver; then ſetting it over the coals, the *mercury* flies away, and leaves the gold adhering like a cruſt to the ſilver. Laſtly, rubbing the cruſt with lapis hæmatites, the ſilver is gilt. See GILDING.

The ſixth character is, That of all fluids, it is the coldeſt, and the hotteſt: ſuppoſing the circumſtances the ſame.

Boerhaave ſhews, that fire is equally diffuſed through all bodies; and that there is in reality the ſame degree thereof in *mercury*, as in ſpirit of wine; and yet if you try with your finger, *mercury* in the cold, is much colder, and, over the ſame fire, conſiderably hotter, than this ſpirit. This property depends on the great weight of *mercury*: for the heat and cold of all bodies is *cæteris paribus* as their weights. Now, *mercury* being fourteen times heavier than water; if both of them be expoſed in a winter's night to the ſame cold, the *mercury* muſt be ſo much colder than water, as it is heavier. So, alſo, if they be both applied to the ſame degree of heat, while the water becomes warm, the *mercury* will be hot enough to burn the hands. See HEAT, and COLD.

The ſeventh property is, that it is diſſoluble by almoſt all acids, and unites itſelf with them; at leaſt with all foſſil acids. Thus it is diſſolved in oil of vitriol, ſpirit of ſulphur per campanam, ſpirit of nitre, and aqua regia.

It is prepared with oil of vitriol, into turbith mineral; with ſpirit of ſulphur, into cinnabar; with aqua regia, or ſpirit of ſea-ſalt or ſal-gemma, into corroſive ſublimate. See TURBITH, CINNABAR, SUBLIMATE, *&c.*

Only vinegar does not diſſolve it; and hence we are furniſhed with a method of detecting the frauds of druggiſts, *&c.* who make a practice of ſophiſticating quick-ſilver with lead. Do but take a mortar, and pound the *mercury*, with vinegar therein; if the vinegar grow ſweetiſh, it is a proof there is a mixture of lead: if copper have been mixed with it, the *mercury* will turn greeniſh, or bluiſh; if there be no adulteration, the *mercury* and vinegar will both remain as before.

The eighth property is, that it is the moſt ſimple of all bodies, next after gold: Accordingly, we find it the ſame in all its parts, ſo far as our obſervation goes. If a ſingle grain of *mercury* be diſſolved in ſpirit of nitre, a proportionable part of the grain will be diſtributed into every minute particle of the menſtruum; and by diluting the whole with an ounce of aqua ſtygia, the whole grain of *mercury* will be revived. Had we the *mercury* of the philoſophers, called alſo *vital mercury*, *mercury of metals*, &c. ſo much talked of; it is aſſerted it would be ſtill vaſtly ſimpler than gold: For, from gold, we can ſometimes ſeparate *mercury*, and ſometimes ſulphur; but from pure *mercury*, nothing beſide itſelf can be ſeparated.

The ninth property of *mercury* is, not to be in any meaſure acrid, for it ſhews no acrimony to the taſte, nor does it corrode any body; and if a carcaſe were to be buried in quick-ſilver, it might doubtleſs remain there without being any way hurt.

The extraordinary effects, however, it produces in the body, have given people a notion of its being acrid. But the caſe is, that when received into the blood, it acts by its weight and velocity; whence it tears and deſtroys the veſſels, and thus occaſions thoſe great alterations, which lead the chymiſts into their miſtakes.

In effect, all its medicinal operations are to be accounted for from the properties already enumerated.

Mines of MERCURY.—The chief are thoſe of Hungary, Spain, Friuli, and Peru. The greateſt part of our quick-ſilver is brought us from Friuli, where there are abundance of mines belonging to the emperor, though now mortgaged to the Dutch. It is found under three ſeveral forms. 1°. In ruddy glebes or clods, called *cinnabar*. 2°. In hard ſtony glebes, or a mineral ſubſtance of a ſaffron, and ſometimes a blackiſh colour. 3°. It is alſo found pure: For upon opening holes in the beds of ſtones, *&c.* there ſometimes guſhes a vein or ſtream of pure *mercury*, call'd *virgin-mercury*.

This laſt ſort is moſt valued: Paracelſus and Baſil Valentine prefer it far to any other ſort, for chymical operations. Dr. Brown aſſures us in his travels, that enquiring of one of the directors of the quick-ſilver mines, wherein the difference between this and common *mercury* conſiſted; he was anſwered, that virgin-*mercury*, mixed and amalgamated with gold, renders the ſulphur of the gold volatile: but this has been ſeveral times tried without ſucceſs.

Method of procuring or ſeparating MERCURY *from the ore or earth.*—They firſt grind the mineral glebe into powder; this done, they pour a great quantity of water upon it, ſtirring and working the whole briſkly about till the water become exceeding thick, and turbid. This water having ſtood till it be ſettled, they pour it off, and ſupply its place with freſh, which they ſtir and work as before. This they repeat, and continue to do, till the water at length comes away perfectly clear; then, all remaining at the bottom of the veſſel, is *mercury*, and other metalline matter.

To this *mercury*, &c. they add the ſcoria of iron, putting the whole in large iron retorts, and ſo diſtilling it; by which means all the heterogeneous, metallic and ſtony part, is ſeparated therefrom; and the *mercury* left pure.

As to the *mercury* in cinnabar, they do not find it worth while to diſtil, and get it out; cinnabar ſelling at too high a price alone. See CINNABAR.

The miſerable people condemned or hired to work in theſe mines, all die in a little time. They are firſt affected with tremors, and proceed to ſalivate; then their teeth drop out, and they are ſeized with pains all over, eſpecially in their bones, which the *mercury* penetrates, and thus die.

In Spain, the melting and exhaling the mineral is performed with more care, and with an engine contrived for that purpoſe.

As to the earthy matter wherewith the *mercury* is mix'd, that of Spain is red, and ſpeckled with black and white; and ſo hard, that it is not to be broken up with gunpowder. In Hungary it is frequently a hard ſtone, but ordinarily a reddiſh earth. In Friuli there is a ſoft earth where the virgin quick-ſilver is found, and a hard ſtone which yields the common *mercury*.

The mine of Idica, one of thoſe belonging to Friuli, is ſo rich that it yields always half quick-ſilver, ſometimes two thirds.

The mine of Juan Cabelaca, in Peru, is ſtill more conſiderable; the earth is of a whitiſh red, like bricks half burnt; it is firſt broke, then expoſed to the fire, by ſpreading it on a layer of common earth, wherewith the grate of an earthen ſurface is covered; under which is lighted a little fire of an herb, called by the Spaniards, *icho*: which is of that neceſſity in theſe works, that the cutting it is prohibited for the ſpace of twenty leagues round. In proportion as the mineral heats, the *mercury* riſes volatilized into ſmoke; which ſmoke finding no vent through the capital of the furnace, which is exactly luted, eſcapes through a hole made for the purpoſe, communicating with ſeveral earthen cucurbits fitted within one another. The water at the bottom of each cucurbit condenſing it to ſmoke, the quick-ſilver precipitates, and is taken up, when the operation is over. In this proceſs, there are three things remarkable. The firſt, That the further the cucurbits are from the furnace, the more they are filled with quick-ſilver. The ſecond, That at laſt they all grow ſo hot, that they would break, were they not ſprinkled from time to time with water. Thirdly, That the workmen employed never hold it long, but become paralytic, and die hectic. A precaution they uſe, is to hold a piece of gold in the mouth, to imbibe the effluvia, and intercept their paſſage into the body. Dr. Pope tells us of one he ſaw in the mines of Friuli, who in half a year's time was ſo impregnated with the metal, that putting a piece of braſs in his mouth, or even rubbing it in his fingers, it would turn white as ſilver.

The method of purifying MERCURY, is, by waſhing it ſeveral times in vinegar, wherein common ſalt hath been diſſolved; or by paſſing, and repaſſing it frequently over a ſhammy ſkin. Am. Paræus tells us, that the beſt way is to make a dog ſwallow a pound at a time, and afterwards to ſeparate it from the excrements, and waſh it in vinegar.

The uſes of MERCURY are very conſiderable in gilding, making looking-glaſſes, in refining gold, *&c.* See each under its head, GILDING, REFINING, MIRROUR, LOOKING-GLASS, FOLIATING, *&c.*

But eſpecially in medicine, and particularly for the cure of the venereal diſeaſe, raiſing ſalivations, and on other occaſions. See VENEREAL *diſeaſe*, SALIVATION, and MERCURIALS.

The preparations of MERCURY are very various; this metal making one of the moſt conſiderable articles in the chymical pharmacy. The moſt common preparations are,

White precipitate of MERCURY, MERCURIUS *præcipitatus albus*, is compounded of crude *mercury* drove over from ſea-ſalt in a retort, or revived from common cinnabar, and diſſolved in aqua fortis; then a brine prepared of ſpring-water and ſea-ſalt is filtred through a cap-paper, and the ſolution of *mercury* dropped gradually into this brine, whence there is a white powder precipitated, which is to be waſhed from all its acrimony with ſome ſimple diſtilled water, or warm ſpring-water, and the whole dried.

This is the common precipitate of the ſhops, uſually called *white precipitate*.—Its operation is moſtly by ſtool, ſometimes by vomit, and will ſalivate, if ordered accordingly. It is frequently mixed with pomatums for the itch, and other foulneſſes of the ſkin; for which purpoſe, it is neceſſary to keep the body laxative, and to take ſomething inwardly to take hold of the mercurial principles, and prevent their raiſing a ſalivation which they may otherwiſe do. See PRECIPITATE.

Corroſive ſublimate of MERCURY, MERCURIUS *ſublimatus corroſivus*, is a compoſition of vitriol calcined to a redneſs, common ſalt, and purified nitre, with crude *mercury* cleanſed by ſtraining through a leather, all rubbed together in a mortar, till the ſalts are reduced into powder, and not the leaſt globule of *mercury* appears. The mixture is then put into a matraſs, and that ſet in a furnace with a ſand-heat, under which a fire being kept to its greateſt height for twelve or fifteen hours, the *mercury* will be ſublimed, and ſtick to the top of the veſſel.

This ſublimate is a violent eſcharotic, and eats away proud fleſh; half a dram of it diſſolved in a pound of lime-water, turns it yellow, which is then called *phagedænic* water; it is uſed to waſh ulcers, and tetterous eruptions. See SUBLIMATE.

Sweet ſublimate of MERCURY, MERCURIUS *ſublimatus dulcis*, or *aquila alba*, is a compoſition of the preceding corroſive ſublimate with crude *mercury*, ground together till no *mercury* appear, and then put into a bolt-head, well ſtopped, and ſet in a ſand-heat, with a gentle fire, for the ſpace of two hours; which heat is to be then increaſed for three hours longer, and, laſtly, made very ſtrong, for as much more. When this is cold, the glaſs is broke, and the ſublimate ſeparated from the light flowers at top, and the duſt at bottom.—This is then powdered afreſh, and the operation repeated in the ſame manner three times.

If it be further repeated, a ſixth time, it is called *calomel*. See CALOMEL.

Fixing of MERCURY. See FIXATION and PHILOSOPHER's *ſtone*.

MERCURY, *or* MERCURY *of bodies*, is alſo uſed by chymiſts to denote the third of the principles, or elements of natural bodies; called alſo *ſpirit*. See PRINCIPLE.

In this ſenſe, *mercury* is defined the moſt ſubtle, light, volatile, penetrating, and active part of all bodies. See SPIRIT.

MERCURY *of metals*, or *of the philoſophers*, is a pure, fluid ſubſtance in form of common running *mercury*, ſaid to be found in all metals, and capable of being extracted from the ſame. See METAL.

The notion of *mercury* of metals, is founded on the common ſyſtem of the chymiſts, That *mercury* or quick-ſilver is the baſis, or matter of all metals; and that metals are only *mercury* fixed by a certain ſulphur. See SULPHUR, *&c.*

Mr. Boyle aſſures us, he had a way of drawing a true, running *mercury*, or quick-ſilver from antimony. See ANTIMONY.

Animated MERCURY is quick-ſilver impregnated with ſome ſubtile and ſpirituous particles; ſo as to render it capable of growing hot, when mingled with gold. See AMALGAMA.

MERCURY alſo ſerves as a title for books, and papers of news; ſo called from the heathen deity Mercury, ſuppoſed the meſſenger of the gods. See JOURNAL.

Thus we have monthly *mercuries*; the French have a gallant *mercury*, &c.

In a like ſenſe, *mercury* is alſo figuratively applied to perſons who make it their buſineſs to collect news, or to run about and diſtribute it.

MERCURY, in heraldry, denotes the purple colour in the coats of ſovereign princes. See PURPURE.

MERCURY is ſometimes alſo uſed for the Torricellian experiment, or barometer. See BAROMETER.

Though *mercury* be not ordinarily ſuſtained in a tube above the height of twenty-eight or twenty-nine inches, yet M. Huygens has found, that *mercury* well purged, and in a cloſe ſtill place, will be ſuſtained to the height of ſeventy-two inches; which is a phænomenon the philoſophers are all at a loſs to account for. See TORRICELLIAN *experiment*.

MERIDIAN, in aſtronomy, a great circle of the ſphere, paſſing through the zenith, nadir, and poles of the world; and dividing the ſphere into two hemiſpheres, the one eaſtern, and the other weſtern. See CIRCLE and SPHERE.

Or, the *meridian* is a vertical circle, as AZBN (*tab. aſtron. fig.* 6.) paſſing through the poles of the world, P and Q. See VERTICAL *circle*.

It is called *meridian*, from the latin *meridies*, noon, or midday, by reaſon when the ſun is in this circle, it is noon in thoſe places ſituate under it.

MERIDIAN, in geography, is a great circle, as PAQD, (*tab. geography, fig.* 7.) paſſing through the poles of the earth P and Q; and any given place at Z. So that the plane of the terreſtrial *meridian*, is in the plane of the celeſtial one.

Hence, 1. As the *meridian* inveſts the whole earth, there are ſeveral places ſituated under the ſame *meridian*. And, 2. As it is noon-tide whenever the centre of the ſun is in the *meridian* of the heavens; and as the *meridian* of the earth is in the plane of the former: it follows, that it is noon, at the ſame time, in all places ſituate under the ſame *meridian*. 3. There are as many *meridians* on the earth, as there are points conceived in the equator. In effect, the *meridians* always change, as you change the longitude of the place; and may be ſaid to be infinite: Each ſeveral place from eaſt to weſt having its ſeveral *meridian*.

Firſt MERIDIAN, is that from which the reſt are accounted, reckoning from weſt to eaſt.—The firſt *meridian* is the beginning of longitude. See LONGITUDE.

The fixing of a firſt *meridian* is a matter merely arbitrary; and hence different perſons, nations, and ages, have fixed it differently; whence ſome confuſion has aroſe in geography. The rule among the ancients was to make it paſs through the place furtheſt to the weſt that was known. But the moderns knowing, that there is no ſuch place in the earth as can be eſteemed the moſt weſterly; the way of computing the longitudes of places from one fixed point is much laid aſide.

Ptolemy aſſumed the *meridian* that paſſes through the furtheſt of the Canary Iſlands as his firſt *meridian*; that being the moſt weſtern place of the world then known. After him, as more countries were diſcovered in that quarter, the firſt *meridian* was removed further off. Some fixed it to the iſland of St. Nicholas, near Cape Verd; Hondius to the iſle of St. James; others to the iſland del Corvo one of the Azores. The lateſt geographers, particularly the Dutch, have pitched on the Pike of Teneriff; others on the iſle of Palm, another of the Canaries; and, laſtly, the French, by command of their king, on the iſland of Fero, another of the Canaries.

But, without much regard to any of theſe rules, our geographers, and map-makers, frequently aſſume the *meridian* of the place where they live, or the capital of their country, for a firſt *meridian*, and thence reckon the longitudes of their places.

The aſtronomers in their calculations uſually chuſe the *meridian* of the place where their obſervations are made, for their firſt *meridian*; as Ptolemy at Alexandria; Tycho Brahe at Uranibourg; Riccioli at Bologna; Mr. Flamſteed at the royal obſervatory at Greenwich; the French at the obſervatory at Paris. See OBSERVATORY.

In the *Philoſophical Tranſactions*, there is a ſuggeſtion, that the *meridians* vary, in time.—This ſeems very probable, from the old *meridian-line* in the church of St. Petronio at Bologna, which is found to vary no leſs than eight degrees from the true *meridian* of the place at this time; and from that of Tycho at Uranibourg, which M. Picart obſerves, varies eighteen minutes from the modern *meridian*. If there be any thing of truth in this hint, Dr. Wallis ſays, the change muſt ariſe from a change of the terreſtrial poles, (here on earth, of the earth's diurnal motion) not of their pointing to this or that of the fixed ſtars: For if the poles of the diurnal motion remain fixed to the ſame place on the earth, the *meridians* which paſs through theſe poles muſt remain the ſame.

But the notion of the changes of the *meridian* ſeems overthrown by an obſervation of M. Chazelles, of the French Academy of Sciences, who, when in Egypt, found that the four ſides of a pyramid built three thouſand years ago, ſtill looked very exactly to the four cardinal points. A poſition which can never be looked upon as fortuitous!

MERIDIAN *of a globe*, or *ſphere*, is the brazen circle, in which the globe hangs and turns. See GLOBE.

It is divided into four nineties, or three hundred and ſixty degrees,

grees, beginning at the equinoctial: On it, each way, from the equinoctial, on the celeſtial globes, is counted the ſouth and north declination of the ſun or ſtars: And on the terreſtrial globe, the latitude of places north or ſouth. There are two points on this circle called the *poles:* and a diameter continued from thence through the centre of either globe, is called the *axis*, of the earth or heavens, on which they are ſuppoſed to turn round. See Pole, and Axis.

On the terreſtrial globes there are uſually thirty-ſix *meridians* drawn; one through every tenth degree of the equator, or through every tenth degree of longitude.

The uſes of this circle are, to ſet the globes to any particular latitude; to ſhew the ſun's or a ſtar's declination, right aſcenſion, greateſt altitude, *&c.* See Globe.

Meridian *line*, an arch, or part, of the meridian of a place; terminated, each way, by the horizon.

Or, a *meridian line* is the interſection of the plane of the meridian of the place, with the plane of the horizon; vulgarly called a *north and ſouth line*, becauſe its direction is from one pole towards the other. See Meridian.

The uſe of a *meridian line* in aſtronomy, geography, dialling, *&c.* is very great; and on its exactneſs all depends: Whence infinite pains have been taken by divers aſtronomers to have it to the laſt preciſion.—M. Caſſini has diſtinguiſhed himſelf by a *meridian line* drawn on the pavement in the church of St. Petronio at Bologna, the largeſt and moſt accurate in the world. In the roof of the church, a thouſand inches above the pavement, is a little hole, through which the ſun's image, when in the *meridian*, falling upon the *line*, marks his progreſs all the year. When finiſhed, M. Caſſini, by a public writing, informed the mathematicians of Europe, of a new oracle of Apollo or the ſun eſtabliſhed in a temple, which might be conſulted with entire confidence as to all difficulties in aſtronomy. See Solstice, and Gnomon.

To draw a **Meridian** *line.*—Knowing the ſouth quarter pretty nearly, obſerve the altitude FE (*Tab. Aſtronomy*, *fig.* 8.) of ſome ſtar on the eaſtern ſide thereof not far from the *meridian* HZRN. Then keeping the quadrant firm on its axis, ſo as the plummet may ſtill cut the ſame degree, only directing it to the weſtern ſide of the *meridian*, wait till you find the ſtar has the ſame altitude as before, *fe*. Laſtly, Biſſect the angle E C *e* formed by the interſection of the two planes wherein the quadrant is placed at the time of the two obſervations, by the right line HR. This HR is a *meridian line.*

Or thus; On a horizontal plane, from the ſame centre C, (*Fig.* 9.) deſcribe ſeveral arches of circles BA, *ba*, *&c.* And on the ſame centre C, erect a ſtyle or gnomon perpendicular to the plain ACB, a foot, or half a foot long. About the twenty-firſt of June, between the hours of nine and eleven in the morning, and between one and three after noon, obſerve the points, B, *b*, *&c.* A, *a*, wherein the ſhadow of the ſtyle terminates. Biſſect the arches AB, *ab*, *&c.* in D, *d*, *&c.* If then the ſame right line DE biſſect all the arches AB, *ab*, *&c.* it will be the *meridian line* ſought.

In regard the extremity of the ſhadow is ſomewhat hard to determine, it is beſt to have the ſtyle flat a-top, and to drill a little hole, noting the lucid ſpot projected by it on the arches AB and *ab*, inſtead of the extremity of the ſhadow. Otherwiſe the circles may be made with yellow, inſtead of black, *&c.*

Several authors have invented particular inſtruments and methods for the deſcribing of *meridian lines*, or rather for determining equal altitudes of the ſun in the eaſtern and weſtern parts of the heavens; as Mr. Grey, Mr. Derham, *&c.* in the *Philoſophical Tranſactions*. But as the former of the methods above delivered, ſuffices for aſtronomical obſervations, and the latter for more ordinary occaſions, we ſhall forbear to give any deſcriptions thereof.

From what has been ſhewn, it is evident that whenever the ſhadow of the ſtyle covers the *meridian line*, the centre of the ſun is in the meridian; and therefore it is then noon.—And hence the uſe of a *meridian line* in adjuſting the motion of clocks, *&c.* to the ſun.

Hence alſo, if the *meridian line* be biſſected by a right line OV, drawn perpendicularly through the point C; OV will be the interſection of the meridian, and firſt vertical; and, conſequently, O will ſhew the eaſt point, and V the weſt.

Laſtly, if a ſtyle be erected perpendicularly in any other horizontal plane, and a ſignal be given when the ſhadow of the ſtyle covers the *meridian line* drawn in another plane, noting the apex or extremity of the ſhadow projected by the ſtyle, a line drawn from that point through that wherein the ſtyle is raiſed will be a *meridian line*. See Meridian *altitude*.

Meridian *line*, on a dial, is a right line ariſing from the interſection of the *meridian* of the place with the plane of the dial. See Dial.

This is the line of twelve o'clock; and from hence the diviſion of the hour-line begins.

Magnetical **Meridian**, is a great circle paſſing through or by the magnetical poles; to which the magnetic needle, or needle of the mariners compaſs, if not otherwiſe hindered, conforms itſelf. See Magnet, and Compass.

Meridian *altitude* of the ſun or ſtars, is their altitude when in the *meridian* of the place where they are obſerved. See Altitude.

The *meridian* altitude may be defined an arch of a great circle perpendicular to the horizon, and comprehended between the horizon and the ſtar then in the *meridian* of the place. See Sun, Star, Planet, *&c.*

To take the **Meridian** *altitude of the ſtars.*—Aſtronomers make two principal kinds of obſervations of the ſtars; the one when they are in the *meridian*, and the other when in vertical circles. See Celestial *obſervation.*

For *meridian obſervations*; there are two inſtruments principally uſed, the quadrant and gnomon. See Quadrant, and Gnomon.

To take the meridian altitude with a quadrant; if the poſition of the *meridian* be known, and the plane of the aſtronomical quadrant be placed in the *meridian* line by means of the plumb-line ſuſpended at the centre; the *meridian* altitudes of the ſtars, which are the principal obſervations whereon the whole art of aſtronomy is founded, may eaſily be determined.

The *meridian* altitude of a ſtar may likewiſe be had by means of a pendulum-clock, if the exact time of the ſtar's paſſage by the *meridian* be known. Now it muſt be obſerved, that ſtars have the ſame altitude for a minute before and after their paſſage by the *meridian*, if they be not in or near the zenith: But if they be, their altitudes muſt be taken every minute when they are near the *meridian*; and then their greateſt altitudes will be the *meridian* altitudes ſought.

As to the manner of obſerving, it is found very difficult to place the vane of the quadrant in the *meridian* exactly enough to take the *meridian* altitude of a ſtar; for unleſs there be a convenient place, and a wall where the quadrant may be firmly faſtened in the plane of the *meridian*, which is not eaſily had, we ſhall not have the true poſition of the *meridian* proper to obſerve the ſtars. It will be much eaſier therefore, on ſeveral accounts, to uſe the portable quadrant, by which the altitude of the ſtar may be obſerved a little before its paſſage over the *meridian* every minute till its greateſt altitude be found. Here though we have not the true poſition of the *meridian* by this means, yet we have the apparent *meridian* altitude of the ſtar.

Though this method, in the general be very good, and free of any ſenſible error, yet in caſe a ſtar paſſes by the *meridian* near the zenith, it proves ſomewhat defective: For in theſe kind of obſervations, the inconvenient ſituation of the obſerver; the variation of the ſtar's azimuth ſeveral degrees in a little time; the alteration of the inſtrument, and the difficulty of replacing it vertically, will prevent the obſervations from being oftner than in every four minutes. But in each minute, the altitude varies about fifteen minutes of a degree, ſo that there will be the difference of a degree in the ſtar's altitude between each obſervation. In ſuch caſes, therefore, it will be better to have the true poſition of the *meridian*, or the exact time wherein the ſtar paſſes the *meridian*, in order either to place the inſtrument in the *meridian*, or to obſerve the altitude of the ſtar the moment it paſſes the *meridian*.

To find the **Meridian** *altitude of the ſun*, &c.—*by a gnomon.* See Gnomon.—by other means, ſee Altitude.

MERIDIANI*, in antiquity, is a name which the Romans gave to a kind of gladiators, who entered the arena about noon; after the beſtiarii, who fought in the morning againſt beaſts, had finiſhed. See Gladiator.

* They were thus called from *Meridies*, *i. e.* noon, the time when they exhibited their ſhews.

The *Meridiani* were a ſort of artleſs combatants, who fought man with man, ſword in hand: Hence Seneca takes occaſion to obſerve, that the combats of the morning were full of humanity, compared with thoſe which followed.

MERIDIONAL *diſtance*, in navigation, the ſame with *departure*, or eaſting and weſting; being the difference of longitude between the *meridian*, under which the ſhip now is, and any other *meridian* ſhe was under before. See Departure, and Longitude.

Meridional *parts*, *miles*, or *minutes*, in navigation, are the parts by which the *meridians* in Mercator's chart do increaſe, as the parallels of latitude decreaſe. See Chart.

The co-ſine of the latitude of any place being equal to the radius, or ſemi-diameter of that parallel, therefore in the true ſea-chart, or nautical planiſphere, this radius being the radius of the equinoctial, or whole ſine of ninety degrees, the *meridional parts* at each degree of latitude muſt increaſe as the ſecants of the arch contained between that latitude and the equinoctial do decreaſe.

The tables therefore of *meridional parts* in books of navigation, are made by a continual addition of ſecants, calculated in ſome books (as in Sir Jonas Moor's tables) for every degree and minute of latitude; and theſe will ſerve, either to make or graduate a Mercator's chart, or to work the Mercator's ſailing.

To uſe them, you muſt enter the table, with the degree of latitude at the head, and with the minute on the firſt column towards the left hand; and in the angle of meeting, you will have the *meridional* parts.

Having the latitudes of two places, to find the *meridional miles*, or *minutes* between them: conſider whether the places be, one under the equinoctial, and the other wide thereof; or the one on the one ſide the equinoctial, and the other on the other; or whether they both lie on the ſame ſide.

If one place lie under the equator, the *meridional minutes* next under the degree of latitude of the other place, is the *meridional* difference of latitude, or latitude enlarged.

If one be in north, and the other in ſouth latitude; the *meridional minutes* correſponding to the two latitudes added together, give the *meridional minutes* between them.

Both places lying towards the ſame pole; ſubſtract the *meridional parts* anſwering to the leſs latitude from thoſe of the greater; the remainder gives the *meridional minutes*.

MERIT, in theology, is uſed to ſignify the moral goodneſs of the actions of men, and the reward due to them.

The Romiſh ſchoolmen diſtinguiſh two kinds of *merit* towards God: the one of *congruity*, the other of *condignity*.

MERIT *of congruity*, is, when there is no juſt proportion between the action, and the reward; but he who beſtows the reward, ſupplies by his goodneſs or liberality, what was wanting in the action.—Such is the *merit* of a ſon towards his father: but this is only *merit* in an improper ſenſe.

MERIT *of condignity*, is, when there is an abſolute equality, and a juſt eſtimation between the action, and the reward: as in the wages of a workman.

Thoſe of the reformed religion diſclaim all *merit of condignity* towards God: Even their beſt works do not merit any thing at his hands.—The doctrine of *condign merits* makes one of the great articles of controverſy between the Romiſh and Reformed churches.

MERLON*, in fortification, that part of the parapet which lies betwixt two embraſures. See PARAPET, and EMBRASURE.

* The word comes from *merula*, or *merla*, which in the corrupt Latin was uſed for a battlement.

It is uſually from eight to nine feet long on the ſide of the cannon, and ſix on the ſide of the field; about ſix feet high, and eighteen thick.

MERMAID, or MERMAN, a ſea-creature frequently talked of, ſuppoſed half human, and half a fiſh. See MONSTER.

However naturaliſts may doubt of the reality of *mermen*, or *mermaids*, we have teſtimony enough to eſtabliſh it. In the year 1187, as Larry informs us, ſuch a monſter was fiſhed up in the county of Suffolk, and kept by the governour for ſix months. It bore ſo near a conformity with man, that nothing ſeemed wanting to it but ſpeech. One day it took the opportunity of making its eſcape, and plunging into the ſea, was never more heard of. *Hiſt. de Angleterre*, P. I. p. 403.

In the year 1430, after a huge tempeſt, which broke down the dykes in Holland, and made way for the ſea into the meadows, *&c.* ſome girls of the town of Edam in Weſt-Freezeland, going in a boat to milk their cows, perceived a *mermaid* embarraſſed in the mud, with a very little water. They took it into their boat, and brought it with them to Edam, dreſſed it in women's apparel, and taught it to ſpin. It fed like one of them, but could never be brought to offer at ſpeech. Some time afterwards it was brought to Haerlem, where it lived for ſome years, though ſtill ſhewing an inclination to the water. Parival relates, that they had given it ſome notion of a deity, and that it made its reverences very devoutly when ever it paſſed by a crucifix. *Delices de Hollande*.

In the year 1560, near the iſland of Manar, on the weſtern coaſt of the iſland of Ceylon, ſome fiſhermen brought up at one draught of a net, ſeven *mermen* and *maids*; of which, ſeveral Jeſuits, and among the reſt, F. Hen. Henriques, and Dimas Boſquez, phyſician, to the vice-roy of Goa, were witneſſes. The phyſician, who examined them with a great deal of care, and made diſſections thereof, aſſerts, that all the parts both internal and external, were found perfectly conformable to thoſe of men. See the *Hiſt. de la compagnie de Jeſus*, P. II. T. IV. N°. 276. where the relation is given at length.

We have another account well atteſted of a *merman*, near the great rock called Diamond, on the coaſt of Martinico. The perſons who ſaw it, gave in a preciſe deſcription of it before a notary. They affirmed that they ſaw it wipe its hand over its face, and even heard it blow its noſe.

Another creature of the ſame ſpecies was caught in the Baltic in the year 1531, and ſent as a preſent to Sigiſmond king of Poland, with whom it lived three days, and was ſeen by all the court. Another very young one was taken near Rocca de Sintra, as related by Damian Goes.

The king of Portugal and the grand maſter of the order of St. James, are ſaid to have had a ſuit at law to determine which party theſe monſters belong to.

MERO *motu*. See the article EX *mero*.

MERSION. See IMMERSION, and EMERSION.

MERUIT.—*Quantum* MERUIT. See QUANTUM.

MESARÆUM, ΜΕΣΑΡΙΟΝ, in anatomy, the ſame with *meſenterium*. See MESENTERY.

MESARÆUM, is alſo uſed in a more reſtrained ſenſe for a part, or diviſion of the meſentery; being that faſtned to the ſmall guts. See MESENTERY.

That part of the meſentery which is faſtned to the thick guts is called meſocolon. See MESOCOLON.

MESARAIC *veſſels*, in the general ſenſe, are the ſame with *meſenteric*. See MESENTERIC.

In common uſe, *meſaraic* is more frequently applied to the veins; and meſenteric to the arteries, of the meſentery.

MESENTERIC, or MESARAIC, an epithet given to two arteries ariſing from the deſcending aorta, and proceeding to the meſentery.

There is an upper, or ſuperior *meſenteric*, which goes to the upper part of the meſentery; and a lower, or inferiour *meſenteric*, which diſtributes itſelf through the lower part.—See *Tab. Anat.* (*Angeiol.*) *fig.* 1. *n.* 43, 45. See alſo ARTERY.

We have alſo a *meſenteric vein*, compoſed of an infinity of veins proceeding from the meſentery; which, with the vena ſplenica ariſing from the ſpleen, form the vena porta.

Anatomiſts alſo reckon a *meſenteric nerve*, which arriſes from the intercoſtal, and ſends ſeveral branches to the meſentery. See NERVE.

MESENTERIC *plexus*, a plexus, or piece of net-work formed by the branches or ramifications of the par vagum.

The *plexus meſentericus magnus*, or *great meſenteric plexus*, is formed out of the concurrent branches of ſeveral other plexus's, and ſends its nervous fibres through the whole meſentery along with the meſaraic veſſels, which, with various circumligations, they accompany to the inteſtines. See PLEXUS.

Omphalo-MESENTERIC. See the article OMPHALO-*meſenteric*.

MESENTERY*, MESENTERIUM, or MESARÆUM, in anatomy, a fatty membranous body; thus called, as being placed in the middle of the inteſtines, which it connects to one another. See INTESTINES.

* The word comes from the Greek μεσος, middle, and εντερον, inteſtine, gut.

The *meſentery* is almoſt of a circular figure, with a narrow production, to which the end of the colon, and the beginning of the rectum, are tied.

It is about four fingers and a half in diameter: Its circumference, being full of plaits and foldings, is about three ells in length. The inteſtines are tied like a border on this circumference of the *meſentery*: There are three inches of the inteſtines thus faſtned. See INTESTINES.

The *meſentery* itſelf is ſtrongly tied to the three firſt vertebræ of the loins. It is compoſed of three laminæ; the inner, upon which the glands and fat lie, and the veins and arteries run, is its own proper membrane; and the other two, which cover each ſide of the proper membrane, come from the peritonæum. Between the two external laminæ of the *meſentery*, run the branches of the arteria meſenterica, ſuperior and inferior, which bring the blood to the inteſtines; and the venæ meſaraicæ, which being branches of the porta, carry the blood back to the liver. Here the large branches of both arteries and veins communicating with one another, march directly to the guts; where, with the nerves from the plexus meſentericus, they divide into an infinite number of ſmall branches, which ſpread themſelves extremely finely upon the coats of the inteſtines. The venæ lacteæ, and lymphatic veſſels, run likewiſe upon the *meſentery*, in which there are alſo ſeveral veſicular glands; the biggeſt of which in the middle of the *meſentery*, is called *pancreas aſellii*; theſe glands receive the lympha and chyle from the lacteal veins. See PANCREAS and LACTEAL.

The *meſentery* has been ordinarily divided into two parts, the meſaræum, and meſocolon. The firſt appended to the inteſtina tenuia; and the latter to the craſſa.—But this is a diviſion of no great moment.

The uſe of the *meſentery*, is, firſt, to gather the inteſtines into a narrow compaſs, that the courſe of the chyliferous veſſels towards their common receptacle may be but ſhort; to cover and protect them and the blood-veſſels; and to connect and diſpoſe the inteſtines, ſo as to ſecure them from any entanglement that might hinder their periſtaltic motion.

MESN*, or MEASNE, a term in law ſignifying him who is lord of a manor, and ſo hath tenants holding of him; yet he himſelf holds of a ſuperior lord. See LORD.

* The word is properly derived from *maiſne, quaſi minor natu*, becauſe his tenure is derived from another, from whom he holds.

MESN, alſo denotes a writ, which lieth where there is lord *meſn* and tenant; and the tenant is diſtrained for ſervices due from the *meſn* to the ſuperior lord.

MESOCOLON, ΜΕΣΟΚΩΛΟΝ, in anatomy, that part of the meſentery connected to the great guts, eſpecially the colon. See MESENTERY.

The *meſocolon* lies in the midſt of the colon, to which it is joined. Its lower part ſticks to a part of the rectum.

MESOLABE, MESOLABIUM, a mathematical inſtrument invented by the ancients for finding two mean proportionals mechanically, which they could not come at geometrically. See PROPORTIONAL.

It conſiſts of three parallelograms moving in a groove to certain interſections. Its figure is deſcribed by Eutochius in his commentary on Archimedes.

MESO-LOGARITHM, a term uſed by Kepler to ſignify the logarithms of the co-ſines, and co-tangents: The former of which my lord Neper calls *anti-logarithms*, and the latter *differentiales*.

Theſe are alſo called *artificial ſigns and tangents*. See Logarithm, Co-Sine, Co-Tangent, Anti-Logarithm, *&c.*

MESOPLEURII*, in anatomy, the intercoſtal muſcles. See Intercostal.

* The word is derived from *μεσος*, *medius*, middle; and *πλευρον*, *coſta*, rib.

Meso-Pleurii, is ſometimes alſo uſed for the intermediate ſpaces between the coſtæ, or ribs. See Ribs.

MESSE, or Mass, Missa. See Mass.

MESSENGERS, in the Engliſh polity, are carriers of letters and meſſages; more particularly, certain officers chiefly employed under the direction of the ſecretaries of ſtate; always in readineſs to be ſent with all manner of diſpatches, foreign, and domeſtic. See Secretary *of ſtate.*

They are alſo employed, with the ſecretaries warrants, to take up perſons for high treaſon, or other offences againſt the ſtate, which do not ſo properly fall under the cognizance of the common law, and perhaps, are not proper to be divulged in the ordinary courſe of juſtice.

The priſoners they apprehend are uſually kept at their own houſes, for which they are allowed by the government 6 *s.* 8 *d.* *per* day. When they are diſpatched abroad, they have an allowance for their journey, as ſtated, *viz.* to Paris 30 *l.* to Holland 25 *l.* to Edinburgh 30 *l.* to Ireland 30 *l.* and ſo to other places in proportion. Part of which money is advanced to them for their journey.

They wait twenty at a time, monthly, diſtributed as follows, *viz.* four at court, five at one ſecretary's office, five at the other, and two at the third office for North Britain, three at the council-office, and one at the lord chamberlain's of the houſhold. Their poſts, if purchaſed, are eſteemed worth 300 *l.* Their ſtanding ſalary is 45 *l. per annum.*

Messengers *of the exchequer*, are officers attending the exchequer, in the nature of purſuivants. They are four in number. Their buſineſs is to attend the lord treaſurer, carry his letters, precepts, *&c.*

Messenger *of the preſs*, a perſon who by order of the court ſearches printing-houſes, bookſellers ſhops, *&c.* in order to diſcover ſeditious books, *&c.*

MESSIAH*, a term ſignifying anointed or ſacred; and in that ſenſe applied to kings and prieſts: but, by way of eminence, to Jeſus Chriſt, the Saviour promiſed by the prophets of the old law. See Christ.

* The word comes from the Hebrew, *maſcuach*, anointed, of the verb *maſchach*, to anoint: whence Jeſus Chriſt claims the title on a manifold account: 1°. As having been anointed king of kings from all ages. 2°. As chief of the prophets. 3°. As high-prieſt of the law of grace, or prieſt for ever after the order of Melchizedek.

The ſon of God is variouſly denominated according to his various qualities and attributes. He is called the *word*, as being the eternal ſon of the father, and conſubſtantial with him: *Chriſt*, Χριστος, a Greek term, ſignifying anointed, of the ſame import with the Hebrew *Meſſiah*; *Jeſus*, *i. e.* ſaviour, of the Hebrew, *Jehoſua*, by reaſon he ſaves his people from their ſins. —In effect, he is called *word*, as being the ſon of God; *Jeſus*, as man; *Chriſt*, as being anointed; and *Meſſiah*, as being both God and man.

The Jews ſtill wait for the coming of the *Meſſiah*; being infatuated with the notion of a temporal *Meſſiah* that is to be a mighty conqueror, and to ſubdue all the world. See Prophecy, *&c.*

Jeſus Chriſt aſſerts himſelf the *Meſſiah*. In St. John, iv. 25. the Samaritan woman ſays to Jeſus, *I know that when* Meſſiah *comes, (who is called the* Chriſt) *he will tell us all things. Jeſus anſwered her, I that ſpeak to thee, am he.*

There are ſeveral impoſtors who have endeavoured to paſs for *Meſſiahs*. J. Lent, a Dutchman, has written a hiſtory of falſe *Meſſiahs: De pſeudomeſſiis.* The firſt he mentions was one Barcochab, who appeared under the empire of Adrian. The laſt is rabbi Mordecai, who began to be talked of in 1682. A little before him, *viz.* in 1666, appeared Sabbethai Sebi, who was taken by the Turks, and turned Mahometan.

MESSIEURS, a French title of honour, or civility, lately introduced into our language; being the plural of *monſieur*, and equivalent to the Engliſh, *ſirs*. See Monsieur, Sire, *&c.*

The French lawyers always begin their pleadings, and harangues with *meſſieurs*; which word is alſo frequently repeated in the courſe of their ſpeeches; on which occaſion it anſwers to our Engliſh word, *gentlemen.*

The French ſay, *Meſſieurs du parlement*; *du conſeil*; *des comptes*, &c.

MESSUAGE, Messuagium, in law, a dwelling-houſe with ſome land adjoining, aſſigned for its uſe.

By the name of *meſſuage* may a garden, ſhop, mill, cottage, chamber, cellar, or the like, paſs.

In Scotland, Messuage, denotes what we call the *manor-houſe*; *viz.* the principal dwelling-houſe within any barony. See Manor, Mansion, *&c.*

MESYMNIUM, a name which the ancients gave to a part of their tragedy; or to certain verſes in their tragedies. See Tragedy.

The *meſymnium* was a kind of burden, as *Io Pæan*; *O Dithyrambe*; *Hymen, O Hymenæe*, or the like; which when placed at the end of a ſtrophe, was called *ephymnium*; and when inſerted in the middle of a ſtrophe, *meſymnium*. See Strophe, and Chorus.

METACARPUS*, or Metacarpium, in anatomy, that part of the hand between the wriſt and the fingers.—See *Tab. Anat.* (*Oſteol.*) *fig.* 3. *n.* 10. *fig.* 7. *n.* 13. See alſo Hand.

* The word comes from the Greek *μετα*, *poſt*, behind; and *καρπος*, *manus*, hand. See Carpus.

The *metacarpus* conſiſts of four bones, which anſwer to the four fingers; whereof that which ſuſtains the fore-finger is the biggeſt and longeſt. They are all round and long, a little convex towards the back of the hand, and concave and plain towards the palm: They are hollow in the middle, and full of marrow; they touch one another only at their extremities, leaving ſpaces in their middle, in which lie the muſculi interoſſei. See Interossei.

In their upper end there is a ſinus, which receives the bones of the wriſt; their lower extremity is round, and is received into the ſinus of the firſt bones of the fingers. See Finger.

The inner part of the *metacarpus* is called the *palm*, and the outer, the *back of the hand*. See Palm, *&c.*

METACHRONISM, in chronology, an error in computation of time, either on the ſide of defect, or exceſs. See Chronology, Anachronism, *&c.*

METACISM, Metacismus, in grammar, a defect in the pronunciation of the letter *M.*

Iſidore repreſents the *metaciſm* as a final *m*, followed by a vowel; as *bonum aurum, Bethlehem erat*, &c.

METACONDYLI, is uſed by ſome authors for the out-moſt bones, or joints of the fingers, next the nails. See Finger, and Condylus.

METAL, ΜΕΤΑΛΛΟΝ, in natural hiſtory, a ſimple, ponderous, ſhining, fixt, foſſil body, that fuſes, and becomes fluid, by fire, and by cold coagulates and hardens into a ſolid maſs, capable of being diſtended under the hammer. See Fossil.

Metal is ſaid to be *ſimple*, as it may be affirmed of every the minuteſt particle of a *metal*, *e. gr.* a grain of gold, that it is gold, or has all the properties of gold. See Gold.—*Fuſible* by fire, that is, when expoſed to a great fire, it diſſolves into parts which are eaſily moveable among themſelves, or are in actual motion. See Fusion.—*Fixt*, *i. e.* bearing the fire without flying off in vapours: Though it is only to a certain degree that *metals* are fixt; for by the large burning-glaſſes of Meſſ. Tſchirnhauſen and Villette, all *metals* are found to evaporate. See Fixity, Volatility, Burning-*glaſs*, &c.

Such is the proper idea of *metals*, which is not applicable to any other body in nature: for a diamond, or other ſtone, though a ſimple body, is not fuſible in the fire, nor capable of being ſtretched under the hammer. See Diamond. And ſalt, though diſſolvable by fire, is not malleable, but breaks under the hammer. See Salt, *&c.*

There are indeed certain woods which yield in ſome meaſure to the hammer; but then they fall to duſt in the fire: and ſo of the reſt. See Malleable, *&c.*

We find but ſix *metals* in all nature, *viz.* gold, lead, ſilver, copper, iron, and tin. See the nature, characters, production, uſes, *&c.* of each, under its proper article; Gold, Lead, Silver, Copper, Iron, and Tin.

To theſe a ſeventh *metal* is uſually added, *viz.* mercury, or quick-ſilver; but improper, as it has not all the characters of a *metal*, nor ſcarce any thing in common with the other *metals*, except weight and ſimilarity of parts. See Mercury, *&c.*

Thus it is neither diſſolvable by fire, malleable, nor fixt: In effect, it ſeems to conſtitute a peculiar claſs of foſſils, and is rather the mother, or baſis of all *metals*, than a *metal* itſelf.—However, as it is uſually reckoned among them, and as it wants nothing to render it a *metal*, but an additional ſulphur to fix and connect its parts together, it may without any great harm be conſidered under that claſs.

The common radical character of *metals* is, that of all known bodies, they are the heavieſt. By Dr. Halley's experiments, the weight of gold to that of glaſs is determined to be as 9 to 1; and the weight of tin, the ligheſt of all *metals*, to that of gold, as 7 to 19; which conſiderably ſurpaſſes the weight of all ſtones, marbles, gems and other the moſt ſolid bodies, as appears from the tables of ſpecific gravities. Nor is there any body in nature but a *metal*, that is one third of the weight of gold. See Specific *gravity.*

The Royal Society furniſh us with various experiments of this kind. The weights of the ſeveral *metals*, and other ſolids, they have examined hydroſtatically, by weighing them in air and in water: and the weights of the fluids by weighing an equal portion of each. By ſuch experiments they find, that taking the ſame weights of water and gold, the bulk or magnitude of the former is to the latter as 19636 to 1000; conſequently that the weight of gold is to water nearly as 19 to 1.

The ſpecific weight of the ſeveral *metals* by this means determined, ſtands thus:

Gold	19636	Iron	7852
Quick-ſilver	14019	Tin	7321
Lead	11345	Granate	3978
Silver	10535	Water	1000
Copper	8843	Air	$\frac{3}{17}$

The cubic inch of		*Ounces,*	*Drams.*	*Grains.*
Gold	Weight	12	2	52
Quick-ſilver		8	6	8
Lead		7	3	30
Silver		6	5	28
Copper		5	6	36
Iron		5	1	24
Tin		4	6	17

As to the origin and formation of METALS, various are the ſentiments of philoſophers, ancient and modern.—M. Tournefort is of opinion, that *metals*, as well as all other minerals, have their origin from ſeeds, like plants; that they have veſſels with juices circulating in them, &c. See STONE, and MINERAL.

Plato will have the cauſe of *metals* to be a humid vapour, incloſed in the bowels of the earth, which being variouſly intermixed with parts of the earth, produces various *metals*. Plotin maintains ſulphur to be the father of *metals*; and an oleaginous viſcous humour, the mother. Lidyat endeavours to prove all *metals* generated by a ſubterranean fire; urging, among other reaſons, that many *metals*, when taken out of the earth, are exceedingly hot. Du Hamel ſhews, that *metals* do not take their riſe either from any vaporous exhalation, or from water, or from earth; but are generated of mercury, ſulphur, and ſalt. He adds, that *metals* take their matter and weight from the mercury, (ſee MERCURY) and their tincture and form from ſulphur. See SULPHUR.

The ſame author owns the firſt rudiment of a *metal* to be a ſaline ſubſtance ſwimming in water, which is by little and little carried off. By how much the terreſtrial parts are more exquiſitely mixed with the aqueous or humid, by ſo much is the *metal* more heavy and firm, as having fewer and ſmaller pores. Hence its ductility: for its parts being extremely ſmall, denſe, and complicated, may be drawn out into a very ſpacious ſurface. On which account it is, that gold exceeds all other *metals* both in weight and ductility; hence alſo its fixity, its parts being too cloſe and denſe to be exhaled. The water defends the earth from being burnt, and the earth the water from flying off; neither forſakes the other, but each is bound in an undiſſolvable knot. The moiſture gives ductility, the earth ſolidity. Where the mixture is leſs perfect, whether the earth or the water prevail, the *metal* will neither have ſo much weight, as having larger pores; nor will it bear the fire ſo well. For if the earth prevail, as in iron, or the water, as in lead; heat will ſet the one at liberty from the other; the moiſture evaporates, and the earth is reduced into ſcoria, &c.

Dr. Woodward maintains, that all *metals* now found in the ſtrata of the earth owe their preſent condition to the deluge; when, he alſo imagines, the ſtrata of ſtone, earth, marble, &c. were formed. See DELUGE.

The *metallic* and mineral matter now found in the perpendicular intervals or fiſſures of the ſeveral ſtrata, whereof the earth is compoſed, was, according to him, at the time of the deluge, lodged in the bodies of thoſe ſtrata; and brought thence, and tranſmitted into theſe intervals ſince that time; the intervals themſelves not exiſting, till the ſtrata were formed and broke again, to let the water from the earth. See STRATA.

Now the water, which, he imagines, is conſtantly aſcending from the abyſs (ſee ABYSS) towards the ſurface of the earth, continually pervading the ſtrata, detaches out of their pores and interſtices ſuch *metallic* and mineral corpuſcles as it finds looſe in its way, carying them along with it to the perpendicular intervals, where having a freer paſſage than before, it deſerts them, and leaves them in thoſe intervals. And this he takes to be the way in which all *metals* now found in thoſe places, were brought thither, and ſtill grow.

Thoſe in the ſtrata, however, he obſerves, do not nor can grow; but, on the contrary, are continually leſſened and diminiſhed, by ſo much as has been conveyed into the perpendicular intervals, and brought forth of the ſurface of the earth by ſprings and exhalations from the abyſs, &c. See FOSSIL.

The ſame ingenious author complains of the great uncertainty and inconſtancy in the mineral and *metallic* kingdom; neither colour, figure, nor ſituation in the earth, being to be depended on, ſo as to make any poſitive judgment from them.—A pyrites or marcaſite, for inſtance, ſhall have the colour and brightneſs of gold or ſilver, and yet afford nothing but a little vitriol and ſulphur; while a pebble in appearance ſhall have a mixture of a valuable *metal* in it. It is common too, to find the ſame *metal* ſhot into a great number of different forms, as well as to find different kinds of *metal* of the ſame form. And as to their place in the earth, there is the ſame uncertainty; being ſometimes found in the perpendicular fiſſures or intervals of the ſtrata, ſometimes interſperſed in the bodies of the ſtrata, and ſometimes in both. The ſame *metals* are alſo placed indifferently in all kind of terreſtrial matter, or in ſtrata of very different natures. They are frequently intermixed with each other, ſo that it is a rare thing to find any of them pure and ſimple; but copper and iron ſhall be in the ſame maſs, gold and copper, ſilver and lead, tin and lead; nay, ſometimes all ſix together in the ſame lump. See MINERAL.

The French chymiſts have been very curious in their inquiries into the nature and production of metals.—M. Geoffroy, from a mixture of ſulphur with a vitriolic ſalt, and an argillous earth, brought an iron, which he maintained to be a new production, or a compoſition reſulting from the aſſemblage of certain principles which exiſted ſeparately in the ingredients that formed the *metal*; in a word, that it was an artificial iron. And obſerving that there were parcels of this *metal* in the coloured aſhes of plants, and of moſt other inflammable ſubſtances, he concluded that it might be formed there alſo by the union of the ſame three principles.

This was oppoſed by M. Lemery the younger, who maintained that the iron contained in the aſhes of plants, was not formed there by calcination, but was really exiſtent in the plants themſelves; being raiſed in their veſſels along with the juices of the earth; and further, that all the ingredients whereof M. Geoffroy's artificial iron was formed, do really contain iron in themſelves, either in ſmaller or larger quantities: Not the argilla only, where the iron is eaſily diſcovered by an animated knife; nor the oil of vitriol, which is drawn from a mineral the ground whereof is iron; but alſo linſeed-oil, whereof M. Geoffroy's ſulphur was made; and even that of turpentine, ſweet almonds, &c. relating withal the operations whereby each of thoſe oils may be reduced to an earth wherein is iron.

To this it was anſwered, that in what manner ſoever iron be procured from the ſeveral ingredients ſeparately, there will be ſtill found infinitely leſs in them, than when mixed; and that of conſequence the mixture produces iron. That as for oils, it is evident they are not ſimple ſubſtances, but are compoſed of an earth, an acid, and a ſulphurous or inflammable part; which are the three preciſe principles required for the formation of iron: ſo that, according to all appearances, it is of an aſſemblage of thoſe ſulphurs, ſalts, and earth in the oil, that the iron is formed by calcination; and therefore that the means uſed to the iron in the ingredients, are the very ſame with thoſe by which it is compoſed.

Hence it appears, that vegetable matters contain the principles of minerals. But M. Geoffroy goes further: and to ſupport his doctrine of the production of *metals*, undertakes to prove, that the principles of vegetables, and thoſe of minerals, are eſſentially the ſame; and that one may readily, and with eaſe, decompound minerals, by ſeparating their principles, and compound them again, by ſubſtituting principles taken from vegetables in lieu of thoſe taken away.

To clear this point, he examines and compares the principles of mineral and vegetable ſalts. The principal in the mineral claſs, are nitre, ſea-ſalt, and vitriol: All which ſalts we find in plants. On the other hand, the eſſential ſalt of the parietaria is wholly nitrous, and melts on the coals like ſalt-petre. The fixt ſalts of the carduus benedictus, abſinthium, kali, &c. contain a great deal of ſea-ſalt, which cryſtallizes in cubes, and precipitates on the coals. Add, that the greateſt part of the fixt ſalts of plants calcined to a certain degree, yield a ſtrong ſmell of ſulphur, which can proceed from nothing but a vitriolic ſalt, rarefied and volatilized by the oil of the plant. By theſe ſalts we may be able to judge of all the other ſalts of plants; for the volatile ſalts are nothing elſe but fixed ſalts diſengaged from the groſſeſt part of their earth, and joined with parts of oil. See SALT.

Further, there is ſcarce any reaſon to doubt, that the acid juices drawn from vegetables are of the ſame nature with the mineral acids; with this only difference, that the acids of plants have been extremely rarefied by fermentation, united ſo cloſely with ſulphurs, that it is not without a great deal of difficulty that they are ſeparated.

Thus, diſtilled vinegar, which we make no ſcruple of ranking among the vitriolic acids; does only differ from ſpirit of ſulphur, ſpirit of vitriol, or even the cauſtic oil of vitriol, in that the acids in the vinegar are diffuſed among a great deal of phlegm, and ſtrongly united to a great deal of oil, which yet may be ſeparated. By diſſolving copper in the acid of vinegar, ſeparated as much as poſſible from its oil, there are formed cryſtals, like in figure to thoſe of blue vitriol. From all which it appears, that the ſalts of plants do not differ eſſentially from thoſe of minerals.

For ſulphurs, the inflammable or ſulphurous principle is the ſame in vegetables as in minerals. And M. Geoffroy even ſhews, that the principle of inflammability in common ſulphur, is the ſame with that which renders the fat of animals, the oils and reſins of plants, and the bitumens of the earth, inflammable. To which he adds, that this ſame ſulphurous principle is not only likewiſe found in metallic ſubſtances, but that it is this which gives them their fuſibility, ductility, and metalline forms. Thus antimony, which is a ſubſtance approaching the neareſt of any to a *metal*, is little elſe but a burning ſulphur. By exhaling this, it loſes its *metallic* form, and turns to a kind of grey aſhes, which being melted, inſtead of *metal* become glaſs. By melting this over again, and adding to it ſome inflammable matter, as tartar, it returns into a regulus.

As to the ſpecies of METALS, there are four which the chymiſts call *imperfect*, becauſe their principles are not bound ſo faſt together, but that the force of a common fire deſtroys them; theſe are iron, copper, lead, and tin: the others, which are proof againſt common fire, are gold and ſilver, called *perfect metals*.

In the four firſt it is eaſy to ſee the principle of inflammability: They become all fuſible by the addition of ſalt-petre, either in a greater or leſs degree. Iron is that wherein this is the moſt viſible; next, tin; then copper and lead.—But the principle is more conſpicuous ſtill, in the duſt or ſmall filings of the *metals*, let fall in the flame of a candle, than in the lump.

For gold and ſilver, the ſulphurous principle is not ſo obvious. No heat but that of the ſun collected into a focus, is able to decompound them. But no doubt they have the ſame principles with the other *metals*, though not ſo eaſily ſeen.—In gold, as well as in the imperfect *metals*, the baſis is an earth capable of vitrification, as appears by the glaſs remaining after the calcination of gold in a burning-glaſs; and there is reaſon to believe, that the greateſt part of what is exhaled in ſmoke during the operation, is the ſulphurous principle mixed with ſalts.

As to ſilver, there is ſomething in it extremely various. When purified with antimony, it vitrifies by the burning-glaſs; but if purified with lead, it leaves nothing behind it but grey aſhes.—The baſis of this *metal* is doubtleſs an earth capable of vitrification; and what exhales in ſmoke, is apparently a mixture of ſulphur, ſalts, and a little earth volatilized by the fire. See SULPHUR.

From all which, and many more obſervations of the ſame kind, M. Geoffroy ventures to draw the following concluſions. That the ſubſtances whereof *metals* are compoſed, do not differ eſſentially from thoſe which compoſe vegetables.—That the imperfect *metals* are compoſed of a ſulphur, vitriolic ſalt, and vitrifiable earth.—That this ſulphurous principle is more or leſs ſtrongly joined with the other principles; very ſtrongly in gold and in ſilver, leſs in antimony, and very little in mineral ſulphur.—That the principle of inflammability may be ſeparated from *metallic* ſubſtances, either by culinary fire, or by the ſun.—That the *metal* thus deſpoiled of its principle, is converted into aſhes; and that theſe aſhes, purſued farther with a violent fire, vitrify; and that ſuch aſhes or glaſſes, by the application of ſome inflammable matter, reſume the *metallic* form they had loſt.—That it is by this means linſeed-oil turns argilla into iron.—That if we knew all the other *metallic* earths, they might likewiſe be immediately converted into *metals*, by the projection of ſome inflammable matter.—That it is the ſaline and earthy parts, found in oil of vitriol, that furniſh the earthy vitrifiable part which makes the baſis or ground of iron, and that it receives the *metallic* form from the ſulphurous principle of the oil.—That the iron found in the aſhes of plants, was produced there in the ſame manner: And, That it is a compoſition of the vitrifiable earth of the plants, the acid of thoſe plants, and their oily or inflammable principle.

The ſame author, the better to aſcertain the conſtituent parts of *metals*, made a great number of experiments on them with the duke of Orleans's large burning-glaſs; the reſult whereof falls in with, and confirms the doctrine laid down above.—From thoſe experiments, he gathers, That the four *metals* which we call *imperfect*, *viz.* iron, copper, tin, and lead, are compoſed of a ſulphur or oily ſubſtance, capable of burning, and a *metallic* earth, capable of vitrification.—That from this ſulphur proceed the opacity, brightneſs, and malleability of a *metal*.—That this *metallic* ſulphur does not appear at all different from the oil or ſulphur of vegetables, or even animals; and that it is the ſame in mercury as in the four imperfect *metals*.—That theſe four *metals* have for their baſis an earth ſuſceptible of vitrification; that this earth is different in each of the four *metals*, in that it vitrifies differently in each; and that on this difference in vitrifying, depends the difference of *metals*. See VITRIFICATION.

The learned Boerhaave, after an accurate ſurvey of the ſeveral *metals*, their characters, properties, preparations, uſes, &c. draws the following corollaries concerning the general nature of *metals*. 1°. That which diſtinguiſhes *metals* from all other bodies, as well as from each other, is their heavineſs: Though every *metal* has its peculiar weight; which no art is able to imitate, and which depends, as Helmont and the chymiſts expreſs it, on the anatic homogeneity of their parts. Now, the later philoſophers have proved, that all corporeal magnitude has juſt ſo much reality in it, as weight; and therefore if you have found the heavineſs of any *metal*, you have at the ſame time found its corporeity. Sir Iſaac Newton treating of gravity, and Huygens of the pendulum, ſhew that weight and reality are correſpondent. See WEIGHT, and GRAVITY.

2°. The *metals* appear to be ſimple, yet are really compounds. Their component principles, according to the ancients, are ſulphur and mercury; to which ſome of the moderns have added ſalt: but it is certain ſalt is no conſtituent part, or ingredient of *metals*, but rather ſomething external adhering to them. All *metals* conſiſt of two parts, or principles; mercury as the baſis or matter; and ſulphur as the binder or cement: the firſt, the ſubſtratum, or *metallic* matter; and the ſecond, that which renders it fixed and malleable. The mercury, it is to be noted, is the ſame with our quick-ſilver, only defæcate, and clear of any heterogeneous matter; whereas the common quick-ſilver is always mixed. As to the ſulphur, it is not the vulgar foſſil ſulphur, but a peculiar ſort of matter ſpecifically denominated *ſulphur of metals*, concluded by ſome of our lateſt, and beſt chymiſts, particularly M. Homberg, to be fire; which being mixed with the mercury, fixes it, and according to the different degrees of its union and coheſion therewith, produces different *metals*. See MERCURY, SULPHUR, FIRE, &c.

This doctrine of the compoſition of *metals* is confirmed by an experiment of Mr. Boyle, who after having retained mercury a long time in a moderate fire, took a piece of gold out of it, which it was apparent was not in the mercury before it was expoſed to the fire. M. Homberg has an experiment to the ſame effect; from which he concludes, that gold conſiſts of a ſulphurous igneous part, and a heavy mercurial part fixed thereby; and that upon taking away the ſulphurous or fiery part, the gold is converted into fluid mercury. See MERCURY.

3°. All *metals* muſt firſt be mercury, ere they be gold; and the thing ſuperadded to common mercury, whereby it is prevented from becoming gold, is a ſharp volatile body, which, when heated, becomes corroſive, and emits fumes; which are the properties of the foſſil ſulphur.

4°. If any *metal*, or other body, could be found, that only differed from gold in its wanting weight, it were impoſſible ever to make gold of it; and, on the contrary, if a body could be had that is as heavy as gold, all the other properties, as colour, fixity, ductility, &c. might eaſily be added. And hence the more knowing among the alchymiſts hold the primary matter of gold to be quick-ſilver; which, ſay they, is gold at heart, as coming neareſt to gold in point of ſpecific gravity. Only there is a corroſive body, *i. e.* ſulphur, adhering to it, which, if it were ſeparated, you would have gold; or if it were only inverted, ſilver.

And accordingly on ſuch principles whoever would make gold out of any other foreign matter, muſt remember, that the more his matter differs from mercury in weight, &c. the leſs gold it will make. See PHILOSOPHER's *ſtone*.

5°. Therefore *metals* are tranſmutable into one another: for if mercury be the common matter of all *metals*, and if all the difference lie in the fixing ſpirit of ſulphur, which, as it is leſs or more ſubtile or pure, conſtitutes this or that *metal*; it is no way improbable they ſhould be tranſmuted by a purer fixing ſulphur taking place of a corroſive one, and fixing the matter into a more perfect *metal*. See TRANSMUTATION.

6°. The pureſt *metals* reſult of the pureſt and moſt defæcate mercury, and the ſmalleſt quantity of the ſubtileſt ſulphur. Hence, mercury of gold is heavier than common mercury, and has always ſome impure part that is lighter than gold; and could that be taken away, and the fixing ſpirit be added, it would become heavier than gold.

7°. The imperfect *metals* conſiſt of impure mercury and imperfect ſulphur, with ſome other variable heterogeneous matter in it: This, fuſed by the fire, emits a fume which whitens copper, after which the ſulphur exhales yet further. The reality of ſuch a third matter is evinced hence, that all theſe baſer *metals* are reſolvable not only into mercury and ſulphur, but alſo into ſcoria or ſordes, which are lighter and more earthy than either of the other, and accordingly ſwim therein.

8°. Upon the whole it appears, that in the three nobler *metals*, gold, mercury, and ſilver, it is principally the greater or leſs proportion of the ſulphur to the mercury, that determines them to be gold, mercury, or ſilver: That it is by this proportion thoſe ſeveral *metals* are defined and denominated; and that from this difference of proportion, flow all the ſpecific differences of colour, weight, fixity, ductility, volatility, fuſibility, ſolubility, ſalubrity, &c.

9°. That in the other baſer *metals*, beſides this different proportion of the two principles, there intervenes another cauſe of diverſity, *viz.* a third principle, or matter of an earthy kind, and very different from either of the reſt; which adhering to the pure elemental ſulphur, corrupts and adulterates, and variouſly modifies it: And from the different circumſtances of this third principle, conſidered along with thoſe of the ſulphur itſelf, reſult the ſpecific differences of the more imperfect *metals* as to weight, colour, &c.

Bath METAL, called alſo *Princes* METAL, is a kind of factitious *metal*, compoſed of the fineſt and pureſt braſs mixed with tin, or rather with ſome mineral, as zinc; whereby it becomes more diſpoſed to receive a poliſh, luſtre, &c. as alſo fitter to be gilt. It is ſaid to have been invented by prince Rupert, whence its name. See ZINC.

Bell METAL, is a compoſition of copper and tin melted together. See BELL.

The ordinary proportion is twenty-two or twenty-three pounds of tin to an hundred weight of copper.—Some add lead and braſs to the compoſition. See BRASS.

Blueing of METALS. See the article BLUEING.

Painting on METALS. See the article PAINTING.

Ruſt of METALS. See the article RUST.

Line of METALS.—On Gunter's Sector, are ſometimes two lines thus called, and noted with the characters of the ſeven metals, ☉, ☽, ☿, ♄, ♀, ♂, and ♃; their uſe is to give the proportions between the ſeveral *metals* as to their magnitudes and weights. See SECTOR.

To be laid under METAL, in gunnery, is when the mouth of a gun lies lower than her breech.

METAL, in heraldry.—There are two *metals* uſed in heraldry, by way of colours, *viz.* gold and ſilver; in blazon, called *or*, and *argent*. See OR and ARGENT.

In the common painting of arms, theſe *metals* are repreſented by white and yellow, which are the natural colour of thoſe *metals*. See COLOUR.

In engraving, gold is expreſſed by dotting the coat, *&c.* all over; ſilver, by leaving it quite blank.

It is a general rule in heraldry, never to place *metal* upon *metal*, nor colour on colour: So that if the field be one of the *metals*, the bearing muſt be of ſome colour, and *vice verſa*; otherwiſe the arms are falſe: though this rule admits of ſome exceptions. See COLOUR.

METALLIC, or METALLINE, an adjective applied to ſomething that bears a relation to *metals*. See METAL.

Painting in enamel is performed with *metallic* colours, that is, with ſuch as come from *metals*, or are made with *metals*; no other being able to endure the fire. See ENAMEL.

F. Romani has publiſhed a *metallic* hiſtory of the popes. La France Metallique, is a Book of medals moſtly imaginary, pretended to be taken from the cabinets of the curious, where they never were, by Jaques de Bie, engraver. M. Bizot has alſo publiſhed the *metallic* hiſtory of Holland.

METALLIC *mines*. See the article MINE.

METALLIC *vitriols*. See the article VITRIOL.

METALLORUM *crocus*. See the article CROCUS.

Sulphur METALLORUM. See the article SULPHUR.

METALLURGIA, the art of *metals*, that is, of preparing and working metals, from the glebe or mineral, to the utenſil. See METAL.

The *metallurgia* includes what relates to the finding of the metallic glebe, or ore in the mine; the judging of its kind, richneſs, and the proportion of metal therein; the digging and ſeparating it from the earth, and other matters; and the purifying and diſpoſing it into a compleat, pure, malleable metal. See MINE, and MINERAL.

Boerhaave divides *metallurgia* into four parts. The firſt teaches how metals grow in the mine, how they are diſcovered, and how procured out of the ſame. The ſecond how to ſeparate the metallic from the other matter of the ore. The third, how to reduce the ſeparated matter to its ſimplicity and ductility. The fourth, to work, gild, poliſh, and imitate the finer metals in the coarſer.

METAMORPHISTS, a ſect of heretics in the XVIth century, whoſe diſtinguiſhing tenet was, That the body of Jeſus Chriſt was, upon his aſcenſion into heaven, changed, and metamorphoſed into God.

METAMORPHOSIS *, *transformation*; the change of a perſon or thing into another form. See TRANSFORMATION.

* The word is Greek, Μεταμορφωσις; formed of μετα, change, or removal from one place or ſtate to another; and μορφη, form, figure.

The ancients held two kinds of *metamorphoſes*: the one real, the other apparent. The *metamorphoſis* of Jupiter into a bull, and of Minerva into an old woman, were only apparent. That of Lycaon into a wolf, and of Arachne into a ſpider, were of the real kind.

Moſt of the ancient *metamorphoſes* include ſome allegorical meaning, relating either to phyſics or morality.—Ovid's *metamorphoſes* is a collection of hiſtories of ſuch transformations, poetically related.—Some authors are of opinion, that a great part of the ancient philoſophy is couched under them; and Dr. Hooke has made an attempt to unriddle, and lay open ſeveral of them.

METAPHOR *, METAPHORA, in rhetorick, a figure of ſpeech whereby a word is transferred from its proper ſignification, to another: or, whereby the proper denomination of one thing is applied to another; which other thing is more elegantly explained by this tralatitious or foreign name, than by that which naturally belongs to it. See TROPE.

* The word comes from the Greek μεταφορα, tranſlation, or diſplacing; of μετα, trans, and φερω, I bear, or carry.

As, when we ſay, the light of the underſtanding; to burn with zeal; to float between hope and deſpair, *&c.*

The *metaphor* is the moſt common of all the figures of ſpeech; and is that uſually meant when we ſay a thing is ſpoken figuratively. See FIGURE.

The *metaphor* is a ſhort ſimile; an image being thereby called from its proper ſubject to give the reſemblance of another. See SIMILE.—An allegory is no more than a continued *metaphor*. See ALLEGORY.

The ſources or places whence *metaphors* are drawn, are innumerable: They may be fetched from divine matters; thus Cicero calls Plato our *God*, *deus ille noſter Plato*. From the elements; as a *torrent* of eloquence. From plants; as where virtue has taken *root*. From artificial things; as where Apian is called the *cymbal* of the world; Longinus, a living *library*; Pertinax, fortune's *foot-ball*, &c.

Quintilian diſtinguiſhes *metaphors* into four kinds: The firſt, when a word is transferred from one animal to another; as when Livy ſays, that Cato uſed to *bark* at Scipio: or, when our Saviour calls Herod, *fox*. The ſecond, when the word is transferred from one inanimate to another; as *bridle*, for *laws*. The third, when inanimates are applied to animates; as the *flower* of youth. And the laſt, when animates are applied to inanimates; as the river *diſdained* its bounds.

As the *metaphor* is intended to ſet things before the eyes; it becomes ſo much the more perfect, as it ſhews them the more vividly, by repreſenting them in motion and action. A *metaphor* ſhould have nothing in it either coarſe or ſhocking, or that may raiſe it above the ſimplicity of nature: Nor ſhould it appear a *metaphor* to any but thoſe who view it very cloſely. A *metaphor* ſhould never be carried too far; for in that caſe, it degenerates into puerility.—*Metaphors* ſhould always be followed in the ſame kind; they become unnatural, when different images are introduced.—In all *metaphorical* dictions, there ſhould be a kind of unity, ſo that the different words uſed, may have a kind of ſuitableneſs to each other: Different ideas are always abſurd: As in this inſtance; The church was beſieged with a deluge of troubles: where the two images, *ſiege* and *deluge*, have no relation.

There is nothing young writers are more faulty in, than the indiſcreet uſe of *metaphors*: Thoſe who affect the marveilleux, are eternally on the metaphorical ſtrain; nor know any bounds, or reſtraint. They who underſtand them beſt, uſe them with the greateſt reſerve. Mr. Addiſon propoſes it as a rule for writers, to imagine their *metaphors* actually painted before them, and to view and examine the juſtneſs of their application and aſſemblage under thoſe circumſtances; throwing every thing out of the writing, but what might be retained in the picture. Card. Perron preſcribes this general rule for *metaphors*; that they muſt always deſcend from the genus to the ſpecies; and never go backwards from the ſpecies to the genus: Thus we ſay figuratively, the *bonds of ſociety*; and not the *human cords* which tie us together: *Bond* being a genus, and *cord* a ſpecies.

METAPHRAST, METAPHRASTES, a tranſlator, or perſon who renders an author into another form or another language, word for word. See TRANSLATION.

A *metaphraſe*, μεταφρασις, uſually ſignifies ſomething more than either a paraphraſe, or a tranſlation: According to Baillet, a *metaphraſt* implies a tranſlator, gloſſator, and interpolator, all at once. See PARAPHRASE, *&c.*

METAPHYSICS *, METAPHYSICA, *tranſnaturals*; a branch of ſcience, about whoſe nature and idea, there is ſome difference among authors. See SCIENCE.

* The word is formed of the prepoſition μετα, *trans*, beyond, or above; and φυσις, nature, or φυσικη, natural.

Some define *metaphyſics*, that part of ſcience which conſiders ſpirits, and immaterial beings; which others chuſe to diſtinguiſh by the name of *pneumatics*. See SPIRIT, and PNEUMATICS.

Others, keeping cloſer to the etymology of the word, explain *metaphyſics* by *tranſ-natural*, or *præter-natural*, or even *poſt-natural philoſophy*.

Others, with more propriety, conceive *metaphyſics* to be what ſome others call *ontology*, or *ontoſophy*, *i. e.* the doctrine *de ente*, or of being, *quatenus* being. See ONTOLOGY, and ABSTRACTION.

In the ſame view, ſome philoſophers call this ſcience by the name *philoſophia*, or *ſcientia generalis*, as being the foundation, or, as it were, the ſtamen or root from whence all the other parts of philoſophy ariſe, and wherein they all meet; its object being *being* in the abſtract, or general, not reſtrained to this or that ſpecies of beings; not to ſpirit any more than body: So that the doctrines of *metaphyſics*, are applicable to all beings whatever. See ENS.

Philoſophers again, are divided as to the notion of a ſcience *de ente* in general. Some hold it real, preciſe, and ſolid enough to be demonſtrated; others judge it too obſcure, faint, and confuſed to be admitted into philoſophy.

Being, abſtracted from every ſort or ſpecies of being, is certainly a very vague term; and does not ſeem to give footing enough for a ſcience: We do not ſee how it can affect the mind as an object. Add, that the common *metaphyſics* cannot demonſtrate any part of its ſubject, but aſſumes the whole: There are no principles, or axioms whereon to demonſtrate *metaphyſics*, which contain the principles of all other ſciences. See MATHEMATICS.

The firſt who wrote profeſſedly on the ſubject of *metaphyſics* is Ariſtotle. Indeed he is the firſt who uſes the word: Μετα τα φυσικα, is the title of one of his books, which ſome of his commentators will have to ſignify no more than *after the books of phyſics*. M. du Hamel, taking the prepoſition μετα in the ſenſe of *poſt*, is even of opinion that the word was coined by Ariſtotle's ſtotle's followers; and that the word was unknown to Ariſtotle.

Ariſtotle's *metaphyſics* ſeem to have been intended for a kind of natural theology. F. Malebranche and Mr. Locke have wrote much more clearly and conſiſtently of *metaphyſics*, than any of the ancients. See UNITY, MODE, TRUTH, DURATION, *&c.*

METAPHYSICAL, ſomething belonging to *metaphyſics.* See METAPHYSICS.

The word is alſo uſed to denote ſomething ſubtile, abſtract, and refined.—In which ſenſe we ſay, ſuch a reaſoning; ſuch a proof, is too *metaphyſical, &c.*

A *metaphyſical* caſe, is an imaginary or chimerical caſe, which can ſcarce ever happen, or not without much difficulty; and which ought not to be laid down as a rule for common occaſions.

METAPHYSICAL *certitude.* See CERTITUDE.

METAPHYSICAL *diſtinction.* See DISTINCTION.

METAPHYSICAL *evidence.* See EVIDENCE.

METAPHYSICAL *form.* See FORM.

METAPHYSICAL *perfection.* See PERFECTION.

METAPHYSICAL *poſſible.* See POSSIBLE.

METAPHYSICAL *univerſality.* See UNIVERSALITY.

METAPLASM*, METAPLASMUS, in grammar, a tranſmutation, or change made in a word, by adding, retrenching, or altering a letter or ſyllable thereof.

* The word comes from the Greek *μεταπλασμος*, which ſignifies the ſame; compounded of *μετα* and *πλασσω*, *fingo.*

METASTASIS, ΜΕΤΑΣΤΑΣΙΣ, in medicine, the removal of a morbid humour from one part to another; frequently obſerved in nervous caſes.

A *metaſtaſis*, or tranſlation, is ſometimes alſo found in the groſſer humours; the refluent blood taking up digeſted matter from one part, and diſpoſing it upon another. See FLUXION.

METATARSUS*, in anatomy, that part of the human ſkeleton, containing the middle of the foot.—See *Tab. Anat.* (*Oſteol.*) *fig.* 3. *n.* 30. *fig.* 7. *lit. e. e.* See alſe FOOT.

* The word comes from *μετα*, *trans*, beyond; and *ταρσος*. See TARSUS.

The *metatarſus* conſiſts of five bones, reaching from the heel to the toes; whereof that which ſuſtains the great toe, is the thickeſt; and that which ſuſtains the next toe, the longeſt. The reſt grow, each ſhorter than other. They are longer than the bones of the metacarpus; in other things they are like them, and are articulated to the toes, as theſe are to the fingers. See METACARPUS.

METATHESIS*, *tranſpoſition*; a grammatical figure, whereby letters or ſyllables of a word are tranſpoſed, or ſhifted out of the natural ſituation.—as, *Evandre* for *Evander*; *I præ* for *præi.* See TRANSPOSITION.

* The word is Greek, *μεταθεσις*, formed of *μετα*, *trans*; and *θεσις*, *poſition.*

METEMPSYCHI, ancient heretics, who, in imitation of Pythagoras, held the *metempſychoſis*, or tranſmigration of ſouls. See METEMPSYCHOSIS.

METEMPSYCHOSIS*, ΜΕΤΕΜΨΥΧΩΣΙΣ, in the ancient philoſophy, the paſſage or tranſmigration of the ſoul of a man, after death, into the body of ſome other animal. See SOUL.

* The word is Greek, formed of *μετα*, beyond; and *εμψυχοω*, I animate, or enliven.

Pythagoras and his followers held, That after death mens ſouls paſſed into other bodies, of this or that kind, according to the manner of life they had led. If they had been vicious, they were impriſoned in the bodies of miſerable beaſts, there to do penance for ſeveral ages; at the expiration whereof, they returned afreſh to animate men.—If they had lived virtuouſly, ſome happier brute, or even a human creature, was to be their lot. See PYTHAGOREANS.

What led Pythagoras into this opinion, was, the perſuaſion he had, that the ſoul was not of a periſhable nature: whence he concluded, that it muſt remove into ſome other body, upon its abandoning this. Lucan treats this doctrine as a kind of officious lye, contrived to mitigate the apprehenſion of death, by perſuading men that they only changed their lodging; and ceaſed to live, to begin a new life.

Reuchlin denies this doctrine; and maintains, that the *metempſychoſis* of Pythagoras implied nothing more than a ſimilitude of manners, deſires, and ſtudies formerly exiſting in ſome perſon deceaſed, and now revived in another alive.—Thus, when it was ſaid that Euphorbus was revived in Pythagoras, no more was meant than that the martial virtue, which had ſhone in Euphorbus at the time of the Trojan war, was now in ſome meaſure revived in Pythagoras, by reaſon of the great reſpect he bore the Athletæ. For thoſe people wondering how a philoſopher ſhould be ſo much taken with men of the ſword, he palliated the matter, by ſaying that the ſoul of Euphorbus, *i.e.* his genius, diſpoſition and inclinations, were revived in him. And this gave occaſion to the report that Euphorbus's ſoul, who periſhed in the Trojan war, had tranſmigrated into Pythagoras.

Ficinus aſſerts, That what Plato ſpeaks of the migration of a human ſoul into a brute, is intended allegorically, and to be underſtood only of the manners, affections, and habits degenerating into a beaſtly nature by vice.—Serranus, though he allows ſome force to this interpretation, yet inclines rather to underſtand the *metempſychoſis* of a reſurrection. See RESURRECTION.

Pythagoras is ſaid to have borrowed the notion of a *metempſychoſis* from the Egyptians, others ſay from the ancient Brachmans. It is ſtill retained among the Banians and other idolaters of India and China; and makes the principal foundation of their religion. So extremely are they bigotted to it, that they not only forbear eating any thing that has life, but many of them even refuſe to defend themſelves from wild beaſts. They burn no wood, leſt ſome little animalcule ſhould be in it; and are ſo very charitable, that they will redeem from the hands of ſtrangers, any animals that they find ready to be killed. See BRACHMANS, BANIANS, *&c.*

METEMPTOSIS*, a term in chronology, expreſſing the ſolar equation, neceſſary to prevent the new moon from happening a day too late.

* The word comes from the Greek, *μετα*, *poſt*, and *πιπτω*, *cado*, I fall.

By which it ſtands contra-diſtinguiſhed from *proemptoſis*, which ſignifies the lunar equation, neceſſary to prevent the new moon from happening a day too ſoon. See PROEMPTOSIS.

The new moons running a little backwards, that is, coming a day too ſoon at the end of three hundred and twelve years and a half; by the proemptoſis, a day is added every three hundred years, and another every two thouſand four hundred years: On the other hand, by the *metemptoſis*, a biſſextile is ſuppreſſed each one hundred thirty four years, that is, three times in four hundred years.—Theſe alterations are never made, but at the end of each century; that period being very remarkable, and rendring the practice of the calendar eaſy.

There are three rules for making this addition, or ſuppreſſion of the biſſextile-day, and by conſequence for changing the index of the epacts. 1°. When there is a *metemptoſis* without a proemptoſis, the next following, or lower index, muſt be taken. 2°. When there is a proemptoſis without a *metemptoſis*, the next preceding, or ſuperior index, is to be taken. 3°. When there is both a *metemptoſis* and a proemptoſis, or when there is neither the one nor the other, the ſame index is preſerved. Thus in 1600 we had D; in 1700, by reaſon of the *metemptoſis*, C was taken; in 1800 there will be both a proemptoſis and a *metemptoſis*; ſo the ſame index will be retained. In 1900 there will be a *metemptoſis* again, when B will be taken, which will be preſerved in 2000; becauſe there will then be neither the one nor the other.—This is as far as we ſhall need it. Clavius has calculated a cycle of 301800 years; at the end of which period, the ſame indices return in the ſame order. See EPACT.

METEOR*, in phyſiology, a changeable, moveable, imperfect mixt body, or reſemblance of a body, appearing in the atmoſphere, and formed out of the matter of the common elements, altered a little by the action of the heavenly bodies, but not transformed.

* The Greeks call them *μετεωρα*, q. d. *ſublimia*, or high-raiſed; the Latins *impreſſiones*, as making ſigns or impreſſions in the air.

Meteors are of three kinds:

Igneous or *fiery* METEORS, conſiſt of a fat ſulphurous ſmoke ſet on fire; ſuch are lightning, thunder, ignis fatuus, draco volans, falling ſtars, and other fiery phænomena appearing in the air. See THUNDER, FATUUS, *&c.*

Aerial or *airy* METEORS, conſiſt of flatulent and ſpirituous exhalations; ſuch are winds, whirlwinds, and hurricanes. See WIND, HURRICANE, *&c.*

Aqueous or *watery* METEORS, are compoſed of vapours, or watery particles variouſly ſeparated and condenſed by heat and cold; ſuch are clouds, rainbows, hail, ſnow, rain, dew, and the like. See CLOUD, RAINBOW, HAIL, SNOW, RAIN, DEW, *&c.*

The formation of *meteors* is explained pretty largely by Des Cartes, in a treatiſe expreſs. Ariſtotle and Gaſſendus have alſo handled the ſame ſubject. Dr. Woodward's opinion is, That the matter of *meteors* is in great meaſure of a mineral nature: That the mineral particles contained in the ſtrata of the earth, are raiſed by the ſubterraneous heat, together with the vapours aſcending from the abyſs, and pervading thoſe ſtrata; eſpecially at ſuch times as the ſun's heat is ſufficient to penetrate the exterior parts of the earth, and to make room for their eſcape into the atmoſphere. Thus ſulphurous, nitrous, and other active, and volatile mineral particles, form various *meteors*, according to the various fate they meet with in the air. See VAPOUR, EXHALATION, MINERAL, AIR, *&c.*

METEOROLOGY, the doctrine of meteors; explaining their origin, formation, kinds, phænomena, *&c.* See METEOR.

METEOROSCOPE*, a name which the ancient mathematicians gave to ſuch inſtruments as they uſed for obſerving, and determining the diſtances, magnitudes and places of the heavenly bodies.

* From the Greek *μετεωρος*, high; and *σκοπος* of *σκεπτομαι*, I view, obſerve.

METHEGLIN*, a drink prepared of honey; one of the moſt pleaſant and general drinks the northern parts of Europe afford; and much uſed among the ancient inhabitants. See Drink, Honey, Mead, &c.

* The word is Welch, *meddyglin*, where it ſignifies the ſame.

There are divers ways of making it: One of the beſt whereof follows. Put as much live honey naturally running from the comb, into ſpring-water, as that when the honey is thoroughly diſſolved, an egg will not ſink to the bottom, but be juſt ſuſpended in it: This liquor boil for an hour, or more, till ſuch time as the egg ſwim above the liquor about the breadth of a groat; when very cool, next morning, it may be barrelled up; adding to each fifteen gallons an ounce of ginger, as much of mace and of cloves, and half as much cinnamon, all groſsly pounded: a ſpoonful of yeſt may be alſo added at the bunghole, to promote the fermenting. When it has done working, it may be cloſely ſtopped up, and after it has ſtood a month, may be drawn off into bottles.

METHOD*, Methodus, the art, or rule of diſpoſing things in ſuch a manner, as they may be eaſily comprehended; either in order to diſcover the truth, which we ourſelves are ignorant of; or to ſhew and demonſtrate it to others when known. See Truth and Error.

* The word comes from the Greek μεθοδος, which ſignifies the ſame.

The ſchools have a long time diſputed, whether logic be an art, a ſcience, or *method?* See Logic, Art, Science, &c.

Gaſſendus diſtributes *method* with regard to its object, into three kinds or branches; *viz.* inventionis, *the method of invention*, or diſcovering a truth unknown. See Invention.

Methodus judicii, the method of judging, or determining of a truth, or propoſition propoſed. See Judgment.

And *methodus demonſtrationis*, or method of demonſtration; that is, of exhibiting it to another. See Demonstration.

Method, with regard to the order of procedure, is uſually divided into two kinds; the one of *reſolution*, which is that we generally uſe in our enquiry after truth.—The other of *compoſition*, by which the truth once found, is taught or imparted to others. See Composition, and Resolution.

In the *method of reſolution*, called alſo by geometers the *analytic method*, we proceed from ſome general, known truth, to others which belong to ſome particular or ſingular thing. See Analysis.

In the *method of compoſition*, called alſo the *ſynthetic method*, we propoſe ſome certain, general truths, from which we produce particular truths. See Synthesis.

If in the *method* of reſolution we lay down any axioms; it is not immediately in the beginning, and all together; but as they are found neceſſary in the diſquiſition: on the contrary, in the *method* of compoſition, they are propoſed all together in the beginning, before there is any abſolute need of them. See Axiom, and Maxim.

The two *methods* differ from each other, as the *methods* of ſearching out a genealogy, either by deſcending from the anceſtors to their poſterity, or by aſcending from the poſterity to the anceſtors: both of them have this in common, That their progreſſion is from a thing known, to another unknown. Thoſe things that are known, in each, are ſet in the front, or firſt place; that by them we may be able to arrive at thoſe which are not known.

The following things are required in both *methods*, that error may be avoided.—1°. That no propoſition be admitted as true, to which a man can, with a good conſcience, deny his aſſent; or which is not evident. 2°. That the connection of the following propoſition with the foregoing, in every ſtep of the progreſſion, be likewiſe evident or neceſſary. To theſe may be added two other prudential maxims, that hold good in each *method:* as, that we ought to reaſon on thoſe things only, of which we have clear and perſpicuous ideas; or of obſcure things only, ſo far as we know them: and that we ſhould always begin from the ſimple and eaſy, and dwell on them a while, before we proceed to things compounded, and more difficult.

Laws peculiar to the analytic method, are, 1°. That we muſt clearly and perfectly underſtand the ſtate of the queſtion propoſed. 2°. That with ſome energy or effort of the mind, one or more intermediate ideas be diſcovered; which are to be a common meaſure or ſtandard, by whoſe help the relations between the ideas to be compared are to be found out. 3°. That we cut off all that has no neceſſary relation to the truth ſought after, from the thing which is to be the ſubject of our conſideration. 4°. That a compounded queſtion be divided into parts, and thoſe ſeparately conſidered in ſuch order, as that we begin with thoſe which conſiſt of the more ſimple ideas, and never proceed to the more compounded, till we diſtinctly know the more ſimple, and by reflection have rendered them obvious to the underſtanding. 5°. That certain ſigns of our ideas comprehended in obvious and eſtabliſhed figures, or in the feweſt words poſſible, be imprinted in the memory, or marked on paper, leſt the mind have any further trouble about them. 6°. Theſe things done, that the ideas (according to the ſecond law) be then compared with each other, either by reflection alone, or by expreſs words. 7°. If after we have compared all the ideas, we cannot find out what we ſeek, we are then, by the third law, to cut off all the propoſitions, which, after a full examination, we find of no uſe to the ſolution of the queſtion, and begin afreſh. If, after this method has been repeated as often as is neceſſary, nothing of what we have obſerved ſeems to conduce to the ſolution of the queſtion, we ought to give it over as out of our reach.

The *ſynthetic method*, is only practicable in things, whoſe principles we perfectly know; as in geometry, which is wholly employed in the conſideration of abſtract modes; of which our mind has clear and adequate ideas.—When the enquiry is into ſubſtances, as in phyſics, we cannot make uſe of the *method of compoſition*, by reaſon their kinds, and intimate eſſences are unknown to us. See Substance, Body, &c.

This *method* has not been by any ſo juſtly and accurately obſerved, as by the mathematicians, whoſe principles are perfectly known: its laws therefore will be beſt drawn from their practice. As 1°. To offer nothing but what is couched in words or terms perfectly underſtood; for which reaſon they always define the words they make uſe of. 2°. To build only on evident and clear principles, ſuch as cannot be contradicted by any who underſtand them; for which reaſon they firſt propound their maxims or axioms, which they demand to be granted them, as being ſelf-evident, and needing no proof. 3°. To prove demonſtratively all their conſequences; for which reaſon they uſe nothing in their arguments or proofs, but definitions that have been laid down, axioms that have been granted, and propoſitions that have been already proved; which become principles to things that follow them.

Method, *methodus*, is more peculiarly uſed in mathematics for divers particular proceſſes for ſolving problems.—In this ſenſe we ſay

Method *of exhauſtions*. See Exhaustions.

Method *of fluxions*. See the article Fluxions.

Method *de maximis & minimis*, &c. See Maximum.

Method *of tangents*. See the article Tangents.

Differential Method, &c. See Differential.

Exponential Method, &c. See Exponential.

Poriſtic Method. See the article Poristic.

METHODISTS, Methodici, a ſect of ancient phyſicians, who reduced the whole healing art to a few common principles or appearances. See Physician.

The *methodiſts* were the followers of Theſſalus, whence they were alſo called *Theſſalici*.—They were ſtrenuouſly oppoſed by Galen in ſeveral of his writings; who ſcrupled not to aſſert, that the *methodical hereſy* ruined every thing that was good in the art.

Quincy miſtakenly uſes *methodiſts*, *methodici*, for thoſe phyſicians who adhere to the doctrine of Galen, and the ſchools; and who cure with bleedings, purges, &c. duly applied according to the ſymptoms, circumſtances, &c. in oppoſition to empirics and chymiſts, who uſe violent medicines, and pretended ſecrets or noſtrums. See Empiric, Chymist, &c.

METOCHE, ΜΕΤΟΧΗ, in the ancient architecture, a term uſed by Vitruvius, to ſignify the ſpace or interval between the dentils.—See *Tab. Archit. fig.* 30. *lit. cc.* See alſo Denticle.

Baldus obſerves, that in an ancient MS. copy of that author, the word *metatome* is found for *metoche*. Hence Daviler takes occaſion to ſuſpect that the common text of Vitruvius is corrupted; and concludes, that it ſhould not be *metoche*, but *metatome*, *q. d.* ſection.

METONIC *cycle*, in chronology, the lunar cycle, or period of nineteen years; thus called from its inventor Meton, an ancient Athenian. See Cycle and Period.

When the *metonic* cycle is compleated, the lunations, or the new and full moons, return on the ſame day of the month; ſo that on whatever days the new and full moons happen this year, nineteen years hence they will fall preciſely on the very ſame day of the month, as Meton and the primitive fathers thought. See Lunation.

For this reaſon, at the time of the council of Nice, when the manner of ſettling the time for obſerving Eaſter was eſtabliſhed, the numbers of the *metonic* cycle were inſerted in the calendar in letters of gold, on account of their great uſe; and the year of the cycle for that year was called the *golden number* of that year. See Golden Number.

METONYMY*, ΜΕΤΩΝΥΜΙΑ, a rhetorical trope, conſiſting in a tranſmutation, or change of names; or a putting of the effect for the cauſe, or the ſubject for the adjunct: and *vice verſa*. See Figure.

* The word comes from the Greek μετα, *trans*, and ονομα, *nomen*, name.

The *metonymy* is the moſt extenſive of all the tropes. It is ſometimes alſo called *tranſnominatio*, and differs not much from hypallage. See Hypallage.

There are four kinds of *metonymies* in principal uſe: The firſt, when we put the inventor for the thing invented; as Bacchus for wine, Ceres for bread. The ſecond, when we put the containing for the thing contained; as a glaſs for the wine within it. The third, when an effect is put for the cauſe; as the captain for his ſoldiers, Greece for the Greeks, the author for his works. The fourth, when the ſign is put for the thing ſignified; as the gown for the prieſthood, &c.

METOPE*, or METOPA, in architecture, the ſquare ſpace or interval between the triglyphs, in the Doric frieze.—See *Tab. Archit. fig.* 28. *lit. R.* See alſo TRIGLYPH, and FRIEZE.

* The word, in the original Greek, ſignifies the diſtance between one aperture or hole and another, or between one triglyph and another; the triglyphs being ſuppoſed to be ſolives or joiſts that fill the apertures: from μετα *inter*, between, and οπη *foramen*.

The ancients uſed to adorn theſe parts with carved works, or paintings, repreſenting the heads of oxen, veſſels, baſons, and other utenſils of the heathen ſacrifices.

As there is found ſome difficulty in diſpoſing the triglyphs and *metopes* in that juſt ſymmetry which the Doric order requires; ſome architects make it a rule, never to uſe this order but in temples.

Semi-METOPE is a ſpace ſomewhat leſs than half a *metope*, in the corner of a Doric frieze.

METOPOSCOPY*, ΜΕΤΩΠΟΣΧΟΠΙΑ, the art of diſcovering the temperament, inclinations, and manners of perſons by inſpecting their features, and the lines in their faces, and eſpecially of their foreheads. See DIVINATION.

* The word comes from the Greek μετωπον, *frons*, forehead; and σκοπια, inſpection, of σκεπτομαι, I view.

Metopoſcopy is no more than a branch of phyſiognomy; the latter taking its conjectures from all parts of the body: But both the body, and the branch are extremely precarious, not to ſay vain. See PHYSIOGNOMY.

Ciro Spontoni, who has wrote on the ſubject of *metopoſcopy*, obſerves, that there are ſeven principal lines conſidered in the forehead; each of which has its peculiar planet. The firſt is the line of Saturn; the ſecond of Jupiter, &c.

METRE, or METER, ΜΕΤΡΟΝ, in poetry, denotes a ſyſtem of feet of a juſt length. See FOOT, VERSE, and MEASURE.

Ariſtides defines *metre*, a ſyſtem of feet compoſed of diſſimilar ſyllables, of a juſt extent.

In which ſenſe *metre* amounts to much the ſame with genus carminis, or ſort of verſe, and differs from rhythm. See VERSE, and RHYTHM.

METRICAL *verſes* are thoſe conſiſting of a determinate number of long, and ſhort ſyllables; as thoſe of the Greek and Latin poets. See QUANTITY.

Capellus obſerves, that the genius of the Hebrew language is incompatible with *metrical* poetry. See HEBREW, POETRY, VERSIFICATION, &c.

METRICE, or METRICA, among the ancients, was that part of poetry employed about the quantities of ſyllables, feet, ſorts of metre, or verſe, &c. See QUANTITY, MUSIC, POETRY, VERSE, FOOT, &c.

METROCOMIA*, a term in the ancient church-hiſtory, ſignifying a borough or village, that had other villages under its juriſdiction.

* The word comes from the Greek μητηρ, mother, and κωμη, town, village.

What a metropolis was among cities, that a *metrocomia* was among country towns. The ancient *metrocomiæ* had each its chorepiſcopus or rural-dean, and here was his ſee or reſidence. See METROPOLIS, and CHOREPISCOPUS.

METROPOLIS*, ΜΗΤΡΟΠΟΛΙΣ, the capital of a country, or province; or the principal city, and as it were, mother of all the reſt. See CITY.

* The word comes from the Greek μητηρ, *mater*, mother; and πολις, *urbs*, city; as who ſhould ſay, the mother-city, &c.

METROPOLIS is alſo applied to archiepiſcopal churches; and ſometimes to the principal or mother church of a city. See CHURCH, and METROPOLITAN.

METROPOLITAN, is indifferently applied to an archbiſhop, and to his cathedral church. See ARCHBISHOP, and CATHEDRAL.

The Roman empire having been divided into thirteen dioceſes, and one hundred and twenty provinces; each dioceſe and each province had its metropolis, or capital city, where the proconſul, or the vicar of the empire had his reſidence. See DIOCESE, and PROCONSUL.

To this civil diviſion, the eccleſiaſtical was afterwards adapted; and the biſhop of the capital city had the direction of affairs, and the pre-eminence over all the biſhops of the province. His reſidence in the metropolis, gave him the title of *metropolitan*.

This erection of *metropolitan* is referred to the end of the third century, and was confirmed by the council of Nice.—Indeed archbiſhop Uſher, and de Marca, maintain it to be an eſtabliſhment of the apoſtles; but in vain: For it is next to certain, that the eccleſiaſtical government was regulated on the foot of the civil, and that it was hence the name and authority of *metropolitans* was given to the biſhops of the capital cities of the empire, or the provinces that compoſed it.—This is ſo true, that in the conteſt between the biſhop of Arles, and the biſhop of Vienne, each of whom laid claim to the *metropolitanſhip* of the province of Vienne; the council of Turin appointed, that which-ever of them could prove his city to be the civil metropolis, ſhould enjoy the title, and rights of eccleſiaſtical *metropolitan*.

Though the eccleſiaſtical government was modelled on the political; yet in Gaul, and ſome other countries, the diſtinctions of *metropolitan* and primate were not obſerved till very late. As the Præfectus Galliæ reſided by turns at Trevoux, Vienne, Arles, and Lyons, he communicated the rank and dignity of *metropolitan* and primate to each of them in their turn; and yet none of the Gallican biſhops aſſumed to themſelves the rights, nor even the precedence of *metropolitans*. The epiſcopate levelled them all; and they had no regard, but to the privileges of ſeniority.—This equality laſted till the fifth century, when the conteſt between the biſhops of Vienne and Arles was ſet on foot.

M. du Pin obſerves, that in the provinces of Africa, excepting thoſe whereof Carthage was the *metropolis*, the place where the moſt aged biſhop reſided became the *metropolis*. The reaſon of which without doubt was this, that neither the proconſul, nor præfectus, ever fixed their reſidence.

The ſame author obſerves, that in Aſia there were *metropolis's* merely nominal, that is, which had no ſuffragan, nor any rights of *metropolitans*. The biſhops of Nice, Chalcedon, and Berytus, had the precedence of the other biſhops, and the title of *metropolitans*, without any other prerogative beſides the honour of the appellation; they themſelves being ſubject to their *metropolitans*.

A *metropolitan* has the privilege of ordaining his ſuffragans; and appeals from ſentences paſſed by the ſuffragans, are preferred to the *metropolitan*. See BISHOP, and PRIMATE.

MEZANINE, or MEZZANINE, a term uſed by ſome architects to ſignify an attic, or little ſtory contrived occaſionally over the firſt ſtory, for the conveniency of a wardrobe or the like. See ATTIC.

The word is borrowed from the Italians, who call *mezzanini* thoſe little windows, leſs in height than breadth, which ſerve to illuminate an attic, or entreſole.

MEZZO-TINTO, in ſculpture, a particular manner of engraving figures on copper. See ENGRAVING.

Mezzo-tinto is ſaid to have been firſt invented by prince Rupert; and Mr. Evelyn, in his hiſtory of Chalcography, gives us a head performed by that prince in this way.

It is pretty different from the common way of engraving. To perform it, they rake, hatch, or punch the ſurface of the plate all over with a knife, or inſtrument for the purpoſe; firſt one way, then a-croſs, &c. till the face of the plate be thus entirely furrowed with lines or furrows cloſe, and as it were contiguous to each other; ſo that if an impreſſion were then taken from it, it would be one uniform blot or ſmut.

This done, the deſign is drawn, or marked on the ſame face: after which, they proceed with burniſhers, ſcrapers, &c. to expunge and take out the dents or furrows in all the parts where the lights of the piece are to be; and that more or leſs, as the lights are to be ſtronger or fainter: leaving thoſe parts black, which are to repreſent the ſhadows or deepnings of the draught.

MIASMA, ΜΙΑΣΜΑ, is uſed to ſignify ſuch particles, or atoms, as are ſuppoſed to ariſe from diſtempered, putrifying, or poiſonous bodies, and to affect people at a diſtance. See CONTAGION.

MICHAELMAS, the feaſt of St. Michael the arch-angel; held on the 29th of September. See QUARTER-DAY, and TERM.

MICHAEL's *wing*. See the article WING.

MICROCOSM*, ΜΙΚΡΟΚΟΣΜΟΣ, a Greek term, literally ſignifying *little world*; chiefly underſtood of *man*, who is ſo called by way of eminency, as being an epitome of all that is wonderful in the great world, or macrocoſm. See MACROCOSM.

* The word is formed from the Greek μικρος, *parvus*, little; and κοσμος, *mundus*, world.

MICROGRAPHIA*, MICROGRAPHY, a deſcription of the parts, and proportions of objects that are too ſmall to be viewed without the aſſiſtance of a microſcope. See MICROSCOPE.

* The word is compounded of μικρος, *parvus*, and γραφη, *ſcriptio*, deſcription.

MICROMETER*, an aſtronomical machine, which, by means of a very fine ſcrew, ſerves to meaſure extreamly ſmall diſtances in the heavens; as the apparent diameters of the planets, &c. to a great degree of accuracy. See DISTANCE.

* The word comes from the Greek μικρος, *parvus*, and μετρον, *menſura*; in regard a ſmall length, *e. gr.* an inch, is hereby divided into a vaſt number of parts, *e. gr.* in ſome, 2800; and in others, more.

There is ſome controverſy about the invention of the *micrometer*. Meſſ. Auzout and Picard have the credit of it in common fame; as being the firſt who publiſhed it, in the year 1666. But Mr. Townley, in the *Philoſophical Tranſactions*, reclaims it for one of our own countrymen, Mr. Gaſcoyne. He relates, that from ſome ſcattered papers and letters of this gentleman, he had learnt, that before our civil wars he had invented a *micrometer*, of as much effect as that ſince made by M. Auzout, and had made uſe of it for ſome years, not only in taking the diameters of the planets, and diſtances upon land, but in determining other matters of nice importance in the heavens; as the moon's diſtance, &c.

Monſ. de la Hire, in a diſcourſe on the æra of the inventions of the *micrometer*, pendulum clock, and teleſcope, read before the royal academy of ſciences, in 1717, makes M. Huygens the inventor of the *micrometer*. That author, he obſerves, in his *obſervations on Saturn's ring*, &c. publiſhed in 1659, gives a method of finding the diameters of the planets by means of a teleſcope, *viz.* by putting an object, which he calls *virgula*, of a proper bigneſs to take in the diſtance to be meaſured, in the focus of the convex object-glaſs: In this caſe, ſays he, the ſmalleſt object will be ſeen very diſtinctly, in that place of the glaſs. By ſuch means, he adds, he meaſured the diameters of the planets, as he there delivers them.

This *micrometer*, M. de la Hire obſerves, is ſo very little different from that publiſhed by the marquis de Malvaſia, in his ephemerides, three years after, that they ought to be eſteemed the ſame; and the *micrometer* of the marquis differed yet leſs from that publiſhed four years after his by Auzout and Picard. Hence M. de la Hire concludes, that it is to M. Huygens the world is indebted for the invention of the *micrometer*: without taking any notice of the claim of our countryman, Mr. Gaſcoyne, which is prior by many years to any of them.

Conſtruction and uſe of the MICROMETER.—Wolfius deſcribes a *micrometer*, of a very eaſy, and ſimple ſtructure; firſt contrived by Kirchius, thus:

In the focus of a teleſcope fit a braſs or iron ring AB (*tab. Aſtron. fig.* 11.) with female ſcrews diametrically oppoſite to each other. Into theſe inſert male ſcrews CE and FB, of ſuch length as that they may be turned into the tube, ſo as to touch each other. And with this inſtrument very ſmall ſpaces in the heavens may be accurately meaſured.

For when any objects, viewed through a tube, appear contiguous to the ſcrews; if theſe be turned till they juſt touch two oppoſite points, whoſe diſtance is to be meaſured, it will be evident how many threads of the ſcrew they are apart. To determine how many ſeconds anſwer to each thread; applying the tube towards the heavens, turn the ſcrews; till they touch two points, whoſe diſtance is already accurately known; and obſerve the number of threads correſponding to that interval. Thus, by the rule of Three, a table may be made of the ſeconds correſponding to the ſeveral threads; by means whereof, without more ado, the diſtances of any points may be determined.

The ſtructure of the *micrometer* now chiefly in uſe, with the manner of fitting it to a teleſcope, and applying it, is as follows:

ABC*g* (*Tab. Aſtron. fig.* 12.) is a rectangular braſs frame; the ſide AB being about three inches long, and the ſide BC, as likewiſe the oppoſite ſide A*g*, about ſix inches; and each of the three ſides about eight tenths of an inch deep. The two oppoſite ſides of this frame are ſcrewed to the circular plate, to be mentioned hereafter.

The ſcrew P, which has exactly forty threads in an inch, being turned round, moves the plate GDEF along two grooves made near the tops of the two oppoſite ſides of the frame; and the ſcrew Q having the ſame number of threads in an inch as P, moves the plate RNMY along two grooves, made near the bottom of the ſaid frame, in the ſame direction as the former plate moves, but with only half the velocity of that other. Theſe ſcrews are turned both at once, and ſo the plates are moved along the ſame way, by means of a handle turning the endleſs ſcrew S, whoſe threads fall in between the teeth of the pinions on the ſcrews P and Q. And note, that two half revolutions of the endleſs ſcrew S, carry the ſcrew P exactly once round.

The ſcrew P turns the hand *a* faſtened thereto, over a hundred equal diviſions, made round the limb of a circular plate, to which the above-named two oppoſite ſides of the frame are ſcrewed at right angles. The teeth of the pinion on the ſcrew P, whoſe number is 5, take into the teeth of a wheel on the back-ſide of the circular plate, whoſe number is 25. Again, on the axis of this wheel is a pinion of two, which takes into the teeth of another wheel, moving about the centre of the circular plate on the outſide thereof; having fifty teeth. This laſt wheel moves the leſſer hand *b* once round the above-mentioned circular plate, in the $\frac{1}{100}$ part of the time the hand *a* is moving round: For becauſe the number of teeth in the pinion on the ſcrew P, are 5, and the number of teeth of the wheel this pinion moves, are 20; therefore the ſcrew P moves four times round, in the time that wheel is moving once round. Further, ſince there is a pinion of two which takes into the teeth of a wheel, whoſe number is 50; therefore this wheel with 50 teeth, will move once round in the time that the wheel of 20 teeth moves 25 times round; and conſequently the ſcrew P, or hand *a*, muſt move a hundred times round, in the ſame time as the wheel of fifty teeth or the hand *b*, has moved once round.

Hence it follows, that if the circular plate W, which is faſtened at right angles to the other circular plate, be divided into two hundred equal parts, the index *x*, to which the handle is faſtened, will move five of thoſe parts in the ſame time, in which the hand *a* moves one of the hundred diviſions round the limb of the other circular plate. Thus by means of an index *x*, and plate W, every fifth part of each of the diviſions round the other plate, may be known.

Farther, ſince each of the ſcrews P and Q, have exactly forty threads in an inch; therefore the upper plate GDEF, will move one inch, while the hand *a* moves forty times round; the four thouſandth part of an inch, while the hand moves over one of the diviſions round the limb; and the twenty thouſandth part of an inch, while the index *x* moves one part of the two hundred round the limb of the circular plate W: and the under plate RNMY will move half an inch, the two thouſandth part of an inch, and the ten thouſandth part of an inch, the ſame way, in the ſaid reſpective times.

Hence, if the under plate, having a large round hole therein, be fixed to a teleſcope, ſo that the frame is moveable, together with the whole inſtrument, except the ſaid lower plate; and the ſtraight ſmooth edge HI, of the fixed plate ABIH; as likewiſe the ſtraight ſmooth edge DE of the moveable plate GDEF, be perceivable through the round hole in the under plate, in the focus of the object-glaſs; then, when the handle of the *micrometer* is turned, the edge HI of the narrow plate ABIH fixed to the frame, and DE of the moveable plate, will appear through the teleſcope equally to approach to, or recede from each other.

By theſe edges we ſhall be able to meaſure the apparent diameters of the ſun, moon, &c. the manner of doing which take as follows:

Suppoſe in looking at the moon through the teleſcope, you have turned the handle till the two edges DE and HI are opened, ſo as juſt to touch or claſp the moon's edges; and that there were twenty-one revolutions of the hand *a*, to compleat that opening. Firſt ſay, As the focal length of the object-glaſs, which ſuppoſe ten feet, is to radius, ſo is one inch to the tangent of an angle ſubtended by one inch in the focus of the object-glaſs; which will be found twenty-eight minutes thirty ſeconds. Again, becauſe there are exactly forty threads of the ſcrews in one inch; ſay, If forty revolutions of the hand *a*, give an angle of $28' \, 30''$, what angle will twenty-one revolutions give? The anſwer will be, fifteen minutes eight ſeconds. And ſuch was the moon's apparent diameter; and ſo may the apparent diameters of any other objects be taken.

It muſt be here obſerved, that the diviſions on the top of the plate GDEF, are diagonal diviſions of the revolutions of the ſcrews, with diagonal diviſions of inches againſt them. Thus as the ſaid plate ſlides along, theſe diagonals are cut by diviſions made on the edge of the narrow plate KL, fixed to the oppoſite ſides of the frame by means of two ſcrews. Theſe diagonal diviſions ſerve for a regiſter to count the revolutions of the ſcrews, and to ſhew how many there are in an inch, or the parts of an inch.

Mr. Derham tells us, that his *micrometer* is not, as uſually, to be put into a tube, but to meaſure the ſpectres of the ſun on paper, (of any radius) or to meaſure any part of them. By this means he can eaſily, and very exactly, with the help of a fine thread, take the declination of a ſolar ſpot at any time of the day; and by his half-ſeconds watch, meaſure the diſtance of the ſpot from the ſun's eaſtern or weſtern limb.

MICROSCOPE, ΜΙΚΡΟΣΚΟΠΕΙΟΝ, a dioptrical inſtrument, by means whereof very minute objects are repreſented exceedingly large, and viewed very diſtinctly; according to the laws of refraction. See REFRACTION.

Microſcopes are properly diſtinguiſhed into ſimple, or *ſingle*; and compound, or *double*.

Single MICROSCOPES are thoſe which conſiſt of a ſingle lens, or a ſingle ſpherule.

Compound MICROSCOPES conſiſt of ſeveral lenſes duly combined. See LENS.

As optics have been improved, other varieties have been contrived, in the ſorts of the *microſcopes*: Hence *reflecting microſcopes*, *water microſcopes*, &c. See REFLECTING, &c.

When, and by whom *microſcopes* were firſt invented, is not certainly known. Huygens tells us, that one Drebbel, a Dutchman, had the firſt *microſcope*, in the year 1621; and that he was reputed the inventor of it: though F. Fontana a Neapolitan, claims the invention to himſelf, but dates it from the ſame year. As a teleſcope inverted is a *microſcope*; the diſcovery might eaſily enough have aroſe from thence. See TELESCOPE.

Foundation and theory of ſingle MICROSCOPES.—If an object AB (*tab. Optics, fig.* 21.) be placed in the focus of a ſmall convex lens, or ſimple *microſcope* DE, and the eye be applied cloſe to the other ſide of the microſcope, *the object will be ſeen diſtinct, in an erect ſituation, and magnified in the ratio of the diſtance of the focus to the diſtance wherein objects are to be placed to be ſeen diſtinctly with the naked eye.*

For the object AB being placed in the focus of the convex lens DE, the rays iſſuing from the ſeveral points thereof, after refraction, will be parallel to each other. See LENS and REFRACTION. Conſequently the eye will ſee it *diſtinctly*, by virtue of what is proved under the word TELESCOPE.

Further, ſince one of the rays AF proceeding from the point A, after refraction, becomes parallel to the incident ray; and therefore, ſetting aſide the thickneſs of the lens, is found directly againſt it; and the ſame holds of all the other rays carried to the eyes: the rays, AF, and BF, to which the reſt coming from A and B are parallel, will enter the eye in the ſame manner as if they entered without paſſing through the lens; and will therefore appear erect; as if the lens were away. See VISION.

Laſtly, it is manifeſt that the object AB will be ſeen under the ſame angle as if viewed by the naked eye: But ſince it appears very diſtinct, whereas to the naked eye, at the ſame diſtance, it would appear extremely confuſed, it is the ſame thing as if the object ſhould ſeem removed to the diſtance FH, wherein it is viewed with equal diſtinctneſs, and under the ſame angle. The diameter of the object AB, therefore, will be to the apparent diameter IK, as FC to FH, *i. e.* as the diſtance of the focus of the lens to the diſtance wherein an object is to be placed in order to view it diſtinctly. See MAGNITUDE, and ANGLE.

Huygens takes it for granted, that an object ſeen with the naked eye, is then in its utmoſt diſtinctneſs when ſeen at the diſtance of eight digits, or tenths of a foot; which agrees pretty near with the obſervations of others.

Laws of ſingle MICROSCOPES.—1°. Simple *microſcopes* magnify the diameter of the object AB in the ratio of the diſtance of the focus FC to an interval of eight digits. *v. gr.* If the ſemi-diameter of a lens convex on both ſides be half a digit, AB : $IK = \frac{1}{2}\,8 = 1 : 16$, that is, the diameter of the object will be increaſed in a ſedecuple proportion, or as ſixteen to one.

2°. Since the diſtance FH is conſtant, *viz.* eight digits, by how much the diſtance of the focus FC is ſmaller, ſo much the ſmaller ratio will it have to FH; conſequently the diameter of the object will be ſo much the more magnified.

3°. Since in plano-convex lens's, the diſtance of the focus is equal to the diameter; and in lens's convex on both ſides, to the ſemi-diameter; ſimple *microſcopes* will enlarge the diameter ſo much the more, as they are ſegments of ſmaller ſpheres.

4°. If the diameter of the convexities of a plano-convex lens, and a lens convex on both ſides, be the ſame, *viz.* $= 1$; the diſtance of the focus of the firſt will be 1; of the ſecond $\frac{1}{2}$. Conſequently, the ſemi-diameter of the object AB will be to the apparent one in the firſt caſe as 1 to 8, in the latter as $\frac{1}{2}$ to 8, *i. e.* as 1 to 16. A lens, therefore, convex on both ſides, magnifies twice as much as a plano-convex.

As the whole depends on the juſt and ſteady ſituation of objects with regard to the lens, various methods have been contrived to that end: Whence we have ſeveral different kinds of ſingle *microſcopes*. The moſt ſimple is as follows.

1°. AB, *fig.* 22. is a little tube, to one of whoſe baſes BC, is fitted a plain glaſs, to which an object, *viz.* a gnat, wing of an inſect, down, or the like, is applied: To the other baſe, AD, at a proper diſtance from the object is applied a lens convex on both ſides, whoſe ſemi-diameter is about half an inch. The plain glaſs is turned to the ſun, or the light of a candle, and the object is ſeen magnified. And if the tube be made to draw out, lens's of different ſpheres may be uſed.

Again, a lens, convex on both ſides, is incloſed in a cell AC, *fig.* 22. n° 2. and by a ſcrew H there faſtened acroſs; through the pedeſtal CD paſſes a long ſcrew, by means whereof, and the female ſcrew I, a ſtyle or needle fixed perpendicular to its extreme, is kept firm at any diſtance from the lens. In E is a little tube, on which, and on the point G, the various objects are to be diſpoſed: Thus there may be lens's of various ſpheres applied.

2°. But the *microſcope* which is found to anſwer the end beſt, is as follows: AB, *fig.* 23. is a round braſs tube, whoſe exterior ſurface is formed into a ſcrew of a length ſomewhat leſs than the diſtance of the focus of a glaſs convex on both ſides, uſed here for illuminating the object, and fitted to its baſe AC, by a ring with a ſcrew in it DE.

FG is another braſs tube, ſomewhat wider than the firſt, and open each way for an object to be applied to the *microſcope*. To its upper baſe GH is faſtened a ſpring of ſteel-wire, twiſted into a ſpiral I; whereby an object placed between two round plates or ſlices, K and L, in the manner hereafter mentioned, is by means of the ſcrew BC, brought to the *microſcopical* lens, (or magnifying glaſs, whereof there are ſeveral) and kept firm in its place. To the baſis HG, which has a female ſcrew M, are fitted cells N, with a male ſcrew O, wherein lens's of various ſpheres, guarded by ferrils, are included. In P is a female ſcrew, by which an ivory handle PQ is faſtened to the *microſcope*.

In the ivory ſlice T are round holes, in which are fitted little circles of Muſcovy talc, for objects, eſpecially ſmall and pellucid ones, as little inſects, or the wings, ſcales, *&c.* of larger, to be faſtened to.

When live inſects are to be viewed, they are covered with the braſs ſlice Y, which is put in a little ſquare braſs bed, perforated with holes X: And the ſame ſlice, whether alone, or incloſed in the bed, being laid between the round plates K and L, is brought to the lens by means of the ſcrew AB, till the object may be diſtinctly viewed.

If other pellucid oblong objects are to be viewed, as down, cuticle, *&c.* inſtead of the ſlice above, is uſed the inſtrument mentioned above, for viewing wings of flies; whoſe ſtructure is manifeſt from inſpection.

There are other inſtruments in the apparatus of the *microſcope*, as little tongs, *&c.* for taking up ſmall objects, a glaſs tube for viewing the circulation of the blood in fiſhes, *&c.* which need no deſcription.

What has been ſaid hitherto, is to be underſtood of *lenticular microſcopes*; for *ſpherical* ones, their doctrine will be underſtood from what follows.

If an object AB, *fig.* 21. n° 2. be placed in the focus of a glaſs ſpherule F, and the eye be behind it, *v. gr.* in the focus G; the object will be ſeen diſtinct, in an erect ſituation, and magnified as to its diameter, in a ratio of $\frac{3}{4}$ of the diameter EI, to the diſtance at which objects are to be placed to be ſeen diſtinctly with the naked eye.

The firſt part of the propoſition is proved in the ſame manner of ſpheres, as of lens's: As, then, a good eye ſees an object diſtinctly at the diſtance of eight digits, a glaſs ſpherule will inlarge the diameter of an object in a ratio of $\frac{3}{4}$ of the diameter to 88 digits. Suppoſe then the diameter of the ſpherule EI $\frac{1}{10}$ of a digit, CE will be $= \frac{1}{20}$, and $FE = \frac{1}{40}$; and therefore $FC = \frac{1}{20} + \frac{1}{40} = \frac{3}{40}$. Conſequently, the true diameter of an object to its apparent one is in the ratio of $\frac{3}{40}$ to 8; *i. e.* as 3 to 320, or 1 to 103 nearly.

Now a lens convex on both ſides, increaſes the diameter in a ratio of the ſemi-diameter to the ſpaces of eight digits; wherefore $\frac{1}{2}$ having a leſs ratio to 8 than $\frac{3}{4}$; if a lens and a ſphere have the ſame diameter, the former will magnify more than the latter: And pretty much after the ſame manner it may be ſhewn that a ſphere of a leſs diameter, magnifies more than another of a large one.

For the methods of caſting little glaſs ſpherules for MICROSCOPES; there are various.—Wolfius deſcribes one as follows: A ſmall piece of very fine glaſs, ſticking to the wet point of a ſteel-needle, is to be applied to the extreme bluiſh part of the flame of a torch; or, which is better, to the flame of ſpirit of wine, to prevent its being blackned. Being there melted, and run into a little round drop, it is to be removed from the flame; upon which it inſtantly ceaſes to be fluid: folding, then, a thin plate of braſs, and making very ſmall ſmooth perforations ſo as not to leave any roughneſs on the ſurfaces; and further, ſmoothing them over to prevent any glaring: fit the ſpherule between the plates againſt the apertures, and the whole in a frame, with objects convenient for obſervation.

Dr. Adams gives another method, thus: Take a piece of fine window-glaſs, and raiſe it with a diamond into as many lengths as you think needful, not exceeding an eighth of an inch in breadth; then holding one of thoſe lengths between the fore-finger and thumb of each hand over a very fine flame till the glaſs begins to ſoften, draw it out till it be as fine as an hair, and break; then, applying each of the ends into the pureſt part of the flame, you have two ſpheres preſently, which you may make larger or leſs at pleaſure. If they ſtay long in the flame, they'll have ſpots; ſo they muſt be drawn out immediately after they are turned round. As to the ſtem, break it off as near the ball as poſſible; and lodging the remainder of the ſtem between the plates; by drilling the hole exactly round, all the protuberances are buried between the plates; and the *microſcope* performs to admiration.

After theſe manners may ſpheres be made much ſmaller than any lens; ſo that the beſt *microſcopes*, or thoſe which magnify the moſt, are made thereof. For ſuppoſe the diameter of a ſpherule to be $\frac{1}{16}$ of a digit, the diſtance of its focus will be $\frac{1}{64}$; and therefore its real diameter to its apparent one, as $\frac{1}{32} + \frac{1}{64}$; that is, as $\frac{3}{64}$ to 8, or as 3 to 512; or laſtly, as 1 to 170. Its ſurface therefore will be increaſed in the proportion of 1 to 28900, and its bulk in a ratio of 1 to 4913000.

M. Leewenhoeck and M. Muſſchenbroeck have ſucceeded very well in ſpherical *microſcopes*; and the apparatus of the latter is much commended: But we forbear any deſcriptions thereof; it being eaſy for any who conſiders the ſtructure of thoſe conſiſting of lens's, to conceive how thoſe of ſpheres may be contrived.

Water MICROSCOPE.—Mr. S. Gray, and after him, Wolfius and others, have contrived *water-microſcopes*, conſiſting of ſpherules, or lens's of water inſtead of glaſs, fitted up ſomewhat after the manner of thoſe above-mentioned; (as ſpheres of water may likewiſe be uſed inſtead of glaſs in any of the common *microſcopes*.) But ſince the diſtance of the focus of a lens or ſphere of water, is greater than in one of glaſs, (the ſpheres whereof they are ſegments being the ſame) *water-microſcopes* magnify leſs, and are therefore leſs eſteemed than thoſe of glaſs.

The ſame Mr. Gray firſt obſerved that a ſmall drop or hemiſpherule of water held to the eye by candle-light or moon-light, without any other apparatus, magnified the animalcule contained in it, vaſtly more than any other *microſcope*. The reaſon is, that the rays coming from the interior ſurface of the firſt hemiſphere, are reflected ſo as to fall under the ſame angle on the ſurface of the hind hemiſphere, to which the eye is applied, as if they came from the focus of the ſpherule; whence they are propagated to the eye in the ſame manner as if the objects were placed without the ſpherule in its focus.

Hollow glaſs ſpheres, of the diameter of about half a digit, filled with ſpirit of wine, are frequently uſed for *microſcopes*; but they do not magnify near ſo much.

Theory of compound, or double MICROSCOPES.—Suppoſe an object-glaſs ED, *Fig.* 24. the ſegment of a very ſmall ſphere, and the object AB placed without the focus F.

Suppoſe an eye-glaſs GH, convex on both ſides, and the ſegment of a ſphere greater (though not too great) than that of DE, and let it be ſo diſpoſed behind the object, as that if CE : CL : : CL : CK, the focus of the eye-glaſs may be in K.

Laſtly ſuppoſe, LK : LM : : LM : LI.

If then O be the place wherein an object is ſeen diſtinct with the naked eye; the eye in this caſe being placed in I, will ſee the object AB diſtinctly in an inverted ſituation, and magnified in a compound ratio of MK to LK, and LC to CO; as is proved from the laws of dioptrics.

Laws of double MICROSCOPES.—1°. The more an object is magnified by the *microſcope*, the leſs is its *field*, *i. e.* the leſs it takes in at one view.

2°. To the ſame eye-glaſs, may be ſucceſſively applied object-glaſſes of various ſpheres; ſo as that both the entire objects, but leſs magnified, and their ſeveral parts, much more magnified, may be viewed through the ſame *microſcope*. In which caſe, by reaſon of the different diſtance of the image, the tube LK, in which the lens's are fitted, ſhould be made to draw out.

For the proportion of the object-glaſs to the eye-glaſs, ſome commend the ſubduple ratio, and ſome the ſubſeſquiſextile. De-Chales will have the ſemi-diameter of the convexity of the object-glaſs to be $\frac{1}{3}$ of a digit; or at moſt $\frac{1}{2}$; in the eye-glaſs an entire digit, or even 1 $\frac{1}{2}$. Cherubin makes the ſemidiameter of the object-glaſs $\frac{1}{4}$, $\frac{1}{3}$, or $\frac{1}{2}$ of a digit; the ſemi-diameter of the eye-glaſs 1 $\frac{3}{4}$, or 1 $\frac{1}{2}$ of a digit.

Since it is proved, that the diſtance of the image LK from the object-glaſs DE will be greater, if another lens, concave on both ſides, be placed before its focus; it follows, that the object will be magnified the more, if ſuch a lens be here placed between the object-glaſs DE, and the eye-glaſs GH.—Such a *microſcope* is much commended by Conradi, who uſed an object-lens, convex on both ſides, whoſe ſemi-diameter was two digits, its aperture equal to a muſtard-ſeed; a lens concave on both ſides 12, or at moſt 16 digits; and an eye-glaſs convex on both ſides, of 6 digits.

4°. Since the image is projected to the greater diſtance, the nearer another lens of a ſegment of a larger ſphere, is brought to the object-glaſs; a *microſcope* may be compoſed of three lens's, which will magnify prodigiouſly.

5. From theſe conſiderations it follows, that the object will be magnified the more, as the eye-glaſs is the ſegment of a ſmaller ſphere; but the field of viſion will be the greater, as the ſame is a ſegment of a larger ſphere: If then two eye-glaſſes, the one a ſegment of a larger, the other of a ſmaller ſphere, be ſo combined, as that the object appearing very near through them, *i. e.* not farther diſtant than the focus of the firſt, be yet diſtinct; the object at the ſame time will be exceedingly magnified, and the field of viſion much greater than if only one lens were uſed: And the object will be ſtill more magnified, and the field enlarged, if both the object and eye-glaſs be double. But in regard an object appears dim, when viewed through ſo many glaſſes, part of the rays being reflected in paſſing through each; the multiplying of lens's is not adviſeable: And the beſt among compound *microſcopes*, are thoſe which conſiſt of one object-glaſs, and two eye-glaſſes.

For a *microſcope* of three lens's, De-Chales commends an object-glaſs of $\frac{1}{3}$ or $\frac{1}{4}$ of a digit; and the firſt eye-glaſs he makes 2, or 2 $\frac{1}{2}$ digits; the diſtance between the object-glaſs and eye-glaſs about twenty lines.—Conradi had an excellent *microſcope*, the object-glaſs whereof was half a digit, and the two eye-glaſſes (which were placed very near) four digits: But it anſwered beſt when in lieu of the object-glaſs, he uſed two glaſſes, convex on both ſides, their ſphere about a digit and half, or at moſt two, and their convexities touching each other within the ſpace of half a line.—Euſtachius de Divinis, inſtead of an object-glaſs, convex on both ſides, uſed two plano-convex lens's, whoſe convexities touched. Grindelius did the ſame; only that the convexities did not quite touch. Zahnius made a binocular *microſcope*, wherein both eyes were uſed.

Structure or mechaniſm of a double MICROSCOPE.—The induſtry and addreſs of our countryman, Mr. Marſhal, here deſerves to be remembred: The moſt commodious *double microſcope* is of his contrivance. In this, the eye-glaſſes are placed in the tube at A and B, *Fig.* 25. and the object-glaſs at C. The little pillar DE is turned by means of a ball E, moveable in the ſocket F; and thus the *microſcope* is accommodated to any ſituation. The ſame pillar is divided into as many parts, 1, 2, 3, 4, 5, &c. as there are lens's of different ſpheres to be uſed in viewing different objects; ſo that the diſtance of the object from the object-glaſs may be found without any trouble. But as it is ſcarce exactly enough determined this way, the tube may be brought nearer the object at diſcretion by means of the ſcrew GH.

The objects are either laid on the circle I, or fitted to proper inſtruments, having their points or ſtiles paſſing through the little tube LM.

Laſtly, to illuminate the object, a lens convex on both ſides, NO, is diſpoſed in a convenient ſituation. The reſt appears from the figure.

Reflecting MICROSCOPE, is that which magnifies by reflection, as the above-mentioned ones do by refraction. See REFLECTION.

The ſtructure of ſuch a *microſcope* may be conceived thus: Near the focus of a concave ſpeculum, AB, *fig.* 25. nº 2. place a minute object C, that its image may be formed larger than itſelf in D. To the ſpeculum join a lens convex on both ſides EF, ſo as the image D may be in its focus.

The eye will here ſee the image inverted, but diſtinct, and enlarged; conſequently the object will be larger than if viewed through the lens alone. See MIRROUR.

The inventor of this *microſcope* is the great Sir I. Newton; but it is ſomewhat to be feared leſt the objects appear dim.

Any teleſcope is converted into a *microſcope*, by removing the object-glaſs to a greater diſtance from the eye-glaſs. And ſince the diſtance of the image is various, according to the diſtance of the object from the focus; and it is magnified the more, as its diſtance from the object-glaſs is greater; the ſame teleſcope may be ſucceſſively converted into *microſcopes* which magnify the object in different degrees. See TELESCOPE.

MID, or MIDDLE, in philoſophy, and mathematics. See MEAN and MEDIUM.

MIDDLE *latitude*, in navigation, is half the ſum of two given *latitudes*. See LATITUDE.

MIDDLE *latitude ſailing*, is uſed for a method of working the ſeveral caſes in ſailing, nearly agreeing with Mercator's way, but without the help of meridional parts. See SAILING, MERIDIONAL *parts*, MERCATOR, &c.

MIDDLE *priced ſtones*. See the article STONE.

MIDDLE *region*. See the article REGION.

MIDDLE *of the action*. See the article ACTION.

MIDDLE *of an eclipſe*. See the article ECLIPSE.

Maſonry filled up in the MIDDLE. See the article MASONRY.

MID-HEAVEN, *medium cœli*, in aſtronomy, is that point of the ecliptic which culminates, or is in the meridian. See CULMINATION, &c.

MIDRIFF, in anatomy. See the article DIAPHRAGM.

MIDSHIP-*men*, are officers aboard a ſhip, whoſe ſtation, when they are on duty, is, ſome on the quarter-deck, others on the poop, &c.

Their buſineſs is to mind the braces, to look out, and to give about the word of command from the captain, and other ſuperiour officers. They all aſſiſt on occaſion both in ſailing the ſhip, and in ſtowing and rummaging the hold.

They are uſually gentlemen, who having ſerved their time as volunteers, are now upon their preferment.

MIDSUMMER-*day*, is the feſtival of St. John the baptiſt, held on the 24th of June. See QUARTER-DAY.

MIGRATION, or TRANSMIGRATION, the paſſage, or removal of any thing out of one ſtate, or place into another; particularly of colonies of people, birds, &c. into other countries. See TRANSMIGRATION.

The *migration of the ſouls of men* into other animals after death, is the great doctrine of the Pythagoreans, called the *metempſychoſis*. See METEMPSYCHOSIS.

The *migration of birds*, as the ſwallow, quail, ſtork, crane, fieldfare, woodcock, nightingale, and other birds of *paſſage*, is a very curious article in natural hiſtory, and furniſhes a notable inſtance of the powerful inſtinct impreſſed by the Creator. Mr. Derham obſerves two things remarkable therein; the firſt, That theſe untaught, unthinking creatures ſhould know the proper times for their paſſage, when to come, and when to go; as alſo, that ſome ſhould come when others go.—No doubt, the temperature of the air as to heat and cold, and their natural propenſity to breed their young, are the great incentives to thoſe creatures to change their habitation: But why ſhould they at all ſhift their habitation, and why is not ſome certain place to be found in all the terraqueous globe, affording them convenient food and habitation all the year round?

The ſecond, That they ſhould know what way to ſteer their courſe, and whither to go. What inſtinct is it, that moves a poor fooliſh bird to venture over vaſt tracts of land and ſea? If it be ſaid, that by their high aſcents up into the air, they can ſee croſs the ſeas, yet what ſhould teach or perſuade them that that land is more proper for the purpoſe than this? That Britain, for inſtance, ſhould afford them better accommodation than Egypt? than the Canaries? than Spain? or any other of the intermediate countries? *Phyſico-Theol.* p. 349.

Lud. de Beaufort remarks, that birds in their *migration* obſerve a wonderful order and polity: They fly in troops, and ſteer their courſe through huge unknown regions, without the compaſs. *Coſmol. Divin.* It is to be added, that the birds of paſſage are all peculiarly accommodated by the ſtructure of their parts for long flights. See PASSAGE.

Naturaliſts are divided as to the places whither birds of paſſage retire when they leave us. Mr. Willughby thinks the ſwallows fly into Egypt, and Æthiopia. *Ornith. lib.* 2. *c.* 3.

Olaus Magnus ſays, they lurk in holes, or under water; which is confirmed by Etmuller, who aſſures us, that he ſaw a buſhel of them taken out of a frozen fiſh-pond, all hanging together head to head, feet to feet, &c. in one cluſter. *Diſſert.* 2. c. 10. —Olaus adds, that this is a common thing in the northern countries; and that ſuch a cluſter being carried accidentally by ſome boys into a ſtove, the ſwallows, after thawing, began to fly about, but weakly, and for a very little time.

A further confirmation of this account was given by Dr. Colas, a perſon very curious in ſuch things, to the *Royal Society.* Speaking of the way of fiſhing in the northern parts, by breaking holes, and drawing their nets under the ice, he related, that he ſaw ſixteen ſwallows ſo drawn out of the lake of Samrodt, and about thirty out of the king's great pond in Roſineilen; and that at Schlebitten, near a houſe of the earl of Dohna, he ſaw two ſwallows juſt come out of the waters that could ſcarce ſtand, being very wet and weak, with their wings hanging on the ground.—He added, that he had often obſerved the ſwallows to be weak for ſome days after their appearance.

MILDEW, *rubigo*, a diſeaſe happening to plants, cauſed by a dewy moiſture, which falling on them, and continuing, for want of the ſun's heat to draw it up; by its acrimony corrodes, gnaws, and ſpoils the inmoſt ſubſtance of the plant, and hinders the circulation of the nutritive ſap: upon which the leaves begin to fade, and the bloſſoms and fruit are much prejudiced.

According to Cook and Mortimer, *mildew* is a thick, clammy vapour exhaled in the ſpring and ſummer from plants, bloſſoms, and even the earth itſelf, in cloſe ſtill weather, when there is neither ſun enough to draw it on high, nor wind enough to diſperſe it.—Hanging thus in the lower regions, when the evening's cold comes on, it condenſes and falls on the plants; with its thick clammy ſubſtance ſtops up their pores, and thus prevents perſpiration, and hinders the ſap from aſcending to nouriſh its flowers, ſhoots, &c. See DEW.

It is added, this dew falling on the top of the ſhoot of a cherry-tree about Midſummer, has been found to ſtop the ſhoot; ſo as the tree has ſhot forth in other places.

Blights and *mildews* are commonly taken for the ſame thing; yet are they very different. See BLIGHT.

On plants which have ſmooth leaves, as the oak, &c. the dew hangs, and may be ſeen, taſted, &c. Others, whoſe leaves are rougher, imbibe it. When it falls on wheat, &c. it beſpots the ſtems with a colour different from the natural one.

Theſe dews, Mr. Mortimer takes to be the principal food of bees; being ſweet, and eaſily convertible into honey. See HONEY.

MILE, in geography, a long meaſure, whereby the Engliſh, Italians, and ſome other nations, uſe to expreſs the diſtance between places. See MEASURE, DISTANCE, &c. See alſo MERIDIONAL.

In which ſenſe *mile* amounts to much the ſame with *league* uſed by the French and other nations for the like purpoſe. See LEAGUE.

The *mile* is of different extent in different countries. The geographical, or Italian, *mile* contains a thouſand geometrical paces, mille paſſus, whence the term *mile* is derived. See PACE, GEOGRAPHICAL, &c.

The Engliſh *mile* conſiſts of eight furlongs, each furlong of forty poles, and each pole of ſixteen foot one half. See POLE.

Caſimir has made a curious reduction of the *miles*, or leagues, of the ſeveral countries in Europe into Roman feet, which are equal to the Rhinland feet generally uſed throughout the north. See FOOT.

	Feet
The mile of Italy	5000
of England	5454
of Scotland	6000
of Sweden	30000
of Muſcovy	3750
of Lithuania	18500
of Poland	19850
of Germany, the ſmall	20000
The middle	22500
The largeſt	25000
of France	15750
of Spain	21270
of Burgundy	18000
of Flanders	20000
of Holland	24000
of Perſia, called alſo Paraſanga	18750
of Egypt	25000

MILES, a Latin term, which, in its general import, ſignifies *ſoldier*. See SOLDIER, and MILITIA.

In our Engliſh laws, and cuſtoms, *miles* is peculiarly appropriated to a knight, called alſo *eques*. See KNIGHT, and EQUES.

MILIARY *glands*, *glandulæ* MILIARES, in anatomy, a great number of ſmall glands interſperſed throught the ſubſtance of the cutis, or ſkin. See GLAND and CUTIS.

The *miliary glands* are the organs whereby the matter of ſweat, and inſenſible perſpiration, is ſecreted from the blood. See PERSPIRATION and SWEAT.

They are interwove with the pyramidal papillæ of the ſkin; and are each ſerved with a branch of an artery, vein, and nerve; as alſo with a proper excretory duct, through which the fluid matter ſecreted from the blood in the ſubſtance of the gland, is excreted, and ſent forth at the pores, or perforations of the cuticle. See PORE and CUTICLE.

MILIARY *fever*, is a malignant fever wherein the ſkin is ſprinkled over with little purple ſpots, like grains of *millet*.

It is alſo called a *purple fever*, from the colour of the ſpots. See PURPLE, and FEVER.

MILIARY *herpes*. See the article HERPES.

MILITANT, a term underſtood of the body of Chriſtians, while here on earth.

The Romaniſts divide the church into *militant*, patient, and triumphant: The *militant* is on earth; the patient, or paſſive, they place in purgatory; and the triumphant in heaven. See CHURCH.

MILITARE *ærarium*. See the article ÆRARIUM.

MILITARIS *toga*. See the article TOGA.

MILITARIS *via*. See the article VIA.

MILITARY, ſomething belonging to the *militia*, or ſoldiery. Thus,

MILITARY *architecture* denotes the art of fortification. See ARCHITECTURE, and FORTIFICATION.

MILITARY *art*, the art or ſcience of making or ſuſtaining war to advantage. See WAR.

MILITARY *column* among the Romans, was a column on which was engraved a liſt of the troops of an army, or the ſoldiers employed in an expedition. See COLUMN.

MILITARY *execution*, the delivery of a city, or country, up to be ravaged, and deſtroyed by the ſoldiers, upon its refuſing to pay contribution-money. See EXECUTION.

MILITARY *exerciſes*, are the evolutions, or various manners of ranging, and exerciſing ſoldiers. See EVOLUTION.

MILITARY *fever*, a kind of malignant fever frequent in armies, by reaſon of the ill food, &c. of the ſoldiers. See FEVER.

MILITARY *government* is the ſupreme command and diſpoſal of all the *military* power of a nation, by land and ſea. See GOVERNMENT.

MILITARY *law*. See LAW *of arms*, and MARTIAL.

MILITARY *machine*. See the article MACHINE.

MILITARY *order*. See ORDER, and KNIGHTHOOD.

MILITARY *pyrotechny*. See the article PYROTECHNY.

MILITARY *teſtament* among the Romans was what we call a nuncupative-will; or a teſtament made only by word of mouth, in the preſence of two witneſſes. See TESTAMENT.

This was a privilege peculiar to the ſoldiery, and to them only when in the field; for at other times they were ſubject to the common laws.

MILITARY *ways*, *viæ militares*, are the large Roman roads, which Agrippa procured to be made through the empire, in the time of Auguſtus, for the more convenient marching of troops, and conveyance of carriages. See ROAD.

N. Bergier has wrote the hiſtory of the origin, progreſs, and amazing extent of theſe *military roads*; which were paved from the gates of Rome to the extreme parts of the empire. See VIÆ.

MILITES *candidati*. See the article CANDIDATI.

MILITIA*, a collective term, underſtood of the body of ſoldiers, or perſons who make profeſſion of arms. See SOLDIER.

* The word comes from the Latin, *miles*, a ſoldier; and *miles*, from *mille*, which was anciently wrote *mile*: For in levying ſoldiers at Rome, as each tribe furniſhed a thouſand, *mille* or *mile*, men, whoever was of that number, was called *miles*. See TRIBE.

MILITIA, in its proper and more reſtrained ſenſe, is uſed to ſignify the inhabitants, or, as we call them, the *trained-bands* of a town, or country; who arm themſelves, on a ſhort warning, for their own defence.

In which ſenſe, *militia* is oppoſed to regular, ſtated forces.

The ſtanding *militia* of England is now computed to be about 200000 horſe and foot; but may be increaſed at the pleaſure of the king.

For the direction and command of theſe, the king conſtitutes *lords lieutenants* of each country, with power to arm, array, and form into companies, troops, and regiments, to conduct, (upon occaſion of rebellion, and invaſion) and employ the men ſo armed within their reſpective counties, and other places where the king commands; to give commiſſions to colonels, and other officers; to charge any perſon with horſe, horſeman, arms, &c. proportionable to his eſtate, &c. See LORD *lieutenant*, &c.

No perſon to be charged with a horſe unleſs he have 500 pounds yearly revenue, or 6000 pounds perſonal eſtate; nor with a foot-ſoldier, unleſs he have fifty pounds yearly, or 600 pounds perſonal eſtate.

MILITUM *curia*. See the article CURIA.

MILITUM *expenſis levandis*. See the article EXPENSIS.

MILK, *lac*, a white juice, or humour, which nature prepares in the breaſts of women, and the udders of other animals; for the nouriſhment of their young. See BREAST.

Milk is thicker, ſweeter, and whiter, than the chyle itſelf, from which it is derived, and that probably, without much more artifice or alteration than the leaving behind ſome of its aqueous parts. See CHYLE.

The ancients held it formed from the blood; but the moderns are of opinion, it comes from the pure chyle, conveyed by the arteries to the breaſts, and without any other coction filtrated through the glands whereof they are compoſed, like urine through the reins; without undergoing any conſiderable change. See SECRETION.

According to M. Leewenhoeck's obſervations, *milk* conſiſts of little globules ſwimming in a clear tranſparent liquor, called *ſerum*, or *whey*. See SERUM.

Milk is a compoſition of three different kinds of parts, butyrous, caſeous, and ſerous. The *butyrous* parts are the cream and oil that ſwim a-top. See BUTTER. The *caſeous* are the groſſer parts, and thoſe that coagulate, and are made into cheeſe. See CHEESE. The *ſerous* are properly a lympha, and make what we call *whey*. See SERUM, LYMPH, *&c.*

Dr. Drake ſays, that *milk* is nothing but oil and water united by the artifice of nature, perhaps by the intervention of ſome peculiar ſalts, which, *milk* itſelf, however ſweet at firſt, does, after a little ſtanding, diſcover to be pretty plentifully therein.

Milk is firſt found in the breaſts of women after they have been pregnant about four months The fermentation of the *milk* in the breaſts, the firſt days after a woman is delivered, occaſions a fever, which takes its name therefrom.

Ariſtotle ſays, there are ſome men who have *milk* in their breaſts. Cardan tells us he ſaw one that had enough to ſuckle a child.

In the *Philoſophical Tranſactions*, we have an account of a wether brought to *milk* by the ſucking of a lamb; which lamb was maintained by it all the ſummer, till it was weaned.

Milk corrupted in the ſtomachs of children, occaſions the ſeveral diſeaſes incident to that age. Dohel, a Daniſh phyſician, who has wrote expreſsly on this ſubject, tells us, an excellent remedy in ſuch caſe, is a glaſs of water with a little ſalt diſſolved in it: This acts as an emetic, and throws up the corruption that occaſioned the diſorder. Celſus mentions this remedy, *l.* 1. *c.* 3. See CHILDREN.

Galen obſerves, that in animals fed with *milk*, the greateſt part of the food of the mother is converted into that humour.

There are ſeveral kinds of *milk*, uſed not only as food, but as phyſic: as cows *milk*, aſſes *milk*, mares *milk*, ſheeps *milk*, and goats *milk*.—Theſe are preſcribed as proper to alter a ſharp thin blood into a craſis more ſoft, balſamic, and nutritive; and in conſtitutions where they fit the firſt paſſages, muſt be very good for that end, as being already prepared into nutriment, ſo far as is required for their admiſſion into the blood. But where the juices of the ſtomach are ſharp, theſe liquors are apt to be turned into curd. Whenever *milk*, therefore, of what kind ſoever, is ordered in conſumptions, and as a reſtorative, it is with good reaſon joined with the teſtaceous powders, and ſuch things as are proper to deſtroy thoſe acidities.

Aſſes *milk* is ſaid to be a great beautifier and preſerver of the ſkin. Poppæa, wife of the emperor Nero, uſed it for that purpoſe; having four or five hundred aſſes conſtantly in her retinue, to furniſh her every morning with a freſh bath.

We have ſeveral artificial *milks*, ſo called from their reſemblance of natural ones. As,

MILK *of the moon*, *lac lunæ*, a name given by naturaliſts to foſſil agaric. See AGARIC.

Milk of the moon, or *flower of ſilver*, is a white, porous, friable, inſipid earth, frequently found in form of a white farinaceous powder, but ſometimes concreted into a maſs, ſoft, fungous, and not unlike agaric.

Some ſay it is chiefly found in ſilver mines, and that it is a flower ſublimate from the ore of that metal; whence its denomination. See SILVER.

MILK *of ſulphur*, *lac ſulphuris*, a preparation of flowers of ſulphur, and ſalt of tartar; preſcribed by phyſicians, as a ſudorific. See SULPHUR.

MILK *water*. See the article WATER.

Virgin's MILK, *lac virginale*, compoſed of rock allum, ſpring water, litharge, and vinegar; uſed as a coſmetic, to drive in pimples, and check any cutaneous eruptions, by its cooling, reſtringent quality.

MILKY *grotto*. See the article GROTTO.

MILKY *way*, *via lactea*, or *galaxy*. See GALAXY.

MILL, in propriety, denotes a machine for *grinding*. See GRINDING.

MILL, in a more general ſignification, is applied to all machines whoſe action depends on a circular motion. See MACHINE, *&c.*

Of theſe there are various kinds, which acquire different names according to the various manners in which the moving power is applied —They may all be reduced to three: *viz. Windmills*, *water-mills*, and *hand-mills*; under which laſt, are alſo comprehended thoſe worked by horſes, *&c.*

Water-MILLS, are thoſe turned by the force, or fall of a river, *&c.* Of which, there are two kinds; thoſe where the force of the water is applied above the wheel, called *over-ſhot*; and thoſe where it is applied below the wheel, called *under-ſhot mills.*

Wind-MILLS, are thoſe turned by the force of wind gathered in their ſails.

Of theſe, ſome are called *vertical*, others *horizontal*, according to the poſition of the ſails; or rather according to the direction of their motion with regard to the horizon.

For the beſt form of horizontal ſails, as alſo for determining the poſition of the axis of wind-mills, ſee WIND-*mill.*

Portative, or *Hand*-MILLS, are thoſe kept in motion by the hand; or whoſe mill-ſtones are turned, or piſtons driven, by the force of horſes, or other beaſts.

The uſe of *mills* and mill-ſtones, according to Pauſanias, was firſt invented by Myla, ſon of Meleges, firſt king of Sparta. Though Pliny attributes the invention of every thing belonging to bread and baking, to Ceres. Polydore Virgil was not able to diſcover the author of ſo uſeful a machine. It is doubted whether or no water-mills were known to the Romans, there being no mention made in the Digeſt but of *mills* turned by ſlaves and aſſes.—Salmaſius, however, and Gothofred, will not allow *water-mills* to have been unknown to the ancient Romans, though they were not in ordinary uſe.—*Wind-mills* are of much more modern invention: The firſt model of theſe was brought from Aſia into Europe, in the time of the holy wars.

MILL is alſo uſed for any machine, which being moved by ſome external force, ſerves to give a violent impreſſion on things applied thereto.

Mills in this ſenſe, are machines of vaſt uſe in the manufactures, arts, and trades; for the making and preparing divers kinds of merchandizes.—The principal are thoſe which follow.

Fulling-MILL, is a water-mill which ariſes and beats down large wooden piſtons in proper veſſels, called *peels* or *troughs*; in order to full, ſcower, and cleanſe woollen ſtuffs. See FULLING.

Linnen-MILLS do not differ much from fulling-mills. Their uſe is to ſcower linnens, after having been firſt cleanſed when taken out of the lixivium, or lye. See BLEACHING. Some of theſe go by water, the generality by horſes.

Paper-MILL, a water-mill furniſhed with ſeveral large hammers, which beat, or pound the rags or cloth in a kind of wooden troughs; and thus by reducing them to little pieces, turn them into a kind of pulp, by means of water conveyed into the troughs by a pipe for the purpoſe. See PAPER.

MILL in coinage, is a machine uſed to prepare the laminæ or plates of metal, and to give them the proper thickneſs, hardneſs, and conſiſtence before they be ſtruck or ſtamped. See COINING.

This machine has not been long known among us; but is of ſome ſtanding in Germany. It conſiſts of ſeveral wheels dented like thoſe of clocks, *&c.* which move two cylinders of ſteel, between which the metal is paſſed to be brought to its proper thickneſs. It was firſt turned with water; ſince, with horſes.

MILL, among gold-wire-drawers, is a little machine conſiſting of two cylinders of ſteel, ſerving to flatten the gold or ſilver wire, and reduce it into laminæ, or plates. See GOLD-WIRE.

They have alſo *mills* to wind the gold-wire or thread on the ſilk; compoſed of ſeveral rows of bobins all turned at the ſame time. See DUCTILITY.

Forge-MILLS, turned by water, ſerve to raiſe and let fall one or more huge hammers, to beat and form the iron into bars, anchors, or other maſſive works. See FORGE.

Gun-powder MILL, is that uſed to pound, and beat together the ingredients whereof gun-powder is compoſed. See GUN-POWDER.

This is done in a kind of iron or braſs mortar by means of iron peſtles wrought by a wheel without-ſide the *mill*, turned by the water falling on it.

Leather-MILLS, are uſed to ſcower, and prepare with oil, the ſkins of ſtags, buffalo's, elks, bullocks, *&c.* to make what they call *buff-leather*, for the uſe of military men.

This is effected by means of ſeveral large piſtons riſing and falling on the ſkins in large wooden troughs, by means of a wheel without-ſide, turned by the force of water. See BUFF.

Oil-MILLS, whether turned by men, water, hand, or horſe, ſerve to bruiſe or break the nuts, olives, and other fruits and grains, whoſe juice is to be drawn by expreſſion to make oil. See OIL, OLIVE, *&c.*

Sawing-MILL is a water-mill, ſerving to ſaw ſeveral planks or boards at the ſame time. See SAWING.

Theſe are frequent in France, eſpecially in Dauphiné. They were lately prohibited in England, where they were begun to be introduced, from a view to the ruin of the ſawyers, which muſt have enſued.

There are alſo *Silk*-MILLS, for ſpinning, throwing, and twiſting ſilks; which are large round machines in form of turrets, five or ſix foot high, and ſix yards in diameter; which being turned either by the force of water, or that of men, work at the ſame time an infinity of bobins faſtned thereto, whereon the ſilk had been wound to be here ſpun and twiſted. See SILK, *&c.*

There are abundance of *mills* of this kind in France, eſpecially about Lyons and Tours, ſome of which are ſo diſpoſed, as that three of them will go at the ſame time, and by the ſame wheel wrought by water, or by ſtrength of hand. That in the Hopital de la Charité at Lyons, is wonderful, a ſingle man working no leſs than forty-eight of theſe *mills*. See MILLING.

Stamping MILL. See the article STAMPING.

Sugar-**MILL**, is a machine that ſerves to bruiſe the ſugar-canes, and expreſs the liquor or juice contained therein. See SUGAR.

The *ſugar-mills* are very curious contrivances.—Of theſe there are four kinds, being turned either by water, wind, men, or horſes.

Thoſe turned by the hand were firſt in uſe, but are now laid aſide, as being an intolerable hardſhip on the poor Negroes, who were doomed thereto; beſides the ſlowneſs of their progreſs.

Wind-mills are the moſt modern, but they are yet ſomewhat rare; excepting in St. Chriſtopher's and Barbadoes, and among the Portugueze. Theſe make good diſpatch, but have this inconvenience, that they are not eaſily ſtopped; which proves frequently fatal to the Negroes who feed them.

Tan, or *Bark*-**MILLS**, wrought by water or horſes, ſerve to cut certain barks into a coarſe ſort of powder, proper for the tanning of hides, &c. See BARK, and TANNING.

MILLS *for ſword-blades*, are likewiſe moved by water. They are frequent at Vienne in Dauphiné. By working heavy hammers, they forge thoſe excellent ſword-blades, called *blades of Vienne*.

MILL-*pool*. See the article POOL.

MILLEPEDES, *wood-lice*, a ſort of little inſects, with a multitude of feet, uſually of a dark colour, and which when touched roll up into a ball; of conſiderable uſe in medicine.

Millepedes are ſo much in the acquaintance of the people, that they ſeem to be maſters of their medicinal uſes, and take them in many caſes without any other direction. They are, by all experience, found to be very diuretic and abſterſive; which makes them not only frequent in preſcriptions for diſorders in the reins, but alſo in obſtructions of the viſcera, and particularly in the jaundice.

They abound with a nitrous ſalt, which they ſeem to derive from the earthy diet they live on. It is ſomewhat volatilized by its digeſtion and circulation in the inſect; as ſuch ſalt always is more or leſs, in proportion to the digeſtive powers of the animal, into whoſe blood it enters; yet not ſo much, but that it is brackiſh and pungent upon the palate. This makes their deterſive qualities extend further than the larger glands, and enables them to ſcower even the minuteſt paſſages, and keep the nerves clear from viſcidities, and ſuch things as would clog their ſprings; whereby they are good in palſies, epilepſies, and all nervous diſtempers.

As they open and cleanſe away viſcoſities, and by their minuteneſs and aſperities cut their way through any obſtructions, they are good in ſtruma's, and all inveterate tumours or ulcers. Remarkable cures have been performed in each way by a long uſe of them. They are beſt adminiſtred in ſubſtance, or bruiſed in white wine, the liquor being taken without ſettling.

There are ſeveral chymical preparations of *millepedes*, as ſpirit, volatile ſalt, oil, and wine of *millepedes*.

MILLENARII*, **MILLENARIANS**, a ſect among Chriſtians, chiefly in the primitive church; who hold that Jeſus Chriſt is to come again and reign on earth for the ſpace of a thouſand years; during which time, the faithful are to enjoy all manner of temporal bleſſings, and at the expiration of this term, the day of judgment is to take place. See MILLENNIUM.

* The *millenarii* are alſo called *chiliaſts*, *chiliaſtæ*; from the Greek χιλιας, *mille*, a thouſand.

This opinion of the *millenarii* is very ancient, and may be traced back almoſt as far as the time of the apoſtles. It had its origin from a paſſage in the apocalypſe too literally underſtood, wherein mention is made of Chriſt's reign on earth, &c.

The opinion of S. Papias, ſays Mr. Launoy, touching the new kingdom of Jeſus Chriſt on earth, after the reſurrection, was held for near three centuries, e'er it was charged as erroneous; as appears from eccleſiaſtical hiſtory. It was allowed of, and followed by the greateſt men among the primitive fathers; as Irenæus, Juſtin Martyr, Tertullian, &c. Dionyſius of Alexandria, and St. Jerom, oppoſed this imaginary *millenary* reign very ſtrongly.

MILLENNIUM*, a term literally ſignifying a *thouſand years*; chiefly uſed for the time of our Saviour's ſecond appearance, and reign on earth. See MILLENARII.

* The word is Latin, compounded of *mille*, a thouſand, and *annus*, year.

Mr. Whiſton, in ſeveral of his writings, has endeavoured to ſupport the notion of a *millennium*. According to his computation, it was to have commenced about the year 1720.

MILLIARE, or **MILLIARIUM**, among the Romans, denoted a *mile*, conſiſting of a thouſand paces, *mille paſſus*; whence the name. See MILE and LEAGUE.

In the Roman empire, the *milliaria*, in all the great roads, were marked with ſtones, or columns, erected for that purpoſe; commencing from a column in the heart of the city, called *milliare aureum*. See ROAD.

Thoſe columns were alſo hence denominated *milliary columns*. See COLUMN.

MILLIARY *fever*. See the article MILIARY.

MILLIARY *glands*. See the article MILIARY.

MILLIARY *herpes*. See the article HERPES.

MILLIARY *terms*. See the article TERM.

MILLING, in the manufactories, an operation called alſo *fulling*. See FULLING.

MILLING, or *throwing of ſilk*, is the laſt preparation of ſilk before dying; ſerving to twiſt it, more or leſs according to the work it is intended for. See SILK.

To prepare the ſilk for *milling*, they firſt put it in boiling water, incloſed between two linnen cloths.—The *mill* is a ſquare machine, compoſed of ſeveral pieces of wood mortiſed in each other ſo as to form a kind of large cage, in the centre whereof are two wheels placed parallel over each other, whoſe axis bears on two poſts.—When the machine is ſimple, a ſingle man turns theſe wheels by means of a little cogg in which they catch, and a large handle.

The wheels put in motion by the handle, communicate their motion to eight windles, or reels, or even more, according to the largeneſs of the machine; on the flights, or arms whereof, the ſilk is wound from off two rows of bobins placed on each ſide the machine, each row at the height of one of the two wheels in the centre.—Theſe bobins have their motion by means of leathern thongs, which bear on little cylinders of wood that ſupport them, and turn at length on the two wheels at the centre; ſo that the ſilk on each bobin twiſts, as it winds, and forms its ſeparate ſkain.

The ſmalleſt wheel moves two hundred of theſe bobins, over which a ſingle perſon is ſufficient to inſpect, to put new bobins or ſpools in lieu of thoſe diſcharged of their ſilk, and to knot the ends when they break.

MILLION, in arithmetic, the number of ten hundred thouſand; or a thouſand times a thouſand. See NUMERATION.

The revenues of princes are now only computed in *millions*. See REVENUE and POLITICAL *arithmetick*.

A *million of gold*, or *million of money*, is ſometimes underſtood of a *million* of pounds; and ſometimes a *million* of crowns. See CROWN, &c.

MILL-REE, or **MILLE-RAY**, a Portugueze gold coin, current for ſomewhat more than the Spaniſh piſtole. See COIN.

The *mill-ree* is thus called, as conſiſting of a thouſand *rees*. See REE.—It is alſo called a St. *Stephen*, from the figure of that martyr impreſſed thereon.

They have alſo a *mill-ree* of a little croſs, which in reality is only half the former; and whoſe value is that chiefly uſed in computations.

MILOHYOIDÆUS. See MYLOHYOIDÆUS.

MILT, in anatomy, a popular name for the ſpleen. See SPLEEN.

MILT, or **MELT**, in natural hiſtory, the ſoft roe in fiſhes; thus called by reaſon it yields, by expreſſion, a whitiſh juice reſembling milk. See ROE.

The *milt* is properly the ſeed, or ſpermatic part of the male fiſh. The *milt* of a carp is reckoned a choice bit.

It conſiſts of two long whitiſh irregular bodies, each included in a very thin fine membrane. M. Petit conſiders them as the teſticles of the fiſh wherein the ſeed is preſerved: the lower part, next the anus, he takes for the veſiculæ ſeminales. Vid. *Mem. Acad. R. Scien.* ann. 1733. p. 291.

MIME*, **MIMUS**, a term in the ancient comedy, ſignifying a *buffoon* or *mimic*, who acted poſtures ſuitable to the perſon, or ſubject he repreſented. See ARCHIMIMUS.

* The word comes from the Greek, μιμος, imitator; formed of μιμεομαι, I imitate. The ſame comedians were alſo ſometimes called *pantomimes*, becauſe of their counterfeiting all manner of poſtures and geſtures. See PANTOMIME.

MIMESIS, ΜΙΜΗΣΙΣ, in rhetoric, a figure, whereby the words, geſtures, ſpeech, actions, &c. of another perſon are imitated. See MIME, and PANTOMIME.

MIND, *mens*, denotes a thinking or underſtanding being. See THINKING, &c.

Philoſophers generally allow of three kinds of *minds*, viz. *God*, *angels*, and the human *ſoul*. For a thinking being muſt either be finite or infinite: If infinite, it is *God*; and if finite, it is either joined with a human body, or not; if the latter, it is an *angel*; if the former, a *ſoul*. See GOD, ANGEL, and SOUL.

The *human mind* is properly defined a thinking, rational ſubſtance: By *thinking*, it is diſtinguiſhed from body; and by *reaſoning*, from God, and angels, which are ſuppoſed to ſee and know things intuitively, without the help of deduction, and diſcourſe. See DISCOURSE, REASONING, and KNOWLEDGE.

Affections of the MIND. See the article AFFECTION.

MINE, in natural hiſtory a place under ground where metals, minerals, or even precious ſtones, are dug up. See METAL, MINERAL, PRECIOUS STONE, &c.

As therefore the matter dug out of *mines* is various; the *mines* themſelves acquire various denominations: as *gold-mines*, *ſilver-*

ſilver-mines, *copper-mines*, *iron-mines*, *diamond mines*, *ſalt-mines*, *mines of antimony*, *of alum*, &c.

For *gold* and *ſilver mines*, the richeſt and moſt celebrated are thoſe of Peru and Chili in America. See GOLD and SILVER. —*Iron-mines* are more abundant in France than elſewhere. See IRON.—*Copper-mines* are chiefly in Sweden and Denmark. See COPPER.—*Lead* and *Tin-mines* abound moſt in England. See LEAD and TIN.—*Quick ſilver-mines* in Hungary and Spain.—*Diamond-mines* in Golconda.—*Salt-mines* in Poland, &c. See QUICKSILVER, DIAMOND, SALT, &c.

Metallic mines are chiefly found in mountains; though the reaſon thereof does not appear. It is probable plains may abound as much therewith, would people dig deep enough. But plains are commonly cultivated; and beſide, the water will ſcarce allow them to be dug. Add, that the *metallic* veins always run either horizontal or oblique; and for that reaſon, are eaſieſt found on the ſides of eminences.

The metallic veins are commonly encompaſſed with a ſort of ſtone peculiar to the *mine*, and are accompanied with ſeveral ſtrata of different matters, as clay, gravel, rock, &c. They who work in *mines*, know by the ſize, and colour of the ſtones, when they approach the vein. See STRATA, and VEIN.

They diſcover that there is a *mine* in a mountain by the marcaſites, or mineral ſtones falling from it; by the mineral taſte of the waters; by the quality of the exhalations raiſed from it; and by the difference between the earth over the *mines*, and that of the neighbouring parts in the cold parts of ſpring and autumn, the froſt lying on the adjacent places, when it thaws about the mines. Add, that the ground's producing but little graſs, and that little, pale and colourleſs, is an indication of a *mine*.

Some pretend to diſcover *mines* by the ſole virtue of the hazle-tree, out of which they form a forked ſtick, called *virgula divinatoria*, which, they ſay, turns of itſelf, in their hands, but differently, according to the different nature of the metals or minerals underneath. This artifice made a great noiſe in France towards the end of the ſeventeenth century; and the corpuſcular philoſophy was called to account for it. But it is now in little credit. See VIRGULA DIVINA.

There are ſome *mines* wherein the metals are found at their firſt opening very crude and imperfect; which yet, in time, grow ripe and rich. Alonſo Barba relates, that in Potoſi, ſtones have frequently been thrown aſide, as not containing any thing conſiderable of metal; and yet have been found many years afterwards exceeding full thereof. Cæſalpinus aſſures us, that earths which yield no metal at all, ſometimes become very fertile veins. In an iſland of the Tyrrhene-Sea, after the iron *mines* have been exhauſted, they ſtop them up about ten years, at the end whereof, they find them as rich as before.—*For the formation of mineral and metallic matters in mines*, ſee MINERAL.

MINE, in the art of war, denotes a ſubterraneous canal, or paſſage dug under the wall, or rampart of a fortification, intended to be blown up by gun-powder.

The *alley*, or paſſage of a *mine*, is uſually about four foot ſquare; at the end of this is the *chamber* of the *mine*, which is a cavity about five foot in width and in length, and about ſix in height; and here the gun-powder is beſtowed. See CHAMBER.

The *ſauciſſe* of the *mine* is the train; for which there is always a little aperture left. See SAUCISSE.

There are various kinds of *mines*, which acquire various names; as royal *mines*, ſerpentine *mines*, forked *mines*, according as their paſſages are ſtrait, oblique, winding, &c.

There are alſo mines made in the field, which are called *fougades*. See FOUGADE.

Mines are either dug within the body of the earth, as thoſe made by the beſieged to blow up the works of the beſiegers, before they make a lodgment on the covered way: Or in eminences and riſing grounds, as to make a breach in the ramparts, &c. Or to blow up walls: Or, laſtly, to tear up rocks.

Theory of MINES.—M. Chevalier, in the memoirs of the royal academy of ſciences, has handled the ſubject of *mines* with a great deal of accuracy. He has calculated the force of gun-powder, the effort it makes, and the reſiſtance it meets with in heaving up the ground. He ſhews, that a cubic foot of air incloſed in two cubic feet of gun-powder, is capable of ſuſtaining a weight of near 290000 pounds. But obſerves withal, that this force is vaſtly greater than what it is found by experience to have; and that in fact, 140 pounds of powder do not raiſe above 30000 pounds of earth. The reaſon of which difference he aſcribes to ſeveral cauſes; as, that the powder does not take fire all at once, ſo that its force is divided; that part of the ſhock is loſt in the canal or paſſage of the *mine*, and in the pores of the bodies incompaſſing the *mine*; that the tenacity of the parts of the earth reſiſt a ſeparation; that it is not enough that the earth be ſupported, but it muſt be carried upwards with a certain velocity; and that the weight of the atmoſphere, is a very conſiderable obſtacle, to which no regard is had in the calculation. See GUN-POWDER.

From a great number of experiments it appears, 1°. That the effect of a *mine* is always towards the weakeſt ſide; ſo that the diſpoſition of the chamber of a *mine* does not at all contribute to determine this effect either one way or another, as the miners miſtakenly imagine.

2°. That the quantity of the powder muſt be greater or leſs, in proportion to the greater or leſs weight of the bodies to be raiſed, and to their greater or leſs coheſion; and the reſult of all the experiments that have been made for determining the different quantity of powder to be uſed for different bodies, is to allow for each cubic fathom,

Of looſe earth,	9 or 10 pounds of powder.
Of firm ſolid earth, and ſtrong ſand	11 or 12
Of argil, or fat clayey earth,	15 or 16
Of new maſonry, not very ſtrongly bound,	15 or 20
Of old maſonry well bound,	25 or 30

3°. That the aperture, or funnel of a *mine* that has been played, if it had been rightly charged, is a cone, the diameter of whoſe baſe is double the height, taken from the center of the *mine*.

4°. That when the *mine* has been over-charged, its aperture is nearly cylindrical, the upper extremity not being much wider than the chamber at bottom, where the powder was lodged.

5°. That, beſide the ſhock of the powder againſt the bodies it takes up, it likewiſe cruſhes all the earth that borders upon it, both underneath and ſide-ways, which cruſh extends itſelf the further as the matters make the leſs reſiſtance.

To account for all the effects reſulting from theſe experiments, and to determine the quantity of powder required for the charge of a *mine*, and the moſt advantageous diſpoſition for anſwering the intent: let us conceive, 1°. A *mine*, whereof all the parts wherewith it is incompaſſed are incapable of being compreſſed, and make an equable reſiſtance, ſuch as that of a bomb equally thick throughout, ſuſpended in the air; where it muſt be obſerved, that beſides the reſiſtance of the body, the effort of the powder muſt likewiſe ſurmount the weight of the ambient air; in which caſe the body will be beaten into duſt, or at leaſt into very ſmall pieces.

2°. Conceive a *mine* incompaſſed wholly by ſuch bodies as are equally compreſſible, and that reſiſt every way with equal force. In this caſe, the firſt effect of the powder will be to compreſs all thoſe bodies equally, and they will not be ſeparated, till by the violence of their compreſſion, they are all incapable, any longer, to reſiſt its effort; ſo that unleſs the powder be in great quantity, all its effect may end in the mere compreſſion of the adjacent bodies. For this reaſon, they ſometimes block up the chamber of the *mine* with large beams, and ſometimes wall it up with ſtones, that the adjacent bodies may reſiſt the more.

Laſtly, Suppoſe a *mine* where all the bodies that encompaſs it, are equally compreſſible, but where there is leſs reſiſtance on one ſide than another; in this caſe, there will be a ſphere of compreſſion, whoſe diameter will be ſo much the greater, as the weak ſide reſiſts the more. With regard to which, there are three things to be conſidered.

Firſt, If the effort of the powder be very great with relation to the reſiſtance of the weak ſide, the compreſſion will but reach a little way, that ſide being tore off too ſuddenly for the neighbouring parts to receive their ſhock. In which caſe, the aperture or funnel will be almoſt cylindrical, the diameter of the upper extreme not much exceeding that of the chamber; and the earth will be thrown to a great diſtance, which the enemy may make an advantage of, by forming lodgments in the cavity, as was done at the ſiege of Verue.

Secondly, If the *mine* be under-charged, it only makes a ſimple compreſſion on the weakeſt ſide, as it happened at Cividad Rodrigo.

Thirdly, If the *mine* be charged with a quantity of powder between the two extremes, it will raiſe a cone of earth, the diameter of whoſe baſe will have a greater or leſs ratio to its height from the center of the *mine*, as the effort of the powder is greater or leſs.

The moſt advantageous effect is when the diameter of the baſe of the cone is double its height: in which caſe, the earth blown up, falls almoſt all back again into the aperture of the *mine*; ſo that the enemy cannot make any lodgment.

To charge a *mine* therefore, ſo as it may have the moſt advantageous effect poſſible, the weight of the matter to be carried up muſt be known, *i. e.* the ſolidity of a right cone, whoſe baſe is double the height of the earth over the center of the *mine*, which is eaſily found from the rules of geometry.—Having found the ſolidity of the cone in cubic fathoms, multiply the number of fathoms by the number of pounds of powder neceſſary for raiſing the matter it contains, according to the proportion already laid down; and if the cone contain matters of different weights, take a mean weight between them all; having always a regard to their degree of coheſion.

As to the diſpoſition of *mines*, we have but one general rule, which is, that the ſide towards which one would determine the effect, be the weakeſt. But this varies according to occaſions and circumſtances.

Counter-MINE. See the article COUNTER-*mine*.

Gallery of a mine. See the article GALLERY.

Knight of the Mine, is a military honour, anciently conferred on perſons who had diſtinguiſhed themſelves in engagements in *mines*.

Mine-*ſhips*, are ſhips filled with gun-powder, incloſed in ſtrong vaults of brick or ſtone, to be fired in the midſt of an enemy's fleet.

Mine is alſo a French meaſure. See Measure.

MINERA, in medicine, the ſeat, or rather matter, of a diſeaſe. See Disease.

The term is applied by ſome authors to thoſe parts of the body wherein there are collections and coacervations of humours made; which hardening, form obſtructions, and produce diſeaſes.

In this ſenſe we ſay, the *minera morbi*, &c.—

MINERAL, in natural hiſtory, is ſometimes uſed in the general for *foſſil*; and applied to any body, ſimple or compound, dug out of a ſubterraneous place or *mine*; from which it takes the denomination. See Mine.

In this ſenſe, metals, ſulphurs, foſſil ſalts, ſemi-metals, &c. are *mineral*. See Fossil.

On this principle, they divide *minerals* into two claſſes; the one *fuſible*, and *malleable*; *i. e.* which melt with fire, and ſtretch on the anvil; which are what we properly call *metals*. See Metal.—The others want thoſe two properties; and are what in the ſtrict ſenſe we call *minerals*. See Ore, and Marcasite.

Some divide *minerals* into *ſimple* and *compound*: To the firſt belong *ſtones*; *ſalts*, as alum, nitre, &c. *Inflammable minerals*, as ſulphur and bitumen; and *metals*, as gold, &c.

Other more accurate writers, reſtrain the word *mineral* to what we otherwiſe call *ſemi-metal*. See Semi-metal.

Mineral, in this ſenſe, may be defined a compound foſſil, wherein there is ſomething diſcovered, in all reſpects like metal, only that it is not malleable; joined, or compounded with ſome other foſſil, as ſalt, ſulphur, ſtone, or earth.

Such are *antimony*, *cinnabar*, *biſmuth*, *calaminaris*, *vitriol*, *pyrites*, *marcaſites*, *cobalt*, *oker*, the *magnet*, *lapis hæmatites*, *armenus*, and *ſtellatus*. See each under its proper article, Antimony, Cinnabar, Bismuth, Vitriol, Calaminaris, &c.

Some attribute the formation of *minerals* to the action of the ſun without; ſome to the central fire within; and ſome think the cold does all by uniting, condenſing, and congealing certain juices of the earth.

Des Cartes takes metals to have been formed from the beginning of the world; and to have ranged themſelves, by the laws of gravity, about the centre. In proceſs of time, he ſuppoſes theſe to have been corroded by the acid ſalts, &c. and abundance of the parts thereof carried up along with thoſe ſalts by the ſubterranean heat, and depoſited in divers parts of the earth.

Monſ. Tournefort ſuppoſes ſeeds of *minerals*, as of animals, and vegetables. Every thing, according to him, comes from eggs, even ſtones; and the largeſt rocks were originally no more than grains of ſand. See his ſyſtem more at length under the article Stone.

Others, as M. Geoffroy, contend that metals, &c. may be the reſult of a mixture of certain matters, which had nothing metallic in them. Thus, in the aſhes of all vegetables we find a ferruginous matter which the load-ſtone attracts; and yet it will hardly be ſaid that iron exiſted in the plants. We ſee no ſigns of iron in argilla, work it in what manner you will; and yet add linſeed oil, and by fire you will procure iron. And the like may be ſaid of divers other matters.

Hence it is probable, metals may be formed by a mere combination of different ingredients; much like ſulphur, which we all know is made by adding an inflammable principle to a vitriolic ſalt. The earth may every where abound with thoſe matters, which are continually circulating through its pores and canals, and which meeting with an earth homogeneous to them, fix thereto; and commence *minerals*.

The *minerals*, metals, and ſtones lie in beds; and have done ſo ever ſince the flood, if not from the creation; yet it is highly probable they have a faculty of growing in their reſpective beds; that, as their beds are robbed and emptied by miners, ſo after a while they recruit again. Thus vitriol, Mr. Boyle thinks, may grow by the help of the air, and alum does the ſame. We are aſſured (ſays that author) by the experienced Agricola, that the earth, or oil of alum, being robbed of its ſalts, will in tract of time, recover it by being expoſed to the air.

As for metals, there is good reaſon to believe they grow likewiſe; from what has been alledged by Mr. Boyle in his obſervations about the growth of metals, and particularly as to the growth of iron. To the inſtances he brings from Pliny, Fallopius, Cæſalpinus, and others, we may add, that in the foreſt of Dean in Glouceſterſhire, the beſt iron, and in the greateſt quantities, are found in the old cinders which they melt over again.—This ſome impute to the negligence of the former melters in not exhauſting the ore. But Mr. Derham thinks it rather owing to the new impregnations of the old ore, or cinders from the air, than to any ſeminal principle in the ore itſelf.

The chymiſts generally take *minerals* to be nothing elſe but imperfect metals, which not having arrived at maturity, may be perfected by the chymical operations, and raiſed to true metals.—This agreeable, but fatal deluſion, has given riſe to the ſect of philoſophers, who ſtudy the philoſopher's ſtone. See Metal, Gold, Philosopher's *ſtone*, &c.

Æthiops Mineral. See the article Æthiops.

Turbith Mineral. See the article Turbith.

Mineral-*oil*. See the article Oil.

Minerale *bezoardicum*. See the article Bezoardicum.

Cryſtal Mineral. See Crystal *mineral*.

Mineral-*waters*, are thoſe, which at their ſpringing forth from under ground, are found impregnated with ſome *mineral* matter; as ſalt, ſulphur, vitriol, &c. See Water.

Such are hot baths, ſpaws, purging, &c. ſprings. See Bath, Spaw, Spring, &c.

MINIATURE*, or Mignature, a delicate kind of painting, conſiſting of little points or dots, inſtead of lines; uſually done on velom, with very thin, ſimple water-colours. See Painting.

* The word comes from the Latin *minium*, red lead; that being a colour much uſed in this kind of painting. The French frequently call it *mignature*, from *mignon*, fine, pretty, on account of its ſmallneſs and delicacy.

Miniature is diſtinguiſhed from other kinds of painting by the ſmallneſs and delicacy of its figures, the weakneſs of their colours, and faintneſs of the colouring; and in that it requires to be viewed very near.

Thoſe colours that have the leaſt body, are the beſt and moſt commodious for painting in *miniature*; as carmine, ultramarine, fine lakes, and green made of the juices of ſeveral kinds of herbs and flowers.

Painting in *miniature* is the niceſt and moſt tedious of all others; being performed wholly with the point of the pencil.

There are ſome painters who never uſe any white colour in *miniature*, but make the ground of the velom ſerve to raiſe their figures; in which caſe, the lights appear bright in proportion to the depth and ſtrength of the colours of the figures. Others, before they go to work, give the velom a light waſh with white lead, well prepared and purified.

When the colours are laid on flat without dotting, though the figures be ſmall, and the ground either velom or paper, it is not called *miniature*, but *waſhing*.

The colours for *miniature* may be mixed up with water of gum arabic, or gum tragacanth.

MINIM, in muſic, a note, or character of time; equal to two crotchets, or half a ſemibreve. See Time, and Characters *of muſic*.

Sextuple of the Minim. See the article Sextuple.

MINIMA *naturæ*, or Minima *naturalia*, among philoſophers, the primary particles, whereof bodies conſiſt; the ſame with what are otherwiſe called *corpuſcles* and *atoms*. See Corpuscle, Atom, Matter, Particle, &c.

Minima, in the higher geometry, the ſmalleſt quantities attainable in any given caſe. See Maximum.

Per Minima. See the article Per *minima*.

MINIMENTS, or Muniments. See Muniments.

MINIMI *digiti extenſor*. See the article Extensor.

Minimi *digiti pedis abductor*. See the article Abductor.

MINIMS, Minimi, an order of religious, inſtituted about the year 1440, by S. Francis de Paulo.

Theſe have improved on the humility of the *minors*, by terming themſelves *minimi*, or *minims*, q. d. leaſt, or ſmalleſt. See Minors.

MINIMUS *glutæus*. See the article Glutæus.

MINION, a ſort of cannon, or piece of ordnance, whereof there are two kinds; large, and ordinary. See Cannon, and Ordnance.

The large Minion, or one of the largeſt ſize, has its bore $3\frac{1}{4}$ inch diameter, and is 1000 pounds weight; its load is $3\frac{1}{2}$ pounds of powder; its ſhot three inches in diameter, and $3\frac{3}{4}$ pound weight; its length is eight foot, and its level range 125 paces.

The ordinary Minion is three inches diameter in the bore, and weighs about 800 pounds weight. It is ſeven foot long; its load $2\frac{1}{2}$ pounds of powder; its ſhot near three inches diameter, and weighs three pounds four ounces; and ſhoots point-blank 120 paces.

MINISTER, one that ſerves, or attends on God, the public, or a private perſon. See Servant.

In the reformed church, prieſts, or thoſe ordained to preach, and do the other functions of the prieſthood, are called abſolutely and ſimply *miniſters*.

In which ſenſe, biſhops, &c. are ſaid to be *miniſters* of God; *miniſters* of the word; of the goſpel, &c. In ſome churches they are alſo called *paſtors*. See Bishop, Priest, &c.

Ministers *of the altar*, are properly thoſe who attend, and aſſiſt the prieſt at the adminiſtration of the euchariſt.

Deacon and ſubdeacon, are titles that properly ſignify *miniſters*; Διακονος, *miniſter*. See Deacon, and Subdeacon.

Officers of ſtate, &c. are called the king's *miniſters*; as adminiſtring the affairs of juſtice, policy, *&c.* for him. See OFFICER.

Minister *of ſtate*, is he with whom a prince entruſts the adminiſtration of his government; or to whom he commits the care, and direction of the principal affairs thereof. See STATE, GOVERNMENT, and ARCH-MINISTER.

Boethius is propoſed as a model for *miniſters* of ſtate. The grand viſier is the prime *miniſter* of the Ottoman empire. See VISIER.

Foreign **Ministets**, or the *miniſters of foreign princes*, are their ambaſſadors, envoys, agents or reſidents in the courts of other princes.

There are two kinds of foreign *miniſters.—Miniſters* of the firſt rank, who are alſo called *embaſſadors* and *envoys in extraordinary.* See EMBASSADOR, and ENVOY.

And *miniſters* of the ſecond rank, who are the ordinary reſidents. See RESIDENT.

Thoſe of the firſt rank have a repreſentative character, which the others have not; though theſe laſt are ſometimes inveſted with fuller powers than the former.

Minister is alſo the title which certain religious orders give to their ſuperior. See SUPERIOR.

In this ſenſe we ſay the *miniſter* of the Mathurins, or Trinitarians. See TRINITARIAN, *&c.*

Minister, among the Jeſuits, is the ſecond ſuperior of each houſe; thus called, as being an aſſiſtant to the ſuperior, or rector. See JESUITS.

The general of the Cordeliers order is called the *miniſter general.* See GENERAL.

MINISTRY, or **Ministery**, a profeſſion, office, or employment which a perſon diſcharges for the ſervice of God, the public, or ſome particular perſon. See MINISTER.

In which ſenſe we ſay, a biſhop muſt give account to God of his *miniſtry*, &c.

Ministry is alſo uſed for the government of a ſtate, by ſome great miniſter, under the ſovereign authority.

In which ſenſe we ſay, the *miniſtry* of the cardinal de Richelieu, *&c.*

Ministry is alſo frequently uſed as a collective word, ſignifying the miniſters or officers of ſtate.

Thus we ſay, the *miniſtry* oppoſed a thing; meaning, the miniſters oppoſed it.

MINIUM, a mineral colour, called alſo *red lead*, uſed by painters, illuminers, *&c.* See LEAD.

Minium is a preparation of lead, performed by fire. It is made by melting the metal in an earthen unglazed pan, and ſtirring it over the fire till it be reduced to a powder called *calcined lead*, which being further urged by a reverberatory fire for three or four hours, turns red, and is the *minium.*

Beſide the uſe of *minium* as a colour, it is alſo an ingredient in an officinal compoſition, called *emplaſtrum de minio*, uſed as a deſiccative and cicatrizer.

It was with *minium*, prepared in this manner, the ancient Roman and Grecian ladies tinged their nails and faces of a red colour. For as to vermillion, without doubt it was not known in thoſe days. See VERMILLION.

MINOR, a Latin term, litterally denoting *leſs*; uſed in oppoſition to *major*, greater. See MAJOR.

Thus we ſay, St. James *minor*; Aſia *minor*; the *minor* excommunication, *&c.*

The four **Minor** *orders*, are the four inferior orders conferred in the Romiſh church, between the tonſure and ſubdeaconate.—Theſe are that of *porter*, or *door-keeper*; that of *reader*; that of *exorciſt*; and that of *acolyth.* See EXORCIST, ACOLYTH, *&c.*

Minor *ædiles.* See the article ÆDILE.

Minor *anticus ſerratus.* See the article SERRATUS.

Minor *barons.* See the article BARON.

Canis **Minor.** See the article CANIS.

Rectus **Minor.** See the article RECTUS.

Minor *gaſtricus.* See the article GASTRICUS.

Minor *oculi obliquus.* See the article OBLIQUUS.

Teres **Minor.** See the article TERES.

Urſa **Minor.** See the article URSA.

Minor, in law, denotes a perſon yet under age, or who, by the laws of the country, is not yet arrived at the power of adminiſtring his own affairs, or the poſſeſſion of his eſtate. See AGE.

Among us a perſon is a *minor* till the age of twenty-one: before which time his acts are invalid. See MAJOR.

Yet if a patron, *&c.* have a right of advowſon, by the common law he may preſent at the age of fourteen years; and may of himſelf, and without his father, or guardian, conſent to any proceſs relating to beneficiary matters. See PATRON.

Hence, in the canon law, there is no title, *de minoribus*; and the reaſon is, that the ſeveral ages whereat the common law declares a perſon capable of a benefice, or of ſacred orders, are ſo many ſpecies of canonical majorities.

Minor, in logic, is the ſecond propoſition of a formal, or regular ſyllogiſm, called alſo the *aſſumption.* See SYLLOGISM, PROPOSITION, ASSUMPTION, and MAJOR.

I grant the major, but deny the *minor.* See TERM, and PREMISES.

Minor, in muſic, is applied to certain concords, which differ from, or are lower than others of the ſame denomination by a leſſer ſemi-tone, or four commas.

Thus we ſay, a third *minor*, or leſſer third: a ſixth major, and *minor.* See THIRD, SIXTH, *&c.*

Concords that admit of major and *minor*, *i. e.* greater and leſs, are ſaid to be *imperfect concords.* See CONCORD.

MINORS, or *Friars* **Minors**, an appellation which the Franciſcans aſſume, out of ſhew of humility; calling themſelves *fratres minores*, i. e. *leſſer brothers*; and ſometimes *minorites.* See CORDELIERS, and ORDER.

There is alſo an order of regular *minors* at Naples, eſtabliſhed in the year 1588, and confirmed by Sixtus V.

MINOT, a French meaſure. See MEASURE.

MINOTAUR, **Minotaurus**, in antiquity, a fabulous monſter, much talked of by the poets; feigned to be half man, and half bull.

The *minotaur* was brought forth by Paſiphaë, wife of Minos king of Crete. It was ſhut up in the labyrinth of that iſland; and at laſt killed by Theſeus. See LABYRINTH.

Servius gives us the explication of this fable. He ſays, that a ſecretary of King Minos, named Taurus, bull, had an intrigue with the queen Paſiphaë, in the chamber of Dædalus; and that ſhe was at length delivered of twins, one of which reſembled Minos, and the other Taurus.—This occaſioned the production to be reputed monſtrous.

MINOVERY*, a treſpaſs committed in the foreſt, by ſomething that is a man's handy-work; as an engine to catch deer, *&c.* See FOREST.

* The word is formed of the French *Main œuvre*, q. d. handywork.

MINSTER*, anciently ſignified the church of a monaſtery, or convent. See CHURCH.

* The word is Saxon, *mynſter*, or *mynſtre.*

MINSTREL*, an ancient term for a fidler, or player on any other kind of muſical inſtrument.

* Borel derives the word from *manus* and *hiſtrio*, one who diverts with the hand; or from *minor hiſtrio*, little buffoon: Du Cange from *miniſtellus*, a diminutive of miniſter, by reaſon the *minſtrels* were anciently ranked among the lower officers, miniſters, or ſervants.

The word *minſtrel*, in its original, was uſed for people who ſung, and ſerenaded their miſtreſſes. Afterwards it became a name for all kinds of muſicians: and at length paſſed to buffoons, and country-ſcrapers.

MINT, the place where the king's money is coined. See COIN.

Anciently there were *mints* in moſt cities of England. See MONEY, and COINAGE.—The chief *mint* at preſent, is the tower of London. See TOWER.

Officers of the **Mint**, are, 1°. The *warden*, who is the chief, and is to receive the bullion, and over-ſee all the other officers. See WARDEN, and MASTER. 2°. The *maſter-worker*, who receives the bullion from the warden, cauſes it to be melted, and delivered to the moneyers, and takes it from them again when coined. 3°. *Comptroller*, who is to ſee that the money be made to the juſt aſſize, and to over-ſee the officers. 4°. The *aſſay-maſter*, who weighs the ſilver and gold, and ſees whether it be ſtandard. 5°. The *auditor*, who takes all the accounts. 6°. The *ſurveyor of the melting*, who is to ſee the ſilver caſt out, and that it be not altered after it is delivered to the melter, *i. e.* after the aſſay-maſter has made trial of it. 7°. The *clerks of the irons*, who is to ſee that the iron be clean, and fit to work with. 8°. The *graver*, who engraves the dyes and ſtamps for the coinage of the money. 9°. The *melters*, who melt the bullion before it comes to coining. 10°. The *blanchers*, who anneal, or boil and cleanſe the money. 11°. The *porters*, who keep the gate of the *mint.* 12°. The *provoſt* of the *mint*, who provides for all the moneyers, and overſees them. And laſtly, the *moneyers*, ſome of which ſhear the money; ſome forge it; ſome ſtamp or coin it; and ſome round and mill it. See COINAGE.

MINT-*water.* See the article WATER.

MINTERS, or **Moneyers.** See MONEYERS.

MINTING, is ſometimes uſed for the coining of money. See COINING.

MINUS, in algebra. See CHARACTERS in *arithmetic.*

Quo **Minus**, in law. See the article QUO *minus.*

MINUSCULÆ, in printing, denotes the ſmall, or running letters; as contradiſtinguiſhed from *majuſculæ*, or capitals. See LETTER, CAPITAL, *&c.*

MINUTE*, in geography and aſtronomy, is the 60th part of a degree. See DEGREE.

* The word comes from the Latin, *minutus*, ſmall.

In which ſenſe, *minute* is alſo called *prime*, or *prime-minute.* See PRIME.—The diameter of the ſun is ſeen under an angle of 39 *minutes* in winter; and 31 in ſummer. See DIAMETER, and SUN.

The diviſions of degrees are fractions, whoſe denominators increaſe in a ſexagecuple ratio; that is, a *minute* or prime is $=\frac{1}{60}$; a ſecond, or ſecond *minute* $=\frac{1}{3600}$, *&c.* See SEXAGESIMAL.

In aſtronomical tables, *&c. minutes* are expreſſed by acute accents.

cents, thus, ′; ſeconds by two, ″; thirds by three, ‴. See Second, and Third, &c.

Minute, in computation of time, is uſed for the ſixtieth part of an hour. See Hour.

Minute, in architecture, uſually denotes the ſixtieth, ſometimes only the thirtieth part, or diviſion of a module. See Module.

Minute, is alſo uſed to ſignify a ſhort memoir, or ſketch of any thing taken haſtily in writing.

In this ſenſe we ſay, the *minutes* of the proceedings of the houſe of lords, &c.

Meridional **Minutes**. See the article Meridional.

Minutes *of emerſion*. See the article Emersion.

MIPARTY, *Chamber of*. See Chamber.

MIQUELETS, a kind of foot-ſoldiers, inhabiting the Pyrenean mountains; armed with piſtols under their belts, a carbine, and a dagger.—The *miquelets* are dangerous people for travellers to meet.

MIRABILIS *aqua*. See the article Water.

Rete **MIRABILE**. See the article Rete.

MIROBOLANS, or Myrobalans, in pharmacy. See Myrobalans.

MIRACLE, in a popular ſenſe, is a *prodigy*; or an extraordinary event that ſurprizes us by its novelty. See Prodigy.

Miracle, in a more accurate and philoſophical ſenſe, is an effect that does not follow from any of the known laws of nature; or which is inconſiſtent with ſome known laws thereof. See Nature.

A *miracle*, therefore, being a ſuſpenſion of ſome law, cannot come from any hand leſs than his who fixed that law. See God, Law, &c.

Spinoſa denies that any power can ſuperſede that of nature; or that any thing can diſturb, or interrupt the order of things: and accordingly defines a *miracle* to be a rare event, happening in conſequence of ſome laws that are unknown to us. See Spinosism.

Divines define *miracle*, an extraordinary and wonderful effect, above the power of nature, wrought by God, to manifeſt his power or providence; or to give credit to ſome meſſenger ſent from himſelf.—Thus Jeſus Chriſt evinced the truth of his miſſion, and his doctrine, by *miracles*; and thus alſo did Moſes. It is ſtill a diſpute in the world, how far it may be in the power of the devil to work *miracles*; or wherein the ſpecific difference lies between the *miracles* of Moſes, and thoſe of Pharaoh's magicians; thoſe of Jeſus Chriſt and the apoſtles, and thoſe of Simon Magus and Apollonius Tyaneus! Whether the latter were any more than mere deluſions of the ſenſes; or whether any ſupernatural and diabolical power concurred with them? See Magic.

The Romans attribute *miracles* to their emperors Adrian and Veſpaſian.—The church of Rome abounds in *miracles*; if we believe their writers, ſome of their monks have wrought more *miracles* than all the apoſtles; and this without any viſible neceſſity for them.

As full as that church pretends to be of ſaints, it is a rule with them, that none are ever canonized till there be good proof of his having wrought *miracles*. So that were all thoſe allowed good *miracles*, and to have happened out of the common order of nature, they are ſo numerous, one would be tempted to think there were no order or law of nature at all. See Saint, and Canonization.

St. Auguſtine is a ſtrong advocate for *miracles*. He mentions ſeveral, whereof he was an eye-witneſs; and others, whereof he was informed by thoſe that were. In the ſingle city of Hippo he tells us there were ſeventy *miracles* wrought in the ſpace of two years, on the building a chapel in honour of St. Stephen.

There are thoſe however, who ſet aſide the authority of all *miracles*; thinking it unbecoming the wiſdom of God to eſtabliſh ſuch laws, as that he ſhould find it frequently neceſſary to ſuperſede. And as the former, from the avowed authority of ſome *miracles*, fetch an argument for the truth of all; pleading thoſe which are allowed as well as thoſe which are queſtioned: ſo theſe alledge the falſe ones as concluſions againſt them all.

In effect, though *miracles* may prove the ſuperintendency of a voluntary agent, and that the univerſe is not guided by neceſſity or fate; yet that mind muſt be weak and inadvertent, who needs them to confirm the belief of a wiſe and good deity: Since the deviation from general laws, unleſs upon very extraordinary occaſions, muſt be a preſumption of inconſtancy and weakneſs, rather than of a ſteady wiſdom and power; and muſt weaken the beſt arguments we have for the ſagacity and power of the univerſal mind. *Inquiry into the original of the ideas of beauty*, &c.

MIRROUR, or Mirror, a *ſpeculum*, or body which exhibits the images of objects preſented thereto, by reflection. See Reflection.

The uſe of *mirrours* is very ancient. Mention is made of brazen *mirrours*, or looking-glaſſes, in Exodus xxxviii. 8. where Moſes is ſaid to have made a *brazen laver*, or baſon, *of the looking-glaſſes of the women continually aſſembled at the door of the tabernacle*. It is true, ſome modern commentators will not allow the *mirrours* themſelves to have been braſs; but of glaſs, only ſet, or framed in braſs. But the moſt learned among the rabbins do all allow that in thoſe times, the *mirrours* made uſe of by the Hebrew women in dreſſing their heads, were of metal; and that the devout women mentioned in this paſſage, made preſents to Moſes of all their *mirrours* to make the brazen laver. See the Jeſuit Bonfrerius's comment on this text.

It might likewiſe be proved, that the ancient Greeks made uſe of brazen *mirrours*; from divers paſſages among the ancient poets. See Burning-*glaſs*.

Mirrour, in the more confined ſenſe of the word, is peculiarly uſed to ſignify a ſmooth ſurface of glaſs, tinned or quickſilvered on the back ſide; which exhibits the images of objects oppoſed thereto. See Looking-Glass.

Mirrour, in catoptrics, denotes any poliſhed body impervious to the rays of light, and which of conſequence reflects them equally. See Ray, and Light.

Thus water in a deep well or river, and ſmooth polite metals, are ranked among the number of *mirrours*.

In this ſenſe, the doctrine of *mirrours* makes the ſubject of catoptrics. See Catoptrics.

The doctrine of **Mirrours** *is founded on the following general principles.*—1°. Light reflected from any *mirrour*, or ſpeculum, makes the angle of incidence equal to that of reflection; which ſee demonſtrated under the word Reflection.

Hence, a ray of light, as H B (*Tab. Optics. fig.* 26.) falling perpendicularly on the ſurface of a ſpeculum, D E, will be reflected back upon itſelf:—which we find by experience it actually does.

From the ſame point of a *mirrour*, therefore, A, there cannot be ſeveral rays reflected to the ſame point; ſince in that caſe, all the angles of reflection muſt be equal to the ſame angle of incidence A B D, and therefore to each other; which is abſurd. Nor can the ray A B be reflected to two or more points: ſince, in that caſe, all the angles of reflection would be equal to the ſame angle of incidence A B F: which is likewiſe abſurd.

2°. From every point of a *mirrour*, are reflected rays thrown on it from every point of a radiant object.—Since then rays coming from different parts of the ſame object, and ſtriking on the ſame point of the *mirrour*, cannot be reflected back to the ſame point; the rays which flow from different points of the ſame radiating object, are again ſeparated after reflection: ſo that each point ſhews whence it came. See Radiant.

Hence it is, that the rays reflected from *mirrours* exhibit the objects to view.—Hence alſo, it appears, that rough uneven bodies muſt reflect the light in ſuch manner, as that rays coming from different points will be blended or thrown confuſedly together.

Mirrours may be divided into *plane*, *concave*, *convex*, *cylindrical*, *conical*, *parabolical*, and *elliptical*.

Plane **Mirrours**, are thoſe which have a plain or flat ſurface. See Plane, and Plain.

Theſe, by a popular word, we call *looking-glaſſes*.

For the manner of making plain *mirrours*, or ſpecula, ſee Looking-Glass.

Laws and phænomena of plain mirrours.—1°. In a plain *mirrour*, every point of an object, as A, (*Tab. Optics*, *fig.* 27.) is ſeen in the interſection, B, of the cathetus of incidence, A B, with the reflected ray C B.

Hence, 1°. As all the reflected rays meet with the cathetus of incidence in B; by whatever reflected ray the radiant point A be ſeen, it will ſtill appear in the ſame place. Conſequently, any number of perſons viewing the ſame object in the ſame *mirrour*; will all ſee it in the ſame place behind the *mirrour*.—And hence it is, that the ſame object has only one image, and that we do not ſee it double with both eyes. See Vision.

Hence alſo the diſtance of the image B, from the eye C, is compounded of the ray of incidence A D, and the reflected ray C D: And the object A radiates reflectedly, in the ſame manner as it would do directly, were it removed into the place of the image.

2°. The image of a radiant point, B, appears juſt ſo far behind a plain *mirrour*, as the radiant point is before it.

Hence, If the *mirrour* A G be placed horizontal; the point A will ſeem ſo much below the horizon, as it is really elevated above it: Conſequently, erect objects will appear as if inverted; and therefore men ſtanding on their feet, as if on their heads. Or, if the *mirrour* be faſtened to the ceiling of a room, parallel to the horizon, objects on the floor will apear above the ceiling as much as they really are below it; and that upſide down.

3°. In a plain *mirrour*, the images are perfectly ſimilar, and equal to the objects. And hence their uſe as looking-glaſſes.

4°. In a plain *mirrour*, things on the right hand, appear as on the left; and *vice verſa*.

Hence alſo, we have a method of meaſuring any inacceſſible altitude by means of a plain *mirrour*.—Thus, the *mirrour* being placed horizontally in C, (*Fig.* 28.) retire from it till ſuch time as the top of the tree be ſeen therein. Meaſure the height of the eye D E; the diſtance of the ſtation from the point of reflection E C, and the diſtance of the foot of the tree from the ſame. Then to E C, C B, and E D, find a fourth proportional A B. This is the altitude ſought. See ALTITUDE.

5°. If a plain *mirrour* be inclined to the horizon in an angle of 45 degrees; an object perpendicular to it will appear parallel, and an horizontal object perpendicular.

And hence, the eye being placed beneath the *mirrour*, the earth will appear perpendicularly over it; or if placed over it, the earth will appear perpendicularly under it. Hence alſo, a globe deſcending down a plane a little inclined, may, by means of a *mirrour*, be exhibited as mounting up a vertical plain, to the great ſurprize of ſuch as are unacquainted with catoptrics.—And hence we have a method of repreſenting ourſelves as if flying.—For a *mirrour* inclined to the horizon under an angle of 45°, we have obſerved, will repreſent vertical objects as if horizontal. Conſequently, a large *mirrour* being ſo diſpoſed; as you advance toward it, you will ſeem to move horizontally; and nothing will be wanting to the appearance of flying, but to ſtrike out the arms and legs. It muſt be added, however, that as the floor is elevated along with you, your feet will ſtill be ſeen to walk as along a vertical plane. To deceive the eye intirely, therefore, it muſt be kept from the feet.

6°. If the object A B (*fig.* 29.) be parallel to the ſpeculum C D, and equally diſtant from it, with the eye; the reflecting line C D will be half the length of the object A B.

And hence, to be able to ſee the whole body in a plain *mirrour*; its height and breadth muſt be half your height and breadth. Conſequently, the height and breadth of any object to be ſeen in a *mirrour*, being given; we have alſo the height and breadth of the *mirrour* wherein the whole object will appear, at the ſame diſtance with the eye.

Hence alſo, as the length and breadth of the reflecting part of the ſpeculum, are ſubduple of thoſe of the object to be reflected; the reflecting part of the *mirrour*, is to the ſurface reflected in a ſubquadruple ratio. Conſequently, the reflecting portion being a conſtant quantity; if in any place you ſee the whole body in a *mirrour*, you will ſee it in every other place, whether you approach nearer, or recede farther from it.

7°. If ſeveral *mirrours*, or ſeveral fragments, or pieces of a *mirrour*, be all diſpoſed in the ſame plane; they will only exhibit an object once.

8°. If two plain *mirrours*, or ſpecula meet in any angle; the eye, placed within that angle, will ſee the image of an object placed within the ſame, as often repeated as there may be catheti drawn determining the places of the images, and terminated without the angle.

Hence, as the more catheti terminated without the angle, may be drawn as the angle is more acute; the acuter the angle, the more numerous the images. Thus Z. Traber found at an angle of one third of a circle, the image was repreſented twice, at $\frac{1}{4}$ thrice, at $\frac{1}{6}$ five times, at $\frac{1}{12}$ eleven times.

Further, if the *mirrours* be placed upright, and ſo contracted; or if you retire from them, or approach to them, till the images reflected by them coaleſce, or run into one, they will appear monſtrouſly diſtorted: Thus if they be at an angle ſomewhat greater than a right one, the image of your face will appear with only one eye; if the angle be leſs than a right one, you will ſee three eyes, two noſes, two mouths, &c. At an angle ſtill leſs, the body will have two heads. At an angle ſomewhat greater than a right one, at the diſtance of four feet, the body will be headleſs, &c. Again, if the *mirrours* be placed the one parallel to the horizon, the other inclined to it, or declined from it, it is eaſy to perceive that the images will be ſtill more romantic. Thus, one being declined from the horizon to an angle of 144 degrees, and the other inclined to it; a man ſees himſelf ſtanding with his head to another's feet.

Hence it appears how *mirrours* may be managed in gardens, &c. ſo as to convert the images of thoſe near them into monſters of various kinds: And ſince glaſs *mirrours* will reflect the image of a lucid object twice or thrice; if a candle, &c. be placed in the angle between two *mirrours*, it will be multiplied an infinite number of times.

On theſe principles are founded various catoptric machines, ſome of which repreſent objects infinitely multiplied and diſtorted; others infinitely magnified, and ſet at vaſt diſtances. See CATOPTRIC *ciſtula*, &c.

Convex MIRROURS are thoſe whoſe ſurface is convex. See CONVEX.

Note, by *convex* ſurfaces, authors generally mean ſuch as are ſpherically convex. See CONVEXITY.

Manner of preparing or making convex ſpecula, or MIRROURS.—There are divers methods uſed by divers artiſts; particularly as to the matter, or compoſition. One of the beſt that is known, is given us by Wolfius thus:

Melt one part of tin, another of marcaſite together, and to the melted maſs add two parts of mercury; as ſoon as the mercury begins to evaporate into ſmoke (which it preſently does) the whole compoſt is to be thrown into cold water, and when well cooled, the water decanted off. The mixture is then to be ſtrained through a linen cloth two or three fold; and what is thus ſecerned, poured into the cavity of a glaſs ſphere: this ſphere is to be turned gently round its axis till the whole ſurface is covered; the reſt being reſerved for future uſe.

If the ſphere were of coloured glaſs, the *mirrour* will be ſo too.

And in the ſame manner may conic, elliptic, cylindric, and other *mirrours* be made.

How they may be made of metal, ſee under *concave* MIRROUR.

Laws, or phænomena of convex MIRROURS.—1°. In a ſpherical convex *mirrour*, the image of a radiant point appears between the centre, and the tangent; but nearer to the tangent than the centre.

Hence, the diſtance of the object from the tangent is greater than that of the image. And, conſequently, the object is further diſtant from the ſpeculum than the image.

2°. If the arch BD, (*fig.* 31.) intercepted between the point of incidence D, and the cathetus A B; or the angle C formed in the centre of the *mirrour* by the cathetus of incidence A C, and that of obliquation F C, be double the angle of incidence; the image B will appear on the ſurface of the ſpeculum.

3°. If the arch intercepted between the point of incidence, and the cathetus; or the angle C formed in the centre of the *mirrour* by the cathetus of incidence, and the cathetus of obliquation, be more than double the angle of incidence; the image will be without the *mirrour*.

4°. If the arch intercepted between the point of incidence, and the cathetus; or the angle formed in the centre of the *mirrour*, by the cathetus of incidence, and that of obliquation be leſs than double the angle of incidence; the image will appear within the ſpeculum.

5°. In a convex *mirrour*, a remoter point, A, (*fig.* 32.) is reflected from a point F, nearer the eye O, than any nearer point B in the ſame cathetus of incidence.

Hence, if the point of the object A, be reflected from the point of the *mirrour* F; and the point of the object B from the point of the *mirrour* E: all the intermediate points between A and B will be reflected from the intermediate points of the ſpeculum between F and E. Conſequently F E will be the line that reflects A B.

Hence alſo, a point of the cathetus B, ſeems at a greater diſtance C *b* from the centre C; than a more remote one, A.

6°. A nearer point B (*fig.* 33.) not in the ſame cathetus with a remoter, H; is reflected to the eye O, from a nearer point of the ſpeculum, than the remoter H.

Hence, if the point of an object A, be reflected from the point of a *mirrour* C; and the point of the object B, from the point of the ſpeculum D, all upon the ſame point O: All the intermediate points between A and B will be reflected from all the intermediate points between C and D. Conſequently, the image FG, of the object B A, is contained between the cathetus B E, and A E.

7°. In a ſpherical convex *mirrour*, the image is leſs than the object.

And hence the uſe of ſuch *mirrours* in the art of painting, where objects are to be repreſented leſs than the life.

8°. In a convex *mirrour*, the more remote the object; the leſs its image: And again, the ſmaller the *mirrour*, the leſs the image.

9°. In a convex *mirrour*, the right hand is turned to the left; and the left to the right: And magnitudes perpendicular to the *mirrour*, appear topſy turvey.

10°. The image of a right line perpendicular to the *mirrour*, is a right line; but that of a right line either oblique to the *mirrour*, or parallel thereto, is convex.

11°. Rays reflected from a convex *mirrour*, diverge more than if reflected from a plane *mirrour*.

Hence light, by being reflected from a ſpherical *mirrour*, is weakned; and, conſequently, the effects of reflected light are weaker than thoſe of direct. Hence alſo, myopes ſee remote objects more diſtinctly in a convex *mirrour*, than they do directly.

Rays reflected from a convex *mirrour* of a ſmaller ſphere, diverge more than if reflected from a larger. Conſequently, the light is more weakned, and its effects are leſs conſiderable in the former caſe than the latter.

Concave MIRROURS are thoſe whoſe ſurface is concave. See CONCAVE.

Note, by *concave*, authors commonly mean *ſpherically concave*.

Manner of preparing or making concave MIRROURS.—Firſt, a mould is to be provided for caſting them. In order to this, take clay well dried, pulverize, and ſift it; mix it up with water, and then ſtrain or filter it; with this, work up horſe-dung and hair ſhred ſmall, till the maſs be ſufficiently tough; to which, on occaſion, may be added charcoal-duſt, or brick-duſt, well ſifted.

Two coarſe moulds are then prepared of a gritty ſtone, the one concave, the other convex, which are to be ground on one another with wet ſand between, till ſuch time as the one perfectly fits the other. By this means a perfect ſpherical figure is acquired.

The maſs prepared before, is now to be extended on the table by means of a wooden roller, till it be of a thickneſs proper for the *mirrour*; and then being ſtrewed with brick-duſt to prevent its ſticking, it is laid over the convex mould, and ſo gets the figure of the *mirrour*. When this is dry, it is covered with another lay of the ſame maſs; which once dried, both covers, or ſegments of the hollow ſphere made of clay, are taken off. The innermoſt of the two being laid aſide, the ſtone mould is anointed with a pigment prepared of chalk and milk, and the outer cover again put over it.

Laſtly, the joining being covered over with the ſame clay whereof the cover is formed; the whole mould is bound together with iron-wire; and two holes cut through the cover, the one for the melted matter of the *mirrour* to be poured thro', the other for the air to eſcape at, to prevent the *mirrour's* being ſpoiled with bubbles.

The mould thus prepared; eight parts of copper, one of Engliſh tin, and five of marcaſite, are melted together; a little of the mixture is taken out with a ladle, and if it be too red, when cold, more tin is put in; if too white, more copper: The maſs is then poured into the mould before prepared; and ſo aſſumes the figure of a *mirrour*.

Some with ten parts of copper mix four of Engliſh tin, a little antimony and ſal armoniac, ſtirring the maſs about as long as any fumes ariſe from it. Others have other compoſitions; many of which are deſcribed by Schottus and Zahnius.

The *mirrour* being thus caſt, is cemented to a wooden frame, and thus worked to and fro over the convex ſtone mould, firſt with water and ſand; and, laſtly, without ſand, till it be fit for poliſhing. The ſtone-mould is then covered with paper, and that ſmeared over with Tripoly duſt and calx of tin: over which the *mirrour* is worked to and fro till it have got a perfect poliſh.—And in the ſame manner are glaſs *mirrours* poliſhed, excepting that the convex ſurface is there worked in the concave mould.

When the *mirrours* are very large, they are fixed on a table, and firſt ground with a gritty ſtone, then with pumice, then with fine ſand, by means of a glaſs cemented to a wooden frame; and laſtly rubbed with calx of tin and Tripoly duſt by a wet leather.

For concave *mirrours* of glaſs; the mould is uſually made of alabaſter: The reſt, as in metal *mirrours*.

Laws and phænomena of concave MIRROURS.—1°. If a ray, as KI, (*fig.* 34.) fall on a concave *mirrour* LI, under an inclination of 60 degrees, and parallel to the axis AB; the reflected ray IB will concur with the axis AB in the pole of the glaſs B.—If the inclination of the incident ray be leſs than 60 degrees, as that of E, the reflected ray EF will concur with the axis at the diſtance BF, which is leſs than a fourth part of the diameter.—And univerſally, the diſtance of the point F, wherein the ray HE concurs with the axis, from the centre C, is to half the radius CD in the ratio of the whole ſine, to the coſine of inclination.

Hence it is gathered by calculation, that in a concave ſpherical *mirrour*, whoſe breadth ſubtends an angle of ſix degrees, parallel rays meet after reflection in a part of the axis leſs than the one thouſand four hundred fifty ſeventh part of the radius: if the breadth of the concave *mirrour* be 6, 9, 12, 15, or 18° degrees; the part of the axis wherein the parallel rays meet after reflexion is leſs than $\frac{1}{363}$, $\frac{1}{160}$, $\frac{1}{89}$, $\frac{1}{56}$, $\frac{1}{36}$ of the radius.

And on this principle it is, that *burning-glaſſes* are built.

For ſince the rays diffuſed through the whole ſurface of the concave *mirrour*, after reflection are contracted into a very ſmall compaſs; the light and heat of the parallel rays muſt be prodigiouſly increaſed thereby, *viz.* in a duplicate ratio of the breadth of the *mirrour*, and the diameter of the circle wherein all the rays are collected: And ſince the ſun's rays are, as to any purpoſes on earth, parallel, (ſee LIGHT) no wonder concave *mirrours* ſhould burn with ſo much violence. See BURNING-*glaſs*.

From this ſame principle is likewiſe deduced a method of repreſenting the images of objects in a dark room; which ſee under CAMERA *obſcura*.

2°. A lucid body being placed in the focus F, of a concave *mirrour*, EI, (*fig.* 34.) the rays after reflection become parallel. Hence an intenſe light may be projected to a vaſt diſtance, by a ligted candle, &c. placed in the focus of a concave *mirrour*.

Hence alſo, if the parallel rays be received by another concave *mirrour*, they will again concur in its focus, and burn.

Zahnius mentions an experiment of this kind made at Vienna, where two concave *mirrours*, the one ſix, the other three feet diameter, being placed about twenty-four feet apart, with a live coal in the focus of the one, and a match and tinder in the other, the rays of the coal lighted the candle.

3°. If a lucid body be placed between the focus F, (*fig.* 34. *n.* 2.) and the *mirrour* HBC, the rays after reflection will diverge from the axis BA. Whence it follows that light is weakned by reflection.

4°. If a lucid body be placed between the focus F, and the centre G, the rays after reflection will meet in the axis beyond the centre.

Hence if a candle be placed in I, its image will appear in A; if it be placed in A, its image will be in I; in the intermediate points between I and A the ſection of light will be a circle, and that ſo much the greater, as it is nearer the point of concourſe.

5°. If a luminous body be placed in the centre of the *mirrour*, all the rays will be reflected back upon themſelves. Hence if the eye be placed in the centre of a concave *mirrour*, it will ſee nothing but itſelf, and that confuſedly through the whole *mirrour*.

6°. If a ray falling from the point of the cathetus *h*, (*fig.* 35.) on the convex *mirrour*, *b*E, be together with its reflex IF, continued within the concavity of the *mirrour*; FH will be the incident ray from the point of the cathetus H, and FO its reflex.

Hence, ſince the point of the cathetus H is the image of the point *h* in the convex *mirrour*; but the point *h* the image of H in the concave: if the image of an object reflected by a convex ſpeculum, be ſeen by a reflection made in its concavity, it will appear like the object itſelf.

And ſince the image of an infinite cathetus is leſs in a convex glaſs by one fourth of its diameter; a portion of the cathetus leſs than a fourth part of the diameter, may appear of any magnitude required in a concave one.

A point therefore diſtant from a concave ſpeculum, leſs than one fourth of the diameter, muſt appear behind the *mirrour* at any diſtance, how great ſoever.

Since the image of any object, how broad ſoever, is contained in a convex ſpeculum, between the two lines of incidence of its extreme points; if an object be placed between the two lines at a diſtance leſs than one fourth of its diameter, the breadth of the image, how great ſoever, may all appear.

Since the image of an object included between two lines, at a diſtance leſs than one fourth of the diameter, may exceed the juſt height and breadth of the object; nay, may be made of any magnitude, how big ſoever: Objects placed between the focus and the *mirrour*, muſt appear of enormous magnitudes in concave *mirrours*; the image being ſo much the greater in the concave *mirrour*, as it is leſs in the convex.

In a convex *mirrour*, the image of a remote object appears nearer the centre than that of a nearer object: therefore in a concave *mirrour*, the image of an object remote from the *mirrour*, appears at a greater diſtance than that of a nearer object, provided the diſtance of the object from the centre be leſs than a fourth part of the diameter.

In a convex ſpeculum, the image of a remote object is leſs than that of a near one; therefore in a concave one, the image of an object placed between the focus and the *mirrour*, is nearer the focus than the ſpeculum.

The image therefore of an object receding continually from a concave ſpeculum, becomes continually greater, provided it do not recede beyond the focus, where it becomes confuſed; and as it approaches, it grows continually leſs.

In a convex ſpeculum, if the ſphere, whereof it is a ſegment, be ſmaller, the image is ſmaller than in another of a larger ſphere; therefore in a concave, if the ſphere whereof it is a ſegment, be ſmaller, the image will be larger than in another, whoſe ſphere is larger: whence concave *mirrours*, if they be ſegments of very ſmall ſpheres, will do the office of microſcopes.

7°. If an object be placed between a concave *mirrour* and its focus, its image will appear behind the *mirrour*, in an erect but inverted ſituation.

8°. If an object AB, (*fig.* 36.) be placed between the focus and the centre, its image EF will appear inverted, and in the open air, beyond the centre, the eye being placed beyond the centre.

9°. If an object EF be placed beyond the centre C, and the eye likewiſe beyond the centre, the image will appear inverted in the open air between the centre and the focus.

Hence, the inverted images of objects placed beyond the centre, are reflected by a concave *mirrour*, erect, and may be received on a paper applied between the centre and the focus, eſpecially if the room be dark: if the object EF be further diſtant from the centre than is the focus, the image will be leſs than the object.

On this principle, concave *mirrours*, eſpecially thoſe which are ſegments of large ſpheres, and are capable of reflecting entire objects, exhibit many pleaſing phænomena. Thus, if a man flouriſh a ſword againſt the *mirrour*, another comes out thereof, and meets him with the ſame motions; and the image of his head coming out of the *mirrour*, if he ſtrike it with his real ſword, the imaginary ſword will ſtrike his real head. If he ſtretch out his hand, another hand will be ſtretched out of the *mirrour*, and meet it at a great diſtance in the open air, &c.

And on the ſame principle are built catoptric ciſtulæ, which when looked into, exhibit images vaſtly bigger than the cheſt. See CATOPTRIC *ciſtula*.

10°. The image of a right line perpendicular to a concave *mirrour*, is a right line; but all oblique or parallel lines are concave.

Cylindrical, conical, parabolical, and *elliptical* MIRROURS, or ſpecula, are thoſe terminated by a ſurface reſpectively cylindrical, conical, parabolical, and ſpheroidical. See CYLINDER, CONE, PARABOLA, &c.

To prepare, or make, cylindrical, conical, parabolical, elliptical, and hyperbolical MIRROURS.—For the *cylindrical* and *conical* ſort, if they are to be of glaſs, the method of preparing them is the ſame as that already laid down for convex *mirrours*.

If of metal, they are to be made after the manner of concave *mirrours*, only that the clay moulds there deſcribed, require other wooden ones of the figure of the *mirrour*.

For *elliptical*, *parabolical*, and *hyperbolical mirrours*, the mould is to be thus prepared: On a wooden or brazen plane or table, deſcribe the figure of an ellipſis, A B, (*Fig.* 37.) a parabola, or an hyperbola, C D, (*Fig.* 38.) after the manner taught under thoſe heads; which done, cut out the figure from the plane with all the accuracy imaginable.

To the elliptic figure, fit an axis, as E F, with two fulcra to ſuſtain it, *&c.* and a handle to move it. Lay a quantity of the clay above deſcribed under it; and turn about the axis by the handle, till the plane A B have turned, or impreſſed the elliptical figure exactly thereon.

The axis of the parabolical, or hyperbolical figure C D, is to be fixed at the vertex in ſuch manner as that it may always remain erect. This to be turn'd about as above, till it have given its own figure to the clay applied about it.

The part of the mould thus formed, is to be dried, and either ſmeared over with fat, or ſprinkled with brick-duſt. Then a convex mould to be made, by putting a quantity of the ſame clay into the cavity thus formed.—This latter is called the *male*, as the former the *female* mould.

The male mould being well dried, is to be applied within the female; in ſuch manner as only to leave the intended thickneſs of the *mirrour* between them.—The reſt as for concave *mirrours*.

Theſe mirrours are not made without the utmoſt difficulty; by reaſon, be the moulds ever ſo juſt, the figure of the *mirrour* is apt to be damaged in the grinding.

Phænomena, or properties of cylindrical MIRROURS.—1°. The dimenſions of objects correſponding length-wiſe to the *mirrour*, are not much changed; but thoſe correſponding breadthwiſe have their figures altered, and their dimenſions leſſened ſo much the more, as they are further from the *mirrour*: Whence ariſes a very great diſtortion.

2°. If the plane of reflexion cut the cylindric *mirrour* through the axis, the reflexion is performed in the ſame manner, as in a plane *mirrour*; if it cut it parallel to the baſe, the reflexion happens in the ſame manner as in a ſpherical *mirrour*; if, laſtly, it cut it obliquely, or be oblique to its baſe, the reflexion is the ſame as in an elliptic *mirrour*.

Hence, as the plane of reflexion never paſſes through the axis of the *mirrour*, except when the eye and objective-line are in the ſame plane; nor parallel to the baſe, except when the radiant point and the eye are at the ſame height: the reflexion in a cylindrical *mirrour* is uſually the ſame as in an elliptic one.

3°. If a hollow cylindric *mirrour* be oppoſed directly to the ſun, inſtead of a focus of a point, the rays will be reflected into a lucid line parallel to its axis, at a diſtance ſomewhat leſs than a fourth part of its diameter.

Hence ariſes a method of drawing anamorphoſes, *i. e.* wild deformed figures on a plane, which appear beautiful and well proportioned when viewed in a cylindrical *mirrour*. See ANAMORPHOSIS.

For elliptic, *parabolic*, *conic*, and *pyramidal* MIRROURS, we are not much acquainted with their properties: Only that,

In the firſt, if a ray ſtrike on it from one of its focus's, it is reflected into the other: So that a lighted candle being placed in one, its light will be collected in the other.

That the ſecond, inaſmuch as all the rays they reflect meet in one point, make the beſt burning-glaſſes of all others.

And, laſtly, That wild irregular figures may be ſo drawn on a plane, as that the eye being placed over the axis of the two laſt, they ſhall appear beautiful and well proportioned. See ANAMORPHOSIS.

MIS, a particle prefixed to divers words, particularly law-terms; denoting ſome fault, or defect.—As, in *miſpriſion*; *miſdicere*, to ſcandalize one; *miſdocere*, to teach amiſs, *&c.* See MISPRISION, *&c.*

MISANTHROPY *, a general diſlike or averſion to man, and mankind.

> * The word is Greek, Μισανθρωπια, formed of μισος, *odium*, hatred; and ανθρωπος, *homo*, man.

In which ſenſe it ſtands oppoſed to *philanthropy*. See PHILANTHROPY.

MISAVENTURE, or MISADVENTURE, in law, the killing a man partly by negligence, and partly by chance.—As, if a perſon, thinking no harm, careleſsly throw a ſtone, or ſhoot an arrow, wherewith he kills another: This is a *miſadventure*; and in this caſe he commits no felony, but only loſes his goods, and has a pardon of courſe for his life. See HOMICIDE.

Staundford diſtinguiſhes between *aventure* and *miſaventure*. The firſt he makes to be mere chance; as if a man being upon, or near the water, be taken with ſome ſudden ſickneſs, and ſo fall in, and be drowned; or into the fire, and be burnt. See CHANCE-*medley*.

Miſaventure, according to him, is when a man comes to his death by ſome outward violence; as the fall of a tree, the running of a cart-wheel, the ſtroke of a horſe, or the like. Weſt diſtinguiſhes homicide into caſual and mixed. The firſt, when a man is ſlain by mere accident, againſt the mind of the killer; as, if the ax fly off the helve, and kill a man: which is the ſame with Briton's *miſaventure*.

MISCHNA, or MISNA, a part of the Jewiſh talmud. See TALMUD.

The *miſchna* contains the text; and the gemara, which is the ſecond part of the talmud, contains the commentaries: ſo that the gemara is, as it were, a gloſſary on the *miſchna*.

The *miſchna* conſiſts of various traditions of the Jews, and of explanations of ſeveral paſſages of ſcripture.—The Jews maintain, that it was compleated, and reduced into a body, by rabbi Juda, in the ſecond century, to prevent the memory of their traditions from periſhing. But the generality of the learned ſcarce allow it ſo much antiquity, and bring it ſeveral centuries lower.

It is written in a much purer ſtyle, and is not near ſo full of dreams and viſions as the gemara. See GEMARA.

MISCONTINUANCE, in law, the ſame with *diſcontinuance*. See DISCONTINUANCE.

MISDEMEANOUR, an offence, or fault, particularly in the execution of an office.

High crimes and miſdemeanours, denote offences of a heinous nature next to high treaſon. See CRIME, *&c.*

MISE, a French term, literally denoting expence, or diſburſement; uſed in our law-books in divers acceptations.—Sometimes for the profits of lands; ſometimes for taxes, or taillages; and ſometimes for expences, or coſts: As, *pro miſis & cuſtagiis*, for coſts and charges in the entries of judgments, *&c.*

MISE, more peculiarly denotes an honorary gift, or cuſtomary preſent, wherewith the people of Wales uſed to ſalute every new king and prince of Wales at their entrance upon the principality.

Anciently, the *miſe* was given in cattle, wine, corn, *&c.* for the ſupport of the prince's family; but when that dominion was annexed to the Engliſh crown, the gift was changed into money.—The county of Flint pays two thouſand marks, *&c.* for their *miſe*.

The county of Cheſter alſo pays a *miſe* or tribute of five thouſand marks at the change of every owner of the ſaid earldom, for enjoying the privileges of that palatinate.—At Cheſter they have a *miſe* book, wherein every town and village in the county is rated what to pay towards the *miſe*.

MISE is alſo uſed in ſpeaking of a writ of right. What in other actions is called in *iſſue*, in a writ of right is called a *miſe* or *me*: ſo that *to join the miſe upon the meer*, is as much as to ſay, to join iſſue on the meer right, *i. e.* to join upon this point, whether has the more right, the tenant or demandant. See ISSUE, *&c.*

Yet even in a writ of right, if a collateral point be tried, it is there called an *iſſue*, not a *miſe*. See RIGHT.

MISE is alſo ſometimes uſed corruptly for *meaſe*, a meſſuage or tenement.

In ſome manors, a *miſe* or *meaſe* place is taken for ſuch a meſſuage or tenement, as yields the lord a herriot at the death of the tenant.

MISERERE, *have mercy*, the name, and firſt word, of one of the penitential pſalms; being that commonly given by the ordinary to ſuch condemned malefactors, as are allowed the benefit of the clergy.—Whence it is alſo called the *pſalm of mercy*. See CLERGY.

MISERERE *mei*, denotes a kind of colic, or diſorder of the inteſtines, wherein the excrements, inſtead of paſſing off the common way, are thrown up by the mouth. See COLIC.

The *miſerere mei* is the ſame with what we otherwiſe call *volvulus* and *iliac paſſion*. See ILIAC *paſſion*.

It takes its name from the intolerable pain and anguiſh it occaſions the patient; which is ſuch as claims pity from the beholders: *Miſerere mei* being a Latin phraſe, which literally ſignifies, Have pity on me.

MISERICORDIA, MERCY, in law, an arbitrary amerciament, or puniſhment impoſed on any perſon for an offence. See AMERCEMENT.

Where the plaintiff or defendant in any action is amerced, the entry is always *ideo in miſericordia*.

It is thus called, according to Fitzherbert, by reaſon it ought to be but ſmall, * and leſs than the offence, according to the tenor of magna charta.

> * *Mulcta lenior ſic dicta, quod leniſſima imponitur* miſericordia; *graviores enim mulctas* fines *vocant*; *atrociſſimas*, redemptiones. See FINE, and REDEMPTION.

Hence, if a man be unreaſonably amerced in a court not of record, as a court-baron, *&c.* there is a writ called *moderata miſericordia*, directed to the lord, or his bailiff, commanding them to take moderate amerciaments.

MISERICORDIA *communis*, is when a fine is ſet on the whole county, or hundred.

MISFEASANCE, in law, a miſdeed or treſpaſs. Whence alſo *misfeaſor*, a treſpaſſer. See TRESPASS.

MISKERING, *Miskerring*. See ABISHERSING.

MISLETOE. See the article MISTLETOE.

N° XII

them is the ſame as that already laid down for convex *mirrours*.

If of metal, they are to be made after the manner of concave *mirrours*, only that the clay moulds there deſcribed, require other wooden ones of the figure of the *mirrour*.

For *elliptical*, *parabolical*, and *hyperbolical mirrours*, the mould is to be thus prepared: On a wooden or brazen plane or table, deſcribe the figure of an ellipſis, A B, (*Fig.* 37.) a parabola, or an hyperbola, C D, (*Fig.* 38.) after the manner taught under thoſe heads; which done, cut out the figure from the plane with all the accuracy imaginable.

To the elliptic figure, fit an axis, as E F, with two fulcra to ſuſtain it, &c. and a handle to move it. Lay a quantity of the clay above deſcribed under it; and turn about the axis by the handle, till the plane A B have turned, or impreſſed the elliptical figure exactly thereon.

The axis of the parabolical, or hyperbolical figure C D, is to be fixed at the vertex in ſuch manner as that it may always remain erect. This to be turn'd about as above, till it have given its own figure to the clay applied about it.

The part of the mould thus formed, is to be dried, and either ſmeared over with fat, or ſprinkled with brick-duſt. Then a convex mould to be made, by putting a quantity of the ſame clay into the cavity thus formed.—This latter is called the *male*, as the former the *female* mould.

The male mould being well dried, is to be applied within the female; in ſuch manner as only to leave the intended thickneſs of the *mirrour* between them.—The reſt as for concave *mirrours*.

Theſe mirrours are not made without the utmoſt difficulty; by reaſon, be the moulds ever ſo juſt, the figure of the *mirrour* is apt to be damaged in the grinding.

Phænomena, or properties of cylindrical Mirrours.—1°. The dimenſions of objects correſponding length-wiſe to the *mirrour*, are not much changed; but thoſe correſponding breadthwiſe have their figures altered, and their dimenſions leſſened ſo much the more, as they are further from the *mirrour*: Whence ariſes a very great diſtortion.

2°. If the plane of reflexion cut the cylindric *mirrour* through the axis, the reflexion is performed in the ſame manner, as in a plane *mirrour*; if it cut it parallel to the baſe, the reflexion happens in the ſame manner as in a ſpherical *mirrour*; if, laſtly, it cut it obliquely, or be oblique to its baſe, the reflexion is the ſame as in an elliptic *mirrour*.

Hence, as the plane of reflexion never paſſes through the axis of the *mirrour*, except when the eye and objective-line are in the ſame plane; nor parallel to the baſe, except when the radiant point and the eye are at the ſame height: the reflexion in a cylindrical *mirrour* is uſually the ſame as in an elliptic one.

3°. If a hollow cylindric *mirrour* be oppoſed directly to the ſun, inſtead of a focus of a point, the rays will be reflected into a lucid line parallel to its axis, at a diſtance ſomewhat leſs than a fourth part of its diameter.

Hence ariſes a method of drawing anamorphoſes, *i. e.* wild deformed figures on a plane, which appear beautiful and well proportioned when viewed in a cylindrical *mirrour*. See Anamorphosis.

For elliptic, *parabolic*, *conic*, and *pyramidal* Mirrours, we are not much acquainted with their properties: Only that,

In the firſt, if a ray ſtrike on it from one of its focus's, it is reflected into the other: So that a lighted candle being placed in one, its light will be collected in the other.

That the ſecond, inaſmuch as all the rays they reflect meet in one point, make the beſt burning-glaſſes of all others.

And, laſtly, That wild irregular figures may be ſo drawn on a plane, as that the eye being placed over the axis of the two laſt, they ſhall appear beautiful and well proportioned. See Anamorphosis.

MIS, a particle prefixed to divers words, particularly law-terms; denoting ſome fault, or defect.—As, in *miſpriſion*; *miſdicere*, to ſcandalize one; *miſdocere*, to teach amiſs, &c. See Misprision, &c.

MISANTHROPY *, a general diſlike or averſion to man, and mankind.

* The word is Greek, Μισανθρωπια, formed of μισος, *odium*, hatred; and ανθρωπος, *homo*, man.

In which ſenſe it ſtands oppoſed to *philanthropy*. See Philanthropy.

MISAVENTURE, or Misadventure, in law, the killing a man partly by negligence, and partly by chance.—As, if a perſon, thinking no harm, careleſly throw a ſtone, or ſhoot an arrow, wherewith he kills another: This is a *miſadventure*; and in this caſe he commits no felony, but only loſes his goods, and has a pardon of courſe for his life. See Homicide.

Staundford diſtinguiſhes between *aventure* and *miſaventure*. The firſt he makes to be mere chance; as if a man being upon, or near the water, be taken with ſome ſudden ſickneſs, and ſo fall in, and be drowned; or into the fire, and be burnt. See Chance-*medley*.

Miſaventure, according to him, is when a man comes to his death by ſome outward violence; as the fall of a tree, the running of a cart-wheel, the ſtroke of a horſe, or the like. Weſt diſtinguiſhes homicide into caſual and mixed. The firſt, when a man is ſlain by mere accident, againſt the mind of the killer; as, if the ax fly off the helve, and kill a man: which is the ſame with Briton's *miſaventure*.

MISCHNA, or Misna, a part of the Jewiſh talmud. See Talmud.

The *miſchna* contains the text; and the gemara, which is the ſecond part of the talmud, contains the commentaries: ſo that the gemara is, as it were, a gloſſary on the *miſchna*.

The *miſchna* conſiſts of various traditions of the Jews, and of explanations of ſeveral paſſages of ſcripture.—The Jews maintain, that it was compleated, and reduced into a body, by rabbi Juda, in the ſecond century, to prevent the memory of their traditions from periſhing. But the generality of the learned ſcarce allow it ſo much antiquity, and bring it ſeveral centuries lower.

It is written in a much purer ſtyle, and is not near ſo full of dreams and viſions as the gemara. See Gemara.

MISCONTINUANCE, in law, the ſame with *diſcontinuance*. See Discontinuance.

MISDEMEANOUR, an offence, or fault, particularly in the execution of an office.

High crimes and miſdemeanours, denote offences of a heinous nature next to high treaſon. See Crime, &c.

MISE, a French term, literally denoting expence, or diſburſement; uſed in our law-books in divers acceptations.—Sometimes for the profits of lands; ſometimes for taxes, or taillages; and ſometimes for expences, or coſts: As, *pro miſis & cuſtagiis*, for coſts and charges in the entries of judgments, &c.

Mise, more peculiarly denotes an honorary gift, or cuſtomary preſent, wherewith the people of Wales uſed to ſalute every new king and prince of Wales at their entrance upon the principality.

Anciently, the *miſe* was given in cattle, wine, corn, &c. for the ſupport of the prince's family; but when that dominion was annexed to the Engliſh crown, the gift was changed into money.—The county of Flint pays two thouſand marks, &c. for their *miſe*.

The county of Cheſter alſo pays a *miſe* or tribute of five thouſand marks at the change of every owner of the ſaid earldom, for enjoying the privileges of that palatinate.—At Cheſter they have a *miſe* book, wherein every town and village in the county is rated what to pay towards the *miſe*.

Mise is alſo uſed in ſpeaking of a writ of right. What in other actions is called in *iſſue*, in a writ of right is called a *miſe* or *me*: ſo that *to join the miſe upon the meer*, is as much as to ſay, to join iſſue on the meer right, *i. e.* to join upon this point, whether has the more right, the tenant or demandant. See Issue, &c.

Yet even in a writ of right, if a collateral point be tried, it is there called an *iſſue*, not a *miſe*. See Right.

Mise is alſo ſometimes uſed corruptly for *meaſe*, a meſſuage or tenement.

In ſome manors, a *miſe* or *meaſe* place is taken for ſuch a meſſuage or tenement, as yields the lord a herriot at the death of the tenant.

MISERERE, *have mercy*, the name, and firſt word, of one of the penitential pſalms; being that commonly given by the ordinary to ſuch condemned malefactors, as are allowed the benefit of the clergy.—Whence it is alſo called the *pſalm of mercy*. See Clergy.

Miserere *mei*, denotes a kind of colic, or diſorder of the inteſtines, wherein the excrements, inſtead of paſſing off the common way, are thrown up by the mouth. See Colic.

The *miſerere mei* is the ſame with what we otherwiſe call *volvulus* and *iliac paſſion*. See Iliac *paſſion*.

It takes its name from the intolerable pain and anguiſh it occaſions the patient; which is ſuch as claims pity from the beholders: *Miſerere mei* being a Latin phraſe, which literally ſignifies, Have pity on me.

MISERICORDIA, Mercy, in law, an arbitrary amerciament, or puniſhment impoſed on any perſon for an offence. See Amercement.

Where the plaintiff or defendant in any action is amerced, the entry is always *ideo in miſericordia*.

It is thus called, according to Fitzherbert, by reaſon it ought to be but ſmall, * and leſs than the offence, according to the tenor of magna charta.

* *Mulcta lenior ſic dicta, quod leniſſima imponitur* miſericordia; *graviores enim mulctas* fines *vocant*; *atrociſſimas*, redemptiones. See Fine, and Redemption.

Hence, if a man be unreaſonably amerced in a court not of record, as a court-baron, &c. there is a writ called *moderata miſericordia*, directed to the lord, or his bailiff, commanding them to take moderate amerciaments.

Misericordia *communis*, is when a fine is ſet on the whole county, or hundred.

MISFEASANCE, in law, a miſdeed or treſpaſs. Whence alſo *miſfeaſor*, a treſpaſſer. See Trespass.

MISKERING, *Miſkerring*. See Abishersing.

MISLETOE. See the article Mistletoe.

MISNA. See the article Mischna.

MISNOMER*, in law, a wrong name; or the uſing of one name for another. See Name.

* The word is compounded of the French *mis*, which in compoſition ſignifies amiſs; and *nommer*, to name.

MISPRISION, in law, ſignifies a neglect, or overſight.—Thus,

Misprision *of clerks*, is a neglect of clerks, in writing or keeping records. See Clerk.

By the *miſpriſion of clerks*, no proceſs ſhall be annulled or diſcontinued. And juſtices of aſſize ſhall amend the defaults of clerks miſ-ſpelling of a ſyllable, or letter in writing.

Misprision *of treaſon*, is a negligence in not revealing treaſon, where a perſon knows it to be committed. See Treason.

Miſpriſion is the concealment, or not diſcloſing, of known treaſon, for which the offenders are to ſuffer impriſonment during the king's pleaſure; and to loſe their goods, and the profit of their lands during their lives.

Misprision *of felony*, is only fineable by the juſtices before whom the party is attainted. See Felony.

Juſtices of the common pleas have a power to aſſeſs any amerciaments upon perſons offending by *miſpriſions*, contempts, or neglects, for not doing, or miſdoing any thing in, or concerning, fines. See Fine.

MISSAL, Missale, a maſs-book, containing the ſeveral maſſes to be uſed on the ſeveral days, feaſts, &c. See Mass.

The Roman *miſſal* was firſt compiled by pope Zachary, and afterwards reduced into better order by pope Gregory the great, who called it the *book of ſacraments*.

Each dioceſe, and each order of religious, have their particular *miſſal*, accommodated to the feſtivals of the province, or of the order.

MISSELTOE. See the article Mistletoe.

MISSEN-*maſt*, or Mizzen-*maſt*, of a ſhip, is a *maſt*, or round long piece of timber, ſtanding upright in the ſternmoſt part.—See *Tab. Ship. fig.* 1. *n.* 1, 13, 19. See alſo Mast.

Missen-*ſail*, is that belonging to the miſſen-yard. See Sail.

When at ſea they uſe the word *miſſen* alone, they always mean the *ſail*, and not the *maſt*. See Sail.

Some great ſhips require two *miſſens*; in which caſe, that next the main-maſt, is called the *main-miſſen*; that next the poop the *bonaventure-miſſen*.

Change the Missen, that is, bring the *miſſen-yard* over to the other ſide the maſt.

Peek the Missen, that is, put the *miſſen* right up and down the maſt. See Peek.

Spell the Missen, &c. that is, let go the ſheet, and peek it up.

MISSION. See Emission, Manumission, Remission, and Transmission.

Mission, in theology, denotes a power, or commiſſion to preach the goſpel. See Evangelist, &c.

Jeſus Chriſt gave his diſciples their *miſſion* in theſe words, *Go, and teach all nations*, &c. See Apostle.

The Romaniſts reproach the Proteſtants, that their miniſters have no *miſſion*; as not being authorized in the exerciſe of their miniſtry, either by an uninterrupted ſucceſſion from the apoſtles, or by miracles, or by any extraordinary proof of a vocation. See Ordination.

The Anabaptiſts deny any other *miſſion* neceſſary for the miniſtry than the talents neceſſary to diſcharge it. See Anabaptist.

Mission is alſo uſed for an eſtabliſhment of people zealous for the glory of God, and the ſalvation of ſouls; who go and preach the goſpel in remote countries, and among infidels. See Missionary.

There are *miſſions* in the Eaſt, as well as the Weſt-Indies.—Among the Romaniſts, the religious orders of St. Dominic, St. Francis, St. Auguſtin, and the Jeſuits, have *miſſions* in the Levant, America, &c.

The Jeſuits have alſo *miſſions* in China, and all other parts of the globe, where they have been able to penetrate.—The mendicants abound in *miſſions*.

Mission, is alſo the name of a congregation of prieſts, and laymen, inſtituted by Vincent de Paul, and confirmed in 1626 by Pope Urban VIII. under the title of *Prieſts of the congregation of the* miſſion.

Theſe profeſs to make it their whole buſineſs to aſſiſt the poor people in the country; and to this purpoſe oblige themſelves never to preach, or adminiſter any of the ſacraments in any town where there is an archbiſhop, biſhop, or provincial reſiding.

They are ſettled in moſt provinces of France, Italy, Germany, and in Poland.—At Paris, they have a ſeminary, which they call the *foreign miſſion*; where youth are bred up and qualified for *miſſions* abroad.

MISSIONARY, an eccleſiaſtic who devotes himſelf and his labours, to ſome *miſſion*; either for the inſtruction of the orthodox, the conviction of heretics, or the converſion of infidels.

MISSIVE, ſomething *ſent* to another.—From the Latin, *mitto*, I ſend.

We ſay *miſſive* letters, or letters *miſſive*, meaning letters ſent from one to another. See Epistle.

In propriety, *letters miſſive* are letters of buſineſs, but not buſineſs of great concern; in contradiſtinction from letters of gallantry, letters on points of learning, diſpatches, &c.

MIST, a meteor called alſo *fog*. See Fog.

MISTLETOE, Misletoe, or Misseltoe, in natural hiſtory, a plant of the paraſite kind; growing, not on the ground, but on other trees, as the oak, apple-tree, pear-tree, white-thorn, aſh, lime, willow, elm, &c. See Parasite.

Miſtletoe, by phyſicians, &c. called *viſcus*, grows to the height of about two feet. It conſiſts of ſeveral ſtems, which are uſually covered with a greeniſh, ſometimes a yellowiſh bark, about the thickneſs of the finger, hard, woody, and divided by knots; from which ſpring the leaves, which grow by two and two oppoſite to each other, oblong, thick, of a greeniſh, or yellow colour, veined their whole length, and rounded at the end. Its flowers grow by three and three, trefoil-wiſe, at the extremes of the branches: each flower is a yellow calyx, one third of an inch in diameter, divided into four parts.

The fruit likewiſe grows by three and three, at the extremes of the branches: They are a kind of white oval berries, not unlike little pearls, filled with a flattiſh ſeed in form of a heart; covered with a fine ſilvered membrane, and encloſed with a viſcid, glutinous humour, of a whitiſh colour, wherein the ſeed naturally buds or germinates, and puts forth two eyes.—From this juice it is, that the Latins denominate the plant *viſcus*.—The fruit grows on different branches from the flowers.

That uncommon ſoil, whereon the *miſtletoe* grows, has occaſioned abundance of fabulous notions both as to its production and virtues.

Pliny and moſt naturaliſts relate, that thruſhes being exceedingly fond of the berries of the *miſtletoe*; they ſwallow them, and caſt them out again on the branches of trees where they uſe to perch; and by this means give occaſion to a new production of *miſtletoe*. By cracking the berries with their bills, or claws, they are ſuppoſed to let out the viſcous juice, which facilitates their ſticking: And hence that proverb, *Turdus ſibi cacat malum*; the *viſcus* being ſometimes uſed as bird-lime.

Mr. Bradley endeavours to refute the popular opinion of the ancients, that the ſeeds of the *miſtletoe* could not vegetate. Their endeavouring to propagate it in the earth without ſucceſs, he takes to have led them into the error: And aſſerts, that it may be propagated by ſeed on any tree whatever. The method too is very eaſy. About Chriſtmas, when the berries are full ripe, you need only apply them on the ſmooth bark of any tree; the viſcid juices they are encompaſſed withal, will make them ſtick; and, provided the birds do not devour the ſeed, you may, without any further trouble, expect a young plant, the following year.

Others rather chuſe to account for the propagation of *miſtletoe* from the ſyſtem hereafter advanced for that of *muſhrooms*. See Mushroom.

For the virtues of *miſtletoe*, it ſeems of the moſt efficacy in the epilepſy; againſt which ſome will have it ſpecifick. Dr. Colbatch has wrote expreſsly to prove it ſuch. It is alſo preſcribed in apoplexies, lethargies, and vertigos; and wore about the necks of children to prevent convulſions, and eaſe the cutting of their teeth.

The beſt is the *miſtletoe of the oak*; though it is not this which is commonly uſed, but that of the apple or pear-tree. Mr. Bradley obſerves, that there is no variety in this plant, but that the leaves, flowers, fruit, &c. are all alike on whatever kind of tree it grows: But others pretend to diſtinguiſh that of the oak by ſeveral particulars.

The virtues aſcribed to the *miſtletoe*, may perhaps be the remains of the religiours honours paid it by the ancient Gauls; among whom the Druids, aſſembled conſtantly on the firſt day of the year, went in queſt thereof with hymns, and other ceremonies and rejoicings, diſtributing it again among the people, as a thing ſacred, after having firſt conſecrated it, crying, *Au guy l'an neuf*, to proclaim the new year. See Druids.

The cry is ſtill kept up in Picardy, where they add *plantez*, to wiſh a plentiful new year.

M. Perrault obſerves, that the *miſtletoe* is full of a poiſonous juice, which weakens the tree whereon it grows; and that the fruit has always a diſagreeable taſte while it ſticks on it.

MISY, ΜΙΣΥ, in natural hiſtory; ſee Chalcitis.

MITE, a ſmall coin, formerly current; equal to about one third part of a farthing. See Money, and Coin.

Mite alſo denotes a ſmall weight uſed by the moneyers. It is equal to the twentieth part of a grain, and is divided into twenty-four doits. See Weight.

MITHRIDATE, Mithridatium, in pharmacy, an antidote or compoſition in form of an electuary, ſerving either as a remedy or a preſervative againſt poiſons. See Antidote, Poison, &c.

Mithridate is one of the capital medicines in the apothecaries ſhops; being compoſed of a vaſt number of drugs, as *opium*, *myrrh*, *agaric*, *ſaffron*, *ginger*, *cinnamon*, *ſpikenard*, *frankincenſe*, *caſtor*, *pepper*, *gentian*, &c.

It is accounted a cordial, opiate, ſudorific and alexipharmic.—Matthiolus ſays it is more effectual againſt poiſon than Venice-treacle; though eaſier to be made.

It takes its name from its inventor, Mithridates king of Pontus,

tus, who is ſaid to have ſo fortified his body againſt poiſons with antidotes and preſervatives, that when he had a mind to diſpatch himſelf, he could not find any poiſon that would take effect.

The receipt of it was found in his cabinet, written with his own hand, and was carried to Rome by Pompey. It was tranſlated into verſe by Damocrates, a famous phyſician, and was afterwards tranſlated by Galen, from whom we have it: Though there is room to imagine it has undergone conſiderable alterations ſince the time of its royal preſcriber.

MITRALES *valvulæ*, MITRAL *valves*, in anatomy, two valves in the heart: thus called from their reſembling the figure of a mitre. See VALVE, and HEART.

They are placed at the orifice of the pulmonary vein, in the left ventricle of the heart. Their office is to cloſe the orifice thereof, and prevent the return of the blood through the pulmonary vein into the lungs again. See PULMONARY *vein*, CIRCULATION, &c.

MITRE*, MITRA, a pontifical ornament, wore on the head by biſhops, and certain abbots, on ſolemn occaſions. See BISHOP, ABBOT, &c.

* The word comes from the Greek μίτρα, which ſignifies the ſame.

The *mitre* is a round cap, pointed, and cleft a-top with two pendents hanging down the ſhoulders.—Abbots wear the *mitre* turned in profile; and bear the croſier inwards, to ſhew that they have no ſpiritual juriſdiction without their own cloiſters. The pope has alſo granted to ſome canons of cathedrals the privilege of wearing the *mitre*.—The counts of Lyons are ſaid to have aſſiſted at church in *mitres*.

In Germany, ſeveral great families bear the *mitre* for their creſt; to ſhew that they are advocates, or feudataries of ancient abbies, or officers of biſhops, &c. See ADVOUEE.

The pope has four *mitres*, which are more or leſs rich according to the ſolemnity of the feaſt-days they are to be worn on. The *mitre* was originally the womens head-dreſs, as the hat was that of the men. This appears from Servius, who reproaches the Trojans, or Phrygians, that they were dreſſed like women, and wore *mitres*.—*Et tunicæ manicas, & habent redimicula* mitræ.

The cardinals anciently wore *mitres*, before the hat which was firſt granted them by the council of Lyons in 1245. See CARDINAL.—Authors make no mention of the *mitre* as an epiſcopal ornament before the year 1000.

MITRE, in architecture, is the workmens term for an angle that is juſt 45 degrees; or half a right one.

If the angle be a quarter of a right angle, they call it a *half-mitre*. See ANGLE, &c.

To deſcribe ſuch angles, they have an inſtrument called the *mitre-ſquare*; with this they ſtrike *mitre-lines* on their quarters, or battens: And for diſpatch, have a *mitre-box*, as they call it, which is made of two pieces of wood, each about an inch thick, one nailed upright on the edge of the other; the upper piece hath the *mitre-lines* ſtruck upon it on both ſides, and a kerf to direct the ſaw in cutting the *mitre* joints readily, by only applying the piece into this box. See BEVIL.

MITRED *abbots*. See the article ABBOT.

MITTENDIS *recordo & proceſſu*. See RECORDO.

MITTIMUS, in law, a writ, by which records are ordered to be transferred from one court to another; ſometimes immediately, as out of the King's Bench into the Exchequer; and ſometimes by a certiorari into the Chancery, and from thence by a *mittimus* into another court.

MITTIMUS is alſo uſed for a precept in writing directed by a juſtice of peace to a goaler, for the receiving and ſafe keeping a felon, or other offender, by him committed to the goal.

MIXING *of mortar*. See the article MORTAR.

MIXT, or MIXT *body*, in philoſophy, is that which is compounded of divers elements, or principles. See MIXTION, &c.

By which, *mixt* ſtands contradiſtinguiſhed from *ſimple*, or *elementary*, which is applied to bodies conſiſting of one principle only; as the chymiſts take ſulphur, ſalt, &c. to do. See ELEMENT and BODY.

The ſchoolmen define a *mixt body* to be a whole, reſulting from ſeveral ingredients, altered, or new modified by the mixture.—On which principle, the ſeveral ingredients do not actually exiſt in the *mixt*, but are all changed, ſo as to conſpire to a new body of a different form, from the forms of the ingredients.—But the modern philoſophers rarely conceive the term in ſo much ſtrictneſs.

The buſineſs of chymiſtry, we ſay, is to reſolve *mixt bodies* into their principles, or component parts. See PRINCIPLE, CHYMISTRY, &c.

The ſchool-philoſophers diſtinguiſh *mixt bodies* into *perfect* and *imperfect*.

Perfect MIXTS are the claſs of vital or animated bodies; where the elements or ingredients they are compoſed of, are changed or transformed by a perfect mixture.—Such are plants, beaſts, and men.

Imperfect MIXTS are inanimate bodies; the forms whereof remain ſtill the ſame as of the ingredients that conſtitute them.—Such are meteors, minerals, metals, &c.

MIXT *action*, in law, is an action partly real, and partly perſonal. See ACTION.

A *mixt action* is that which lies both for the thing detained, and againſt the *perſon* of the detainer.—Or it is that which ſeeks both the recovery of a thing we are unjuſtly deprived of, and damages, or a penalty for the unjuſt detainment thereof. Such are actions of waſte, and *quare impedit*; actions for tithes on the ſtatute 2 and 3 Edw. 6. &c.

MIXT *angle*. See the article ANGLE.

MIXT *cloths*. See the article CLOTH.

MIXT *fables*. See the article FABLE.

MIXT *figure*, in geometry, is that which conſiſts partly of right lines, and partly of curve lines. See FIGURE.

MIXT *force*. See the article FORCE.

MIXT *hiſtory*. See the article HISTORY.

MIXT *mathematics*. See the article MATHEMATIC.

MIXT *mode*, according to Mr. Locke, is a combination of ſeveral ſimple ideas of different kinds. See IDEA, and MODE.

Thus, *beauty*, as it conſiſts in a certain compoſition of colour, figure, proportion, &c. of different parts, cauſing delight to the beholder, is a *mixt mode*. Such alſo are theft, murder, &c.

The mind, that author obſerves, being once furniſhed with ſimple ideas, can put them together in ſeveral compoſitions, without examining whether they exiſt ſo in nature together. And hence it is that theſe ideas are called *notions*; as if they had their original and conſtant exiſtence more in the thoughts of men, than in the reality of things; and that to form ſuch ideas, it ſufficed that the mind put the parts of them together; and that they were conſiſtent in the underſtanding: without conſidering whether they had any real being. See NOTION.

There are three ways whereby we get theſe complex ideas of *mixt modes*. Firſt, By experience and obſervation of things themſelves: Thus by ſeeing two men wreſtle, we get the idea of wreſtling. Secondly, By invention, or voluntary putting together of ſeveral ſimple ideas in our own mind: So he that firſt invented printing, had an idea of it firſt in his mind before ever it exiſted. Thirdly, By explaining the names of actions we never ſaw, or notions we cannot ſee; and by enumerating all thoſe ideas which go to the making them up.

Thus the *mixt mode* which the word *lye* ſtands for, is made up of theſe ſimple ideas; Firſt, Articulate ſounds. Secondly, Certain ideas in the mind of the ſpeaker. Thirdly, Certain words, the ſigns of theſe ideas. Fourthly, Thoſe ſigns put together by affirmation, or negation, otherwiſe than the ideas they ſtand for are in the mind of the ſpeaker, ſince the language was made.

Complex ideas are uſually got by the explication of thoſe terms that ſtand for them. For ſince they conſiſt of ſimple ideas combined, they may, by words ſtanding for thoſe ſimple ideas, be repreſented to the mind of one who underſtands thoſe words; though that combination of ſimple ideas was never offered to his mind by the real exiſtence of things.

MIXT *number*, in arithmetic, that which is partly an integer, and partly a fraction; as $4\frac{1}{2}$. See FRACTION.

MIXT *obligation*. See the article OBLIGATION.

MIXT *ratio*, or *proportion*, is when the ſum of the antecedent and conſequent is compared with the difference between the antecedent and conſequent—as if $\overset{3}{a} : \overset{4}{b} :: \overset{12}{c} : \overset{16}{d}$ then $\overset{\cdot 7}{a \times b} : \overset{1\ldots}{a - b} :: \overset{28}{c \times} : \overset{4}{c - d}$. See RATIO and PROPORTION.

MIXT *ſalts*. See the article SALTS.

MIXT *ſtairs*. See the article STAIRS.

MIXT *ſervice*. See the article SERVICE.

MIXT *tithes*, are thoſe of cheeſe, milk, &c. and of the young of beaſt. See TITHE.

MIXTILINEAR *angle*. See the article ANGLE.

MIXTION, MIXTIO, or MISTIO, the act of *mixing*; or the union and coalition of divers corpuſcles into one body. See MIXT, and MIXTURE.

The Peripatetics, who hold an alteration eſſential to *mixtion*, define it the union of ſeveral altered ingredients, or miſcibles. See INGREDIENT.

Mixtion makes a conſiderable operation in the chymical and galenical pharmacy; where divers powders, ſpecies, and other ſimples, are ſaid to be *mixed*, *miſceri*, though without any communication or tranſition of the virtues of one into thoſe of another. See COMPOSITION.

MIXTURE, MIXTURA, or MISTURA, in a philoſophical ſenſe, is an aſſemblage, or union of ſeveral bodies of different properties, in the ſame maſs. See MIXT, and MIXTION.

To determine the ratio of the ingredients of a *mixture*, is that celebrated problem propoſed by Hiero king of Syracuſe to Archimedes, on occaſion of a crown of gold wherein the workmen had fraudulently mixed ſilver; the ſolution whereof was matter of ſo much tranſport to that divine mechanic.

It may be determined thus.—Weigh the *mixture*, immerge it in ſome fluid; and find the weight it loſes therein. (See SPECIFIC *gravity*.) Then find what weight any determinate quantity of any ingredient loſes in the ſame fluid: And by the *rule of three* find what weight each ought to loſe therein, were its weight equal to that of the *mixture*. Subtract the leſs loſs from the greater, which will give the exceſs wherewith the loſs of the lighter exceeds that of the heavier. Then ſubtract ſtract the weight loſt by the heavier, from that loſt by the whole *mixture*, to find the exceſs of the weight loſt by the *mixture* beyond that loſt by the heavier.

MIXTURE, in matters of drapery, denotes the union, or blending of ſeveral wools of different colours, not yet ſpun. See CLOTH.

Hence a *mixture*, or mixed ſtuff, is that whoſe woof and warp are of wools of different colours dyed and mixed before they were ſpun.

MOAT, in fortification, a depth or trench dug round a town, or fortreſs to be defended, on the outſide of the wall, or rampart.—See *Tab. Fortif. fig.* 21. *lit. h h h*, &c. See alſo RAMPART, FOSS, and DITCH.

The depth and breadth of the *moat* often depend on the nature of the ſoil; according as it is marſhy, rocky, or the like.

The brink of the *moat* next the rampart in any fortification is called the *ſcarp*, and the oppoſite one the *counterſcarp*. See SCARP and COUNTERSCARP.

Dry MOAT is that which is deſtitute of water; and ought to be deeper than one which is full of water.

Lined MOAT is that whoſe ſcarp and counterſcarp are caſed with a wall of maſon's work lying aſlope.

Flat-bottomed MOAT is that which hath no ſloping, its corners being ſomewhat rounded.

Angle of the MOAT. See the article ANGLE.

MOATAZALITES, a religious ſect among the Turks, who deny all forms and qualities in the divine Being. See GOD, ATTRIBUTE, &c.

There are two opinions among the Turkiſh divines concerning God. The firſt admit metaphyſical forms, or attributes; as, that God has wiſdom by which he is wiſe; power by which he is powerful; eternity by which he is eternal, &c.

The ſecond allow God to be wiſe, powerful, eternal; but will not allow any form or quality in God, for fear of admitting a multiplicity.

Thoſe who follow this latter opinion are called *Moatazalites*—They who follow the former, *Sephatites*.

MOBILE, *Moveable*; any thing ſuſceptible of motion, or that is diſpoſed to be moved either by it ſelf, or by ſome other prior *mobile*, or mover. See MOTION.

Primum MOBILE in the ancient aſtronomy, was a ninth heaven, or ſphere, imagined above thoſe of the planets and fixed ſtars. See SPHERE, HEAVEN, and PRIMUM.

This was ſuppoſed to be the firſt mover, and to carry all the lower ſpheres round along with it; by its rapidity communicating to them a motion whereby they revolved in twenty-four hours.—But the diurnal revolution of the planets is now accounted for, without the aſſiſtance of any ſuch *primum mobile*.

Perpetuum MOBILE. See PERPETUAL *motion*.

MOBILIA *bona*, in the civil law, are what in common law, &c. we call *moveables*, or *moveable goods*. See MOVEABLES.

MOBILITY, in the ſchools, &c. an aptitude, or facility to be moved. See MOTION.

The *mobility* of mercury is owing to the ſmallneſs, and ſphericity of its particles; and is that which renders its fixation ſo difficult. See MERCURY, and FIXATION.

The hypotheſis of the *mobility* of the earth is the moſt plauſible; and is that commonly admitted by the later aſtronomers. See EARTH.

Pope Paul V. appointed commiſſioners to examine the opinion of Copernicus touching the *mobility* of the earth. The reſult of their enquiry, was, a prohibition to aſſert, not that the *mobility* was poſſible, but that it was actually true. That is, they allowed the *mobility* of the earth to be held as an hypotheſis, which gives an eaſy and ſenſible ſolution of the phænomena of the heavenly motions; but forbad the *mobility* of the earth to be maintained as a theſis, or a real effective thing; by reaſon they conceived it contrary to ſcripture. See COPERNICAN.

MODAL, in logic, &c. a term applied to propoſitions which include certain conditions or reſtrictions. See CONDITIONAL, PROPOSITION, and DISTINCTION.

MODE, or MOOD, MODUS, in philoſophy, a *manner* of being; or a quality, or attribute of a ſubſtance, or ſubject, which we conceive as neceſſarily depending on the ſubject, and incapable of ſubſiſting without it. See ATTRIBUTE, and SUBSTANCE.

Mr. LOCKE defines *modes* to be thoſe ideas (he ſhould have ſaid *things*) which do not imply any ſuppoſition of ſubſiſting by themſelves, but are conſidered as mere dependencies, and affections of ſubſtances. See ACCIDENT.

Our ideas of things may be reduced to two kinds: The one of things which we conceive ſeparately, and by themſelves, called *ſubſtances*; and the other of things which we conceive as exiſting in others, in ſuch manner as that we cannot allow them exiſtence without them; and theſe we call *modes*, or *accidents*.

Thus, when we reflect on wax, and roundneſs; we conſider the wax as a thing which may ſubſiſt without the roundneſs; *Wax* therefore we denominate a *ſubſtance*: on the contrary, we conſider the *roundneſs* ſo dependant on the wax, that it cannot ſubſiſt without it, there being no conceiving of roundneſs diſtinct and ſeparate from a round body.—This therefore we call a *mode*, or *accident*. See IDEA.

It is the characteriſtic, then, of a true *mode*, to have ſuch a relation to ſome ſubject, as not to be clearly and diſtinctly conceivable without conceiving the ſubject, whereof it is a *mode*, at the ſame time: when, on the other hand, the conception of the ſubject does not at all infer or require that of the *mode*. See SUBJECT.

Thus, what gives us to know that thought is not a *mode* of extended ſubſtance, or matter, is, that extenſion, and the other properties of matter may be divided from thought, without ceaſing to conceive thought all the while. See THINKING, EXTENSION, &c.

We always conſider things as clothed with certain *modes*, except we reflect on them in the abſtract, or general: And it is the variety of *modes*, and relations, that occaſions the great variety of denominations of the ſame thing. It is the various *modes* of matter, *e. gr.* that make all the diverſity of bodies, or corporeal beings in nature. See RELATION, MATTER, &c.

There are various diviſions and kinds of *modes*: One of the moſt common, is into *internal* and *external*.

Internal MODES are thoſe inherent in the ſubſtance;—as roundneſs in the bowl; flatneſs in the noſe; crookedneſs in the finger, &c.

Theſe, we have obſerved, cannot exiſt, nor even be conceived without the ſubject, as being only circumſtances thereof, or even, according to ſome, only the ſubject itſelf conſidered, not ſimply, but as ſuch. Thus the roundneſs of the bowl, is only the bowl itſelf conſidered as round, &c.

External MODES are thoſe extraneous to the ſubject; as when we ſay a thing is deſired, loved, beheld, &c. Theſe coincide with what we call *relations*. See RELATION.

Add, that there are *modes* which are likewiſe ſubſtances, as apparel, hair, &c. which may ſubſiſt without the ſubject.

Mr. LOCKE divides *modes* into *ſimple*, and *mixt* or *compound*.

Simple MODES are combinations of ſimple ideas of the ſame kind, or even of the ſame ſimple ideas divers times repeated;—as a dozen, a ſcore, &c. which are only the ideas of ſo many diſtinct units put together.

The modifications of any ſimple idea, Mr. Locke obſerves, are as perfectly different and diſtinct ideas in the mind as thoſe the moſt remote and inconſiſtent: Thus, *two* is as diſtinct from *three*, as blindneſs from heat. With this view that author examines the *ſimple modes* of ſpace.—Which are found to be diſtance, capacity, extenſion, figure, place and duration. See SPACE, DISTANCE, EXTENSION, FIGURE, PLACE, and DURATION.

The mind has ſeveral diſtinct ideas of *ſliding*, *rolling*, *walking*, *creeping*, &c. which are all but the different modifications of motion. *Swift* and *ſlow* are two different ideas of motion, the meaſures whereof, are made out of the diſtances of time and ſpace put together. See MOTION.

The like variety we have in ſounds; every articulate word is a different modification of ſound, as are all notes of different length put together, which make that complex idea called *time*. See SOUND and TIME.

The *modes* of colours might be alſo very various; ſome of which we take notice of, as the different degrees, or as they are termed, *ſhades of the ſame colour*. But ſince we ſeldom make aſſemblages of colours without taking in figure alſo, as in painting, &c. thoſe which are taken notice of, do moſt commonly belong to mixed *modes*; as *beauty*, *rainbow*, &c. All compounded taſtes and ſmells are alſo *modes* made up of the ſimple ideas of thoſe ſenſes.

As to the *modes of thinking*; when the mind turns its view inward upon itſelf, *thinking* is the firſt idea that occurs, wherein it obſerves a great variety of modifications; and therefore frames to itſelf diſtinct ideas. See THINKING, and THOUGHT.

Thus the perception annexed to any impreſſion on the body made by an external object, is called *ſenſation*. Where an idea recurs without the preſence of the object, it is called *remembrance*. When ſought after by the mind, and brought again in view, it is called *recollection*. When held there long under attentive conſiderations, it is called *contemplation*. When ideas float in the mind without regard or reflection, it is called in French, *reverie*. When the ideas are taken notice of, and, as it were, regiſtered in the memory, it is *attention*. When the mind fixes its view on any one idea, and conſiders it on all ſides, it is *intention* and *ſtudy*. See SENSATION, &c.

Of theſe various *modes* of thinking, the mind forms as diſtinct ideas, as it does of white and red, a ſquare, or a circle.

Mixed MODES are combinations of ſimple ideas of ſeveral kinds; as in *beauty*, which conſiſts in a certain compoſition of colour, figure, &c. *Theft*, which is the concealed change of the poſſeſſion of any thing without conſent of the proprietor, &c. See MIXT.

There are three ways whereby we get ideas of *mixt modes*. 1°. By experience and obſervation of things themſelves; thus by ſeeing two men wreſtle, we get the idea of wreſtling. 2°. By invention, or voluntary putting together of ſeveral ſimple ideas in our own minds; ſo he that firſt invented printing had an idea of it firſt in his mind, before ever it exiſted. 3°. By explaining the names of actions we never ſaw, or notions we cannot ſee; and by enumerating all thoſe ideas, which go to the making them up.—Thus the *mixt mode* which the word *lye* ſtands for, is made up of theſe ſimple ideas: (1.) Articulate ſounds. (2.) Certain ideas in the mind of the ſpeaker. (3.) Words, the ſigns of theſe ideas. (4.) Thoſe ſigns put together by affirmation, or negation, otherwiſe than the ideas they ſtand for are in the mind of the ſpeaker.

Mixt modes have their unity from an act of the mind, combining thoſe ſeveral ſimple ideas together, and conſidering them as one complex one: The mark of this union is one name given to that combination. Men ſeldom reckon any number of ideas to make one complex one: but ſuch collections as there be names for. Thus, *the killing of an old man* is as fit to be united in one complex idea, as *the killing of a father*; yet there being no name for it, it is not taken for a particular complex idea; nor a diſtinct ſpecies of action from that of killing any other man: Thoſe collections of ideas have names generally affixed, which are of frequent uſe in converſation; in which caſes men endeavour to communicate their thoughts to one another, with all poſſible diſpatch. Thoſe others, which they have ſeldom occaſion to mention, they lay not together, nor give them names.

This gives the reaſon, why there are words in every language, which cannot be rendred by any one ſingle word of another. For the faſhions and cuſtoms of one nation make ſeveral combinations of ideas familiar in one, which another had never any occaſion to make. Such were, 'Οϛρακισμος, among the Greeks; and *proſcriptio* among the Romans. See OSTRACISM, and PROSCRIPTION. This alſo occaſions the conſtant change of languages; becauſe the change of cuſtom and opinion brings with it new combinations of ideas, which, to avoid long deſcriptions, have new names annexed to them, and ſo they become new ſpecies of *mixt modes*.

Of all our ſimple ideas, thoſe which have had moſt *mixt modes* made out of them, are thinking, and motion, (which comprehend in them all action) and power, from whence theſe actions are conceived to flow. For actions being the great buſineſs of mankind, it is no wonder that the ſeveral *modes* of thinking and motion, ſhould be taken notice of; and the ideas of them obſerved, and laid up in memory, and have names aſſigned them. For without ſuch complex ideas with names to them, men could not eaſily hold any communication about them.

Of this kind are the *modes* of actions diſtinguiſhed by their cauſes, means, objects, ends, inſtruments, time, place, and other circumſtances; as alſo of the powers fitted for thoſe actions. Thus *boldneſs* is the power to do or ſpeak what we intend, without fear or diſorder; which power of doing any thing, when it had been acquired by frequent doing the ſame thing, is that idea we call *habit*; and when forward and ready upon every occaſion, to break into action, we call it *diſpoſition*: Thus *teſtineſs* is a diſpoſition or aptneſs to be angry. Power being the ſource of all action, the ſubſtances, wherein thoſe powers are, when they exert this power, are called *cauſes*: And the ſubſtances thereupon produced, or the ſimple ideas introduced into any ſubject, *effects*. The efficacy whereby the new ſubſtance or idea is produced, is called in the ſubject exerting that power, *action*; in the ſubject wherein any ſimple idea is changed, or produced, *paſſion*. Which efficacy in intellectual agents, we can conceive to be nothing elſe, but *modes* of thinking and willing: In corporeal agents, nothing elſe but modifications or motions.

Whatever ſort of action, beſides theſe, produces any effect, we have no notion or idea of. And, therefore, many words which ſeem to expreſs ſome action, ſignify nothing of the action, but barely the effect, with ſome circumſtances of the ſubject wrought on, or cauſe operating: Thus *creation*, and *annihilation*, contain in them no idea of the action, or manner whereby they are produced, but barely of the cauſe, and the thing done. And when a country-man ſays, *the cold freezes water*, though the word *freezing* ſeems to import ſome action, yet it truly ſignifies nothing but the effect, *viz.* that the water that was before fluid, is become hard and conſiſtent; without intimating any idea of the action whereby it is done.

In *mixt modes*, it is the name that ſeems to preſerve their eſſences, and to give them their laſting duration. The collection of ideas is made by the mind; but the name is, as it were, the knot which ties them faſt together: Hence we ſeldom take any other for diſtinct ſpecies of *mixt modes*, but ſuch as are ſet out by names. We muſt obſerve, that the names of *mixt modes* always ſignify the real eſſences of their ſpecies; which being nothing but the abſtract complex ideas, and not referred to the real exiſtence of things, there is no ſuppoſition of any thing more ſignified by any name of a *mixt mode*, but barely that complex idea, the mind itſelf has formed; which when the mind has formed, is all it would expreſs by it, and is that on which all the properties of the ſpecies depend, and from which alone they flow; and ſo, in theſe, the real and nominal eſſence is the ſame.

This alſo ſhews the reaſon, why the names of *mixt modes* are commonly got, before the ideas they ſtand for are perfectly known; becauſe there being no ſpecies of theſe ordinarily taken notice of, but ſuch as have names; and thoſe ſpecies being complex ideas made arbitrarily by the mind; it is convenient, if not neceſſary, to know the names, before we learn the complex ideas: unleſs a man will fill his head with a company of abſtract complex ideas, which others having no names for, he has nothing to do with, but to lay by, and forget again. In the beginning of languages, it was neceſſary to have the idea, before one gave it the name; and ſo it is ſtill, where a new complex idea is to be made, and a name given it. In ſimple ideas, and ſubſtances, it is otherwiſe; which being ſuch ideas, as have real exiſtence and union in nature, the ideas or names are got, one before the other, as it happens.

The ſchoolmen make numerous other diviſions of *modes*; as into *immediate* and *mediate*: *Eſſential* and *non-eſſential*: *Poſitive* and *privative*: Of *ſpirit* and of *body*: Of *thinking*, and of *having*.

Immediate MODES are thoſe immediately attributed to their ſubjects, or ſubſtances.

Mediate MODES are thoſe attributed to ſubjects by the intervention of ſome other *mode*.

Thus, *e. gr.* motion is an immediate *mode* of the body; knowledge of the mind, &c. But ſwiftneſs and ſlowneſs are not immediately attributable to the body; but only to the body in reſpect of motion.

Eſſential, or *inſeparable* MODES, are attributes without which the ſubſtance cannot exiſt.—As, wiſdom, goodneſs, power, &c. in God: figure, place, quantity, extenſion, &c. in body. See ATTRIBUTE.

Non-eſſential, or *ſeparable* MODES, are attributes affecting created ſubſtances, and remaining affixed thereto ſo long as is neceſſary.—Such are coldneſs, of water: hardneſs, of ſtone: whiteneſs of milk, &c.

Poſitive MODES, are thoſe which give ſomething real, poſitive, and abſolute to their ſubſtance.—Thus roundneſs is a poſitive *mode* of a globe, &c.

Privative MODES are attributed to ſubjects, when the mind perceiving ſome attributes wanting therein, frames a word, which at firſt ſight ſeems to note ſomething poſitive, but which in reality only notes the want of ſome property, or *mode*.—Thus a privation of light is attributed to a blind man, &c.

MODES *of ſpirit* are two, *viz.* cognition, or knowledge; and willing. See KNOWLEDGE, and WILL.

MODES *of body* are three, *viz.* figure, reſt, and motion. See FIGURE, REST, and MOTION.

MODES *of having*, are thoſe whereby any thing may be had by another.—Ariſtotle enumerates ſeven of theſe: A thing, for inſtance, may be had either by the *mode* of quality, as knowledge; by that of magnitude, as circumference; by the *mode* of part, as the hand, &c.

Diviſion of a MODE. See the article DIVISION.

MODE, in grammar.
MODE, in logic. } See the article MOOD.

MODE is alſo uſed in logic, for the modification of a propoſition; or that which renders it *modal* and *conditional*. See CONDITIONAL, and PROPOSITION.

Indirect MODES. See the article INDIRECT.

MODE, or MOOD, in muſic, a particular manner of beginning, continuing and ending a ſong, whereby we are engaged to make uſe of certain notes, or chords, preferable to, or oftener than others.

MODE is defined by ſome authors, the particular manner of conſtituting the octave; or the melodious conſtitution of the octave, as it conſiſts of ſeven eſſential, or natural notes beſides the key, or fundamental. See OCTAVE.

A *mode*, then, is not any ſingle note, or ſound; but the particular order of the concinnous degrees of an octave: The fundamental note whereof may, in another ſenſe, be called the *key*, as it ſignifies that principal note which regulates the reſt.

The proper difference between a mode and a key, conſiſts in this, that an octave with all its natural and concinnous degrees, is called a *mode*, with reſpect to the conſtitution, or the manner and way of dividing it; and with reſpect to the place of it in the ſcale of muſic, that is, the degree or pitch of tune, it is called a *key*: that is, an octave of ſounds may be raiſed in the ſame order, and kind of degrees, which makes the ſame *mode*, and yet be begun higher or lower; that is, be taken at different degrees with reſpect to the whole, which makes different keys: and from the ſame definition it follows, that the ſame key may be found with different *modes*; that is, the extremes of two octaves may be in the ſame degree of tune, and the diviſion of them different. See KEY.

Now it may be further obſerved, that of the natural notes of every *mode*, or octave, three go under the name of the eſſential notes in a peculiar manner, *viz.* the fundamental, the third, and fifth; their octaves being reckoned the ſame, and marked with the ſame letters in the ſcale: the reſt are particularly called *dependents*. Again, the fundamental is alſo called the *final*; the fifth the *dominante*; and the third, as being between the other two, the *mediante*. See KEY.

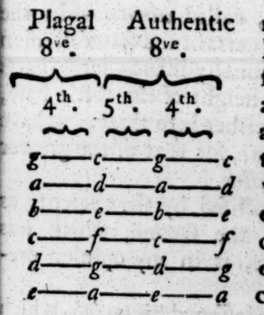
The doctrine of the ancients with regard to *modes*, which they ſometimes alſo call *tones*, is ſomewhat obſcure; there being an unaccountable difference among their authors as to the definitions, diviſions, and names of their *modes.* They agree indeed, that a *mode* is a certain ſyſtem or conſtitution of ſounds; and that an octave, with all its intermediate ſounds, is ſuch a conſtitution: but the ſpecific differences of tones, or *modes*, ſome place in the manner of diviſion, or order of their concinnous parts; and others merely in the different tenſion of the whole; *i. e.* as the whole ſeries of notes are acuter or graver, or ſtand higher or lower in the ſcale of muſic.

Boethius is very dark on this head, and defines a *mode* to be, as it were, an entire body of modulation, conſiſting of a conjunction of conſonances: as, the diapaſon.

Ptolemy makes the modes the ſame with the ſpecies of the diapaſon; but at the ſame time ſpeaks of their being at ſome diſtance from each other. Some contended for thirteen, ſome for fifteen *modes*, which they placed at a ſemi-tone's diſtance from each other; but it is plain, thoſe underſtood the differences to be only in their place or diſtances from each other; and that there is one certain harmonious ſpecies of octave applied to all; *viz.* that order which proceeds from the proſlambanomenos of the ſyſtema immutatum, or the A of the modern ſyſtem. Ptolemy argues, that if this be all, they may be infinite, though they muſt be limited for uſe and practice. But, indeed, much the greater part define them by the ſpecies of the diapaſon; and therefore only make ſeven *modes*; but as to their uſe, we are left entirely in the dark.

If the *modes* be nothing but the ſeven ſpecies of octaves, the uſe of them can only be, that the proſlambanomenos of any *mode*, being made the principal note of a ſong, there may be different ſpecies of melody anſwering to thoſe different conſtitutions. But then we are not to conceive, that the proſlambanomenos, or fundamental of any *mode* is fixed to any particular chord of the ſyſtem, *v. gr.* the Phrygian to *g*, ſo that we muſt always begin there, when we would have a piece of melody of that ſpecies. When we ſay in general, that ſuch a *mode* begins in *g*, it is no more than to ſignify the ſpecies of octave as they appear in a certain fixed ſyſtem; but we may begin in any chord of the ſyſtem, and make it the proſlambanomenos of any *mode*, by adding new chords, or altering the tuning of the old. If this were the true nature, and uſe of the tones, moſt of theſe *modes* muſt have been imperfect, and incapable of good melody, as wanting ſome of thoſe which we reckon the eſſential and natural notes of a true *mode.* Again, if the eſſential difference of the *modes* conſiſt only in the gravity or acuteneſs of the whole octave, then we may ſuppoſe one ſpecies or concinnous diviſion of the octave, which being applied to all the chords of the ſyſtem, makes them true fundamentals for a certain ſeries of ſucceſſive notes, by changing, as above, the tone of certain chords in ſome caſes, or by adding new chords to the ſyſtem. But that muſt have been a ſimple kind of melody, produced by admitting only one concinnous ſeries, and that too wanting ſome uſeful and neceſſary chords.

Muſic was conſiderably improved in the eleventh century, by Guido Aretinus; who, among other innovations, reformed the doctrine of *modes.* It is true, they were ſtill defined by the ſpecies of the octave, in Ptolemy's manner; and their number was fixed to ſeven: but afterwards taking occaſion to conſider the harmonical and arithmetical diviſions of the octave, whereby it reſolves into a fourth above a fifth, or a fifth above a fourth, they hence conſtituted twelve modes, making of each octave two different *modes*, according to this different diviſion: but becauſe there are two of them that cannot be divided both ways, there are but twelve *modes.* Of theſe, ſuch as were divided harmonically, that is, with the fifths loweſt (which were ſix) were called *authentic*; and the other ſix, which had the fifths higheſt, were called *plagal modes.* See the Scheme annexed.



To theſe *modes*, they gave the names of the ancient Greek tones, as Dorian, Phrygian, Lydian: But the ſeveral authors differ in the application and order of theſe names. So that we are ſtill in great meaſure at a loſs what they meant by thoſe diſtinctions, and what their real uſe was.—The beſt account we can give is this; They conſidered that an octave which wants a fourth or fifth, is imperfect; theſe being the concords next to octave, the ſong ought to touch thoſe chords moſt frequently and remarkably; and becauſe their concord is different, which makes the melody different, they eſtabliſhed by this two *modes* in every natural octave that had a true fourth and fifth: Then, if the ſong was carried as far as this octave above, it was called a *perfect mode*; if leſs, as to the fourth or fifth, it was called *imperfect*; if it moved both above and below, it was called a *mixt mode.*—Thus it is ſome authors ſpeak about theſe *modes.* Others conſidering how indiſpenſable a chord the fifth is in every *mode*, took for the final, or key-note, in the arithmetically divided octaves, not the loweſt chord of that octave, but that very fourth.—The only difference then in this method between the authentic and plagal *modes* is, that the authentic goes above its final to the octave; the other aſcends a fifth, and deſcends a fourth; which will indeed be attended with different effects, but the *mode* is eſſentially the ſame, having the ſame final to which all the notes refer.

We are now to conſider wherein the *modes* of one ſpecies, as authentic, or plagal, differ among themſelves: This muſt either be by ſtanding higher or lower in the ſcale, *i. e.* by the different tenſion of the whole octave, or rather by the different ſubdiviſion of the octave into its concinnous degrees; there can be no other.—We are to conſider then, whether theſe differences are ſufficient to produce ſuch very different effects as are aſcribed to the ſeveral *modes*; for inſtance, that the one produces mirth, another ſadneſs, a third is proper for religion, a fourth for love, &c. That theſe effects are owing merely to the conſtitution of the octave, ſcarce any body will affirm. The differences in the conſtitution will, indeed, have ſome influence; but it will be ſo little, as that, by the various combinations of other cauſes, one of theſe *modes* may be uſed to different purpoſes. The greateſt difference is that of thoſe octaves which have the third *l*, or third *g*, making what on other occaſions we call the *ſharp* and *flat key.*

However, if the *modes* depend upon the ſpecies of octaves, how can they be more than ſeven? And as to the diſtinction between authentic and plagal, we have already obſerved, that it is imaginary with reſpect to any eſſential difference conſtituted thereby in the kind of the melody; for though the carrying the ſong above or below the final, may have different effects, yet this is to be aſcribed to other cauſes beſides the conſtitution of the octaves. It is particularly obſervable, that thoſe authors who give us examples in actual compoſition of their twelve *modes*, frequently take in the artificial notes ♯ and ♭, to perfect the melody of their key; and by this means depart from the conſtitution of the octave, as it ſtands fixed in the natural ſyſtem. There is nothing certain or conſiſtent therefore in their way of ſpeaking; but the *modes* are all really reducible to two, *viz.* the ſharp and flat; the other differences reſpecting only the place of the ſcale where the fundamental is taken.

The ancient *modes*, beſides their general diviſion into authentic and plagal, had alſo their reſpective names from the ſeveral Greek provinces where they are ſuppoſed to have been invented.—Originally, indeed, there were but three, *viz.* Doric, Lydian, and Phrygian; which were particularly called *tones*, becauſe at a tone's diſtance from one another. The reſt were added afterwards, and were ſome of them named from the relations they bore to the former, particularly the *hypo-doric*, as being below the doric.

The *Doric* Mode was a mixture of gravity and mirth, invented by Thamyras of Thrace. See Doric.

The *Phrygian* Mode was adapted to the kindling of rage; invented by Marſyas the Phrygian.

The *Lydian* Mode was proper for funeral ſongs; invented, according to Pliny, by Amphion.

The *Myxolodian* was invented by Sappho.—The *Æolic*, *Ionic*, and *Hypo-doric* by Philoxenus.—And the *Hypo-Lydian* by Polymneſtes.

Beſides theſe *modes of tune*, old authors have alſo introduced *modes of time*, or meaſures of notes.—Theſe at firſt were diſtinguiſhed into greater and leſs, and each of theſe again into perfect and imperfect. But afterwards they reduced all into four *modes*, which included the whole buſineſs of time.—As thoſe *modes* are now diſuſed, they are hardly worth the reciting.

The common *mode* now in uſe, is much more ſimple and natural than any of thoſe; the proportion, which in theirs varied, being in ours fixed, *viz.* 2 : 1. A large equal to two longs; a long to two breves; a breve to two ſemi-breves, &c. proceeding in the ſame proportion to the laſt or loweſt notes. And if on ſome occaſions the proportion of 3 : 1 betwixt two ſucceſſive notes is required, it is eaſily expreſſed by annexing a point (.). See Time, Note, &c.

The ancients had likewiſe their *modi melopœiæ*, of which Ariſtides names theſe; *dithyrambic, comic, and tragic:* which were called *modes* from their expreſſing the ſeveral motions and affections of the mind. See Dithyrambic, &c.

MODEL, an original, or pattern propoſed for any one to copy or imitate. See Original.

St. Paul's church is ſaid to be built on the *model* of St. Peter's at Rome. See Archetype, Ectype, &c.

Model is particularly uſed in building, for an artificial pattern, made of wood, ſtone, plaiſter, or other matter, with all its parts and proportions; in order for the better conducting and executing ſome great work, and to give an idea of the effect it will have in large.

In all great buildings, it is much the ſureſt way to make a *model* in relievo; and not to truſt to a bare deſign, or draught, See Design.

There are alſo *models* for the building of ſhips, &c. for extraordinary ſtair-caſes, &c.

Model, in painting and ſculpture, is any thing propoſed to be imitated.—And

Hence in the academies, they give the term *model* to a naked man, diſpoſed in ſeveral poſtures, to give an opportunity to the ſcholars to deſign him in various views and attitudes.

The ſculptors have little *models* of clay or wax to aſſiſt them in their deſigns of others that are larger, in marble, *&c.* and to judge of the attitude and correctneſs of a figure. See FIGURE. Statuaries likewiſe give the name *model* to certain figures of clay or wax, which are but juſt faſhioned, to ſerve by way of guide for the making of larger, whether of marble, or other matter. See STATUE.

MODERATOR, in the ſchools, the perſon who preſides at a diſpute, or in a public aſſembly. See PRESIDENT.

Such a doctor was the *moderator*, the preſident, at ſuch a diſputation, in ſuch an aſſembly, *&c.*

MODERN, ſomething new, or of our time—In oppoſition to what is antique, or *ancient*. See ANCIENT.

Modern authors, according to Naude, are all thoſe who have wrote ſince Boethius: The *modern* philoſophy commences with Galileo: The *modern* aſtronomy with Copernicus. See PHILOSOPHY, and ASTRONOMY.

MODERN *medals*, are all thoſe that have been ſtruck within theſe three hundred years. See MEDAL.

MODERN *coins*, See the article COINS.

MODERN *Hebrew*. See the Article HEBREW.

MODERN *weights*. See the article WEIGHTS.

MODERN, in architecture, is improperly applied to the preſent or Italian manner of building; as being according to the rules of the antique. (See ANTIQUE.) Nor is the term leſs abuſed, when attributed to architecture purely Gothic. See GOTHIC. *Modern architecture*, in propriety, is only applicable to that which partakes partly of the antique, retaining ſomewhat of its delicacy and ſolidity; and partly of the Gothic, whence it borrows members and ornaments, without proportion or judgment. See ARCHITECTURE.

MODIFICATION, in philoſophy, that which *modifies* a thing; that is, gives it this or that manner of being. See MODE.

Quantity and quality are accidents which *modify* all bodies. See QUANTITY, and QUALITY.

According to Spinoſa's ſyſtem, all the beings that compoſe the univerſe, are only ſo many different *modifications* of one and the ſame ſubſtance. It is the different arrangement and ſituation of their parts, that make all the difference between them. See SPINOSISM.

MODIFICATIVE, ſomething that *modifies*, or gives a thing a certain manner of being. See MODE.

Father Buffier eſtabliſhes a new part of ſpeech, which he calls *modificative*. Nouns, and verbs, he obſerves, are ſuſceptible of divers circumſtances or *modifications*: In the phraſe, *zeal acts*, we have a noun and verb, without any *modification*; but in that, *zeal without diſcretion acts raſhly*, the noun and the verb are each attended with a *modification* or circumſtance.

This laſt kind of words, which ſerve to *modify* nouns and verbs, ſince they have no general name in the common grammars, he chuſes to call *modificatives*:—which include what grammarians commonly call *adverb*, *conjunction*, and *prepoſition*. See CONJUNCTION, PREPOSITION, *&c.*

MODILLIONS*, in architecture, ornaments in the corniche of the Ionic, Corinthian, and Compoſite columns.—See *Tab. Architect. fig.* 20, and 26. *lit. c.* See alſo CORNICHE.

The *modillions* are little inverted conſoles, or brackets, in form of an S, under the ſoffit of the corniche, ſeeming to ſupport the projecture of the larmier; though in reality they are no more than ornaments. See CONSOLE.

The *modillion* is ſometimes alſo called *mutule*; though cuſtom has introduced a little difference between the idea of a *modillion* and a mutule; the mutule being peculiar to the Doric order, and the *modillion* to the higher orders. See MUTULE.

The *modillions* ought always to be placed over the middle of the column. They are particularly affected in the Corinthian order, where they are uſually enriched with ſculpture.—Their proportions muſt be ſo adjuſted, as to produce a regularity in the parts of the ſoffit.

The *inter-modillions*, *i. e.* the diſtances between them, depend on the inter-columnations, which oblige the *modillions* to be made of a certain length and breadth, in order to render the intervals perfect ſquares, which are always found to have better effect than parallelograms. To this it muſt be added, that in adjuſting the *modillions*, care ſhould be taken that they have ſuch a proportion, as that when the orders are placed over one another, there be the ſame number in the upper order as in the lower, and that they fall perpendicularly over each other. *Modillions* are alſo uſed under the corniches of pediments; though Vitruvius obſerves that they were not allowed of in his time, in regard *modillions* were intended to repreſent the ends of rafters, which could not be ſuppoſed to be found in a pediment. See PEDIMENT.

Some will have the *modillions* of a pediment to repreſent purlins; and thoſe at the eaves to repreſentt rafters. Daviler rather takes them for a kind of inverted conſoles or corbels.

MODIOLUS, a chirurgeon's inſtrument, the ſame with *anabaptiſton* and *trepanum*. See TREPANUM.

MODIUS, in antiquity, a kind of dry meaſure in uſe among the Romans for ſeveral ſorts of grain. See MEASURE.

The *modius* contained thirty-two heminæ, or ſixteen ſextaries; or $\frac{1}{3}$ of the amphora: amounting to an Engliſh peck. See HEMINA, AMPHORA, *&c.*

MODO *&* *forma*, in law, a phraſe uſed in proceſſes and pleadings, whereby the defendant abſolutely denies the thing charged on him by the plaintiff, *modo & forma declarata*, in the manner and form ſet forth.

The civilians in the like ſenſe ſay, *negat allegata, prout allegantur, eſſe vera*.

MODULATION, in muſic, is the art of keeping in, and on occaſion changing the mode, or key; and returning to it again; without offence to the ear. See MODE.

Under this term is comprehended the regular progreſſion of the ſeveral parts through the ſounds that are in the harmony of any particular key, as well as the proceeding naturally and regularly from one key to another.

The rules of *modulation* in the firſt ſenſe belong to harmony and melody. See HARMONY, and MELODY.—We ſhall here only add a word with regard to the rules of *modulation* in the latter ſenſe.

As every piece muſt have a principal key; and ſince the variety ſo neceſſary in muſic to pleaſe and entertain, forbids the being confined to one key; and that therefore it is not only allowable, but neceſſary, to *modulate* into, and make cadences on ſeveral other keys, having a relation and connection with the principal key: It muſt be conſidered what it is that conſtitutes a connection between the harmony of one key and that of another, that it may be hence determined into what keys the harmony may be conducted with propriety. See KEY.

As to the manner in which the *modulation* from one key to another is to be performed, ſo that the tranſition may be eaſy and natural; it is not eaſy to fix any preciſe rules: for though it is chiefly performed by the help of the ſeventh *g* of the key, into which the harmony is to be changed, whether it be flat or ſharp; yet the manner of doing it is ſo various and extenſive, as no rules can eaſily circumſcribe. A general notion of it may be conceived under the following terms.

The ſeventh *g* in either ſharp or flat key, is the third *g* to the fifth *f* of the key, by which the cadence in the key is chiefly performed; and by being only a ſemi-tone under the key, is thereby the moſt proper note to lead into it, which it does in the moſt natural manner imaginable. Inſomuch that the ſeventh *g* is never heard in any of the parts, but the ear expects the key ſhould ſucceed it; for whether it be uſed as a third, or as a ſixth, it always affects us with ſo imperfect a ſenſation, that we naturally expect ſomething more perfect to follow, which cannot be more eaſily and ſmoothly accompliſhed, than by the ſmall interval of a ſemi-tone, to paſs into the perfect harmony of the key. Hence it is, that the tranſition into one key is beſt effected, by introducing its ſeventh *g*, which ſo naturally leads to it.

MODULE, in architecture, a certain meaſure, taken at pleaſure, for regulating the proportions of columns, and the ſymmetry, or diſtribution of the whole building. See COLUMN.

Architects uſually chuſe the diameter, or ſemi-diameter of the bottom of the column for their *module*; and this they ſubdivide into parts, or minutes. See MINUTE.

Vignola divides his *module*, which is a ſemi-diameter, into twelve parts, in the Tuſcan and Doric, and into eighteen for the other orders.

The *module* of Palladio, Scamozzi, M. Cambray, Deſgodetz, Le Clerc, *&c.* which is alſo the ſemi-diameter, is divided into thirty parts or minutes in all the orders. See MINUTE.

Some divide the whole height of the column into 20 parts for the Doric, $22\frac{1}{2}$ for the Ionic, 25 for the Roman, *&c.* and one of theſe parts they make a *module*, to regulate the reſt of the building by.

There are two ways of determining the meaſures, or proportions of buildings; the firſt by a fixed ſtandard meaſure, which is uſually the diameter of the lower part of the column, called a *module*, ſubdivided into 60th parts, called *minutes*.—In the ſecond, there are no minutes, nor any certain and ſtated diviſion of the *module*; but it is divided occaſionally into as many parts as are judged neceſſary. Thus, the height of the Attic baſe, which is half the *module*, is divided either into three, to have the height of the plinth; or into four, for that of the greater torus; or into ſix, for that of the leſſer.

Both theſe manners have been practiſed by the ancient, as well as the modern architects: But the ſecond, which was that chiefly uſed among the ancients, is in my opinion preferable. Perrault.

As Vitruvius, in the Doric order, has leſſened his *module*, which in the other orders is the diameter of the lower part of the column; and has reduced that great *module* to a mean one, which is a ſemidiameter: M. Perrault reduces the *module* to a third part for the ſame reaſon, *viz.* to determine the ſeveral meaſures without a fraction.—For in the Doric order, beſide that the height of the baſe, as in the other orders, is determined by one of theſe mean *modules*; the ſame *module* gives likewiſe the heights of the capital, architrave, triglyphs, and metopes. But our little *module*, taken from the third of the diameter of the lower part of the column, has uſes much more extenſive; for, by this the heights of pedeſtals, of columns, and entablatures, in all the orders, are determined without a fraction.

---

* The word comes from the Italian, *Modiglione*, a little meaſure.

As then the great *module*, or diameter of the column, has ſixty minutes; and the mean *module*, or half the diameter, thirty minutes; our little *module* has twenty. *Id.*

MODUS *decimandi*, is when a parcel of land, a ſum of money, or a yearly penſion, belongs to the parſon, either by compoſition or cuſtom, time out of mind, in ſatisfaction for tithes in kind. See TITHE.

MOHAIR, a kind of ſtuff, ordinarily of ſilk, both woof and warp; having its grain wove very cloſe.

There are two kinds of *mohairs*, the one ſmooth and plain; the other watered like tabbys: the difference between the two only conſiſts in this, that the latter is calendered, the other not.—There are alſo *mohairs* both plain, and watered, whoſe woof is woollen, cotton, or thread.

MOIDORE, MOEDORE, or MOEDA, a gold coin, ſtruck, and current in Portugal. See COIN.

The *moidore* is properly the Portugueſe *piſtole*; and is equivalent to two mille-rees. See PISTOLE, MILLE-REE, *&c.*

There are alſo *doppio-moedas*, or double piſtoles, and demi-piſtoles.

MOIETY, MEDIETAS, the *half* of any thing. See HALF.

MOINEAU, in fortification, is a flat baſtion raiſed before a curtin when it is too long, and the baſtions of the angles too remote to be able to defend one another. See BASTION.

Sometimes the *moineau* is joined to the curtin, and ſometimes is divided from it by a moat.—Here muſqueteers are placed, to fire each way.

MOISTURE *radical*. See the article RADICAL.

MOLA*, in medicine, ſee the article MOLE.

* The word is Latin, and litterally ſignifies a *mill-ſtone*.

MOLA, in anatomy, a bone of the knee, called alſo *patella*, *rotula*, &c.—See *Tab. Anat.* (*oſteol.*) *fig.* 23. *n.* 21. 22. See alſo PATELLA.

MOLARES, in anatomy, the *grinders*; an epithet given to the large teeth; as ſerving, like millſtones, to grind the food. —See *Tab. Anat.* (*oſteol.*) *fig.* 2. *lit. f.* See alſo TOOTH.

The number of *molares* is not always the ſame. Some perſons have twenty; and others only ſixteen, *viz.* four or five on each ſide of either jaw.—They are very large, hard, and ſtrong; being faſtned into their alveoli or ſockets by ſeveral roots.

MOLASSES. See the article MOLOSSES.

MOLD. See the article MOULD.

MOULDED *column*. See the article COLUMN.

MOLE*, MOLA, or MOLA *carnea*, in medicine, a miſhapen maſs of hard fleſh, ſometimes generated in the wombs of women, inſtead of a fœtus; called alſo a *falſe conception*. See CONCEPTION.

* The Latins give it the name *mola*, which literally ſignifies *mill-ſtone*, from its reſemblance thereto in form and hardneſs.

The *mole* is the chaos of an embryo; and would have grown to an infant, had not the proceſs of conception been diſturbed. Though it be without regular bones, viſcera, *&c.* yet the lineaments frequently are not ſo far effaced, but that there are ſome remains of a child; ſometimes a hand, and ſometimes a foot, have been ſpied; but commonly the ſecundines.

It is rare that more than one *mole* is excluded; though Sennertus obſerves there are inſtances of two, three, or even more. He adds, that though they uſually come alone, yet they have been known to come with a fœtus, ſometimes before it, and ſometimes after it. See CONCEPTION.

The *mole* is diſtinguiſhed from an *Embryo*, in that it has no placenta whereby to receive its nouriſhment from the mother. Inſtead of that, it grows immediately to the womb; and is nouriſhed thence. See FOETUS.

It has a kind of vegetative life, and continues growing in bulk till the time of excluſion. Sometimes it has been borne in the womb for two or three years.

This production is ſuppoſed to ariſe from ſome defect or indiſpoſition of the ovum, or egg; or, perhaps, from the male's ſeed wanting force to penetrate it ſufficiently in order to open, or expand the parts. Or, the effect may be accounted for, by ſuppoſing an ovum to drop into the womb, without being impregnated by the ſeed of the male: In all which caſes, the egg continuing to grow, and yet wanting ſomething neceſſary to organize and form it into an embryo, becomes a ſhapeleſs lump. See EMBRYO.

Authors are divided whether or no women ever bring forth *moles* without any intercourſe with men? Some ſay there are *moles* which derive their origin from the menſtruous blood detained, coagulated, and hardened; through which the blood and ſpirits have made themſelves paſſages, *&c.* See MENSES.

The *mole* is diſtinguiſhed from a true conception, by its tremulous palpitating motion; by its rolling from ſide to ſide; and by the belly's ſwelling equally every way. The breaſts ſwell as in caſe of a juſt embryo; but the humour generated therein is not true milk, but a crude matter, formed of the ſuppreſſed menſes.

To bring the *mola* out of the womb, bleeding and violent purging are uſed, and at laſt ſtrong emmenagogues. If theſe fail, recourſe is to be had to manual operation.

MOLE, MOLES, a maſſive work formed of large ſtones laid in the ſea by means of coffer-dams, extended either in a right line or an arch of a circle, before a port; which it ſerves to cloſe; to defend the veſſels in it from the impetuoſity of the waves, and prevent the paſſage of ſhips without leave.

Thus we ſay the *mole* of the harbour of Meſſina, *&c.*

MOLE, is ſometimes alſo uſed to ſignify the harbour itſelf. See HARBOUR.

MOLE, MOLES, among the Romans, was alſo uſed for a kind of mauſoleum, built in manner of a round tower on a ſquare baſe, inſulate, incompaſſed with columns, and covered with a dome. See MAUSOLEUM.

The *mole* of the emperor Adrian, now the caſtle of St. Angelo, was the greateſt, and moſt ſtately of all the *moles*. It was crowned with a brazen pine-apple, wherein was a golden urn containing the aſhes of the emperor.

MOLECULE, MOLECULA, in phyſics, a little maſs, or portion of any body. See PART, and PARTICLE.

The air, by reſpiration, inſinuating itſelf into the veins and arteries, endeavours by its elaſtic power to divide and break the *molecules* of the blood, which on their ſide reſiſt ſuch diviſion.

MOLESTANDO. See the article NON-*moleſtando*.

MOLINE', in heraldry. A *Croſs*-MOLINE' is that which turns round both ways at all its extremities, though not ſo wide or ſharp as that ſaid to be *anchored*. See CROSS.

In Upton, the points are all cut off, which makes it very different from the croſs anchored. See FER *de moulin*.

MOLINISTS, a ſect in the Romiſh church, who follow the doctrine and ſentiments of the Jeſuit *Molina*, relating to ſufficient and efficacious grace. See GRACE, *&c.*

Their great antagoniſts are the Janſeniſts. See JANSENISM.

MOLINOSISTS, a ſect among the Romaniſts, who adhere to the doctrine of Molinos.—Theſe are the ſame with what are otherwiſe called *Quietiſts*. See QUIETISTS.

MOLLET. See the article MULLET.

MOLLIS *portio*. See the article PORTIO.

MOLMUTIN, or MOLMUTIAN *laws*, the laws of Dunwallo Molmutius, XVIth king of the Britons, who is ſaid to have begun his reign 440 years before the incarnation. See LAW.

He was the firſt who publiſhed any laws in this land; and they continued famous therein till the time of William the Conqueror.

MOLOSSES, MOLASSES, or MELASSES, that groſs, yet fluid matter remaining of ſugar, after refining, and which no boiling will bring to a conſiſtence more ſolid than that of ſyrup; hence alſo called *ſyrup of ſugar*. See SUGAR, and REFINING.

Properly, *moloſſes* are only the ſediment of one kind of ſugar called *chypre*, or brown ſugar, which is the refuſe of other ſugars not to be whitened, or reduced into loaves.

Moloſſes are much uſed in Holland among poor people, for the preparation of tobacco, and inſtead of ſugar.

There are alſo a kind of brandy, or ſpirit made of *moloſſes*; but by ſome held exceedingly unwholeſome, and therefore diſcouraged. See BRANDY, and SPIRIT.

MOLOSSUS, in the Greek and Latin poetry, a foot conſiſting of three long ſyllables.—As *audiri*, *cantabant*, *virtutem*. See FOOT.

It takes its name either from a dance in uſe among the people called *Moloſſi*, or *Epirotæ*; or from the temple of Jupiter *Moloſſus*, where odes were ſung, in which this foot had a great ſhare; or becauſe the march of the *Moloſſi* when they went to the combat, was compoſed of theſe feet, or had the cadence thereof.—The ſame foot was alſo called among the ancients *Voitumnius*, *extenſipes*, *hippius*, *&* *chanius*. Dion. 3. p. 475.

MOLTA, or MOLTURA, a duty or toll paid by vaſſals to the lord for grinding their corn at his mill.

MOLTING, or MOULTING, the falling off or change of hair, feathers, ſkin, horns, voice, and other diſpoſitions of the body of animals, happening in ſome, annually, in others at certain ſtages of their life.

The generality of beaſts *molt* in the ſpring.

The *moulting* of a hawk is called *mewing*. See HAWK, and FALCONRY.

The *molting* of a deer is the quitting of his horns in February or March; the *molting* of a ſerpent is the putting off his ſkin. See EXUVIÆ.

MOLUTA *arma*. See the article ARMA.

MOMENT, in time, the moſt minute, and indiviſible part of duration; or what we otherwiſe call an *inſtant*. See TIME, and INSTANT.

MOMENTS, in the new doctrine of infinites, denote the infinitely ſmall parts of quantity. See INFINITE.

Moments are the ſame with what we otherwiſe call *infiniteſimals*, and *differences*; being the *momentary* increments, or decrements of quantity conſidered as in a continual flux. See DIFFERENCE, and ELUXION.

Moments are the generative principles of magnitude. They have no determinate magnitude of their own; but are only inceptive thereof. See INCEPTIVE,

Hence, as it is the ſame thing if in lieu of theſe *moments*, the velocities of their increaſes and decreaſes be made uſe of, or

The ſculptors have little *models* of clay or wax to aſſiſt them in their deſigns of others that are larger, in marble, *&c.* and to judge of the attitude and correctneſs of a figure. See FIGURE. Statuaries likewiſe give the name *model* to certain figures of clay or wax, which are but juſt faſhioned, to ſerve by way of guide for the making of larger, whether of marble, or other matter. See STATUE.

MODERATOR, in the ſchools, the perſon who preſides at a diſpute, or in a public aſſembly. See PRESIDENT.

Such a doctor was the *moderator*, the preſident, at ſuch a diſputation, in ſuch an aſſembly, *&c.*

MODERN, ſomething new, or of our time—In oppoſition to what is antique, or *ancient*. See ANCIENT.

Modern authors, according to Naude, are all thoſe who have wrote ſince Boethius: The *modern* philoſophy commences with Galileo: The *modern* aſtronomy with Copernicus. See PHILOSOPHY, and ASTRONOMY.

MODERN *medals*, are all thoſe that have been ſtruck within theſe three hundred years. See MEDAL.

MODERN *coins*, See the article COINS.

MODERN *Hebrew*. See the Article HEBREW.

MODERN *weights*. See the article WEIGHTS.

MODERN, in architecture, is improperly applied to the preſent or Italian manner of building; as being according to the rules of the antique. (See ANTIQUE.) Nor is the term leſs abuſed, when attributed to architecture purely Gothic. See GOTHIC. *Modern architecture*, in propriety, is only applicable to that which partakes partly of the antique, retaining ſomewhat of its delicacy and ſolidity; and partly of the Gothic, whence it borrows members and ornaments, without proportion or judgment. See ARCHITECTURE.

MODIFICATION, in philoſophy, that which *modifies* a thing; that is, gives it this or that manner of being. See MODE.

Quantity and quality are accidents which *modify* all bodies. See QUANTITY, and QUALITY.

According to Spinoſa's ſyſtem, all the beings that compoſe the univerſe, are only ſo many different *modifications* of one and the ſame ſubſtance. It is the different arrangement and ſituation of their parts, that make all the difference between them. See SPINOSISM.

MODIFICATIVE, ſomething that *modifies*, or gives a thing a certain manner of being. See MODE.

Father Buffier eſtabliſhes a new part of ſpeech, which he calls *modificative*. Nouns, and verbs, he obſerves, are ſuſceptible of divers circumſtances or *modifications*: In the phraſe, *zeal acts*, we have a noun and verb, without any *modification*; but in that, *zeal without diſcretion acts raſhly*, the noun and the verb are each attended with a *modification* or circumſtance.

This laſt kind of words, which ſerve to *modify* nouns and verbs, ſince they have no general name in the common grammars, he chuſes to call *modificatives*:—which include what grammarians commonly call *adverb*, *conjunction*, and *prepoſition*. See CONJUNCTION, PREPOSITION, *&c.*

MODILLIONS*, in architecture, ornaments in the corniche of the Ionic, Corinthian, and Compoſite columns.—See *Tab. Architect. fig.* 20, and 26. *lit. c.* See alſo CORNICHE.

* The word comes from the Italian, *Modiglione*, a little meaſure.

The *modillions* are little inverted conſoles, or brackets, in form of an S, under the ſoffit of the corniche, ſeeming to ſupport the projecture of the larmier; though in reality they are no more than ornaments. See CONSOLE.

The *modillion* is ſometimes alſo called *mutule*; though cuſtom has introduced a little difference between the idea of a *modillion* and a mutule; the mutule being peculiar to the Doric order, and the *modillion* to the higher orders. See MUTULE.

The *modillions* ought always to be placed over the middle of the column. They are particularly affected in the Corinthian order, where they are uſually enriched with ſculpture.—Their proportions muſt be ſo adjuſted, as to produce a regularity in the parts of the ſoffit.

The *inter-modillions*, *i. e.* the diſtances between them, depend on the inter-columnations, which oblige the *modillions* to be made of a certain length and breadth, in order to render the intervals perfect ſquares, which are always found to have better effect than parallelograms. To this it muſt be added, that in adjuſting the *modillions*, care ſhould be taken that they have ſuch a proportion, as that when the orders are placed over one another, there be the ſame number in the upper order as in the lower, and that they fall perpendicularly over each other. *Modillions* are alſo uſed under the corniches of pediments; though Vitruvius obſerves that they were not allowed of in his time, in regard *modillions* were intended to repreſent the ends of rafters, which could not be ſuppoſed to be found in a pediment. See PEDIMENT.

Some will have the *modillions* of a pediment to repreſent purlins; and thoſe at the eaves to repreſentt rafters. Daviler rather takes them for a kind of inverted conſoles or corbels.

MODIOLUS, a chirurgeon's inſtrument, the ſame with *anabaptiſton* and *trepanum*. See TREPANUM.

MODIUS, in antiquity, a kind of dry meaſure in uſe among the Romans for ſeveral ſorts of grain. See MEASURE.

The *modius* contained thirty-two heminæ, or ſixteen ſextaries; or $\frac{1}{3}$ of the amphora: amounting to an Engliſh peck. See HEMINA, AMPHORA, *&c.*

MODO *&* *forma*, in law, a phraſe uſed in proceſſes and pleadings, whereby the defendant abſolutely denies the thing charged on him by the plaintiff, *modo & forma declarata*, in the manner and form ſet forth.

The civilians in the like ſenſe ſay, *negat allegata, prout allegantur, eſſe vera.*

MODULATION, in muſic, is the art of keeping in, and on occaſion changing the mode, or key; and returning to it again; without offence to the ear. See MODE.

Under this term is comprehended the regular progreſſion of the ſeveral parts through the ſounds that are in the harmony of any particular key, as well as the proceeding naturally and regularly from one key to another.

The rules of *modulation* in the firſt ſenſe belong to harmony and melody. See HARMONY, and MELODY.—We ſhall here only add a word with regard to the rules of *modulation* in the latter ſenſe.

As every piece muſt have a principal key; and ſince the variety ſo neceſſary in muſic to pleaſe and entertain, forbids the being confined to one key; and that therefore it is not only allowable, but neceſſary, to *modulate* into, and make cadences on ſeveral other keys, having a relation and connection with the principal key: It muſt be conſidered what it is that conſtitutes a connection between the harmony of one key and that of another, that it may be hence determined into what keys the harmony may be conducted with propriety. See KEY.

As to the manner in which the *modulation* from one key to another is to be performed, ſo that the tranſition may be eaſy and natural; it is not eaſy to fix any preciſe rules: for though it is chiefly performed by the help of the ſeventh *g* of the key, into which the harmony is to be changed, whether it be flat or ſharp; yet the manner of doing it is ſo various and extenſive, as no rules can eaſily circumſcribe. A general notion of it may be conceived under the following terms.

The ſeventh *g* in either ſharp or flat key, is the third *g* to the fifth *f* of the key, by which the cadence in the key is chiefly performed; and by being only a ſemi-tone under the key, is thereby the moſt proper note to lead into it, which it does in the moſt natural manner imaginable. Inſomuch that the ſeventh *g* is never heard in any of the parts, but the ear expects the key ſhould ſucceed it; for whether it be uſed as a third, or as a ſixth, it always affects us with ſo imperfect a ſenſation, that we naturally expect ſomething more perfect to follow, which cannot be more eaſily and ſmoothly accompliſhed, than by the ſmall interval of a ſemi-tone, to paſs into the perfect harmony of the key. Hence it is, that the tranſition into one key is beſt effected, by introducing its ſeventh *g*, which ſo naturally leads to it.

MODULE, in architecture, a certain meaſure, taken at pleaſure, for regulating the proportions of columns, and the ſymmetry, or diſtribution of the whole building. See COLUMN.

Architects uſually chuſe the diameter, or ſemi-diameter of the bottom of the column for their *module*; and this they ſubdivide into parts, or minutes. See MINUTE.

Vignola divides his *module*, which is a ſemi-diameter, into twelve parts, in the Tuſcan and Doric, and into eighteen for the other orders.

The *module* of Palladio, Scamozzi, M. Cambray, Deſgodetz, Le Clerc, *&c.* which is alſo the ſemi-diameter, is divided into thirty parts or minutes in all the orders. See MINUTE.

Some divide the whole height of the column into 20 parts for the Doric, $22\frac{1}{2}$ for the Ionic, 25 for the Roman, *&c.* and one of theſe parts they make a *module*, to regulate the reſt of the building by.

There are two ways of determining the meaſures, or proportions of buildings; the firſt by a fixed ſtandard meaſure, which is uſually the diameter of the lower part of the column, called a *module*, ſubdivided into 60th parts, called *minutes*.—In the ſecond, there are no minutes, nor any certain and ſtated diviſion of the *module*; but it is divided occaſionally into as many parts as are judged neceſſary. Thus, the height of the Attic baſe, which is half the *module*, is divided either into three, to have the height of the plinth; or into four, for that of the greater torus; or into ſix, for that of the leſſer.

Both theſe manners have been practiſed by the ancient, as well as the modern architects: But the ſecond, which was that chiefly uſed among the ancients, is in my opinion preferable. Perrault.

As Vitruvius, in the Doric order, has leſſened his *module*, which in the other orders is the diameter of the lower part of the column; and has reduced that great *module* to a mean one, which is a ſemidiameter: M. Perrault reduces the *module* to a third part for the ſame reaſon, *viz.* to determine the ſeveral meaſures without a fraction.—For in the Doric order, beſide that the height of the baſe, as in the other orders, is determined by one of theſe mean *modules*; the ſame *module* gives likewiſe the heights of the capital, architrave, triglyphs, and metopes. But our little *module*, taken from the third of the diameter of the lower part of the column, has uſes much more extenſive; for, by this the heights of pedeſtals, of columns, and entablatures, in all the orders, are determined without a fraction.

As then the great *module*, or diameter of the column, has ſixty minutes; and the mean *module*, or half the diameter, thirty minutes; our little *module* has twenty. *Id.*

MODUS *decimandi*, is when a parcel of land, a ſum of money, or a yearly penſion, belongs to the parſon, either by compoſition or cuſtom, time out of mind, in ſatisfaction for tithes in kind. See TITHE.

MOHAIR, a kind of ſtuff, ordinarily of ſilk, both woof and warp; having its grain wove very cloſe.

There are two kinds of *mohairs*, the one ſmooth and plain; the other watered like tabbys: the difference between the two only conſiſts in this, that the latter is calendered, the other not.—There are alſo *mohairs* both plain, and watered, whoſe woof is woollen, cotton, or thread.

MOIDORE, MOEDORE, or MOEDA, a gold coin, ſtruck, and current in Portugal. See COIN.

The *moidore* is properly the Portugueſe *piſtole*; and is equivalent to two mille-rees. See PISTOLE, MILLE-REE, &c.

There are alſo *doppio-moedas*, or double piſtoles, and demi-piſtoles.

MOIETY, MEDIETAS, the *half* of any thing. See HALF.

MOINEAU, in fortification, is a flat baſtion raiſed before a curtin when it is too long, and the baſtions of the angles too remote to be able to defend one another. See BASTION.

Sometimes the *moineau* is joined to the curtin, and ſometimes is divided from it by a moat.—Here muſqueteers are placed, to fire each way.

MOISTURE *radical*. See the article RADICAL.

MOLA*, in medicine, ſee the article MOLE.

* The word is Latin, and litterally ſignifies a *mill-ſtone*.

MOLA, in anatomy, a bone of the knee, called alſo *patella*, *rotula*, &c.—See *Tab. Anat.* (*oſteol.*) *fig.* 23. *n.* 21. 22. See alſo PATELLA.

MOLARES, in anatomy, the *grinders*; an epithet given to the large teeth; as ſerving, like millſtones, to grind the food. —See *Tab. Anat.* (*oſteol.*) *fig.* 2. *lit. f.* See alſo TOOTH.

The number of *molares* is not always the ſame. Some perſons have twenty; and others only ſixteen, *viz.* four or five on each ſide of either jaw.—They are very large, hard, and ſtrong; being faſtned into their alveoli or ſockets by ſeveral roots.

MOLASSES. See the article MOLOSSES.

MOLD. See the article MOULD.

MOULDED *column*. See the article COLUMN.

MOLE*, MOLA, or MOLA *carnea*, in medicine, a miſhapen maſs of hard fleſh, ſometimes generated in the wombs of women, inſtead of a fœtus; called alſo a *falſe conception*. See CONCEPTION.

* The Latins give it the name *mola*, which literally ſignifies *mill-ſtone*, from its reſemblance thereto in form and hardneſs.

The *mole* is the chaos of an embryo; and would have grown to an infant, had not the proceſs of conception been diſturbed. Though it be without regular bones, viſcera, &c. yet the lineaments frequently are not ſo far effaced, but that there are ſome remains of a child; ſometimes a hand, and ſometimes a foot, have been ſpied; but commonly the ſecundines.

It is rare that more than one *mole* is excluded; though Sennertus obſerves there are inſtances of two, three, or even more. He adds, that though they uſually come alone, yet they have been known to come with a fœtus, ſometimes before it, and ſometimes after it. See CONCEPTION.

The *mole* is diſtinguiſhed from an *Embryo*, in that it has no placenta whereby to receive its nouriſhment from the mother. Inſtead of that, it grows immediatly to the womb; and is nouriſhed thence. See FOETUS.

It has a kind of vegetative life, and continues growing in bulk till the time of excluſion. Sometimes it has been borne in the womb for two or three years.

This production is ſuppoſed to ariſe from ſome defect or indiſpoſition of the ovum, or egg; or, perhaps, from the male's ſeed wanting force to penetrate it ſufficiently in order to open, or expand the parts. Or, the effect may be accounted for, by ſuppoſing an ovum to drop into the womb, without being impregnated by the ſeed of the male: In all which caſes, the egg continuing to grow, and yet wanting ſomething neceſſary to organize and form it into an embryo, becomes a ſhapeleſs lump. See EMBRYO.

Authors are divided whether or no women ever bring forth *moles* without any intercourſe with men? Some ſay there are *moles* which derive their origin from the menſtruous blood detained, coagulated, and hardened; through which the blood and ſpirits have made themſelves paſſages, &c. See MENSES.

The *mole* is diſtinguiſhed from a true conception, by its tremulous palpitating motion; by its rolling from ſide to ſide; and by the belly's ſwelling equally every way. The breaſts ſwell as in caſe of a juſt embryo; but the humour generated therein is not true milk, but a crude matter, formed of the ſuppreſſed menſes.

To bring the *mola* out of the womb, bleeding and violent purging are uſed, and at laſt ſtrong emmenagogues. If theſe fail, recourſe is to be had to manual operation.

MOLE, MOLES, a maſſive work formed of large ſtones laid in the ſea by means of coffer-dams, extended either in a right line or an arch of a circle, before a port; which it ſerves to cloſe; to defend the veſſels in it from the impetuoſity of the waves, and prevent the paſſage of ſhips without leave.

Thus we ſay the *mole* of the harbour of Meſſina, &c.

MOLE, is ſometimes alſo uſed to ſignify the harbour itſelf. See HARBOUR.

MOLE, MOLES, among the Romans, was alſo uſed for a kind of mauſoleum, built in manner of a round tower on a ſquare baſe, inſulate, incompaſſed with columns, and covered with a dome. See MAUSOLEUM.

The *mole* of the emperor Adrian, now the caſtle of St. Angelo, was the greateſt, and moſt ſtately of all the *moles*. It was crowned with a brazen pine-apple, wherein was a golden urn containing the aſhes of the emperor.

MOLECULE, MOLECULA, in phyſics, a little maſs, or portion of any body. See PART, and PARTICLE.

The air, by reſpiration, inſinuating itſelf into the veins and arteries, endeavours by its elaſtic power to divide and break the *molecules* of the blood, which on their ſide reſiſt ſuch diviſion.

MOLESTANDO. See the article NON-*moleſtando*.

MOLINE', in heraldry. A *Croſs*-MOLINE' is that which turns round both ways at all its extremities, though not ſo wide or ſharp as that ſaid to be *anchored*. See CROSS.

In Upton, the points are all cut off, which makes it very different from the croſs anchored. See FER *de moulin*.

MOLINISTS, a ſect in the Romiſh church, who follow the doctrine and ſentiments of the Jeſuit *Molina*, relating to ſufficient and efficacious grace. See GRACE, &c.

Their great antagoniſts are the Janſeniſts. See JANSENISM.

MOLINOSISTS, a ſect among the Romaniſts, who adhere to the doctrine of Molinos.—Theſe are the ſame with what are otherwiſe called *Quietiſts*. See QUIETISTS.

MOLLET. See the article MULLET.

MOLLIS *portio*. See the article PORTIO.

MOLMUTIN, or MOLMUTIAN *laws*, the laws of Dunwallo Molmutius, XVIth king of the Britons, who is ſaid to have begun his reign 440 years before the incarnation. See LAW.

He was the firſt who publiſhed any laws in this land; and they continued famous therein till the time of William the Conqueror.

MOLOSSES, MOLASSES, or MELASSES, that groſs, yet fluid matter remaining of ſugar, after refining, and which no boiling will bring to a conſiſtence more ſolid than that of ſyrup; hence alſo called *ſyrup of ſugar*. See SUGAR, and REFINING.

Properly, *moloſſes* are only the ſediment of one kind of ſugar called *chypre*, or brown ſugar, which is the refuſe of other ſugars not to be whitened, or reduced into loaves.

Moloſſes are much uſed in Holland among poor people, for the preparation of tobacco, and inſtead of ſugar.

There are alſo a kind of brandy, or ſpirit made of *moloſſes*; but by ſome held exceedingly unwholeſome, and therefore diſcouraged. See BRANDY, and SPIRIT.

MOLOSSUS, in the Greek and Latin poetry, a foot conſiſting of three long ſyllables.—As *audiri*, *cantabant*, *virtutem*. See FOOT.

It takes its name either from a dance in uſe among the people called *Moloſſi*, or *Epirotæ*; or from the temple of Jupiter *Moloſſus*, where odes were ſung, in which this foot had a great ſhare; or becauſe the march of the *Moloſſi* when they went to the combat, was compoſed of theſe feet, or had the cadence thereof.—The ſame foot was alſo called among the ancients *Voitumnius*, *extenſipes*, *hippius*, & *chanius*. Dion. 3. p. 475.

MOLTA, or MOLTURA, a duty or toll paid by vaſſals to the lord for grinding their corn at his mill.

MOLTING, or MOULTING, the falling off or change of hair, feathers, ſkin, horns, voice, and other diſpoſitions of the body of animals, happening in ſome, annually, in others at certain ſtages of their life.

The generality of beaſts *molt* in the ſpring.

The *moulting* of a hawk is called *mewing*. See HAWK, and FALCONRY.

The *molting* of a deer is the quitting of his horns in February or March; the *molting* of a ſerpent is the putting off his ſkin. See EXUVIÆ.

MOLUTA *arma*. See the article ARMA.

MOMENT, in time, the moſt minute, and indiviſible part of duration; or what we otherwiſe call an *inſtant*. See TIME, and INSTANT.

MOMENTS, in the new doctrine of infinites, denote the infinitely ſmall parts of quantity. See INFINITE.

Moments are the ſame with what we otherwiſe call *infiniteſimals*, and *differences*; being the *momentary* increments, or decrements of quantity conſidered as in a continual flux. See DIFFERENCE, and FLUXION.

Moments are the generative principles of magnitude. They have no determinate magnitude of their own; but are only inceptive thereof. See INCEPTIVE.

Hence, as it is the ſame thing if in lieu of theſe *moments*, the velocities of their increaſes and decreaſes be made uſe of, or the finite quantities proportionable to ſuch velocities; the method of proceeding which conſiders the motions, changes, or fluxions of quantities, is denominated by Sir Iſ. Newton the method of fluxions. See Fluxions.

Leibnitz, and moſt foreigners, conſidering theſe infinitely ſmall parts, or infiniteſimals, as the differences of two quantities; and thereby endeavouring to find the difference of quantities, *i. e.* ſome *moments*, or quantities infinitely ſmall, which being taken an infinite number of times, ſhall equal given quantities, call theſe moments, *differences*; and the method of procedure, the *differential calculus*. See Calculus *differentialis*.

Moment, Momentum, in mechanics, is the ſame with *impetus*; or the quantity of motion in a moving body. See Motion.

Momentum, is ſometimes alſo uſed ſimply for the motion itſelf.

Moment is frequently defined by the *vis inſita*, or the power by which moving bodies continually change place. See Vis.

In comparing the motions of bodies, the ratio of their *momenta* is always compounded of the quantity of matter, and the celerity of the moving body; ſo that the *moment* of any ſuch body may be conſidered as a rectangle under the quantity of matter, and the celerity.

And ſince it is certain that all equal rectangles have their ſides reciprocally proportionable; therefore if the *moments* of any moving bodies be equal, the quantity of matter in one to that of the other will be reciprocally as the celerity of the latter to the celerity of the former; and, on the contrary, if the quantities of matter be reciprocally proportionable to the celerities, the *moments*, or quantities in each, will be equal.

The *moment* alſo of any moving body may be conſidered as the aggregate or ſum of all the *moments* of the parts of that body; and therefore where the magnitudes and number of particles are the ſame, and where they are moved with the ſame celerity, there will be the ſame *moments* of the wholes. See Motion.

MOMENTARY *motion*. See the article Quantity.

MONARCHY*, ΜΟΝΑΡΧΙΑ, a large ſtate governed by one; or a ſtate where the ſupreme power is lodged in the hands of a ſingle perſon. See Government.

* The word comes from the Greek μοναρχης, one who governs alone; formed of μονος *ſolus*, and αρχη *imperium*, government.

The moſt ancient *monarchy* was that of the Aſſyrians, which was founded ſoon after the deluge.—We uſually reckon four grand, or univerſal *monarchies*, the Aſſyrian, Perſian, Grecian, and Roman. Though St. Auguſtin makes them but two, *viz.* thoſe of Babylon and Rome.—There ſeems in reality no neceſſity to make the Medes, Perſians and Greeks ſucceed to the whole power of the Aſſyrians, to multiply the number of the *monarchies*: it was the ſame empire ſtill, and the ſeveral changes that happened in it, did not conſtitute different *monarchies*. Thus the Roman empire was ſucceſſively governed by princes of different nations, yet without any new *monarchy* being formed thereby. Rome therefore may be ſaid to have immediately ſucceeded Babylon in the empire of the world. See Empire.

Of *monarchies* ſome are *abſolute* and *deſpotic*, where the will of the monarch is uncontrollable; as Denmark, &c. others *limited*, where the prince's authority is reſtrained by laws, and part of the ſupreme power lodged in other hands; as in England.

Some *monarchies* again are *hereditary*, where the ſucceſſion devolves immediately from father to ſon; and others *elective*, where, on the death of the *monarch*, his ſucceſſor is appointed by election; as in Poland.

According to Hobbes, *monarchy*, as well as ariſtocracy, derives all its authority from the people, who transfer all their right, *v. gr.* the ſupreme power, by a plurality of ſuffrages, &c. to ſome one perſon called a *monarch*; ſo that whatever the people could have done before this tranſlation, may be now rightfully done by him, to whom the tranſlation is made.—This done, the people are no longer to be looked on as a perſon, but a diſſolved multitude; in regard they were only one by virtue of the ſupreme power, which they have now transferred to another.

Nor can the *monarch*, according to this author, oblige himſelf by any covenants, to any perſon, for the authority he has received; in regard he receives the power from the people, which, as ſoon as that is done, ceaſes to be a perſon; and the perſon ceaſing, the obligation to the perſon ceaſes of courſe.—The people therefore are obliged to pay obedience to the *monarch*, by virtue of thoſe covenants, whereby they mutually oblige themſelves to what the people, as a perſon, injoins to be done.

He argues further, that as a *monarch* cannot be obliged by any covenants; ſo neither can he do any injury to his ſubjects: an injury being nothing elſe but a breach of covenant; and where there is no covenant, there can be no breach. *De cive, cap.* 8.

Monasterii *proviſor*. See the article Proviſor.

MONASTERY, a convent, or houſe built for the reception of religious; whether it be abbey, priory, nunnery, or the like. See Abbey, Priory, &c.

Monastery is only properly applied to the houſes of monks, mendicant friars, and nuns. The reſt are more properly called *religious houſes*. See Religious.

MONASTIC, ſomething belonging to monks, or the monkiſh life. See Monk.

The *monaſtic* profeſſion is a kind of civil death, which has the ſame effect with the natural death. The council of Trent, &c. fix ſixteen years for the age at which a perſon may be admitted into the *monaſtical* ſtate.

St. Anthony is the perſon who in the fourth century firſt inſtituted the *monaſtic* life; as St. Pachomius, in the ſame century, is ſaid to have firſt ſet on foot the cœnobitic life, *i. e.* regular communities of religious. See Cœnobite.

In a ſhort time, the deſarts of Egypt became inhabited with a ſet of ſolitaries, who took upon them the *monaſtic* profeſſion. See Anachoret, Hermite, &c.—St. Baſil carried the monkiſh humour into the eaſt, where he compoſed a rule, which afterwards obtained through a great part of the weſt.

In the eleventh century, the *monaſtic* diſcipline was grown very remiſs: St. Odo firſt began to retrieve it in the monaſtery of Cluny: that monaſtery, by the conditions of its erection, was put under the immediate protection of the holy ſee; with a prohibition to all powers, both ſecular and eccleſiaſtical, to diſturb the monks in the poſſeſſion of their effects, or the election of their abbot. In virtue hereof, they pleaded an exemption from the juriſdiction of the biſhop; and extended this privilege to all the houſes dependent on Cluny. This made the firſt congregation of ſeveral houſes under one chief immediately ſubject to the pope, ſo as to conſtitute one body, or, as they now call it, one *religious order*. Till then, each monaſtery was independent of other, and ſubject to the biſhop. See Order, Congregation, Abbot, Religious, &c.

MOND. See the article Mound.

MONDAY.—*Plough* Monday. See the article Plough.

MONETÆ *pes*. See the article Pes.

MONETAGIUM, Monetage, or Mintage, the right or privilege of coining money. See Mint, Coining, &c.

MONETALES *triumviri*. See the article Triumviri.

MONETARIUS, or Moneyer, a name which antiquaries and medaliſts give to thoſe who ſtruck the ancient coins, or monies. See Moneyer.

Some of the old Roman, &c. coins, have the name of the *monetarius*, either written at length, or at leaſt the initial letters of it. See Coin, &c.

MONEY, or Mony, Moneta, a piece of metal marked for coin, with the arms of a prince, or ſtate, who make it circulate or paſs, at a fixed rate, for things of different value; to facilitate the buſineſs of commerce. See Commerce.

Paulus the lawyer, defines *money* a thing ſtamped with a public coin, and deriving its uſe and value from its impreſſion rather than its ſubſtance.

Monſ. Boizard defines *money* a piece of matter to which public authority has affixed a certain value, and weight; to ſerve as a medium in commerce.

The æra of the invention of *money* is not eaſy to be ſettled. There is no room to doubt but that in the earlieſt ages, the ordinary way of traffick among men was by trucking or exchanging commodity for commodity. Thus in Homer, Glaucus's golden armour was valued at one hundred cows; and Diomedes's armour at ten. See Exchange.

But in courſe of time, it was found neceſſary in the way of commutative juſtice, to have ſome common meaſure or ſtandard, according to which all other things ſhould be eſtimated. This, as ſome gather from Joſephus, was firſt invented by Cain: Though the firſt tidings we hear of it, is in the time of Abraham, who paid four hundred ſhekels for a burying-place. The Greeks refer the invention of *money* to Hermodice, wife of king Midas: and the Latins to Janus.—*Money* being a common meaſure for reducing wares to a balance, it was called by the Greeks *nomiſma*; not from king Numa, but from *nomos*, as being eſtabliſhed by law. By the Latins it was called *pecunia*; either becauſe the wealth of thoſe days conſiſted in their cattle; or, as Pliny will have it, becauſe their firſt coin was ſtamped with the figure of a cow. They alſo call it *moneta*, *à monendo*, as Suidas obſerves, becauſe when the Romans were at a want of *money*, Juno admoniſhed them to uſe juſtice, and there ſhould be no want of *money*. The effect whereof when they had found, ſhe was ſur-named *Juno Moneta*, and *money* was coined in her temple. In proceſs of time, *money* herſelf was made a goddeſs, and enſhrined by the name of *dea pecunia*, under the figure of a woman holding a balance in one hand, and a cornucopia in the other.

On the foot *money* now ſtands, it may be divided into *real*, or *effective*; and *imaginary*.

Real **Money** includes all coins, or ſpecies of gold, ſilver, copper, and the like; which have courſe in commerce, and do really exiſt.—Such are *guineas*, *crowns*, *piſtoles*, *pieces of eight*, *ducats*, &c. which ſee under their proper heads; as alſo under Coin.

Real money, civilians obſerve, has three eſſential qualities, *viz. matter*, *form*, and *weight* or *value*.—For *matter*, copper is that thought to have been firſt coined; afterwards ſilver; and, laſtly, gold, as being the moſt beautiful, ſcarce, cleanly, diviſible, and pure of all metals.

The degrees of goodneſs are expreſſed in gold by carats; and in ſilver by penny-weights, *&c.* For there are ſeveral reaſons for not coining them pure and without alloy, *viz.* the great loſs and expence in refining them, the neceſſity of hardening them to make them more durable, and the ſcarcity of gold and ſilver in moſt countries. See ALLOY.

Among the ancient Britons, iron rings, or, as ſome ſay, iron plates, were uſed for *money*. Among the Lacedæmonians, iron bars quenched with vinegar, that they might not ſerve for any other uſe. Seneca obſerves, that there was anciently ſtamped *money* of leather, *corium forma publica impreſſum*. And the ſame thing was put in practice by Frederic II. at the ſiege of Milan; to ſay nothing of an old tradition among our ſelves, that in the confuſed times of the barons wars, the like was done in England: but the Hollanders, we know, coined great quantities of paſteboard in the year 1574. Numa Pompilius made *money* of wood and leather. Nor does it appear that the Romans were much acquainted with the art of ſtriking *money* in metal during the time of their kings. The firſt ſilver *money* they coined was in the year of Rome 484; and their firſt gold *money* in 546. See COINING.

As to the *form of money*, it has been more various than the matter.—Under this are comprehended the weight, figure, impreſſion, and value.

For the *impreſſion*, the Jews, though they deteſted images, yet ſtamped on the one ſide their ſhekel, the golden pot which had the manna; and on the other, Aaron's rod. The Dardans, two cocks fighting. Alexander, as is held by ſome, his horſe Bucephalus: though this may be doubted of, in regard the horſe is found as frequently on the coins of ſeveral of the kings of Macedon, his predeceſſors, as on his: The Athenians ſtamped their coins with an owl, or an ox; whence the proverb on bribed lawyers, *bos in lingua*. They of Ægina, with a tortoiſe; whence that other ſaying, *virtutem & ſapientiam vincunt teſtudines*. For the Romans, the monetarii ſometimes impreſſed the images of men that had been eminent in their families on the coins: But no living man's head was ever ſtamped on a Roman coin till after the fall of the commonwealth. From that time they bore the emperor's head on one ſide. From this time the practice of ſtamping the prince's image on coins, has obtained among all civilized nations; the Turks and other Mahometans alone excepted, who, in deteſtation of images, inſcribe only the prince's name, with the year of the tranſmigration of their prophet.

As to the *figure*, it is either round, as in England; multangular or irregular, as in Spain; ſquare, as in ſome parts of the Indies; or nearly globular, as in moſt of the reſt.

After the arrival of the Romans in this iſland, the Britons imitated them, coining both gold and ſilver with the images of their kings ſtamped on them. When the Romans had ſubdued the kings of the Britons, they alſo ſuppreſſed their coins, and brought in their own; which were current here from the time of Claudius to that of Valentinian the younger, about the ſpace of five hundred years.

Mr. Camden obſerves, that the moſt ancient Engliſh coin he had known was that of Ethelbert king of Kent, the firſt Chriſtian king in the iſland; in whoſe time all *money* accounts began to paſs by the names of *pounds*, *ſhillings*, *pence*, and *mancuſes*. See POUND, *&c.*

Pence ſeems borrowed from the Latin *pecunia*, or rather from *pendo*, on account of its juſt weight, which was about three pence of our *money*. Theſe were coarſely ſtamped with the king's image on the one ſide, and either the mint-maſter's, or the city's where it was coined, on the other. Five of theſe pence made their ſcilling, probably ſo called from *ſcilingus*, which the Romans uſed for the fourth part of an ounce. Forty of theſe ſcillings made their pound, and four hundred of theſe pounds were a legacy, or a portion for a king's daughter; as appears by the laſt will of king Alfred. See PENNY, *&c.*

By theſe names they tranſlated all ſums of *money* in their old Engliſh teſtament; talents by *pundes*; Judas's thirty pieces of ſilver by *thirtig ſcillinga*; tribute *money*, by *penining*; the mite by *feorthling*.

But it muſt be obſerved, they had no other real *money*, but pence only; the reſt being imaginary *moneys*, *i. e.* names of numbers, or weights. Thirty of theſe pence made a mancus, which ſome take to be the ſame with a mark; manca, as appears by an old MS. was *quinta pars unciæ*. See MARK.

Theſe manca's or mancus's, were reckoned both in gold and ſilver. For in the Year 680, we read that Ina king of the Weſt Saxons obliged the Kentiſhmen to buy their peace at the price of thirty thouſand manca's of gold. In the notes on king Canute's laws, we find this diſtinction, that *mancuſa* was as much as a mark of ſilver; and *manca* a ſquare piece of gold, valued at thirty pence.

The Danes introduced a way of reckoning *money* by ores, *per oras*, mentioned in domes-day book; but whether they were a ſeveral coin, or a certain ſum, does not plainly appear. This, however, may be gathered from the abbey-book of Burton, that twenty ores were equivalent to two marks.

They had alſo a gold coin called *bizantine*, or *bezant*, as being coined at Conſtantinople, then called *Bizantium*. The value of which coin is not only now loſt, but was ſo entirely forgot even in the time of king Edward the third, that whereas the biſhop of Norwich was fined a bizantine of gold to be paid the abbot of St. Edmund's-Bury, for infringing his liberties (as it had been enacted by parliament in the time of the conqueror) no man then living could tell how much it was; ſo it was referred to the king to rate how much he ſhould pay. Which is the more unaccountable, becauſe but a hundred years before, two hundred thouſand beſants were exacted by the ſoldan for the ranſom of St. Lewis of France; which were then valued at one hundred thouſand livres. See BESANT.

Though the coining of *money* be a ſpecial prerogative of the king, yet the ancient Saxon princes communicated it to their ſubjects; inſomuch that in every good town there was at leaſt one mint; but at London eight, at Canterbury four for the king, two for the archbiſhop, one for the abbot at Wincheſter, ſix at Rocheſter, at Haſtings two, *&c.* See MINT.

The Norman kings continued the ſame cuſtom of coining only pence, with the prince's image on one ſide, and on the other the name of the city where it was coined, with a croſs ſo deeply impreſſed, that it might be eaſily parted, and broke into two halves, which ſo broken, they called half-pence; or into four parts, which they called *fourthings*, or *farthings*. See FARTHING.

In the time of king Richard the firſt, money coined in the eaſt parts of Germany, came in ſpecial requeſt in England, on account of its purity, and was called *eaſterling money*, as all the inhabitants of thoſe parts were called *Eaſterlings*. And ſhortly after, ſome of thoſe people ſkilled in coining were ſent for hither, to bring the coin to perfection; which ſince has been called *ſterling* for *Eaſterling*. See STERLING.

King Edward the firſt, who firſt adjuſted the meaſure of an ell by the length of his arm, herein imitating Charles the Great, was the firſt alſo who eſtabliſhed a certain ſtandard for the coin, which is expreſſed to this effect by Greg. Rockley, mayor of London, and mint-maſter.—'A pound of *money* containeth twelve ounces: in a pound there ought to be eleven ounces, two eaſterlings, and one farthing; the reſt alloy. The ſaid pound ought to weigh twenty ſhillings and three pence in account and weight. The ounce ought to weigh twenty pence, and a penny twenty-four grains and a half.—Note, that eleven ounces two pence ſterling ought to be of pure ſilver, called *leaf-ſilver*, and the minter muſt add of other weight ſeventeen pence half-penny farthing, if the ſilver be ſo pure.'

About the year 1320, the ſtates of Europe firſt began to coin gold, and among the reſt, our king Edward III. The firſt pieces he coined were called *florences*, as being coined by Florentines; afterwards he coined nobles; then roſe-nobles, current at ſix ſhillings and eight pence; half-nobles, called *half-pennies*, at three ſhillings and four pence of gold; and quarters at twenty pence, called *farthings of gold*. The ſucceeding kings coined roſe-nobles, and double roſe-nobles, great ſovereigns, and half Henry nobles, angels and ſhillings.

King James the firſt coined unites, double crowns, Britain crowns: then crowns, half crowns, *&c.* See CROWN.

Falſe, or *baſe* MONEY, is either that ſtruck by an unqualified perſon, and of unſtatutable metals; or that which has loſt of its weight, either by being clipped on the corners, or filed on the edges, or laſtly, by having ſome of its ſurface peeled off; if gold, by aqua regalis; if ſilver, by aqua fortis.

Another kind of baſe *money* is that made of pieces of iron, copper, or other metal, covered on each ſide with a thin plate or leaf of gold or ſilver, neatly ſoddered and joined around the edges, and ſtruck, like other coin, with figures, legends, *&c.* only to be diſtinguiſhed from them by the bulk, and weight, and ſound.

Imaginary MONEY, or MONEY *of account*, is that which has never exiſted, or at leaſt which does not exiſt in real ſpecies, but is a denomination invented or retained to facilitate the ſtating of accounts, by keeping them ſtill on a fixed footing, not to be changed, like current coins, which the authority of the ſovereign raiſes or lowers according to the exigencies of ſtate.—Of which kind are *pounds*, *livres*, *marks*, *maravedies*, &c.

Money of account, according to M. Boizard, is a ſum of *money*, or a certain number of ſpecies which may change in ſubſtance and quantity, but never in quality.—Thus fifty pounds conſiſts of fifty pieces called *pounds*, which are not real, but may be paid in ſeveral real ſpecies, as in guineas, crowns, ſhillings, *&c.* which are changeable, as guineas, *v. gr.* which are ſometimes higher, ſometimes lower. See POUND, and GUINEA.

MONEYS *of account, or manner of reckoning* MONEY *in Europe and Aſia.*—We here confine ourſelves to the *moneys* of thoſe two parts of the world: America having none; the reſpective *moneys* of account of the Europeans, who have there made ſettlements, being eſtabliſhed with them. As to Africa, the cities of Barbary and Egypt, whither the Europeans traffick, reckon much after the ſame manner as in the Levant, and in the dominions of the grand ſignior: for the reſt, throughout that vaſt extent of coaſt, where we trade for negroes, gold-duſt, elephants teeth, wax, leathers, *&c.* either the miſerable inhabitants do not know what *money* of account is, or if they have any, it is only what ſtrangers, ſettled among them, have introduced.—The *macoute*, however, and the *piece*, which are manners of accounting among theſe Barbarians, will be mentioned in their place. See PIECE.

Engliſh MONEY *of account*, is the pound, ſhilling, and penny ſterling: The pound containing twenty ſhillings, and the ſhilling twelve pence. See POUND, COIN, and STERLING.

French MONEY *of account*, was anciently the pariſis, tournois, and the ecu, or crown: but ſince the ordonnance of 1667, they only reckon by livres, *i. e.* pounds; ſols, *i. e.* ſhillings; and deniers tournois, *i. e.* pence. The livre, 20 ſols, or $\frac{1}{3}$ of the ecu, or crown; the ſol, 12 deniers. See LIVRE, DENIER, *&c.*

The maille, obole, or half-penny tournois, is alſo now a *money* of account, though anciently a real coin. The maille is divided into two pites, and each pite into two ſemi-pites; all *moneys* of account. To which muſt be added the frank, of the ſame value with the livre, *viz.* 20 ſols tournois; and the blanc, 5 deniers tournois; and the carolus, ten: all three anciently real coins. See FRANC, *&c.*

Dutch and Flemiſh MONEYS *of account*. In Holland, Zealand, Brabant, and Cologne, they uſe the pundt, or livre de gros; ſchelling, or ſol de gros; and penning, or deniers gros. The pundt, containing 20 ſchelling; and the ſchelling, 12 pennings. The pundt equal to 7 livres, 4 ſols French, or 10 ſhillings $\frac{3}{10}$ ſterling. They alſo account by florins or guilders, patards and pennings. The florin is equal to $\frac{1}{6}$ of the pound, or 20 patards; and the patard, 12 pennings. The merchants uſe each method of accounting indifferently.

Spaniſh MONEY *of account*, is the peſo, ducat of ſilver and vellon, rial of vellon, and cornados and maravedis of ſilver and vellon. The peſo is to the ducat as 12 to 10. The ducat of ſilver contains 11 rials of ſilver; and that of vellon, 11 rials of vellon; which makes a difference of near one half. The ſilver rial being current for 7 ſhillings ſterling, and that of vellon only at 3 *s.* 8 *d.* ſterling. 34 maravedis make the rial of vellon, and 63 that of ſilver. The maravedi is divided into 4 cornaros.

German and Swiſs MONEY *of account*. In Switzerland, and many of the chief cities of Germany, particularly Francfort, they account by florins (but on a footing different from that of Holland) by creux's or creutzers, and pennins. The florin equal to 3 ſhillings ſterling, and divided into 60 creux, or kreutz, and the creux into 8 pennins. In others, as Nuremberg, *&c.* they account by rix-dollars, florins, and creux. The rix-dollar equal to 4:8 *d.* ſterling, divided into 100 creux, and the creux into 8 pennins. In others, as Hambourg, Berlin, *&c.* by rix-dollars, marks lubs, ſchellings lubs, and deniers lubs. The rix-dollar and dollar on the foot of the French crown, or 4: 6 *d.* ſterling, divided into 3 marks, and the mark into 16 ſchellings, and the ſchelling into 12 pennins. At Hambourg they alſo uſe the livre, ſchelling, and denier de gros. At Augſbourg and Bolzamont, they account by dollars and creux's; the dollar equal to 4: 6 *d.* ſterling, divided into 90 creux's. At Nambourg, by rix-dollars gros and fenins; the rix-dollar equal to 4: 6 *d.* ſterling, divided into 36 gros, and the gros into 12 fenins. At Straſbourg by florins, creux, and pennins. The florin equal to 1: 6 *d.* ſterling, divided into 60 creux, and the creux into 8 pennins.

Italian MONEYS *of account*. In Italy, the *moneys* of account are various, almoſt as the cities of commerce. At Rome, they account by pounds, ſhillings, and pence of gold *di ſtampa*. At Venice, by ducats, and groſs *di banco*. The ducat divided into 24 groſs, each groſs equal to 2 pence $\frac{1}{2}$ ſterling. And by ducats currant, called alſo *ſequins*, equal to 9: 2 *d.* ſterling; and by pounds, ſhillings, and pence. At Lucca and Bergamo, they uſe the four laſt; and only the three laſt at Bologna, Mantua, and Savoy: In Geneva, beſides pounds, ſhillings, and pence, they account alſo by florins, containing 6 ſolids, or 6 pence $\frac{1}{2}$ ſterling. At Leghorn and Genoa, beſides pounds, ſhillings, and pence, they account by piaſters, equal to 4: 6 *d.* ſterling. At Nova, their *moneys* of account are crowns, ſhillings, and pence of gold *de marc*. At Raconis, pounds, florins, and groſs. At Ancona, crowns, ſhillings, and pence. At Naples, ducats, grains, and tarins, equal to one ſhilling ſterling, divided into 20 grains.

Sicilian and Malteſe MONEYS *of account*. At Meſſina, Palermo, and throughout Sicily, they account by pounds, ounces, tarins, grains, and piccoli's; which are ſummed by 30, 20, and 6: the ounce being 30 tarins, the tarin 20 grains, and the grain 6 piccoli's. At Malta, they account by pounds, ounces, carlins and grains. The ounce 30 tarins, or 60 carlins, or 600 grains; the carlin equal to 6 *d.* $\frac{1}{4}$ ſterling.

Poliſh MONEYS *of account*. Throughout Poland, moſt of the dominions of the king of Pruſſia, and Dantzic, they account by rix-dollars, roups, and grochs. The rix-dollar equal to 4: 6 *d.* ſterling, and divided into 32 roups; and again, in the Pruſſian territories, into 24 grochs: in Poland, into 90 grochs. Sometimes they uſe the florin, groch, and penny.

Swediſh, Daniſh, and Muſcovite MONEYS *of account*. In Sweden, they account by dalles, equal to 32 ſols lubs, or 3 ſhillings ſterling. In Denmark, by rix-dollars, and ſtivers; the rix-dollar divided into 48 ſtivers. In Muſcovy, they account by roobles, altins, and grifs or grives. The rooble equal to 100 copecs, or 2 rix-dollars, or 9 ſhillings ſterling; divided into 10 grifs; 3 altins $\frac{1}{3}$ make the grif, or 10 copecs; the copec at 13 pence $\frac{3}{4}$ ſterling.

Turkiſh MONEYS *of account*. The Turks, both in Europe, Aſia, and Africa, account by purſes, either of ſilver or gold, (the laſt only uſed in the ſeraglio) with half-purſes of gold, called alſo *rizes*. The purſe of ſilver equal to 1500 French livres, or 112 *l.* 10 *s.* ſterling. The half-purſe in proportion. The purſe of gold 15000 ſequins, equal to 30000 French crowns, or 6750 pounds ſterling; ſeldom uſed but for preſents to favourites: ſo that a *purſe*, ſimply, ſignifies a purſe of ſilver, or 1500 livres. They are called *purſes*, becauſe all the *money* in the treaſury of the ſeraglio is kept in leathern bags or purſes, of thoſe contents. The merchants alſo uſe Dutch dallars, called *aſtani* or *abouquels*, with meideins and aſpres. The dallar equal to 35 meidiens, and the meidein to 3 aſpres; the aſpre to $\frac{1}{2}$ penny ſterling.

Perſian MONEYS *of account*. In Perſia, they account by the toman (called alſo *man*, and *tumein*) and the dinar-biſti. The toman is compoſed of 50 abaſſis, or a hundred mamodies, or 200 chapes, or 10000 dinars; which accounting the abaſſi on the foot of eighteen French ſols, or the dinar on that of a denier, amounts to 3 *l.* 12 *s.* 6 *d.* ſterling the toman. They alſo account by larins, eſpecially at Ormus, and on the coaſts of the Perſian gulph. The larin equivalent to 11 pence ſterling; and on that footing uſed alſo in Arabia, and a great part of the Eaſt-Indies.

Chineſe MONEYS *of account*, are the pic, picol, and tael; which though in effect weights, do likewiſe ſerve as *moneys of account*; obtaining in Tunquin as well as China. The pic is divided into 100 catis, ſome ſay 125. The cati into 16 taels; each tael equal to 1 ounce 2 drachms. See *Chineſe* COINS. The picol contains 66 catis $\frac{3}{4}$; the tael equivalent to 6 *s.* 8 *d.* ſterling.

Japaneſe MONEYS *of account*, are the ſchuites, cockiens, oebans or oubans, and taels. Two hundred ſchuites are equal to 500 Dutch pounds; the cockien equal to 10 Low-country pounds; 1000 oebans make 45000 taels.

Mogul MONEYS *of account*. At Surat, Agra, and the reſt of the eſtates of the Great Mogul, they uſe lacres, acres, or leeths; implying a hundred thouſand: thus a lacre of rupees is a hundred thouſand rupees; the lacre being nearly on the footing of the tun of gold in Holland, and the million of France.

MONEYS *of account of other iſlands and coaſts of India*. Throughout Malabar, and at Goa, they uſe tangas, vintins, and pardos xeraphin. The tanga is of two kinds, *viz.* of good, and bad alloy. Hence their cuſtom is to count by good or bad *money*. The tanga of good alloy is $\frac{1}{5}$ better than the bad; ſo that 4 tangas good being allowed the pardos xeraphin, there will be required 5 of the bad; 4 vintins good make a tanga likewiſe good; 15 barucos a vintin. The good baruco is equal to a Portugueſe ree, a French denier, or $\frac{1}{13}$ of a penny ſterling. In the iſland of Java, they uſe the ſonta, ſapacou, fardos, and catis; which laſt *money*, together with the leeth, or lacre, is much uſed throughout all the Eaſt-Indies. The ſanta is two hundred caxas, or little pieces of that country hung on a ſtring; and is equal to $\frac{10}{12}$ of a penny ſterling. Five ſantas make the ſapacou. The fardos equal to 2: 8 *d.* ſterling. The cati contains 20 taels; the tael 6: 8 *d.* ſterling.

There are iſlands, cities, and ſtates of the Eaſt-Indies, whoſe *moneys of account* are not here expreſſed; partly becauſe reducible to ſome of thoſe above-mentioned; and partly becauſe we find no certain conſiſtent account of them in any of the authors, or memoirs herein conſulted.

African MONEYS *of account*. From Cape Verd, to the Cape of Good Hope, all exchanges and valuations of merchandizes are made on the foot of the macoute and piece: which though no *moneys of account*, (for thoſe Barbarians having no real *moneys*, need no imaginary ones to eſtimate them by,) yet ſerve in lieu thereof. At Loango de Boirie, and other places on the coaſt of Angola, the eſtimations are made by macoutes; and at Malimbo, and Cabindo, on the ſame coaſt, the negroes reckon by pieces. Among the firſt, the macoute is equivalent to 10: Ten macoutes make 100; which likewiſe leaves us a kind of imaginary *money*. To eſtimate any purchaſe, exchange, *&c.* they fix on the one ſide the number of macoutes required, *e. gr.* for a negro; on the other, for how many macoutes they agree to receive each kind of merchandize required for the negro: ſo that there are ſeveral bargains made for one. Suppoſe, *v. gr.* the ſlave be fixed at 3500; this amounts to 350 macoutes. To make up this number of macoutes in merchandizes, they fix the price of each in macoutes. Two Flemiſh knives, *e. gr.* are accounted one macoute; a copper-baſon two pounds weight, three; a barrel of gun-powder, three, *&c.* For the piece, it ſerves in like manner to eſtimate the value of goods, duties, *&c.* on either ſide. Thus the natives require 10 pieces for a ſlave; and the Europeans put, *v. gr.* a fuſee at 1 piece; a piece of ſalampoures blue, at 4 pieces, *&c.*

MONEYS *of account among the ancients.*—*Grecian* MONEYS *of account*. The Grecians reckoned their ſums of *money* by drachmæ, minæ, and talenta. The drachma equal to 7 $\frac{3}{4}$ *l.* ſterling; 100 drachmæ made the mina, equal to 3 *l.* 4 *s.* 7 *d.*

ſterling; 60 minæ made the talent, equal to 193 *l.* 15 *s.* ſterling: Hence 100 talents amounted to 19375 *l.* ſterling.

The mina and talentum indeed, were different in different provinces: Their proportions in Attic drachms are as follow.

The Syrian mina contained 25 Attic drachms; the Ptolemaic $33\frac{1}{3}$; the Antiochic and Eubæan 100; the Babylonic 116; the greater Attic and Tyrian $133\frac{1}{3}$; the Æginean and Rhodian $166\frac{2}{3}$.

The Syrian talent contained 15 Attic minæ; the Ptolemaic 20; the Antiochic 60; the Eubæan 60; the Babylonic 70; the greater Attic and Tyrian 80; the Æginean and Rhodian 100.

Roman MONEYS *of account*, were the ſeſtertius and ſeſtertium. The ſeſtertius equal to 1 *d.* $3\frac{3}{4}$. ſterling. One thouſand of theſe made the ſeſtertium, equal to 8 *l.* 1 *s.* 5 *d.* 2 *q.* ſterling. One thouſand of theſe ſeſtertia made the decies ſeſtertium (the adverb *centies* being always underſtood) equal to 8072 *l.* 18 *s.* 4 *d.* ſterling. The decies ſeſtertium they alſo called *decies centena millia nummum.* Centies ſeſtertium, or centies HS were equal to 80729 *l.* 3 *s.* 4 *d.* Millies HS to 807291 *l.* 13 *s.* 4 *d.* Millies centies HS to 888020 *l.* 16 *s.* 8 *d.*

Preſtation-MONEY.		PRESTATION-*money*.
Salvage-MONEY.		SALVAGE-*money*.
Ship-MONEY.		SHIP-*money*.
Trophy-MONEY.		TROPHY-*money*.

MONEYERS, MONEYORS, or MONIERS, officers of the mint, who work, and coin gold and ſilver money; and anſwer all the waſte and charges. See MINT, COINING, and MONETARIUS.

MONEYERS is ſometimes alſo uſed for *bankers*; or thoſe who make a trade of turning and returning money. See BANKER.

MONITORY *letters*, are letters of warning and admonition, ſent from an eccleſiaſtical judge upon information of ſcandals and abuſes within cognizance of his court.

MONK*, anciently denoted a perſon who retired from the world, to give himſelf up wholly to God, and to live in ſolitude, and abſtinence. See RELIGIOUS.

* The word is derived from the Latin *monachus*, and that from the Greek μοναχος, ſolitary, of μονος, *ſolus*, alone; by reaſon the ancient *monks* lived in ſolitude, as the true *monks* ſtill do.

Such were the Hermits and Anachorets, who withdrew into deſarts, and lived remote from all commerce of mankind. See HERMIT and ANACHORET.

Some writers, as father Helyot, *diſſert. prelim.* trace the original of *monks* up as early as the time of the Therapeutæ, and maintain that there had been an uninterrupted ſucceſſion of *monks* from the Therapeutæ to St. Anthony. Others, on the contrary, are contented with going back as far as St. Paul, the firſt hermit. See THERAPEUTÆ.

The *monks*, at leaſt the ancient ones, were diſtinguiſhed into *ſolitaries*, *cænobites*, and *ſarabaites*.

The *ſolitaries* are thoſe who live alone, in places remote from all towns, or habitations of men, as do ſtill ſome of the hermits.

The *cænobites* are thoſe who live in community with ſeveral others in the ſame houſe, and under the ſame ſuperiours. See COENOBITE.

The *ſarabaites* were ſtrolling *monks*, having no fixed rule or reſidence. See SARABAITES.

The houſes of *monks* again were of two kinds, *viz.* *monaſteries* and *lauræ*. See MONASTERY, and LAURA.

Thoſe we call *monks* now-a-days, are cœnobites, who live together in a convent or monaſtery, who make vows of living according to a certain rule eſtabliſhed by the founder, and wear a habit which diſtinguiſhes their order. See VOW, and RULE.

Thoſe that are endowed, or have a fixed revenue, are moſt properly called *monks*, *monachi*; as the Chartreux, Benedictines, Bernardines, &c.—The Mendicants, or thoſe that beg, as the Capuchins, and Franciſcans, are more properly called *religious*, and *friars*; though the names are frequently confounded. See RELIGIOUS.

The firſt *monks* were thoſe of St. Anthony; of St. Baſil, called in the eaſt, *calogeri*, from καλος γερον, good old man; and thoſe of St. Jerom; the hermits of St. Auguſtine, and afterwards thoſe of St. Benedict and St. Bernard; at length came thoſe of St. Francis, and St. Dominic, with a legion of others; which ſee under their proper heads, BENEDICTINS, &c.

Monks are diſtinguiſhed by the colour of their habits into *black*, *white*, *grey*, &c.—Among the *monks*, ſome are called *monks of the choir*, others *profeſſed monks*, and others *lay monks*; which laſt are deſtined for the ſervice of the convent, and have neither clericate nor literature. See LAY.

Cloiſtered MONKS, are thoſe who actually reſide in the houſe: in oppoſition to *extra-monks*, who have benefices depending on the monaſtery.

Monks are alſo diſtinguiſhed into *reformed*, whom the civil and eccleſiaſtical authority have made maſters of ancient convents, and put in their power to retrieve the ancient diſcipline which had been relaxed; and *ancient*, who remain in the convent, to live in it according to its eſtabliſhment at the time when they made their vows, without obliging themſelves to any new reform.

Anciently, the *monks* were all laymen, and were only diſtinguiſhed from the reſt by a particular habit, and an extraordinary devotion.—Not only the *monks* were prohibited the prieſthood; but even prieſts were expreſly prohibited from becoming *monks*, as appears from the letters of St. Gregory. Pope Cyricius was the firſt who called them to the clericate, on occaſion of ſome great ſcarcity of prieſts, that the church was then ſuppoſed to labour under. And ſince that time, the prieſthood has been uſually united to the monaſtical profeſſion. See FATHER, &c.

Profeſſed MONKS. See the article PROFESSED.

Proprietary MONKS. See the article PROPRIETARY.

MONKS-HOOD. See the article ACONITE.

MONKS *rhubarb*. See the article RHUBARB.

MONKS *ſeam*, among ſailors, is, when the ſelvedges of ſails are laid a little over one another, and ſewed on both ſides.

MONOCHORD, a muſical inſtrument wherewith to try the variety and proportion of muſical ſounds. See TUNE.

Monochord, according to Boethius, is an inſtrument invented by Pythagoras, for meaſuring geometrically, or by lines, the quantities and proportions of ſounds.

The ancient *monochord* was compoſed of a rule divided, and ſubdivided into divers parts, whereon there was a ſtring pretty well ſtretched upon two bridges, at each extreme thereof. In the middle between both was a moveable bridge, called *magas*, by whoſe means, in applying it to the different diviſions of the line, the ſounds were found to be in the ſame proportion to one another, as the diviſions of the line cut by the bridge were.

The *monochord* is alſo called the *harmonical canon*, or *canonical rule*; becauſe ſerving to meaſure the degrees of gravity, and acuteneſs of ſounds. Ptolemy examines his harmonical intervals by the *monochord*. See CANON, GRAVITY, &c.

There are alſo *monochords* with divers ſtrings, and a multitude of fixed bridges; the uſe of all which may be ſupplied by one ſingle moveable bridge; by only ſhifting it under a new chord or ſtring, which is placed in the middle, and repreſents the entire ſound, or the open note, anſwering all the diviſions on the other bridges.

When the chord was divided into equal parts, ſo that the terms were as 1 and 1, they called them *uniſons*; if they were as 2 to 1, *octaves*, or *diapaſons*; when they were as 8 to 2, *fifths*, or *diapentes*; if they were as 4 to 3, they called them *fourths*, or *diateſſerons*; if the terms were as 5 to 4, *diton*, or a *greater third*; if as 6 to 5, a *demi-diton*, or a *leſſer third*; laſtly, if as 24 to 25, *demi-diton*, or *dieſis*. See UNISON, OCTAVE, DIAPASON, DIAPENTE, DIATESSERON, &c.

The *monochord* being thus divided, was properly what they called a *ſyſtem*, of which there were many kinds according to the different diviſions of the *monochord*. See SYSTEM.

Dr. Wallis has taught the diviſion of the *monochord* in the *Philoſophical Tranſactions*; but that inſtrument is now diſuſed, the modern muſic not requiring ſuch diviſion.

MONOCHORD*, is alſo uſed for any muſical inſtrument, conſiſting of only one chord, or ſtring.—Such is the trumpet-marine. See CHORD and TRUMPET.

* The word is Greek, Μονοχορδος, formed of μονος, *ſolus*, ſingle; and χορδη, chord.

MONOCHROMA*, ΜΟΝΟΧΡΩΜΑ, a picture all of one colour. See CAMIEUX, CLAIROBSCURE, &c.

* The word is compounded of the Greek, μονος, ſingle; and χρωμα, colour.

MONODY*, MONODIA, in the ancient poetry, a kind of mournful ſong, or ditty, ſung by a perſon all alone; to utter his grief.

* The word is compounded of μονὸς, *ſolus*, and ωδη, ſong.

MONOGAMY*, the ſtate or condition of thoſe who have only married once, or are reſtrained to a ſingle wife. See MARRIAGE, BIGAMY, &c.

* The word is compounded of μονος, *ſolus*, and γαμος, marriage. See POLYGAMY.

MONOGRAM, MONOGRAMMUS, a cipher or character, compoſed of one or more letters interwoven; being a kind of abbreviation of a name; anciently much uſed as a badge, ſeal, arms, &c. See SEAL, CIPHER, &c.

Under the eaſtern empire, it is uſual to find MIK, which are the *monogram* of Maria, Jeſus, Conſtantine.

The uſe of *monograms* is of an ancient ſtanding, as appears from Plutarch, and from ſome Greek medals of the time of Philip of Macedon, Alexander his ſon, &c.

The Roman labarum bore the *monogram* of Jeſus Chriſt, conſiſting of two letters, a P placed perpendicularly through the middle of an X, *e. gr.* ☧, as we find it in ſeveral medals of the time of Conſtantine; thoſe being the two firſt letters of the word ΧΡΙΣΤΟΣ, Chriſt. See LABARUM.

Kings formerly marked their coins with their *monograms*: Of this we have inſtances in Charlemain's coins. That prince alſo uſed the *monogram* for his ſignature. Eginhard gives us this reaſon for it, *viz.* that Charlemain could not write; and that having attempted in vain to learn in his grown age, he was reduced to the neceſſity of ſigning with a *monogram*.

The ancients alſo uſed *monograms* as notes, or abbreviations of inſcriptions; for the underſtanding whereof we have expreſs treatiſes of Valerius Probus, Sert. Urſatus, *&c.* See CHARACTER.

MONOLOGUE*, a dramatic ſcene, wherein a perſon appears alone on the ſtage, and ſpeaks to himſelf. See SOLILOQUY.

* The word is formed of the Greek, μονος, *ſolus*; and λογος, diſcourſe, ſpeech.

MONOMACHIA*, MONOMAXIA, a duel, or ſingle combat of man againſt man. See DUEL.

* The word comes from the Greek, μόνος, *ſolus*; and μαχη, combat.

Monomachia was anciently allowed by law, for the trial or proof of crimes. It was permitted in pecuniary cauſes, as appears by ancient records. It is now forbid both by the civil and canon laws. See COMBAT.—Alciat has wrote a treatiſe *De monomachia.*

MONOMIAL, in algebra, a root or quantity that has but one name; or conſiſts but of one part or member.—Such are *ab*, *aab*, *aaabb*. See QUANTITY, BINOMIAL, TRINOMIAL, ROOT, *&c.*

Monomials may be either rational, or irrational. See RATIONAL, *&c.*

MONOPETALOUS, in botany, a term applied to flowers which have only one undivided petalum or leaf. See FLOWER, PETALA, *&c.*

MONOPHYSITES*, a general name given to all thoſe ſectaries in the Levant, who only own one nature in Jeſus Chriſt. See THEANDRIC.

* The word comes from the Greek, μόνος, *ſolus*; and φυσις, *natura.*

The *monophyſites* however, properly ſo called, are the followers of Severus, and Petrus Fullenſis. See JACOBITE.

MONOPOLY*, ΜΟΝΟΠΟΛΙΟΝ, an unlawful kind of traffic, when one or more perſons make themſelves ſole maſters of any commodity, trade, manufacture, or the like, with deſign to enhance its price; thoſe who have occaſion for it being obliged to purchaſe it at their hands, and on their own terms.

* The word is pure Greek, formed of μονος, *ſolus*, and πωλεω, *vendo*, q. d. I ſell alone.—Among the Romans, the term was ſo odious, that Tiberius, as Suetonius relates, having occaſion to make uſe of it, begged leave of the ſenate for it, as being borrowed from the Greek.

There are two kinds of *monopolies*: The one, when a merchant buys up, for inſtance, all the corn of a province, to retail it at an advanced rate to the people.

The other, when a letter, or patent, is procured from the prince, prohibiting any other perſon to ſell any commodity beſides the patentee.

MONOPTERE, ΜΟΝΟΠΤΕΡΟΣ, a kind of temple among the ancients, round, and without walls; having its dome ſupported by columns. See TEMPLE.

MONOPTOTE, MONOPTOTON, in grammar, a noun which has only one caſe: as, *inficias*. See CASE.

MONOPYRENEOUS *fruits*, are ſuch as only contain one kernel, or ſeed. See FRUIT.

MONORHYME*, a poetical compoſition, all the verſes whereof end with the ſame rhyme. See RHYME.

* The word comes from the Greek, μονος, *ſolus*; and ῥυθμος, rhyme. See RHYME.

Monorhymes are ſaid to have been invented by the old French poet Leonin, who addreſſed ſome Latin verſes of this kind to pope Alexander III. Whence they are alſo called *Leonine verſes.* See LEONINE.

MONOSTICH, MONOSTICHON, an epigram or poetical piece conſiſting of one ſingle verſe. See VERSE, and EPIGRAM.

MONOSYLLABLE, MONOSYLLABUM, a word of a ſingle ſyllable; or, that conſiſts of one or more letters which are pronounced together. See WORD, and SYLLABLE.

The French language abounds in *monoſyllables* more than any other. This renders it the more perplexing to foreigners, and yet the beauty of the language ſeems to conſiſt in it. One of the beſt and ſmootheſt lines in Malherbe conſiſts of twelve *monoſyllables*; ſpeaking of Caliſta, he ſays,—*Et moy je ne voy rien quand je ne la voy pas.*—In this the genius of the Engliſh tongue differs very much from the French, an uninterrupted ſeries of *monoſyllables* in the former having always an ill effect. This Mr. Pope both intimates and exemplifies in the ſame verſe.—*And ten low words oft creep in one dull line.*—Paſquier cites an elegy of forty-two verſes, conſiſting wholly of *monoſyllables.*

MONOTHELITES*, an ancient ſect, who ſprung out of the Eutychians; thus called, as only allowing of one will in Jeſus Chriſt. See EUTYCHIAN.

* The word is compounded of the Greek, μονος, ſingle; and θελημα, will, of θελω, *volo*, I will.

The opinion of the *monothelites* had its riſe in 630, and had the emperor Heraclius for an adherent: It was the ſame with that of the Acephalous Severians. See SEVERIANS.

They allowed of two wills in Chriſt, conſidered with regard to the two natures; but reduced them to one, by reaſon of the union of the two natures: Thinking it abſurd there ſhould be two free wills in one and the ſame perſon. See PERSON.

They were condemned by the ſixth general council, as being ſuppoſed to deſtroy the perfection of the humanity of Jeſus Chriſt, depriving it of will, and operation. That council declared their belief of two wills, and two operations, without diviſion, or without changing the one for the other, without either diſtinguiſhing or confounding them; the human will being ſubject to the divine. See THEANDRIC.

MONOTONIA, MONOTONY, a want of variation, or inflection, of the voice; or a fault in pronunciation, where a long ſeries of words are delivered with one unvaried tone. See PRONUNCIATION.

This is one of the principal faults of our Engliſh orators. *Monotonia* is oppoſed to chanting, or ſinging.

MONS *Lunæ.* See ABDUCTOR.

MONSEIGNEUR*, in the plural MESSEIGNEURS, a title of honour and reſpect uſed by the French in writing to perſons of ſuperiour rank, or quality.

* The word is a compound of *mon*, my, and *ſeigneur*, lord.

Dukes, peers, archbiſhops, biſhops, and preſidents *a la mortier*, are complimented with the title of *monſeigneur*. In the petitions preſented to the ſovereign courts, they uſe the term *noſſeigneurs.*

MONSEIGNEUR, abſolutely uſed, is a quality now reſtrained to the dauphin of France. See DAUPHIN.

This cuſtom was unknown till the time of Louis XIV. Till then, the dauphin was ſtyled *monſieur le dauphin.*

MONSIEUR*, in the plural MESSIEURS, a term, or title of civility, uſed by the French, in ſpeaking to their equals, or thoſe a little below them; anſwering to Mr. or Sir, among the Engliſh. See SIRE.

* The word is a compound of *mon*, my, and *ſieur*, Sir. See SIEUR.—Borel derives it from the Greek κυριὸς, *lord* or *ſire*, q. d. *moncyeur.* Paſquier derives *ſieur*, and *monſieur*, from the Latin *ſenior*, elder. The Italians ſay *ſignor*, and the Spaniards *ſenor*, in the ſame ſenſe, and from the ſame origin.

The ſuperſcriptions of all letters begin, *A monſieur monſieur*, ſuch a one.

The uſe of the word *monſieur* was formerly more extenſive than at preſent: They applied it to people who lived many ages before them: Thus, *monſieur* St. Auguſtine, *monſieur* St. Ambroſe; and the vulgar ſtill ſay, *monſieur* St. Paul, *monſieur* St. James, *&c.* The Romans, during the flouriſhing times of their liberty, were unacquainted with that term of parade and flattery, which they afterwards made uſe of in the word *dominus.* In ſpeaking, or writing to each other, they only gave each other their proper names; which practice laſted even after Cæſar had brought the republic under his command. But after the Roman emperors were once well ſeated in the throne, the courtiers, and minions who by flattery ſought to procure favours from them, ſtudied new honours. Suetonius obſerves, that a comedian on the theatre having called Auguſtus, *dominus*, lord; the ſpectators all ſtared at him. So that the emperor forbad, for the future, that quality to be attributed to him. Caligula was the firſt, who expreſly commanded himſelf to be called *dominus.* Martial, entirely devoted to tyranny, calls Domitian, *dominum deumque noſtrum.*—In time, the title was alſo applied to the people; and of *dominus*, at length was formed *dom.* See DOM.

MONSIEUR, abſolutely uſed, is a title or quality appropriated to the ſecond ſon of France, or the king's brother.

In a letter of Philip de Valois, that prince ſpeaking of his predeceſſor, calls him *monſieur le roy*, *monſieur* the king. At preſent, no body calls the king *monſieur*, but the children of France. See SIRE.

MONSOON, a regular, or periodical wind, in the Eaſt-Indies, blowing conſtantly the ſame way, during ſix months of the year, and the contrary way the remaining ſix. See WIND.

In the Indian ocean, the winds are partly *general*, and blow all the year round the ſame way, as in the Æthiopic ocean; and partly *periodical*, i. e. half the year blow one way, and the other half near on the oppoſite points. And thoſe points and times of ſhifting differ in different parts of this ocean.—Theſe latter are what we call *monſoons.*

Monſoons then are a ſpecies of what we otherwiſe call *trade-winds.* See TRADE-*wind.*

They take the denomination *monſoon* from an ancient pilot, who firſt croſſed the Indian ſea by means hereof. Though others derive the name from a Portugueſe word ſignifying *motion*, or change of wind, and ſea.

Lucretius and Apollonius make mention of annual winds which ariſe every year, *eteſia flabra*, which ſeem to be the ſame with what in the Eaſt-Indies we now call *monſoons.*

MONSTER*, MONSTRUM, a birth, or production of a living thing, degenerating from the proper and uſual diſpoſition of parts, in the ſpecies it belongs to.—As, when there are too many members, or too few; or ſome of them are extravagantly out of proportion, either on the ſide of defect or exceſs.

* The word comes from the Latin, *monſtrum*, of *monſtrando*, ſhewing.—Whence alſo the box wherein relicks were anciently kept to be ſhewn, was called *monſtrum.* Dugdale mentions an inventory of the church of York with this article, *Item unum monſtrum cum oſſibus ſancti Petri in Beryl, & crucifixo in ſummitate.* See RELICK.

Ariſtotle defines a *monſter* to be a defect of nature, when acting towards ſome end, it cannot attain to it, by reaſon ſome of its principles are corrupted. See NATURE.

Monſters do not progagate their kind; for which reaſon ſome rank mules among the number of *monſters*; as alſo hermaphrodites. See MULE, and HERMAPHRODITE.

Females, which bring forth twins, are found moſt liable to produce *monſters*.—The reaſon, probably, is owing to this; that though the twins are covered with one common chorion, yet they have each their ſeparate amnios, which, by their contiguity may chance to grow together, and ſo occaſion a confuſion, or blending of the parts.—Hence ſo many double creatures. See DOUBLE.

F. Malebranche accounts for the production of *monſters* in the animal world, thus.—The creator has eſtabliſhed ſuch a communication between the ſeveral parts of his creation, that we are not only naturally led to imitate one another, *i. e.* have a diſpoſition to do the ſame things, and aſſume the ſame manners with thoſe with whom we converſe; but alſo have certain natural diſpoſitions which incline us to compaſſion, as well as imitation. Theſe things moſt men feel, and are ſenſible of; and, therefore, need not be proved. The animal ſpirits then are not only naturally carried into the reſpective parts of the body to perform the ſame actions, and the ſame motions which we ſee others do, but alſo to receive in ſome manner their wounds, and take part in their ſufferings.

Experience tells us, that when we look attentively on any perſon ſeverely beaten, or that hath a large wound, ulcer, or the like; the ſpirits immediately flow into thoſe parts of our body which anſwer to thoſe we ſee ſuffer in the other; unleſs their courſe be ſtopped from ſome other principle. This flux of ſpirits is very ſenſible in perſons of a delicate conſtitution, who frequently ſhudder, and find a kind of trembling in the body on theſe occaſions; and this ſympathy in bodies, produces compaſſion in the mind.

Now, it muſt be obſerved, that the view of a wound, &c. wounds the perſon who views it the more ſtrongly and ſenſibly, as the perſon is more weak and delicate; the ſpirits making a ſtronger impreſſion on the fibres of a delicate body, than in thoſe of a robuſt one. Thus ſtrong, vigorous men, &c. ſee an execution without much concern, while women, &c. are ſtruck with pity and horror. As to children ſtill in their mother's womb, the fibres of their fleſh being incomparably finer than thoſe in women, the courſe of the animal ſpirits muſt neceſſarily produce much greater alterations.

Theſe things being laid down, *monſters* are eaſily accounted for. Suppoſe, *v. gr.* a child born a fool, and with all its legs and arms broke in the ſame manner as thoſe of criminals in ſome countries are; which caſe we chuſe to inſtance in, becauſe we are told from Paris that ſuch a *monſter* was actually born there, and lived in one of their hoſpitals twenty years: The cauſe of this accident, according to the principles laid down, was, that the mother ſeeing a criminal executed, every ſtroke given to the poor man, ſtruck forcibly the imagination of the woman; and by a kind of counter-ſtroke, the tender and delicate brain of the child. Now, though the fibres of the woman's brain were ſtrangely ſhaken by the violent flux of animal ſpirits on this occaſion, yet they had ſtrength and conſiſtence enough to prevent an entire diſorder; whereas the fibres of the child's brain being unable to bear the ſhock of thoſe ſpirits, were quite ruined; and the ravage was great enough to deprive him of reaſon all his life-time.

Again, the view of the execution frighting the woman, the violent courſe of the animal ſpirits was directed forcibly from the brain to all thoſe parts of the body correſponding to the ſuffering parts of the criminal; and the ſame thing muſt happen in the child. But in regard the bones of the mother were ſtrong enough to reſiſt the impulſe of thoſe ſpirits, they were not damaged. And yet the rapid courſe of theſe ſpirits could eaſily overpower, and break the tender and delicate fibres of the bones of the child; the bones being the laſt parts of the body that are formed, and having a very ſlender conſiſtence while the child is yet in the womb.

To which it may be here added, that had the mother determined the courſe of theſe ſpirits towards ſome other part of her body, by tickling or ſcratching herſelf vehemently, the child would not, in all probability, have had its bones broken; but the part anſwering that, to which the motion of the ſpirits was determined, would have been the ſufferer.

Hence appears the reaſon, why women in the time of geſtation, ſeeing perſons, &c. marked in ſuch a manner in the face, impreſs the ſame mark on the ſame parts of the child: And why, upon rubbing ſome hidden part of the body, when ſtartled at the ſight of any thing, or agitated with any extraordinary paſſion, the mark or impreſſion is fixed on that hidden part rather than on the face of the child. From the principles here laid down, may moſt, if not all, the phænomena of *monſters* be eaſily accounted for.

Vegetable MONSTERS.—There are alſo monſtrous productions in the plant world: Such, *e. gr.* are what ſome botaniſts call *mules*. See MULE, GENERATION, &c.

Floriſts give the denomination *monſters*, or *monſtrous flowers*, to thoſe flowers which are not only double, but double podded; or when inſtead of one flower there are two or three riſing one above another from a ſingle ſtalk. See FLOWER.

MONSTRANS *de droit*, a writ iſſuing out of chancery, for reſtoring a perſon to lands or tenements that are his in right, tho' on ſome occaſion found in poſſeſſion of another lately dead.

MONSTRAVERUNT, a writ which lies for a tenant who holds by free charter in ancient demeſn, upon his being diſtrained for the payment of any ſervice or impoſition contrary to the liberty he does, or ought to enjoy.

MONTANISTS, ancient heretics, ſo called from their leader Montanus, who acted the prophet, and had his propheteſſes.

The *Montaniſts*, are the ſame with what were otherwiſe denominated *Phrygians*, *Cataphrygians*, and *Quintilians*. See PHRYGIAN, CATAPHRYGIAN, QUINTILIAN, and PEPUZIAN.

MONTANUM *veru*. See the article VERU.

MONTENSES. See AGONISTICI.

MONTH, MENSIS, the twelfth part of a year. See YEAR.

Time, we have obſerved, is duration marked out for certain uſes, and meaſured by the motions of the heavenly bodies. See TIME, and DURATION.

Hence reſult divers kinds of years, and *months*, according to the particular luminary by whoſe revolutions they are determined, and the particular purpoſes they are deſtined for: as, *ſolar months*, *lunar months*, *civil months*, *aſtronomical months*, &c.

Solar MONTH is the ſpace of time wherein the ſun moves through one entire ſign of the ecliptic. See SUN.

Hence, if regard be had to the ſun's true motion, the *ſolar months* will be unequal; ſince the ſun is longer in paſſing through the winter ſigns, than thoſe of the ſummer.

But as he conſtantly travels through all the twelve in 365 days, 5 hours, and 49 minutes, the quantity of a mean *month* will be had by dividing that number by 12. On this principle, the quantity of a *ſolar month* will be found 30 days, 10 hours, 29 minutes, 5 ſeconds.

Lunar MONTHS are either *ſynodical*, *periodical*, or *illuminative*.

Lunar ſynodical MONTH, called alſo abſolutely, *lunar* MONTH, and *lunation*, is the ſpace of time between two conjunctions of the moon with the ſun; or between two new moons. See SYNODICAL *month* and LUNATION.

The quantity of the *ſynodical month* is 29 days, 12 hours, $44'$, $3''$, $11'''$. See MOON.

Lunar periodical MONTH is the ſpace of time wherein the moon makes her round through the zodiac; or wherein ſhe returns to the ſame point. See PERIODICAL.

The quantity of this *month* is 27 days, 7 h. $43'$. $8''$.

The ancient Romans made uſe of *lunar months*, and made them alternately of 29 and 30 days. They marked the days of each *month* by three terms, *viz. Calends*, *nones*, and *ides*. See CALENDS, NONES, &c.

Lunar illuminative MONTH, is the ſpace from the firſt time of her appearance after new moon, to her firſt appearance after the new moon following.

Hence, as the moon appears ſometimes ſooner after the new moon, and ſometimes later; the quantity of the *illuminative month* is not always the ſame.—By this *month* the Turks and Arabs go.

Aſtronomical, or *natural* MONTH, is that meaſured by ſome exact interval correſponding to the motion of the ſun, or moon. Such are the lunar and ſolar *months* above mentioned. Where note, That theſe *months* can be of no uſe in civil life; where it is required that the *months* begin and end on ſome certain day. For this reaſon recourſe is had to another form of *months*.

Civil, or *common* MONTH, is an interval of a certain number of whole days, approaching nearly to the quantity of ſome aſtronomical, either lunar, or ſolar *month*. See DAY.

Civil months are various, according to the aſtronomical *month* they are accommodated to.

Civil lunar MONTHS are to conſiſt alternately of 29 and 30 days. Thus will two *civil months* be equal to two aſtronomical ones, abating for the odd minutes. And, conſequently the new moon will be hereby kept to the firſt day of each ſuch *civil month* for a long time together.

However, to make them keep conſtant pace with the *civil months*, at the end of each 948 *months*, a *month* of 29 days muſt be added; or elſe every 33d *month* muſt conſiſt of 30 days. This was the *month* in civil, or common uſe among the Jews, Greeks, and Romans, till the time of Julius Cæſar.

Civil ſolar MONTHS are to conſiſt alternately of 30 and 31 days; excepting one *month* of the twelve, which for every fourth year ſhould conſiſt of 30 days, and the other years of 29.—This form of *civil months* was introduced by Julius Cæſar.

Under Auguſtus, the ſixth *month*, till then from its place called *ſextilis*, was denominated *auguſtus*, in honour of that prince; and to make the compliment yet greater, a day was added to it. So that it now conſiſted of 31 days, though till then it had only contained 30. To make up for which, a day was taken from February; ſo that henceforward it only conſiſted of 28 days, and every third year of 29; though before it had ordinarily conſiſted of 29 days, &c.—And ſuch are the *civil* or *calendar months* which now obtain through Europe. See CALENDAR.

Philoſophical MONTH, among chymiſts, is the ſpace of 40 days and nights. See MENSTRUUM.

Dracontic MONTH. See the article DRACONTIC.

Emboliſmic MONTH. See the article EMBOLISMIC.

Fence-MONTH. See the article FENCE-*month*.

Twelve-MONTH. See the article TWELVE-*month*.

MONTH *climates*. See the article CLIMATE.

MONTHLY *courſes*. See the article MENSES.

MONT-PAGNOTE, *the poſt of the invulnerable*, an eminence choſe without the reach of the cannon of a place beſieged, where curious perſons poſt themſelves to ſee an attack, and the manner of the ſiege, without being expoſed to danger.

MONUMENT*, in architecture, a building deſtined to preſerve the memory of the perſon who raiſed it, or of him for whom it was raiſed.—Such are, a triumphal arch, a mauſoleum, a pyramid, &c. See MAUSOLEUM, &c.

* The word comes from the Latin *monumentum*, of *monere*, to adviſe, advertiſe.

The firſt *monuments* which the ancients erected, were the ſtones which they laid over their tombs, whereon they wrote the names and actions of the deceaſed. See TOMB.

Theſe ſtones were diſtinguiſhed by various names according as their figures were different. The Greeks gave the name *ſteles*, Στηλης, to ſuch as were ſquare in their baſe, and preſerved the ſame depth throughout their whole length; whence were derived our ſquare pilaſters, or attic columns. See PILASTER.

They called thoſe *ſtyles*, Στυλοι, which being round in their baſe, ended in a point at top, which gave occaſion to the invention of diminiſhed columns. See COLUMN.

The name *pyramids* they gave to thoſe which were ſquare at the foot, and terminated in a point at top, in manner of a funeral pile. See PYRAMID.

And the name *obeliſc*, to thoſe whoſe baſes were more in length than in breadth, and which roſe, ſtill leſſening, to a very great height, reſembling the figure of the ſpits or inſtruments uſed by the ancients in roaſting the fleſh of their ſacrifices, which they called *obeli*, οϐελοι. See OBELISK.

The MONUMENT, abſolutely ſo called among us, denotes a magnificent pillar erected by order of parliament, in memory of the burning of the city, anno 1666, in the very place where the fire began.

It is of the Dorick order, 202 foot high from the ground, and 15 foot in diameter, all of ſolid Portland ſtone, with a ſtaircaſe in the middle of black marble. The pedeſtal is 21 foot ſquare, and 40 high; the front being enriched with curious baſſo relievo's.

MONY. See the article MONEY.

MOOD, or MODE, in logic, called alſo *ſyllogiſtic* MOOD, is a proper diſpoſition of the ſeveral propoſitions of a ſyllogiſm, in reſpect of quantity, and quality. See SYLLOGISM, and PROPOSITION.

By proper diſpoſition, we mean ſuch wherein the antecedent being true, the conſequent, in virtue of the form, cannot be falſe.—So that all thoſe *moods* or manners of ſyllogiſms are at once excluded, where no concluſion formally follows; or where the antecedent being true, a falſe concluſion may be drawn from it. See CONCLUSION, &c.

There are two kinds of *moods*; the one *direct*, the other *indirect*.

Direct MOOD, is that wherein the concluſion is drawn from the premiſes directly and immediately.—As, every animal is a living thing; every man is an animal; therefore every man is a living thing.

Indirect MOOD, is that wherein the concluſion is not inferred immediately from the premiſes, but follows from them by means of a converſion.—As, every animal is a living thing, every man is an animal; therefore ſome living thing is a man.

There are fourteen direct *moods*; whereof four belong to the firſt figure; 4 to the 2d; and 6 to the 3d. See FIGURE.

They are denoted by ſo many artificial words framed for that purpoſe, *viz.* 1. *Barbara*, *celarent*, *darii*, *ferioque*. 4. *Baralip*, *celantes*, *dabitis*, *fapeſmo*, *friſeſom*. 2. *Ceſare*, *cameſtres*, *feſtino*, *baroco*. 3. *Darapti*, *felapton*, *diſamis*, *datiſi*, *bocardo*, *feriſon*. The uſe and effect of which words lie wholly in the ſyllables, and the letters whereof the ſyllables conſiſt. Each word, *e. gr.* conſiſts of three ſyllables, denoting the three propoſitions of a ſyllable, *viz.* major, minor, and concluſion. Add, that the letters of each ſyllable are either vowels or conſonants: The vowels are *A*, which denotes an univerſal affirmative propoſition; *E*, an univerſal negative; *I*, a particular affirmative; and *O*, a particular negative.

Thus, *barbara* is a ſyllogiſm or *mood* of the firſt figure, conſiſting of three univerſal affirmative propoſitions: *Boralip* of the fourth figure, conſiſting of two univerſal affirmative premiſes, and a particular affirmative concluſion. See BARBARA, CELARENT, DARII, &c.—The conſonants are chiefly of uſe in the reduction of ſyllogiſms. See REDUCTION.

MOOD, or MODE, in grammar, is uſed to ſignify the different manners of conjugating verbs agreeably to the different actions, or affections to be expreſſed; as ſhewing, commanding, wiſhing, &c. See VERB.

Hence ariſe five *moods*, *viz.* the *indicative*, *imperative*, *optative*, *ſubjunctive*, and *infinitive*. See INDICATIVE, IMPERATIVE, OPTATIVE, &c.

Some grammarians reckon but four *moods*, confounding the optative with the ſubjunctive; and ſome make ſix, dividing the optative into potential, and optative.

The Greeks have five *moods* of verbs differing in termination; but the Latins have but four.—In Engliſh the terminations are the ſame in all the *moods*.

For the origin of *moods*, it may be obſerved, that verbs are of that kind of words which ſignify the manner and form of our thought; whereof the principal is affirmation. Verbs are alſo formed to receive different inflections, as the affirmation regards different perſons, and different times, whence ariſe the tenſes and perſons of verbs. See VERB, &c.

But beſides theſe, men have thought fit to invent other inflections, to explain what paſſes in their mind ſtill more diſtinctly: For, in the firſt place, they conſidered, that beſide the ſimple affirmations, as *he loves*, *he loved*; there were others modified and conditional, as, *if he loved*, *though he ſhould love*: And the better to diſtinguiſh theſe affirmations from the others, they doubled the inflections of thoſe tenſes, or times; making ſome ſerve for ſimple affirmations, as *I love*, *he loved*; and reſerving the reſt for affirmations that were modified; as, *if he ſhould love*, *might he have loved*.—Yet they kept not ſteadily to their rules; but ſometimes made uſe of ſimple inflections to expreſs affirmations that were modified; as *etſi vereor*, for *etſi verear*. And it is from this laſt kind of inflection, that grammarians have formed the *mood* they call *ſubjunctive*. See SUBJUNCTIVE.

But further, beſides the affirmation, the action of our will may be taken for a *mood*, or manner of our thought: and men have found themſelves under a neceſſity of expreſſing what they *will*, as well as what they *think*.—Now we may will a thing in ſeveral manners; whereof there are three which may be conſidered as the principal. Firſt then, we ſometimes will things which do not depend on ourſelves, and in that caſe we only will them by a bare wiſh, which the Latins expreſs by the particle *utinam*; and we by, *pleaſe God*. Some languages, for inſtance the Greek, have invented particular inflections for this end; whence the grammarians have taken occaſion to call it the *optative mood:* and there ſeems ſomething like both in the French, Italian, and Spaniſh tongues, in regard theſe have a kind of triple tenſes; but in Latin, Engliſh, &c. the ſame inflections ſerve for the ſubjunctive, and for the optative. For this reaſon, one may very well retrench this *mood* from the Latin conjugations; it being the different inflections that make *moods*, not the different manners of ſignifying, which may be varied to infinity. See OPTATIVE.

We ſometimes will in another manner: as when we are content a thing ſhould come to paſs, though we do not abſolutely deſire it; as when Terence ſays, *profundat*, *perdat*, *pereat*, let him ſpend, ſink, periſh.—Men might have invented a particular inflection to expreſs this movement, as in Greek they have done to expreſs a ſimple deſire: But they have not done it; and in lieu thereof, make uſe of the ſubjunctive. In Engliſh we add the particle, let him ſpend, &c.—Authors call this the *potential*, or *conceſſive mood*. See POTENTIAL.

The third manner of willing, is when what we deſire, depending on another perſon, of whom we can obtain it, we ſignify our will that he do it.—This is the motion we uſe, when we command or pray; and to expreſs this motion, was invented the *mood* we call *imperative*; which has no firſt perſon in the ſingular, becauſe a man, properly ſpeaking, cannot command himſelf: In ſome languages it has no third perſon, becauſe, in ſtrictneſs, a man cannot command any perſon, but him to whom he ſpeaks and addreſſes himſelf.—And in regard the command or prayer always relates to what is to come, it happens that the imperative *mood*, and the future tenſe, are frequently uſed for each other, (eſpecially in the Hebrew;) as *non occides*, *thou ſhalt not kill*, for *do not kill*. Hence ſome grammarians place the imperative among the number of futures. See IMPERATIVE.

Of all the *moods* we have mentioned, the oriental languages have none but the laſt, which is the imperative; and on the contrary, the modern languages have none of them any particular inflection for the imperative.—The method we take for it in Engliſh, is either to omit the pronoun, or tranſpoſe it; thus, I love, is a ſimple affirmation; love, an imperative: We love, an affirmation; love we, an imperative.

MOOD, in philoſophy. } See the article MODE.
MOOD, in muſic. }

MOON, *luna*, ☽, in aſtronomy, one of the heavenly bodies, uſually ranked among the planets; but with more propriety accounted a ſatellite, or ſecondary planet. See PLANET, and SATELLITE.

The moon is an attendant of our earth, whom ſhe reſpects as a centre, and in whoſe neighbourhood ſhe is conſtantly found; inſomuch as if viewed from the ſun, ſhe would never appear to depart from us by an angle greater than ten minutes. See EARTH.

As all the other planets move primarily round the ſun, ſo does the moon round the earth: her orbit is an ellipſis, in which ſhe is retained by the force of gravity; performing her revolution round us in 27 days, 7 hours, 43 minutes, which is alſo the preciſe time of her rotation round her axis. See ORBIT, and REVOLUTION.

The mean diſtance of the *moon* from the earth, is 60½ ſemidiameters of the earth; which is equivalent to 240,000 miles. See DISTANCE.

The mean eccentricity of her orbit, is $\frac{55}{1000}$ of her mean diſtance, which makes a conſiderable variation in that mean diſtance. See ECCENTRICITY.

The *moon*'s diameter is to that of the earth, as 11 to 40.2; or 2175 miles: Its mean apparent diameter is 31 minutes 16½, and that of the ſun 32 minutes 12 ſeconds. See DIAMETER, and SEMI-DIAMETER.

The *moon*'s ſurface contains 14,000,000 ſquare miles; and its ſolidity 5,000,000,000 cubical ones: The denſity of the *moon*'s body is to that of the earth, as 48911 to 39214; to that of the ſun, as 48911 to 10000: Its quantity of matter to that of the earth, nearly as 1 to 39.15: and the force of gravity on its ſurface, is to that on the ſurface of the earth, as 139.2 to 407.8. See SOLIDITY, DENSITY, GRAVITY, &c.

Phænomena of the MOON.—The different appearances of the *moon* are very numerous: Sometimes ſhe is increaſing, then waneing; ſometimes horned, then ſemi-circular; ſometimes gibbous, then full and globular. See PHASES.

Sometimes again, ſhe illumines us the whole night; ſometimes only a part of it; ſometimes ſhe is found in the ſouthern hemiſphere; ſometimes in the northern: All which variations having been firſt obſerved by Endymion, an ancient Grecian, who watched her motions, he was fabled to have fallen in love with her.

The ſource of moſt of theſe appearances, is, that the *moon* is a dark, opake, and ſpherical body; and only ſhines with the light ſhe receives from the ſun: whence only that half turned towards him is illumined; the oppoſite one remaining in its native darkneſs. The face of the *moon* viſible on our earth, is that part of her body turned towards the earth; whence, according to the various poſitions of the *moon* with regard to the ſun, and earth, we obſerve different degrees of illumination; ſometimes a large, and ſometimes a leſs portion of the enlightened ſurface being viſible.

Phaſes of the MOON.—To conceive the lunar phaſes: Let S (*Tab. Aſtronomy, fig.* 13.) repreſent the ſun, T the earth, RST a portion of the earth's orbit, and ABCDEFG the orbit of the *moon*, wherein ſhe revolves round the earth, in the ſpace of a month, advancing from weſt to eaſt: Connect the centres of the ſun and *moon* by the right line SL, and through the centre of the *moon* imagine a plane MLN, to paſs perpendicular to the line SL: the ſection of that plane with the ſurface of the *moon*, will give the line that bounds light and darkneſs, and ſeparates the illumined face from the dark one.

Connect the centres of the earth and *moon* by TL, perpendicular to a plane PLO, paſſing through the centre of the *moon*; that plane will give on the ſurface of the *moon*, the circle that diſtinguiſhes the viſible hemiſphere, or that towards us from the inviſible one, and therefore called the *circle of viſion*.

Whence it appears, that whenever the *moon* is in A, the circle bounding light and darkneſs, and the circle of viſion, coincide: So that all the illumined face of the *moon* will be turned towards the earth: in which caſe, the *moon* is with reſpect to us full, and ſhines the whole night: with reſpect to the ſun, ſhe is in oppoſition; in regard the ſun and *moon* are then ſeen in oppoſite parts of the heavens; the one riſing when the other ſets. See CONJUNCTION, and OPPOSITION.

When the *moon* arrives at B, the whole illumined diſk MPN is not turned towards the earth; ſo that the viſible illumination will be ſhort of a circle, and the *moon* will appear gibbous, as in B. See GIBBOUS.

When ſhe reaches C, where the angle CTS is nearly right, there only one half of the illumined diſk is turned towards the earth, and then we obſerve a half-*moon*, as in C; and ſhe is ſaid to be *dichotomized* or *biſſected*. See DICHOTOMY.

In this ſituation the ſun and *moon* are a fourth part of a circle removed from each other; and the *moon* is ſaid to be in a *quadrate aſpect*, or to be in her *quadrature*. See QUADRATURE.

The *moon* arriving at D, only a ſmall part of the illumined face MPN, is turned towards the earth: for which reaſon, the ſmall part that ſhines upon us, will be ſeen falcated, or bent into narrower angles or horns, as in D. See FALCATED. At laſt, the *moon* arriving at E, ſhews no part of her illumined face to the earth, as in D; this poſition we call the *new moon*, and ſhe is then ſaid to be in conjunction with the ſun; the ſun and *moon* being in the ſame point of the ecliptic. See CONJUNCTION.

As the *moon* advances towards F, ſhe reſumes her horns: and as before the new *moon*, the horns were turned weſtward; ſo now they change their poſition, and look eaſtward: when ſhe comes at G, ſhe is again in quadrate aſpect with the ſun; in H gibbous, and in A again full.

Here, the arch EL, or the angle STL, contained under lines drawn from the centres of the ſun and *moon* to that of the earth, is called the *elongation of the moon* from the ſun: and the arch MO, which is the portion of the illumined circle MON, that is turned towards us, and which is the meaſure of the angle that the circle bounding light and darkneſs, and the circle of viſion, make with each other, is every where nearly ſimilar to the arch of elongation EL; or which is the ſame thing, the angle STL is nearly equal to the angle MLO: as is demonſtrated by geometers. See ELONGATION.

To delineate the MOON'*s phaſes for any time.*—Let the circle COBP (*fig.* 14.) repreſent the *moon*'s diſk turned towards the earth, and let OP be the line in which the ſemi-circle OCP is projected, which ſuppoſe cut at right angles by the diameter BC; then making LP the radius, take LF equal to the coſine of the elongation of the *moon*; and upon BC, as the greater axis, and LF, the leſs, deſcribe the ſemi-ellipſis BFC; this ellipſis will cut off from the *moon*'s diſk the portion BFCP of the illumined face viſible on the earth.

As the *moon* illumines the earth by a light reflected from the ſun, ſo is ſhe reciprocally illumined by the earth, which reflects the ſun's rays to the ſurface of the *moon*, and that more abundantly than ſhe receives them from the *moon*.—For, the ſurface of the earth is above 15 times greater than that of the *moon*; and therefore ſuppoſing the texture of each body alike, as to the power of reflecting; the earth muſt return 15 times more light to the *moon* than ſhe receives from it.—In new *moons*, the illumined ſide of the earth is turned fully towards the *moon*, and will therefore at that time illumine the dark ſide of the *moon*; and then the lunar inhabitants (if ſuch there be) will have a *full earth*, as we, in a ſimilar poſition, have a *full moon*: And hence ariſes that dim light obſerved in the old and new *moons*; whereby, beſides the bright horns, we perceive ſomewhat more of her body behind them, though very obſcurely.—When the *moon* comes to be in oppoſition to the ſun, the earth ſeen from the *moon* will appear in conjunction with him, and its dark ſide will be turned towards the *moon*; in which poſition the earth will diſappear to the *moon*, as that does to us at the time of the new *moon*, or in her conjunction with the ſun. After this, the lunar inhabitants will ſee the earth in a horned figure.—In fine, the earth will preſent all the ſame phaſes to the *moon*, as the *moon* does to the earth.

Dr. Hook, accounting for the reaſon why the *moon*'s light affords no viſible heat, obſerves, that the quantity of light which falls on the hemiſphere of the full *moon*, is rarified into a ſphere 288 times greater in diameter than the *moon*, ere it arrive at us; and conſequently that the *moon*'s light is 104368 weaker than that of the ſun.—It would therefore require 104368 full *moons* to give a light and heat equal to that of the ſun at noon. See SUN, HEAT, &c.

Courſe and motion of the MOON.—Though the *moon* finiſh its courſe in 27 days, 7 hours, which interval we call a *periodical month*, ſhe is longer in paſſing from one conjunction to another; which ſpace we call a *ſynodical month*, or a *lunation*. See MONTH, and LUNATION.

The reaſon is, that while the *moon* is performing its courſe round the earth in its own orbit, the earth with its attendant is making its progreſs round the ſun, and both are advanced almoſt a whole ſign towards the eaſt; ſo that the point of the orbit, which in the former poſition was in a right line paſſing the centres of the earth and ſun, is now more weſterly than the ſun: and therefore when the *moon* is arrived again at that point, it will not yet be ſeen in conjunction with the ſun; nor will the lunation be compleated in leſs than 29 days and a half. See PERIODICAL, SYNODICAL, &c.

Were the plane of the *moon*'s orbit coincident with the plane of the ecliptic, *i. e.* were the earth and *moon* both moved in the ſame plane, the *moon*'s way in the heavens, viewed from the earth, would appear juſt the ſame with that of the ſun; with this only difference, that the ſun would be found to deſcribe his circle in the ſpace of a year, and the *moon* hers in a month.—But this is not the caſe; for the two planes cut each other in a right line, paſſing through the centre of the earth, and are inclined to each other in an angle of about five degrees. See INCLINATION.

Suppoſe, *e. gr.* AB (*fig.* 15.) a portion of the earth's orbit; T the earth; and CEDF the *moon*'s orbit, wherein is the centre of the earth: from the ſame centre T, in the plane of the ecliptic, deſcribe another circle CGDH, whoſe ſemi-diameter is equal to that of the *moon*'s orbit: Now, theſe two circles being in ſeveral planes, and having the ſame centre T, will interſect each other in a line DC, paſſing through the centre of the earth. Conſequently, CED, one half of the orbit of the *moon*, will be raiſed above the plane of the circle CGH, towards the north; and DFC, the other half, will be ſunk below it towards the ſouth.—The right line DC, wherein the two circles interſect each other, is called the *line of the nodes*, and the points of the angles C and D, *the nodes*: whereof, that where the *moon* aſcends above the plane of the ecliptic, northwards, is called the *aſcending node*, and the *head of the dragon*; and the other D, the *deſcending node*, and the *dragon's tail*; (See NODE.) and the interval of time between the *moon*'s going from the aſcending node, and returning to it, a *dracontic month*. See DRAGON, and DRACONTIC.

If the line of the nodes were immoveable, that is, if it had no other motion, but that whereby it is carried round the ſun, it would ſtill look towards the ſame point of the ecliptic; *i. e.* would always keep parallel to itſelf: but it is found by obſervation, that the line of the nodes conſtantly changes place, and ſhifts in ſituation from eaſt to weſt, contrary to the order of the ſigns, and by a retrograde motion, finiſhes its circuit in about 19 years; in which time each of the nodes returns to that point of the ecliptic, whence it before receded. See CYCLE.

Hence it follows, that the *moon* is never preciſely in the ecliptic, but twice, each period, *viz.* when ſhe is in the nodes.—Throughout the reſt of her courſe ſhe deviates from it, being nearer or further from the ecliptic, as ſhe is nearer or further from the nodes. In the points F and E, ſhe is at her greateſt diſtance from the nodes; which points are called her *limits.* See LIMITS.

The *moon*'s diſtance from the nodes, or rather from the ecliptic, is called her *latitude*, which is meaſured by an arch of a circle drawn through the *moon* perpendicular to the ecliptic, and intercepted between the *moon* and the ecliptic.—The *moon*'s latitude, when at the greateſt, as in E or F, never exceeds five degrees, and about 18 minutes; which latitude is the meaſure of the angles at the nodes. See LATITUDE.

It appears by obſervation, that the *moon*'s diſtance from the earth is continually changing; and that ſhe is always either drawing nearer, or going further from us.—The reaſon is, that the *moon* does not move in a circular orbit, which has the earth for its centre; but in an elliptic orbit; (as repreſented in *fig.* 16.) one of whoſe foci is the centre of the earth: AP repreſents the greater axis of the ellipſis, and the line of the apſides; and TC, the eccentricity: the point A, which is the higheſt apſis, is called the *apogee of the moon*; and P, the lower apſis, is the *moon's perigee*, or the point wherein ſhe comes neareſt the earth. See APOGEE, and PERIGEE.

The ſpace of time wherein the *moon*, going from the apogee, returns to it again, is called the *anomaliſtic month.*

If the *moon*'s orbit had no other motion, but that wherewith it is carried round the ſun, it would ſtill retain a poſition parallel to itſelf, and always point the ſame way, and be obſerved in the ſame point of the ecliptic; but the line of the apſides is likewiſe obſerved to be moveable, and to have an angular motion round the earth from weſt to eaſt, according to the order of the ſigns, returning to the ſame ſituation in the ſpace of about nine years. See ANGULAR *motion*, and APSIS.

The irregularities of the MOON*'s motion*, and that of her orbit, are very conſiderable.—For, 1°. When the earth is in her aphelion, the *moon* is in her aphelion likewiſe; in which caſe ſhe quickens her pace, and performs her circuit in a ſhorter time: On the contrary, when the earth is in its perihelion, the *moon* is ſo too, and then ſhe ſlackens her motion; and thus revolves round the earth in a ſhorter ſpace, when the earth is in her aphelion, than when in her perihelion: So that the periodical months are not all equal. See PERIODICAL *month.*

2°. When the *moon* is in her ſyzygies, *i. e.* in the line that joins the centres of the earth and ſun, which is either in her conjunction or oppoſition; ſhe moves ſwifter, *cæteris paribus*, than when in the quadratures. See SYZYGIES.

3°. According to the different diſtance of the *moon* from the ſyzygies, *i. e.* from oppoſition or conjunction, ſhe changes her motion: In the firſt quarter, that is, from the conjunction to her firſt quadrature, ſhe abates ſomewhat of her velocity; which, in the ſecond quarter, ſhe recovers: In the third quarter, ſhe again loſes; and in the laſt, again recovers.—This inequality was firſt diſcovered by Tycho Brahe, who called it the *moon's variation.* See VARIATION, and REFLECTION.

4°. The *moon* moves in an ellipſis, one of whoſe foci is in the centre of the earth, round which ſhe deſcribes areas proportionable to the times, as the primary planets do round the ſun; whence her motion in the perigee muſt be quickeſt, and ſloweſt in the apogee.

5°. The very orbit of the *moon* is changeable, and does not always perſevere in the ſame figure; its eccentricity being ſometimes increaſed, and ſometimes diminiſhed; greateſt, when the line of the apſides coincides with that of the ſyzygies; and leaſt, when the line of the apſides cuts the other at right angles. See ORBIT.

6°. Nor is the apogee of the *moon* without an irregularity; being found to move forwards, when it coincides with the line of the ſyzygies, and backwards, when it cuts that line at right angles.—Nor is this progreſs and regreſs in any meaſure equal: in the conjunction, or oppoſition, it goes briſkly forwards; and in the quadratures, moves either ſlowly forwards, ſtands ſtill, or goes backward. See APOGEE.

7°. The motion of the nodes is not uniform; but when the line of the nodes coincides with that of the ſyzygies, they ſtand ſtill; when the nodes are in the quadratures, *i. e.* when their line cuts that of the ſyzygies at right angles, they go backwards, from eaſt to weſt; and this Sir I. Newton ſhews, with the velocity of 16″, 19‴, 24⁗, in an hour. See NODE.

The only equable motion the *moon* has, is that wherewith ſhe turns round her axis exactly in the ſame ſpace of time, in which ſhe revolves round us in her orbit; whence it happens, that ſhe always turns the ſame face towards us.

For, as the *moon*'s motion round its axis is equal, and yet its motion or velocity in its orbit is unequal; it follows, that when the moon is in its perigee, where it moves ſwifteſt in its orbit, that part of its ſurface, which, on account of its motion in the orbit, would be turned from the earth, is not ſo, entirely; by reaſon of its motion round its axis.—Thus, ſome parts in the limb, or margin of the *moon*, ſometimes recede from the centre of the diſk, and ſometimes approach towards it, and ſome parts, that were before inviſible, become conſpicuous: which is called the *moon*'s libration. See LIBRATION.

Yet this equability of rotation occaſions an apparent irregularity: for the axis of the *moon*, not being perpendicular to the plane of its orbit, but a little inclined to it; and this axis maintaining its paralleliſm, in its motion round the earth; it muſt neceſſarily change its ſituation, in reſpect of an obſerver on the earth; to whom, ſometimes the one, and ſometimes the other pole of the *moon*, becomes viſible. Whence it appears to have a kind of wavering or vacillation.

Phyſical cauſe of the MOON*'s motions.*—The *moon*, we have obſerved, moves round the earth, by the ſame laws, and in the ſame manner, as the earth and other planets round the ſun.—The ſolution therefore of the lunar motion, in general, comes under thoſe of the earth, and other planets. See PLANET; and EARTH.

As for the particular irregularities in the *moon*'s motion, to which the earth, and other planets, are not ſubject, they ariſe from the ſun, which acts on, and diſturbs her in her ordinary progreſs through her orbit; and are all mechanically deducible from the ſame great law, whereby her general motion is directed, *viz.* the law of *gravitation* or *attraction.* See GRAVITATION.

Other ſecondary planets, *v. gr.* the ſatellites of Jupiter and Saturn, are doubtleſs ſubject to the like irregularities with the *moon*; as being expoſed to the ſame perturbating or diſturbing force of the ſun; but their diſtance ſecures them from our obſervation. See SATELLITE.

The laws of the ſeveral irregularities in the *ſyzygies*, *quadratures*, &c. ſee under SYZYGIES, QUADRATURES, *&c.*

Aſtronomy of the MOON.—1°. To determine the period of the *moon*'s revolution round the earth, or the *periodical month*; and the time between one oppoſition and another, or the *ſynodical month.*

Since, in the middle of a lunar eclipſe, the *moon* is oppoſite to the ſun: (See ECLIPSE.) Compute the time between two eclipſes, or oppoſitions; and divide this, by the number of lunations, that have paſſed in the mean time: the quotient will be the quantity of the ſynodical month.—Compute the ſun's mean motion during the time of the ſynodical month, and add this to the entire circle deſcribed by the *moon.*—Then, as the ſum is to 360°, ſo is the quantity of the ſynodical month to the periodical.

Thus, Copernicus, in the year 1500, November 6, at twelve at night, obſerved an eclipſe of the *moon* at Rome; and Auguſt 1, 1523, at 4 h. 25′, another at Cracow: hence the quantity of the ſynodical month is thus determined:

Obſ. 2 An. 1523 d. 237 h. 4.25′.
Obſ. 1 An. 1500 d. 310 h. 2.20′.

Interval of time An. 22 d. 292 h. 2.5′.
Add the intercalary days 5

Exact interval An. 22 d. 297 h. 2.5′.
or 11991005′.

Which divided by 282 months elapſed, in the mean time, gives the quantity of the ſynodical month 42521′, 9″, 9‴; that is, 29 days, 12 hours, 41 minutes.

From two other obſervations of eclipſes, the one at Cracow, the other at Babylon, the ſame author determines more accurately the quantity of ſynodical months to be

42524′. 3″. 10‴. 9⁗.

That is, 29 d. 11 h. 43′. 3″. 10‴.
The ſun's mean motion in the time 29°. 6′. 24″. 18‴.
The *moon*'s motion 389. 6. 24. 18.
Quantity of the periodical month 27 d. 7 h. 43′. 5″.

Hence, 1°. The quantity of the periodical month being given; by the rule of three we may find the *moon*'s diurnal and horary motion, *&c.* And thus may tables of the mean motion of the *moon* be conſtructed. See TABLES; ſee alſo DIURNAL, and HORARY.

2°. If the ſun's mean diurnal motion be ſubſtracted from the *moon*'s mean diurnal motion; the remainder will give the *moon*'s diurnal motion from the ſun: and thus may a table of latitudes be conſtructed, ſuch as thoſe of Bullialdus. See LATITUDE.

3°. Since in the middle of a total eclipſe, the *moon* is in the node; if the ſun's place be found for that time, and to this be added ſix ſigns, the ſum will give the *place of the node.* See NODE.

4°. From comparing the ancient obſervations with the modern, it appears that the nodes have a motion, and that they proceed *in antecedentia*, i. e. from Taurus to Aries, from Aries to Piſces, *&c.* If then to the *moon*'s mean diurnal motion, be added the diurnal motion of the nodes, the ſame will be the motion of the latitude; and thence, by the rule of three, may be found in what time the *moon* goes 360° from the dragon's head, or in what time ſhe goes from, and returns to it: That is the quantity of the *dracontic month.* See DRACONTIC.

5°. If the motion of the diurnal apogee be ſubſtracted from the mean motion of the *moon*, the remainder will be the *moon*'s mean motion from the apogee: and thence, by the rule of three, is determined the quantity of the *anomaliſtic month.*

According to the obſervations of Kepler, the mean ſynodical month is 29 d. 12 h. 44′. 3″. 2‴. Her periodical month 27 d. 7 h. 43′. 8″. The place of the apogee for the year 1700, January 1. old ſtile, was 11 S. 8°. 57′. 1″. The place of the aſcending nodes 4 S. 27°. 39′. 17″. Mean diurnal motion of the *moon* 13°. 10′. 35″. Diurnal motion of the apogee 6′. 41″. Diurnal motion of the nodes 3′. 11″. Laſtly, the eccentricity 4362 parts, ſuch, whereof the ſemi-diameter of the eccentric is 100000: and therefore the diurnal motion of the latitude is 13°. 13′. 46″; and the diurnal motion from the apogee 13°. 3′. 54″.

To find the MOON's *age.*—To the day of the month add the epact of the year, and the months from March incluſive.—The ſum, if under 30; if over, the exceſs is the *moon*'s age.—If the month have but 30 days, the exceſs above 29 is the *moon*'s age. See AGE.

To find the time of the MOON's *being in the meridian,* or *ſouthing.*—Multiply her age, if under 15 days, by 4; and divide the product by 5; the quotient gives the hour, and the remainder multiplied by 12, the minute. If her age exceed 15, ſubſtract 15, and proceed with the remainder as before.

To find the time of the MOON's *beginning to ſhine.*—Multiply her age, if under 15, by 48; and divide the product by 60: the quotient gives the hour; and the remainder the minute. If her age be above 15 days, ſubſtract the time thus found, from 24; the remainder gives the time of ſhining in the morning.

For the eclipſes of the MOON, ſee ECLIPSES.—*For the* MOON's *parallax,* ſee PARALLAX.

Theory of the MOON's *motions and irregularities.*—The tables of equation, which ſerve to ſolve the irregularities of the ſun, do likewiſe ſerve for thoſe of the *moon.* See EQUATION.

But then theſe equations muſt be corrected for the *moon*; otherwiſe they will not exhibit the true motions in the ſyzygies.—The method is thus: Suppoſe the *moon*'s place in the zodiac, required in longitude, for any given time; here, we firſt find, in the tables, the place where it would be, ſuppoſing its motion uniform, which we call *mean*, and which is ſometimes faſter, and ſometimes ſlower than the true motion: then, to find where the *true* motion will place her, which is alſo the *apparent*, we are to find in another table at what diſtance it is from its apogee; for, according to this diſtance, the difference between her true and mean motion, and the two places which correſpond thereto, is the greater.—The true place thus found, is not yet the *true* place; but varies from it, as the *moon* is more, or leſs remote both from the ſun, and the ſun's apogee: which variation reſpecting, at the ſame time, thoſe two different diſtances, they are to be both conſidered and combined together, as in a table apart. Which table gives the correction to be made of the true places firſt found.—That place thus corrected, is not yet the *true* place, unleſs the *moon* be either in conjunction, or oppoſition: If ſhe be out of theſe, there muſt be another correction, which depends on two things taken together, and compared, *viz.* the diſtance of the *moon's* corrected place from the ſun; and of that at which ſhe is with regard to her own apogee; this laſt diſtance having been changed by the firſt correction.

By all theſe operations and corrections, we at length arrive at the *moon's true place* for that inſtant. In this it muſt be owned, occur prodigious difficulties: The lunar inequalities are ſo many, that it was in vain the aſtronomers laboured to bring them under any rule, before the great Sir Iſ. Newton; to whom we are indebted both for the mechanical cauſes of theſe inequalities, and for the method of computing and aſcertaining them: So that he has a world, in great meaſure, of his own diſcovering, or rather ſubduing.

From the theory of gravity he ſhews, that the larger planets revolving round the ſun, may carry along with them ſmaller planets revolving round themſelves; and ſhews, *à priori,* that theſe ſmaller muſt move in ellipſes having their umbilici in the centres of the larger; and have their motions in their orbit variouſly diſturbed by the motion of the ſun; and, in a word, muſt be affected with thoſe inequalities which we actually obſerve in the *moon.* And from this theory, he argues analogous irregularities in the ſatellites of Saturn.

From this ſame theory he examines the force which the ſun has to diſturb the *moon*'s motion, determines the horary increaſe of the area which the *moon* would deſcribe in a circular orbit by radii drawn to the earth—her diſtance from the earth—the horary motion in a circular and elliptic orbit—the mean motion of the nodes—the true motion of the nodes—the horary variation of the inclination of the *moon*'s orbit to the plane of the ecliptic.

Laſtly, From the ſame theory he has found the annual equation of the *moon*'s mean motion to ariſe from the various dilatation of her orbit; and that variation to ariſe from the ſun's force, which being greater in the perigee, diſtends the orbit; and being leſs in the apogee, ſuffers it to be again contracted.—In the dilating orbit, ſhe moves more ſlowly; in the contracted, more ſwiftly; and the annual equation, whereby this inequality is compenſated, in the apogee, and perigee, is nothing at all; at a moderate diſtance from the ſun, amounts to 11′, 50″; and in other places is proportional to the equation of the ſun's centre, and is added to the mean motion of the *moon*, when the earth proceeds from its aphelion to its perihelion; and ſubſtracted when in the oppoſite part.

Thus, ſuppoſing the radius of the *orbis magnus* 1000, and the earth's eccentricity $16\frac{7}{8}$; this equation, when greateſt, according to the theory of gravity, comes out 11′. 49″.

He adds, that in the earth's perihelion the nodes move ſwifter than in the aphelion, and that in a triplicate ratio of the earth's diſtance from the ſun, inverſely. Whence ariſe annual equations of their motions, proportionable to that of the centre of the ſun.—Now the ſun's motions in a duplicate ratio of the earth's diſtance from the ſun inverſely, and the greateſt equation of the centre which this inequality occaſions, is 1°, 56′, 26″, agreeable to the ſun's eccentricity $16\frac{15}{16}$. If the ſun's motion were in a triplicate ratio of its diſtance inverſely, this inequality could generate the greateſt equation 2°, 56′, 9″; and therefore the greateſt equations which the inequalities of the motions of the *moon*'s apogee and nodes occaſion, are to 2°, 56′, 9″, as the mean diurnal motion of the *moon*'s apogee, and the mean diurnal motion of her nodes are to the mean diurnal motion of the ſun.—Whence the greateſt equation of the mean motion of the apogee comes out 19′, 42″; and the greateſt equation of the mean motion of the nodes 9′, 27″. The former equation is added, and the latter ſubſtracted, when the earth proceeds from its perihelion to its aphelion; and the contrary in the oppoſite part of its orbit.

From the ſame theory of gravity it alſo appears, that the ſun's action on the *moon* muſt be ſomewhat greater when the tranſverſe diameter of the lunar orbit paſſes through the ſun, than when it is at right angles with the line that joins the earth and ſun: And, therefore, that the lunar orbit is ſomewhat greater in the firſt caſe, than in the ſecond.—Hence ariſes another equation of the mean lunar motion, depending on the ſituation of the *moon*'s apogee with regard to the ſun, which is greateſt when the *moon*'s apogee is in an octant with the ſun; and none, when ſhe arrives at the quadrature, or ſyzygies, and is added to the mean motion, in the paſſage of the *moon*'s apogee from the quadrature to the ſyzygies, and ſubſtracted in the paſſage of the apogee from the ſyzygies to the quadrature.

This equation, which Sir Iſaac calls *ſemeſtris,* when greateſt, *viz.* in the octants of the apogee, ariſes to 3′, 45″, at a mean diſtance of the earth from the ſun; but increaſes and diminiſhes in a triplicate ratio of the ſun's diſtance inverſely; and therefore in the ſun's greateſt diſtance, is 3′, 34″; in the ſmalleſt, 3′, 56″, nearly. But when the apogee of the *moon* is without the octants, it becomes leſs, and is to the greateſt equation, as the ſine of double the diſtance of the *moon*'s apogee, from the next ſyzygy or quadrature, to the radius.

From the ſame theory of gravity it follows, that the ſun's action on the *moon* is ſomewhat greater when a right line drawn through the *moon*'s nodes paſſes through the ſun, than when that line is at right angles with another joining the ſun and earth: And hence ariſes another equation of the *moon*'s mean motion, which he calls *ſecunda ſemeſtris,* and which is greateſt when the nodes are in the ſun's octants, and vaniſhes when they are in the ſyzygies, or quadratures; and in other ſituations of the nodes is proportionable to the ſine of double the diſtance of either node from the next ſyzygy, or quadrature.

It is added to the *moon*'s mean motion while the nodes are in their paſſage from the ſun's quadratures to the next ſyzygy, and ſubſtracted in their paſſage from the ſyzygies to the quadratures in the octants.

When it is greateſt, it amounts to 47″, at a mean diſtance of the earth from the ſun; as appears from the theory of gravity: At other diſtances of the ſun, this equation in the octants of the nodes is reciprocally as the cube of the ſun's diſtance from the earth; and therefore in the ſun's perigee it is 45″; in his apogee nearly 49″.

By the ſame theory of gravity, the *moon*'s apogee proceeds the faſteſt when either in conjunction with the ſun, or in oppoſition to it; and is retrograde when in quadrature with the ſun.—In the former caſe, the eccentricity is greateſt, and in the latter ſmalleſt.—Theſe inequalities are very conſiderable, and generate the principal equation of the apogee, which he calls *ſemeſtris,* or *ſemi-menſtrual.* The greateſt *ſemi-menſtrual* equation is about 12°. 18′.

Horrox firſt obſerved the *moon* to revolve in an ellipſis round the earth placed in the lower umbilicus: And Halley placed the centre of the ellipſis in an epicycle whoſe centre revolves uniformly about the earth: And from the motion in the epicycle ariſe the inequalities now obſerved in the progreſs and regreſs of the apogee, and the quantity of the eccentricity.

Suppoſe the mean diſtance of the *moon* from the earth divided into 100000, and let T (*Tab. Aſtronom. fig.* 17.) repreſent the earth, and TC the mean eccentricity of the *moon* 5505 parts; produce TC to B, that CB may be the ſine of the greateſt ſemi-menſtrual equation 12°, 18′ to the radius TC; the circle BDA, deſcribed on the centre C, with the interval CB, will be the epicycle wherein the centre of the lunar orb is placed, and wherein it revolves according to the order of the letters BDA.—Take the angle BCD equal to double the annual argument, or double the diſtance of the true place of the ſun from the *moon*'s apogee once equated, and CTD will be the ſemi-menſtrual equation of the *moon*'s apogee; and TD the eccentricity of its orbit tending to the apogee equated a ſecond time.—From hence the *moon*'s mean motion, apogee, and eccentricity, as alſo the greater axis of its orbit 200000; the *moon*'s true place, as alſo her diſtance from the earth are found, and that by the commoneſt methods.

In the earth's perihelion, by reaſon of the greater force of the ſun, the centre of the *moon*'s orbit will move more ſwiftly about the centre C, than in the aphelion, and that in a triplicate ratio of the earth's diſtance from the ſun inverſely. By reaſon of the equation of the centre of the ſun, comprehended in the annual argument, the centre of the *moon*'s orbit will move more ſwiftly in the epicycle BDA, in a duplicate ratio of the diſtance of the earth from the ſun inverſely.

That the ſame may ſtill move more ſwiftly in a ſimple ratio of the diſtance inverſely from the centre of the orbit D, draw DE towards the *moon*'s apogee, or parallel to TC; and take the angle EDG equal to the exceſs of the annual argument, above the diſtance of the *moon*'s apogee from the ſun's perigee in conſequentia; or, which is the ſame thing, take the angle CDF equal to the complement of the true anomaly of the ſun to 360°; and let DF be to DC as double the eccentricity of the *orbis magnus* to the mean diſtance of the ſun from the earth, and the mean diurnal motion of the ſun from the *moon*'s apogee, to the mean diurnal motion of the ſun from its own apogee, conjunctly, *i.e.* as $33\frac{7}{8}$ is to 1000, and 52′, 27″, 16‴, to 59′ 8″ 10‴ conjunctly; or as 3 to 100. Conceive the centre of the *moon*'s orbit placed in the point F, and to revolve in an epicycle whoſe centre is D, and radius DF, while the point D proceeds in the circumference of the circle DABD: Thus the velocity wherewith the centre of the *moon*'s orbit moves in a certain curve, deſcribed about the centre C, will be reciprocally as the cube of the ſun's diſtance from the earth.

The computation of this motion is difficult, but will be made eaſy by the following approximation. If the *moon*'s mean diſtance from the earth be 100000 parts, and its eccentricity TC 5505 of thoſe parts, the right line CB or CD will be found $1172\frac{3}{4}$, and the right line DF $35\frac{1}{5}$. This right line at the diſtance TC, ſubtends an angle to the earth, which the transferring of the centre of the orbit from the place D to F generates in the motion of this centre; and the ſame right line doubled, in a parallel ſituation, at the diſtance of the upper umbilicus of the *moon*'s orbit from the earth, ſubtends the ſame angle, generated by that tranſlation in the motion of the umbilicus; and at the diſtance of the *moon* from the earth ſubtends an angle which the ſame tranſlation generates in the motion of the *moon*; and which may therefore be called the *ſecond equation of the centre.*

This equation of a mean diſtance of the *moon* from the earth, is as the ſine of the angle contained between the right line DF, and a right line drawn from the point F to the *moon*, nearly; and when greateſt, amounts to 2′, 25″.—Now the angle comprehended between the right line DF and a line from the point D, is found either by ſubſtracting the angle EDF from the mean anomaly of the *moon*, or by adding the *moon*'s diſtance from the ſun to the diſtance of the *moon*'s apogee from the apogee of the ſun. And as radius is to the ſine of the angle thus found, ſo is 2′, 25″ to the ſecond equation of the centre, which is to be added, if that ſine be leſs than a ſemi-circle, and ſubſtracted if greater: Thus we have its longitude in the very ſyzygies of the luminaries.

If a more accurate computation be required, the *moon*'s place thus found muſt be corrected by a ſecond variation. The firſt and principal variation we have already conſidered, and have obſerved it to be greateſt in the octants. The ſecond is greateſt in the quadrants, and ariſes from the different action of the ſun on the *moon*'s orbit, according to the different poſition of the *moon*'s apogee to the ſun, and is thus computed: As radius is to the verſed ſine of the diſtance of the *moon*'s apogee from the ſun's perigee, in conſequentia, ſo is a certain angle P to a fourth proportional. And as radius is to the ſine of the *moon*'s diſtance from the ſun, ſo is the ſum of this fourth proportional and another angle Q to the ſecond variation, which is to be ſubſtracted, if the *moon*'s light be increaſing; and added, if diminiſhing.

Thus we have the *moon*'s true place in her orbit; and by reduction of this place to the ecliptic, the *moon*'s longitude. The angles P and Q are to be determined by obſervation: in the mean time, if for P be aſſumed 2′, and for Q 1′, we ſhall be near the truth.

Nature and furniture of the MOON.—1°. From the various phaſes of the *moon*: From her only ſhewing a little part illumined, when following the ſun ready to ſet: From that part's increaſing as ſhe recedes from the ſun, till at the diſtance of 180° ſhe ſhines with a full face; and again wanes as ſhe re-approaches that luminary, and loſes all her light when ſhe meets him: From the lucid part's being conſtantly turned towards the weſt, while the *moon* increaſes; and towards the eaſt when ſhe decreaſes; it is evident, that only that part ſhines on which the ſun's rays fall.—And from the phænomena of eclipſes, happening when the *moon* ſhould ſhine with a full face, *viz.* when ſhe is 180° diſtant from the ſun; and the darkned parts appearing the ſame in all places, it is evident ſhe has no light of her own, but borrows whatever light ſhe has from the ſun. See PHASES, ECLIPSE, and SUN.

2°. The *moon* ſometimes diſappears in a clear heaven, ſo as not to be diſcoverable by the beſt glaſſes; little ſtars of the fifth and ſixth magnitude all the time remaining viſible.—This phænomenon Kepler obſerved twice anno 1580, and 1583; and Hevelius in 1620. Riccioli, and other Jeſuits at Bologna, and many people throughout Holland obſerved the like April 14, 1642; yet at Venice and Vienna ſhe was all the time conſpicuous. December 23. 1703. there was another total obſcuration: At Arles ſhe firſt appeared of a yellowiſh brown; at Avignon ruddy and tranſparent, as if the ſun had ſhone through; at Marſeilles, one part was reddiſh, the other very duſky; and, at length, though in a clear ſky, wholly diſappeared.—Here it is evident, that the colours appearing different at the ſame time, do not belong to the *moon*; but that they are occaſioned by an atmoſphere around her variouſly diſpoſed in this and that place, for refracting of theſe or thoſe coloured rays.

3°. The eye, either naked, or armed with a teleſcope, ſees ſome parts in the *moon*'s face darker than others, which are called *maculæ*, or *ſpots.* Through the teleſcope, while the *moon* is either increaſing or decreaſing, the illumined parts in the maculæ appear evenly terminated: but in the bright parts, the boundary of the light appears jagged and uneven, compoſed of diſſimilar arches, convex and concave. (See *Tab. Aſtronomy, fig.* 18.)—There are alſo obſerved lucid parts diſperſed among the darker; and illumined parts are ſeen beyond the limits of illumination; other intermediate ones remaining ſtill in darkneſs; and near the maculæ, and even in them, are frequently ſeen ſuch lucid ſpecks.—Beſide the maculæ obſerved by the ancients, there are other variable ones inviſible by the naked eye, called *new maculæ*, always oppoſite to the ſun; and which are hence found among thoſe parts which are the ſooneſt illumined in the increaſing *moon*, and in the decreaſing *moon* loſe their light later than the intermediate ones; running round, and appearing ſometimes longer, ſometimes ſmaller. See MACULÆ, and SPOTS. Hence, (1.) As all parts are equally illumined by the ſun, in as much as they are equally diſtant from him: If ſome appear brighter, and others darker; ſome reflect the ſun's rays more copiouſly than others; and therefore they are of different natures: And, (2.) Since the boundary of the illumined part is very ſmooth and equable in the maculæ, their ſurface muſt be ſo too. (3.) The parts illumined by the ſun ſooner, and deſerted later than others that are nearer, are higher than the reſt, *i. e.* ſtand up above the other ſurface of the *moon*. (4.) The new maculæ anſwer perfectly to the ſhadows of terreſtrial bodies.

4°. Hevelius writes, that he has ſeveral times found, in ſkies perfectly clear, when even ſtars of the ſixth and ſeventh magnitude were conſpicuous, that at the ſame altitude of the *moon*, and the ſame elongation from the earth, and with one and the ſame excellent teleſcope, the *moon* and its maculæ do not appear equally lucid, clear, and perſpicuous, at all times; but are much brighter, purer, and more diſtinct at one time than another. From the circumſtances of the obſervation, it is evident, the reaſon of this phænomenon is not either in our air, in the tube, in the *moon*, nor in the ſpectator's eye; but muſt be looked for in ſomething exiſting about the *moon*.

5°. Caſſini frequently obſerved Saturn, Jupiter, and the fixed ſtars, when hid by the *moon*, near her limb, whether the illumined or dark one, to have their circular figure changed into an oval one; and in other occultations found no alteration of figure at all. In like manner, the ſun and *moon* riſing and ſetting in a vaporous horizon, do not appear circular, but elliptical.

Hence, as we know, by ſure experience, that the circular figure of the ſun and *moon* is only changed into an elliptical one by means of the refraction in the vapory atmoſphere; it is pretty apparent, that at the time when the circular figure of the ſtars is thus changed by the *moon*, there is a denſe matter incompaſſing the *moon*, wherein the rays emitted from the ſtars are refracted; and that at other times, when there is no change of figure, this matter is wanting. See ATMOSPHERE.

This phænomenon is well illuſtrated by the following experiment: To the inner bottom of any veſſel, either plane, convex, or concave, with wax faſten a circle of paper; then pouring in water, that the rays reflected from the circle into the air may be refracted before they reach the eye; viewing the circle obliquely, the circular figure will appear changed into an ellipſis.

6°. The *moon*, then, is a denſe opake body, beſet with mountains, valleys, and ſeas.—That the *moon* is denſe, and impervious to the light, has been ſhewn: but ſome parts ſink below, and others riſe above the ſurface; and that conſiderably, in as much as they are viſible at ſo great a diſtance of the earth from the ſun: In the *moon* therefore are huge mountains, and very deep valleys. Ricciolus meaſured the height of one of the mountains, called *St. Catharine*, and found it nine miles high.

Again, in the *moon* are ſpacious tracts having ſmooth even ſurfaces, and thoſe reflecting leſs light than the reſt: Hence, as the ſurface of fluid bodies is naturally even, and as ſuch bodies being tranſparent, tranſmit a great part of the rays of light, and reflect very little; the lunar ſpots are fluid, tranſparent bodies: and as they continue conſtantly the ſame, are *ſeas*.—In the *moon*, therefore, are mountains, valleys and ſeas.—Hence again, the lucid parts of the ſpots are *iſlands* and *peninſula's*.

And ſince in the maculæ, and near their limbs, are ſeen ſome parts higher than others, in the lunar ſeas are *rocks* and promontories.

And ſince the new ſpots are contiguous to the mountains, and in all reſpects like the ſhadows of bodies on our earth; no doubt they are the ſhadows of the lunar mountains: Whence alſo appears that the matter of the *moon* is opake.

Note, This reaſoning will be put paſt doubt by viewing the ſenſible horizon from ſome eminence: Where it paſſes over a plain, the line will appear ſmooth and even; where a-croſs mountains and valleys, irregular and winding; ſmooth, but dark, *&c.*

7°. The *moon* is incompaſſed with an heavy and elaſtic atmoſphere, wherein vapours and other exhalations aſcend, and whence they return in form of dew and rain.

In a total eclipſe of the ſun, we find the *moon* incircled with a lucid ring parallel to her periphery.

Of this, we have too many obſervations to doubt: In the great eclipſe in 1715, the ring was very conſpicuous at London, and elſewhere. Kepler obſerves the ſame of an eclipſe in 1605, at Naples and Antwerp; and Wolfius of another in 1606 at Leipſick, deſcribed at large in the *Acta Eruditorum*, with this notable circumſtance, that the part next the *moon* was viſibly brighter than that furtheſt from it; which is confirmed by the obſervations of the French aſtronomers in the *Memoires de l'Academie*, *&c. an.* 1706.

Hence about the *moon* is ſome fluid, which correſponds to her figure, and which both reflects and retracts the ſun's rays. And hence alſo, this fluid is denſer below, near the *moon*'s body; and rarer above. Now as the air which incompaſſes our earth is ſuch a fluid, it is manifeſt there is *air* above the *moon*; and ſince the different denſity of the air depends on its different gravity and elaſticity, no doubt the different denſity of the lunar air has the ſame cauſes. Again, we have obſerved, the lunar air is not always equally clear and tranſparent: ſometimes it changes the ſpherical figures of the ſtars into ovals; and in the ſeveral total eclipſes juſt mentioned, there was obſerved a trembling in the *moon*'s limb, immediately before immerſion, with an appearance of thin, light ſmoke flying over it during immerſion, very apparent in England. And hence, as theſe ſame phænomena are obſerved in our air when full of vapours, it is pretty plain, at the time when theſe phænomena are obſerved in that of the *moon*, it is full of *vapours* and *exhalations*. And, laſtly, ſince at other times the lunar air is clear and tranſparent, producing none of theſe phænomena, the vapours muſt have been precipitated on the *moon*; and therefore either dew, or rain, or ſnow have fallen.

8°. The *moon*, then, is a body in all reſpects like our earth, and fitted for the ſame purpoſes. For we have ſhewn that it is denſe—opake—has mountains and valleys—ſeas, with iſlands, peninſulæ, rocks, and promontories—a changeable atmoſphere, wherein vapours and exhalations riſe and fall—day and night; a ſun to illuminate the one, and a moon the other,—ſummer and winter, *&c.*

From theſe, by analogy, may infinite other properties and appendages of the *moon* be deduced—From the changes in the atmoſphere will follow winds, and other meteors; and according to the different ſeaſons of the year, *rains*, *miſts*, *froſt*, *ſnow*, *&c.*—From the inequalities upon the *moon*'s ſurface will ariſe *lakes*, *rivers*, *ſprings*, &c.

Now nature, we know, produces nothing in vain: rains and dews fall on our earth to make plants vegetate; and plants take root, grow, produce feeds and fruits for animals to feed on.—But nature is ſtill uniform and conſiſtent with herſelf, and like things ſerve for like ends.—Why then may not there be plants and animals in the *moon*? To what other purpoſe ſo nice a proviſion for them?

Theſe arguments will receive new force when we come to ſhew that our earth itſelf is a planet; and that when viewed from the other planets, it appears, in ſome, like the *moon*; in others, like Venus; in others, like Jupiter, *&c.* a ſimilitude between the planets, both optical and phyſical, being a ſtrong preſumption their furniture is alike. See Earth, and Planet.

To meaſure the height of the mountains of the Moon.—Suppoſe ED (*fig.* 19.) the *moon*'s diameter, ECD the boundary of light and darkneſs; and A the top of a hill in the dark part beginning to be illumined: With a teleſcope obſerve the proportion of AE, or the diſtance of A from the line where the light commences, to the diameter ED: Here we have two ſides of a rectangled triangle AE, CE; the ſquares of which added together give the ſquare of the third; whence the ſemidiameter CD being ſubtracted, leaves AB, the height of the mountain.

Ricciolus, *v. gr.* found the top of mount St. Catharine illumined at the diſtance of ^{1} of the *moon*'s diameter from the confines of light. Suppoſing, therefore, CE, 8; and AE, 1; the ſquares of the two will be 65, whoſe root is 8.062 the length of AC; ſubtracting therefore BC=8, the remainder is AB=0.62. The *moon*'s ſemi-diameter, therefore, is to the mountain's height as 8 is to 0.62; *i. e.* as 800 to 62. Suppoſing, therefore, the diameter of the *moon* 1182 Engliſh miles, by the rule of three we find the height of the mountain nine miles.

The heights, *&c.* of the lunar mountains being meaſurable, aſtronomers have taken occaſion to give each its name. Ricciolus, whom moſt others now follow, diſtinguiſhed them by the names of celebrated aſtronomers; and by theſe names they are ſtill expreſſed in obſervations of the lunar eclipſes, *&c.* See the figure, *Tab. Aſtron. fig.* 20.

Moon-*dial*. See the article Dial.

Prime of the Moon. See the article Prime.

MOOR, Mora, a heath, or barren tract of ground. See Waste and Common.

The word is ſometimes alſo uſed for a *moraſs*, *moſs*, or *fen*. See Morass.

Mora muſſa, in ancient writings, particularly denotes a moſs, or peat-moſs. See Turf.

MOORING, at ſea, is the laying out of anchors, in a proper place, for the ſecure riding of a ſhip. See Anchor, and Unmoor.

To Moor *acroſs*, is to lay out one of the anchors on one ſide.

To Moor *alongſt*, is to have an anchor in a river, and a hawſer on ſhore.

To Moor *quarter-ſhot*, is to moor quartering, between the two firſt ways.

Mooring *for eaſt*, *weſt*, *&c.* is when they obſerve which way, and on what point of the compaſs the wind or ſea is moſt likely to endanger the ſhip, and there lay out an anchor.

MOORS-*head*, in chymiſtry, a copper cap made in form of a head, to be ſet over the chimney of a reverberating furnace. See Reverberatory, and Head.

Moors-*head* alſo denotes the head of a copper or glaſs-ſtill or alembic, which is luted on to the body or cucurbit, and hath a beak or pipe to let the ſpirit run down into the receiver.

MOOT*, a difficult caſe, or queſtion argued by the ſtudents of inns of court, by way of exerciſe. See Mooting.

* The word is formed either from the Saxon, *metan*, *gemetan*, meeting; or from the French, *mot*, word.

MOOTING, the chief exerciſe of the ſtudents in the inns of court; being the arguing of caſes, which young utter barriſters, *&c.* perform at appointed times, the better to enable them for practice, and the defence of their clients cauſes. See Moot, and Inns *of court*.

Such, as from their learning and ſtanding are called by the benchers to argue *moot-caſes*, are ſometimes called *utter barriſters*; the reſt, who for want of experience, *&c.* are not admitted, are by ſome called *inner barriſters*. See Barrister.

The place where the *moot-caſes* were argued, was anciently called a *moot-hall*. See Hall.

In the inns of court there is a *bailiff* or *ſurveyor of the moots*, yearly choſen by the bench to appoint the *moot-men* for the inns of chancery, and to keep account of performance of exerciſes, both there and in the houſe.

MOOT-*men*, are thoſe who argue *moot caſes*. See Moot.

Out of theſe *moot-men* are choſen readers for the inns of chancery; where, in term-time and in vacations, they argue caſes in the preſence of attorneys and clerks. See Mooting.

MORALS, any thing relating to the manners, or conduct of life. See Manners.

Beſides the theological virtues, as *faith*, *hope*, *charity*, &c. there are alſo *moral* virtues, as *juſtice*, *temperance*, &c. See Virtue.

Moral *actions*, or *acts*, are ſuch as render the agent *good*, or *evil*; and conſequently rewardable and puniſhable becauſe he does them. See Good, *&c.* See alſo Action.

Moral *cauſe*. See the article Cause.

Moral *certainty*, or *aſſurance*, is uſed to ſignify a very ſtrong probability; in contradiſtinction to a mathematical demonſtration. See Certitude.

Moral *evidence*.	See the article	Evidence.
Moral *evil*.		Evil.
Moral *fables*.		Fable.
Moral *good*.		Good.

Moral *impoſſibility*, is what we otherwiſe call a *very great*, and almoſt *inſuperable difficulty*; in oppoſition to a phyſical, or natural impoſſibility. See Impossibility.

Moral *neceſſity*. See the article Necessity.

Moral *perfection*. See the article Perfection.

Moral *philoſophy*, a ſcience whoſe object is to direct, and form men's manners; to explain the reaſon, and nature of actions; and to teach and inſtruct us how to acquire that felicity which is agreeable to human nature. See Philosophy.

Moral philoſophy is the ſame with what we otherwiſe call *ethics*, ſometimes *morality*. See ETHICS, and MORALITY.

MORAL *quantity*. See the article QUANTITY.

MORAL *ſenſe*, the faculty whereby we diſcern, or perceive what is good, virtuous, beautiful, *&c.* in actions, manners, characters, *&c.*

A late author has endeavoured to prove, that it is a peculiar ſenſe whereby we get the ideas of theſe things; and denominates it a *moral ſenſe*. See *moral* SENSE.

MORAL *theology*, is that which treats of caſes of conſcience; called alſo *caſuiſtry*, or *caſuiſtical divinity*. See THEOLOGY.

MORAL *univerſality*. See the article UNIVERSALITY.

MORAL *of a fable*, is the inſtruction drawn from it. See FABLE.

Thus when Phædrus at the end of a fable adds, *Hoc illis dictum qui*, &c. This makes what we call the *moral:* The Greeks called it επιμυθιον, when at the end of the fable; and προμυθιον, at the beginning. Among the Latins it was called *affabulatio.*

MORALITY, denotes a conformity in things and actions, to thoſe unalterable obligations which reſult from the nature of our exiſtence, and the neceſſary relations of life; whether to God as our creator, or to mankind as our fellow-creature. See ACTION, *&c.*

MORALITY, is alſo uſed for the ſcience, or doctrine of morals; or the art of living well and happily: deduced from reaſon, and the nature, relation, and fitneſs of things.

In which ſenſe it amounts to the ſame with what we otherwiſe call *ethics*, *moral philoſophy*, or the *doctrine of offices.* See ETHICS, MORAL, OFFICE, DUTY, *&c.*

Notwithſtanding the great obſcurity and uncertainties in the moral ſcience, Mr. Locke is of opinion, that the doctrine of manners is equally capable of being brought to demonſtration with the doctrine of quantity and number, that is, with the pureſt parts of mathematics. See KNOWLEDGE, DEMONSTRATION, QUANTITY, NUMBER, MATHEMATICS, *&c.*

According to this author, the idea of a ſupreme Being, infinite in power, goodneſs, and wiſdom, whoſe workmanſhip we are, and on whom we depend; and the idea of ourſelves, as underſtanding rational creatures; would, if duly conſidered, afford ſuch foundations of our duty, and rules of action, as might place *morality* among the ſciences capable of demonſtration; wherein we need not doubt, but that from principles as inconteſtable as thoſe of the mathematics, by neceſſary conſequences, the meaſure of right and wrong, might be made out to any one, who will apply himſelf, with the ſame indifferency and attention to the one, as he doth to the other of theſe ſciences. For the relations of other modes may certainly be perceived, as well as thoſe of number and extenſion.—*E. gr.* That *where there is no property, there is no injuſtice*, is a propoſition as certain as any in Euclid; for the idea of property being a right to any thing, and the idea of injuſtice being the invaſion or violation of that right, it is evident, that theſe ideas being thus eſtabliſhed, and theſe names annexed to them, I can as certainly know this propoſition to be true, as that a triangle has three angles equal to two right ones.—Again, *no government allows abſolute liberty:* the idea of government being the eſtabliſhment of ſociety, upon certain rules or laws, which require conformity to them; and the idea of abſolute liberty being for any one to do whatever he pleaſes, I am as capable of being certain of the truth of this propoſition, as of any in mathematics.

What has given the advantage to the ideas of quantity, and made them thought more capable of certainty and demonſtration, than the ideas of good and evil, right and wrong, *&c.* is, 1°. That the former can be repreſented by ſenſible marks, which have a nearer correſpondence with them than any words or ſounds. Diagrams drawn on paper are copies of the ideas, and not liable to the uncertainty that words carry in their ſignification; but we have no ſenſible marks that reſemble our moral ideas, and nothing but words to expreſs them by, which though, when written, they remain the ſame; yet the ideas they ſtand for may change in the ſame man, and it is very ſeldom they are not different in different perſons.

2°. Moral ideas are commonly more complex than figures; whence theſe two inconveniences follow. 1°. That their names are of more uncertain ſignification: the preciſe collection of ſimple ideas they ſtand for, not being ſo eaſily agreed on, and ſo the ſign that is uſed for them in communication always, and in thinking often, does not readily carry with it the ſame idea. 2°. The mind cannot eaſily retain thoſe preciſe combinations ſo exactly and perfectly, as is neceſſary in the examination of the habitudes and correſpondencies, agreements or diſagreements of ſeveral of them one with another, eſpecially where it is to be judged of by long deductions, and the intervention of ſeveral other complex ideas, to ſhew the agreement or diſagreement of two remote ones.

One part of theſe diſadvantages in moral ideas, which has made them be thought not capable of demonſtration, may in a good meaſure be remedied by definitions, ſetting down that collection of ſimple ideas which every term ſhall ſtand for, and then uſing the term ſteadily and conſtantly for that preciſe collection. See DEFINITION.

The mathematician conſiders the truth and properties belonging to a rectangle or circle, only as they are ideas in his own mind, which poſſibly he never found actually exiſted mathematically; that is, preciſely true: yet his knowledge is not only certain, but real; becauſe real things are no further, nor intended to be, meant by any ſuch propoſitions, than as things really agree to thoſe archetypes in the mind. It is true of the idea of a triangle, that its three angles are equal to two right ones; it is true alſo of a triangle, where-ever it exiſts: What is true of thoſe figures that have barely an ideal exiſtence in the mind, will hold true of them alſo, when they come to have a real exiſtence in matter. Hence it follows, that moral knowledge is as capable of real certainty as mathematics: For certainty being nothing but the perception of ſuch agreement, by the intervention of other ideas, our moral ideas, as well as mathematical, being archetypes themſelves, and ſo adequate or compleat ideas, all the agreement or diſagreement we ſhall find in them, will produce real knowledge, as well as in mathematical figures. That which is requiſite to make our knowledge certain, is the clearneſs of our ideas; and that which is required to make it real, is that they anſwer their archetypes.

But it will here be ſaid, That if moral knowledge be placed in the contemplation of our own moral ideas, and thoſe are of our own making, what ſtrange notions will there be of juſtice and temperance? What confuſion of virtues and vices, if every man may make what ideas of them he pleaſes? It is anſwered: No confuſion or diſorder at all in the things themſelves, nor the reaſonings about them, no more than there would be a change in the properties of figures, and their relations one to another, if a man ſhould make a triangle with four corners, or a trapezium with four right angles; that is, in plain Engliſh, change the names of the figures, and call that by one name which is called ordinarily by another. The change of name will indeed at firſt diſturb him, who knows not what idea it ſtands for; but as ſoon as the figure is drawn, the conſequences and demonſtrations are plain and clear.

Juſt the ſame is it in moral knowledge: Let a man have the idea of taking from others, without their conſent, what they are juſtly poſſeſſed of, and call this *juſtice* if he pleaſeth; he that takes the name there, without the idea put to it, will be miſtaken, by joining another idea of his own to that name: but ſtrip the idea of that name, or take it, ſuch as it is, in the ſpeaker's mind, and the ſame things will agree to it, as if you called it *injuſtice*. One thing we are to take notice of, That where God, or any other law-maker, has defined any moral names, there they have made the eſſence of that ſpecies to which that name belongs; and there it is not ſafe to apply or uſe them otherwiſe; but in other caſes, it is bare impropriety of ſpeech to apply them contrary to the common uſage of the country they are uſed in.

MORASSE*, a marſh, fen, or low moiſt grounds, which receive the waters from above, without having any deſcent to carry them off again. See FEN.

* Somner derives the word from the Saxon *merſe*, lake; Salmaſius from *mare*, a collection of waters; others from the German *maraſt*, a muddy place; and others from *mareſc*, of *maricetum*, *à mariſcis*, i. e. ruſhes.

In Scotland, Ireland, and the north of England, they have a peculiar kind of *moraſſes*, called *moſſes*, or *peat-moſſes*, whence the country people dig their peat or turf. See TURF.

The earl of Cromartie gives a particular account of theſe moſſes in the *Philoſophical Tranſactions*. They are covered with a heathy ſcurf, under which is a black, moiſt, ſpungy earth, in ſome places ſhallower, in others deeper, ordinarily from three or four, to ſeven or eight feet depth, though in ſome few places twice or thrice as much.

This black, ſpungy earth, they cut into oblong ſquares with iron ſpades fitted to that end, eight or nine inches long, and four or five broad; as the men cut them up, they are carried and ſpread on a dry ground, to be dried in the wind and ſun. Some of theſe become harder, ſome ſofter, according to the nature of the mould or earth: The more black and ſolid, the better fire; and they are the leaſt eſteemed which are grayeſt, lighteſt, and moſt ſpungy.

When they have cut off one ſurface of four or five inches deep, they proceed downwards to another, and ſo to a third and a fourth, till they come to the hard channel; unleſs they be ſtopped with water, which they alſo ordinarily remove by making a channel, if they can; but where they cannot, there the water ſtagnates. In ſuch waſted pits, or *peat-dikes*, as they call them, where water hinders the cutting the ſpungy earth to the bottom, the pits will be filled up again in ſome years with a new ſpungy earth; which in proceſs of time comes to the conſiſtence of peat-moſſes as at firſt, and a ſcurfy heath-turf grows over the top of it. When the dikes are dug down to the hard channel, the moſſes do not renew, as in the other caſe; though it has been obſerved, that if they be cut down to the channel, provided the heathy turf cut off from the top be but laid on the channel, in courſe of time the moſs grows again. Theſe moſſes are always level; though they are frequently found on hills, and near the tops of them too. Yet, as that curious nobleman obſerves, the moſſes have always a deſcent to them, and generally from them; inſomuch that he never knew any where the water might ſtagnate. It is the water draining from above, that ſeems to be the parent of peat. In many of theſe moſſes are found quantities of fir and oak wood, uſually whole trees; for the ſmaller branches are ſeldom found unconſumed. This wood is as good for uſe as any old wood is; only that having imbibed a deal of moiſture, it takes ſome time to dry, in order to fit it for uſe.

There are many places where wood will not grow, where yet the moſſes are well ſtocked with this under-ground timber; but yet it appears there muſt have been woods formerly; elſe how come they in the moſſes? To prove this, that noble lord gives us the hiſtory and origin of a moſs, in great meaſure from his own experience.—In the pariſh of Lochburn, in the year 1651, he ſaw, near the top of a very high hill, a plain about a mile over, then covered with a firm ſtanding wood, but which was ſo very old, that not only the trees had no leaves or bark on, but the outſide for the ſpace of an inch inward was dead, white timber, though within they were firm. Coming by the ſame place fifteen years after, he could not diſcover the leaſt appearance of a tree, but inſtead thereof a plain green ground covered with a moſs; the trees being all fallen, and having lain ſo thick over one another, the green had over-run the whole timber, by means of the moiſture draining from the hill above it, and ſtagnating on the plain. He adds, that none could paſs over it; the ſcurf not being firm enough to ſupport them. In thirty years more he found the whole piece of ground turned into a common peat-moſs, and the country-people digging turf and peats.—This accounts for the generation of moſſes, and whence it is that many of them are furniſhed with timber.

MORATUR, or DEMORATUR, in law, ſignifies as much as, *he demurs*; that is, the party here goes not forward, but reſts, or abides upon the judgment of the court, who take time to deliberate, argue, and adviſe thereon. See DEMURRER.

When the council of the party are of opinion, that the count or plea of the adverſe party is inſufficient in law; then he *demurs*, or abides in law, and refers the ſame to the judgment of the court.

MORBID, MORBIDUS, in medicine, is applied to thoſe parts, humours, *&c.* wherein a diſeaſe lies. See DISEASE.

MORBID, in painting, is particularly applied to fat fleſh very ſtrongly expreſſed.

MORBILLI, in medicine, a diſeaſe popularly called *meaſles*. See MEASLES.

MORBUS, a term purely Latin, ſignifying *diſeaſe*. See DISEASE.

MORBUS *comitialis*, denotes the *epilepſy*; thus called by the Romans, becauſe when in any of their public aſſemblies perſons fell down with this diſtemper, they immediately broke up, and diſſolved the comitia, which was the common appellation for ſuch courts. See EPILEPSY, and COMITIALIS.

MORBUS *Gallicus*.	See the article	VENEREAL *diſeaſe*.
MORBUS *prodromus*.		PRODROMUS.
MORBUS *pedicularis*.		PEDICULARIS.
MORBUS *regius*.		JAUNDICE.
MORBUS *virgineus*.		CHLOROSIS.
Cholera MORBUS.		CHOLERA.

MORESK, or MORISCO, a kind of painting, carving, *&c.* done after the manner of the Moors; conſiſting of ſeveral groteſque pieces and compartiments promiſcuouſly intermingled, not containing any perfect figure of a man, or other animal, but a wild reſemblance of birds, beaſts, trees, *&c.* See GROTESQUE. Theſe are alſo called *arabeſques*, and are particularly uſed in embroideries, damaſk-work, *&c.* See ARABESQUE.

Moreſque dances, vulgarly called *morrice-dances*, are thoſe altogether in imitation of the Moors: as ſarabands, chacons, *&c.* which are uſually performed with caſtanets, tabours, *&c.* See CASTANETS.

MORGANATIC *marriage*. See the article MARRIAGE.

MORNING, the beginning of the day; or the time of the ſun-riſing. See DAY, and RISING.

The aſtronomers reckon *morning*, *mane*, from the time of midnight, to that of mid-day.—Thus an eclipſe is ſaid to begin at eleven a-clock in the *morning*, *&c.*

MORNING-*ſtar*, is the planet Venus, when a little to the weſtward of the ſun; that is, when ſhe riſes a little before him. In this ſituation, ſhe is called by the Greeks, *phoſphorus*; by the Latins, *lucifer*, *&c.* See PHOSPHORUS.

MORNING *twilight*. See the article CREPUSCULUM.

MOROCCO*, or MARROQUIN, the ſkin of a goat, or ſome other animal reſembling it, called *menon*, frequent in the Levant, dreſſed in ſumac, or galls, and coloured of any colour at pleaſure, much uſed in tapiſtry, book-binding, *&c.*

We have *Morocco* ſkins brought from the Levant, Barbary, Spain, Flanders, and France; red, black, yellow, blue, *&c.* —The various manners of preparing *Moroccos*, both black and in colours, are ſo curious, and withal ſo little known among us, that the public will not be diſpleaſed to find them here.

Manner of preparing black MOROCCO.—The ſkins having been dried in the hair, are ſteeped in clear water three days and nights, ſtretched on a wooden horſe or leg, like that uſed by tanners, beaten with a large knife for the purpoſe, and ſteeped a-freſh in water, changed daily till they be well come again. —In this ſtate, they are thrown into a large vat in the ground, full of water, wherein quick-lime has been ſlaked, where they lie fifteeen days; whence, however, they are taken, and again returned every night and morning: They are then thrown into a freſh vat of lime and water, and ſhifted night and morning as before, for fifteen days longer; then rinſed in clear water, and the hair taken off, on the leg, with the knife; returned into a third vat, and ſhifted as before, for about eighteen days; ſteeped twelve hours in a river, taken out, rinſed, put in pails, where they are pounded with wooden peſtles, changing the water twice: then laid on the horſe, and the fleſh taken off, returned into pails of new water, taken out, and the hair-ſide ſcraped; returned into freſh pails, taken out, and thrown into a pail of a particular form, having holes at bottom: here they are beaten the ſpace of an hour, and freſh water poured on from time to time; ſtretched on the leg, and ſcraped on either ſide; returned into pails of freſh water; taken out, ſtretched, and ſewed up all around in manner of bags, leaving out the hind legs, which ſerve to make an aperture for the conveyance of a mixture mentioned hereafter.

The ſkins thus ſewed, are put in luke-warm water, where dogs excrement has been diſſolved. Here they are ſtirred with long poles half an hour, left at reſt a dozen, taken out, rinſed in freſh water, and filled by a tunnel with a preparation of water and ſumac mixed and heated over the fire till ready to boil; and as they are filled, the hind-legs are ſewed up to ſtop the paſſage. In this ſtate they are let down into the veſſel of water and ſumac, and kept ſtirring four hours ſucceſſively, taken out, and heaped on one another; after a little time, their ſides are changed: and thus they continue an hour and half, till drained. This done, they are looſened, and filled a ſecond time with the ſame preparation, ſewed up again, and kept ſtirring two hours, piled up, and drained as before. This is again repeated a third time, with this difference, that they are now only ſtirred a quarter of an hour; after which, they are left till the morrow morning, when they are taken out, drained on a rack, unſewed, the ſumac taken out, folded in two from head to tail, the hair-ſide outwards, laid over each other on the leg, to perfect their draining, ſtretched out, and dried; then trampled under foot by two and two, ſtretched on a wooden table, what fleſh and ſumac remains ſcraped off, and the hair-ſide rubbed over with oil; and that again with water.

Having thus received their oil and water, they are wrung in the hands, then ſtretched and preſſed right on the table with an iron inſtrument like that of the curriers, the fleſh-ſide uppermoſt; then turned, and the hair-ſide rubbed ſtrongly over with a handful of ruſhes, to ſqueeze out as much of the oil remaining within as poſſible. The firſt courſe of black is now laid on the hair-ſide, by means of a lock of hair twiſted and ſteeped in a kind of black dye, prepared of ſour beer, wherein pieces of old ruſty iron have been thrown. When half dry by hanging in the air, they are ſtretched on a table, and rubbed over every way with a paumelle or wooden-toothed inſtrument, to raiſe the grain, over which is paſſed a light couche of water, then ſleeked, by rubbing them with ruſhes prepared for the purpoſe. Thus ſleeked, they have a ſecond couche of black, then dried, laid on the table, rubbed over with a paumelle of cork, to raiſe the grain again; and after a light couche of water, ſleeked over anew, and to raiſe the grain a third time, a paumelle of wood uſed.

After the hair-ſide has thus received all its preparations, the fleſh-ſide is pared with a ſharp knife for the purpoſe; the hair-ſide rubbed ſtrongly over with a woollen cap, having firſt given it a luſtre with barberries, citron, or orange. The whole is finiſhed, by raiſing the grain lightly for the laſt time with the paumelle of cork, which leaves them in a condition for ſale and uſe.

Manner of preparing red MOROCCO.—The ſkins are ſteeped twenty-four hours in a river, taken out, ſtretched on the leg, beat with the knife, returned into the water for twenty-four hours, re-beaten on the leg, re-ſteeped; thrown into a vat, and for three weeks, taken out and returned every morning, to diſpoſe them to peel.—Being taken out for the laſt time, they are ſcraped with the knife, and when the hair is quite off, thrown in pails of freſh water, where they are rinſed; then the fleſh-ſide ſcraped, thrown into the pails, and thus alternately from the leg to the pails, till they leave the water quite clean: then they are put in lukewarm water, with the ſumac as before, and after twelve hours, rinſed in clear water, and ſcraped on the leg on both ſides, pounded in pails, and the water changed three times; then wrung and ſtretched on the leg, and paſſed after each other into water, with allum diſſolved in it. Thus allumed, they are left to drain till the morning, then wrung out, pulled on the leg, and folded from head to tail, the fleſh inwards.

In this ſtate they receive their firſt dye, by paſſing them after one another into a red liquor, prepared with lacca, and ſome other ingredients, kept ſecret among the *maroquineers*.—This they repeat again and again, till the ſkins have got their firſt colour.

---

* The name is ordinarily derived from the kingdom of *Morocco*, whence it is ſuppoſed the manner of preparing them was firſt borrowed.

Moral philoſophy is the ſame with what we otherwiſe call *ethics*, ſometimes *morality*. See ETHICS, and MORALITY.

MORAL *quantity*. See the article QUANTITY.

MORAL *ſenſe*, the faculty whereby we diſcern, or perceive what is good, virtuous, beautiful, *&c.* in actions, manners, characters, *&c.*

A late author has endeavoured to prove, that it is a peculiar ſenſe whereby we get the ideas of theſe things; and denominates it a *moral ſenſe*. See *moral* SENSE.

MORAL *theology*, is that which treats of caſes of conſcience; called alſo *caſuiſtry*, or *caſuiſtical divinity*. See THEOLOGY.

MORAL *univerſality*. See the article UNIVERSALITY.

MORAL *of a fable*, is the inſtruction drawn from it. See FABLE.

Thus when Phædrus at the end of a fable adds, *Hoc illis dictum qui*, &c. This makes what we call the *moral*: The Greeks called it επιμυθιον, when at the end of the fable; and προμυθιον, at the beginning. Among the Latins it was called *affabulatio*.

MORALITY, denotes a conformity in things and actions, to thoſe unalterable obligations which reſult from the nature of our exiſtence, and the neceſſary relations of life; whether to God as our creator, or to mankind as our fellow-creature. See ACTION, *&c.*

MORALITY, is alſo uſed for the ſcience, or doctrine of morals; or the art of living well and happily: deduced from reaſon, and the nature, relation, and fitneſs of things.

In which ſenſe it amounts to the ſame with what we otherwiſe call *ethics*, *moral philoſophy*, or the *doctrine of offices*. See ETHICS, MORAL, OFFICE, DUTY, *&c.*

Notwithſtanding the great obſcurity and uncertainties in the moral ſcience, Mr. Locke is of opinion, that the doctrine of manners is equally capable of being brought to demonſtration with the doctrine of quantity and number, that is, with the pureſt parts of mathematics. See KNOWLEDGE, DEMONSTRATION, QUANTITY, NUMBER, MATHEMATICS, *&c.*

According to this author, the idea of a ſupreme Being, infinite in power, goodneſs, and wiſdom, whoſe workmanſhip we are, and on whom we depend; and the idea of ourſelves, as underſtanding rational creatures; would, if duly conſidered, afford ſuch foundations of our duty, and rules of action, as might place *morality* among the ſciences capable of demonſtration; wherein we need not doubt, but that from principles as inconteſtable as thoſe of the mathematics, by neceſſary conſequences, the meaſure of right and wrong, might be made out to any one, who will apply himſelf, with the ſame indifferency and attention to the one, as he doth to the other of theſe ſciences. For the relations of other modes may certainly be perceived, as well as thoſe of number and extenſion.—*E. gr.* That *where there is no property, there is no injuſtice*, is a propoſition as certain as any in Euclid; for the idea of property being a right to any thing, and the idea of injuſtice being the invaſion or violation of that right, it is evident, that theſe ideas being thus eſtabliſhed, and theſe names annexed to them, I can as certainly know this propoſition to be true, as that a triangle has three angles equal to two right ones.—Again, *no government allows abſolute liberty:* the idea of government being the eſtabliſhment of ſociety, upon certain rules or laws, which require conformity to them; and the idea of abſolute liberty being for any one to do whatever he pleaſes, I am as capable of being certain of the truth of this propoſition, as of any in mathematics.

What has given the advantage to the ideas of quantity, and made them thought more capable of certainty and demonſtration, than the ideas of good and evil, right and wrong, *&c.* is, 1°. That the former can be repreſented by ſenſible marks, which have a nearer correſpondence with them than any words or ſounds. Diagrams drawn on paper are copies of the ideas, and not liable to the uncertainty that words carry in their ſignification; but we have no ſenſible marks that reſemble our moral ideas, and nothing but words to expreſs them by, which though, when written, they remain the ſame; yet the ideas they ſtand for may change in the ſame man, and it is very ſeldom they are not different in different perſons.

2°. Moral ideas are commonly more complex than figures; whence theſe two inconveniences follow. 1°. That their names are of more uncertain ſignification: the preciſe collection of ſimple ideas they ſtand for, not being ſo eaſily agreed on, and ſo the ſign that is uſed for them in communication always, and in thinking often, does not readily carry with it the ſame idea. 2°. The mind cannot eaſily retain thoſe preciſe combinations ſo exactly and perfectly, as is neceſſary in the examination of the habitudes and correſpondencies, agreements or diſagreements of ſeveral of them one with another, eſpecially where it is to be judged of by long deductions, and the intervention of ſeveral other complex ideas, to ſhew the agreement or diſagreement of two remote ones.

One part of theſe diſadvantages in moral ideas, which has made them be thought not capable of demonſtration, may in a good meaſure be remedied by definitions, ſetting down that collection of ſimple ideas which every term ſhall ſtand for, and then uſing the term ſteadily and conſtantly for that preciſe collection. See DEFINITION.

The mathematician conſiders the truth and properties belonging to a rectangle or circle, only as they are ideas in his own mind, which poſſibly he never found actually exiſted mathematically; that is, preciſely true: yet his knowledge is not only certain, but real; becauſe real things are no further, nor intended to be, meant by any ſuch propoſitions, than as things really agree to thoſe archetypes in the mind. It is true of the idea of a triangle, that its three angles are equal to two right ones; it is true alſo of a triangle, where-ever it exiſts: What is true of thoſe figures that have barely an ideal exiſtence in the mind, will hold true of them alſo, when they come to have a real exiſtence in matter. Hence it follows, that moral knowledge is as capable of real certainty as mathematics: For certainty being nothing but the perception of ſuch agreement, by the intervention of other ideas, our moral ideas, as well as mathematical, being archetypes themſelves, and ſo adequate or compleat ideas, all the agreement or diſagreement we ſhall find in them, will produce real knowledge, as well as in mathematical figures. That which is requiſite to make our knowledge certain, is the clearneſs of our ideas; and that which is required to make it real, is that they anſwer their archetypes.

But it will here be ſaid, That if moral knowledge be placed in the contemplation of our own moral ideas, and thoſe are of our own making, what ſtrange notions will there be of juſtice and temperance? What confuſion of virtues and vices, if every man may make what ideas of them he pleaſes? It is anſwered: No confuſion or diſorder at all in the things themſelves, nor the reaſonings about them, no more than there would be a change in the properties of figures, and their relations one to another, if a man ſhould make a triangle with four corners, or a trapezium with four right angles; that is, in plain Engliſh, change the names of the figures, and call that by one name which is called ordinarily by another. The change of name will indeed at firſt diſturb him, who knows not what idea it ſtands for; but as ſoon as the figure is drawn, the conſequences and demonſtrations are plain and clear.

Juſt the ſame is it in moral knowledge: Let a man have the idea of taking from others, without their conſent, what they are juſtly poſſeſſed of, and call this *juſtice* if he pleaſeth; he that takes the name there, without the idea put to it, will be miſtaken, by joining another idea of his own to that name: but ſtrip the idea of that name, or take it, ſuch as it is, in the ſpeaker's mind, and the ſame things will agree to it, as if you called it *injuſtice*. One thing we are to take notice of, That where God, or any other law-maker, has defined any moral names, there they have made the eſſence of that ſpecies to which that name belongs; and there it is not ſafe to apply or uſe them otherwiſe; but in other caſes, it is bare impropriety of ſpeech to apply them contrary to the common uſage of the country they are uſed in.

MORASSE*, a marſh, fen, or low moiſt grounds, which receive the waters from above, without having any deſcent to carry them off again. See FEN.

* Somner derives the word from the Saxon *merſe*, lake; Salmaſius from *mare*, a collection of waters; others from the German *maraſt*, a muddy place; and others from *mareſc*, of *maricetum*, *à mariſcis*, i. e. ruſhes.

In Scotland, Ireland, and the north of England, they have a peculiar kind of *moraſſes*, called *moſſes*, or *peat-moſſes*, whence the country people dig their peat or turf. See TURF.

The earl of Cromartie gives a particular account of theſe moſſes in the *Philoſophical Tranſactions*. They are covered with a heathy ſcurf, under which is a black, moiſt, ſpungy earth, in ſome places ſhallower, in others deeper, ordinarily from three or four, to ſeven or eight feet depth, though in ſome few places twice or thrice as much.

This black, ſpungy earth, they cut into oblong ſquares with iron ſpades fitted to that end, eight or nine inches long, and four or five broad; as the men cut them up, they are carried and ſpread on a dry ground, to be dried in the wind and ſun. Some of theſe become harder, ſome ſofter, according to the nature of the mould or earth: The more black and ſolid, the better fire; and they are the leaſt eſteemed which are grayeſt, lighteſt, and moſt ſpungy.

When they have cut off one ſurface of four or five inches deep, they proceed downwards to another, and ſo to a third and a fourth, till they come to the hard channel; unleſs they be ſtopped with water, which they alſo ordinarily remove by making a channel, if they can; but where they cannot, there the water ſtagnates. In ſuch waſted pits, or *peat-dikes*, as they call them, where water hinders the cutting the ſpungy earth to the bottom, the pits will be filled up again in ſome years with a new ſpungy earth; which in proceſs of time comes to the conſiſtence of peat-moſſes as at firſt, and a ſcurfy heath-turf grows over the top of it. When the dikes are dug down to the hard channel, the moſſes do not renew, as in the other caſe; though it has been obſerved, that if they be cut down to the channel, provided the heathy turf cut off from the top be but laid on the channel, in courſe of time the moſs grows again. Theſe moſſes are always level; though they are frequently found on hills, and near the tops of them too. Yet, as that curious nobleman obſerves, the moſſes have always a deſcent to them, and generally from them; inſomuch that he never knew any where the water might ſtagnate. It is the water draining from above, that ſeems to be the parent of peat. In many of theſe moſſes are found quantities of fir and oak wood, uſually whole trees; for the ſmaller branches are ſeldom found unconſumed. This wood is as good for uſe as any old wood is; only that having imbibed a deal of moiſture, it takes ſome time to dry, in order to fit it for uſe.

There are many places where wood will not grow, where yet the moſſes are well ſtocked with this under-ground timber; but yet it appears there muſt have been woods formerly; elſe how come they in the moſſes? To prove this, that noble lord gives us the hiſtory and origin of a moſs, in great meaſure from his own experience.—In the pariſh of Lochburn, in the year 1651, he ſaw, near the top of a very high hill, a plain about a mile over, then covered with a firm ſtanding wood, but which was ſo very old, that not only the trees had no leaves or bark on, but the outſide for the ſpace of an inch inward was dead, white timber, though within they were firm. Coming by the ſame place fifteen years after, he could not diſcover the leaſt appearance of a tree, but inſtead thereof a plain green ground covered with a moſs; the trees being all fallen, and having lain ſo thick over one another, the green had over-run the whole timber, by means of the moiſture draining from the hill above it, and ſtagnating on the plain. He adds, that none could paſs over it; the ſcurf not being firm enough to ſupport them. In thirty years more he found the whole piece of ground turned into a common peat-moſs, and the country-people digging turf and peats.— This accounts for the generation of moſſes, and whence it is that many of them are furniſhed with timber.

MORATUR, or DEMORATUR, in law, ſignifies as much as, *he demurs*; that is, the party here goes not forward, but reſts, or abides upon the judgment of the court, who take time to deliberate, argue, and adviſe thereon. See DEMURRER.

When the council of the party are of opinion, that the count or plea of the adverſe party is inſufficient in law; then he *demurs*, or abides in law, and refers the ſame to the judgment of the court.

MORBID, MORBIDUS, in medicine, is applied to thoſe parts, humours, &c. wherein a diſeaſe lies. See DISEASE.

MORESK, or MORISCO, a kind of painting, carving, &c. done after the manner of the Moors; conſiſting of ſeveral groteſque pieces and compartiments promiſcuouſly intermingled, not containing any perfect figure of a man, or other animal, but a wild reſemblance of birds, beaſts, trees, &c. See GROTESQUE.

Theſe are alſo called *arabeſques*, and are particularly uſed in embroideries, damaſk-work, &c. See ARABESQUE.

Moreſque dances, vulgarly called *morrice-dances*, are thoſe altogether in imitation of the Moors: as ſarabands, chacons, &c. which are uſually performed with caſtanets, tabours, &c. See CASTANETS.

MORGANATIC *marriage*. See the article MARRIAGE.

MORNING, the beginning of the day; or the time of the ſunriſing. See DAY, and RISING.

The aſtronomers reckon *morning*, *manè*, from the time of midnight, to that of mid-day.—Thus an eclipſe is ſaid to begin at eleven a-clock in the *morning*, &c.

MORNING-*ſtar*, is the planet Venus, when a little to the weſtward of the ſun; that is, when ſhe riſes a little before him. In this ſituation, ſhe is called by the Greeks, *phoſphorus*; by the Latins, *lucifer*, &c. See PHOSPHORUS.

MORNING *twilight*. See the article CREPUSCULUM.

MOROCCO*, or MARROQUIN, the ſkin of a goat, or ſome other animal reſembling it, called *menon*, frequent in the Levant, dreſſed in ſumac, or galls, and coloured of any colour at pleaſure, much uſed in tapiſtry, book-binding, &c.

* The name is ordinarily derived from the kingdom of *Morocco*, whence it is ſuppoſed the manner of preparing them was firſt borrowed.

We have *Morocco* ſkins brought from the Levant, Barbary, Spain, Flanders, and France; red, black, yellow, blue, &c. —The various manners of preparing *Moroccos*, both black and in colours, are ſo curious, and withal ſo little known among us, that the public will not be diſpleaſed to find them here.

Manner of preparing black MOROCCO.—The ſkins having been dried in the hair, are ſteeped in clear water three days and nights, ſtretched on a wooden horſe or leg, like that uſed by tanners, beaten with a large knife for the purpoſe, and ſteeped a-freſh in water, changed daily till they be well come again. —In this ſtate, they are thrown into a large vat in the ground, full of water, wherein quick-lime has been ſlaked, where they lie fifteeen days; whence, however, they are taken, and again returned every night and morning: They are then thrown into a freſh vat of lime and water, and ſhifted night and morning as before, for fifteen days longer; then rinſed in clear water, and the hair taken off, on the leg, with the knife; returned into a third vat, and ſhifted as before, for about eighteen days; ſteeped twelve hours in a river, taken out, rinſed, put in pails, where they are pounded with wooden peſtles, changing the water twice: then laid on the horſe, and the fleſh taken off, returned into pails of new water, taken out, and the hair-ſide ſcraped; returned into freſh pails, taken out, and thrown into a pail of a particular form, having holes at bottom: here they are beaten the ſpace of an hour, and freſh water poured on from time to time; ſtretched on the leg, and ſcraped on either ſide; returned into pails of freſh water; taken out, ſtretched, and ſewed up all around in manner of bags, leaving out the hind legs, which ſerve to make an aperture for the conveyance of a mixture mentioned hereafter.

The ſkins thus ſewed, are put in luke-warm water, where dogs excrement has been diſſolved. Here they are ſtirred with long poles half an hour, left at reſt a dozen, taken out, rinſed in freſh water, and filled by a tunnel with a preparation of water and ſumac mixed and heated over the fire till ready to boil; and as they are filled, the hind-legs are ſewed up to ſtop the paſſage. In this ſtate they are let down into the veſſel of water and ſumac, and kept ſtirring four hours ſucceſſively, taken out, and heaped on one another; after a little time, their ſides are changed: and thus they continue an hour and half, till drained. This done, they are looſened, and filled a ſecond time with the ſame preparation, ſewed up again, and kept ſtirring two hours, piled up, and drained as before. This is again repeated a third time, with this difference, that they are now only ſtirred a quarter of an hour; after which, they are left till the morrow morning, when they are taken out, drained on a rack, unſewed, the ſumac taken out, folded in two from head to tail, the hair-ſide outwards, laid over each other on the leg, to perfect their draining, ſtretched out, and dried; then trampled under foot by two and two, ſtretched on a wooden table, what fleſh and ſumac remains ſcraped off, and the hair-ſide rubbed over with oil; and that again with water.

Having thus received their oil and water, they are wrung in the hands, then ſtretched and preſſed right on the table with an iron inſtrument like that of the curriers, the fleſh-ſide uppermoſt; then turned, and the hair-ſide rubbed ſtrongly over with a handful of ruſhes, to ſqueeze out as much of the oil remaining within as poſſible. The firſt courſe of black is now laid on the hair-ſide, by means of a lock of hair twiſted and ſteeped in a kind of black dye, prepared of ſour beer, wherein pieces of old ruſty iron have been thrown. When half dry by hanging in the air, they are ſtretched on a table, and rubbed over every way with a paumelle or wooden-toothed inſtrument, to raiſe the grain, over which is paſſed a light couche of water, then ſleeked, by rubbing them with ruſhes prepared for the purpoſe. Thus ſleeked, they have a ſecond couche of black, then dried, laid on the table, rubbed over with a paumelle of cork, to raiſe the grain again; and after a light couche of water, ſleeked over anew, and to raiſe the grain a third time, a paumelle of wood uſed.

After the hair-ſide has thus received all its preparations, the fleſh-ſide is pared with a ſharp knife for the purpoſe; the hair-ſide rubbed ſtrongly over with a woollen cap, having firſt given it a luſtre with barberries, citron, or orange. The whole is finiſhed, by raiſing the grain lightly for the laſt time with the paumelle of cork, which leaves them in a condition for ſale and uſe.

Manner of preparing red MOROCCO.—The ſkins are ſteeped twenty-four hours in a river, taken out, ſtretched on the leg, beat with the knife, returned into the water for twenty-four hours, re-beaten on the leg, re-ſteeped; thrown into a vat, and for three weeks, taken out and returned every morning, to diſpoſe them to peel.—Being taken out for the laſt time, they are ſcraped with the knife, and when the hair is quite off, thrown in pails of freſh water, where they are rinſed; then the fleſh-ſide ſcraped, thrown into the pails, and thus alternately from the leg to the pails, till they leave the water quite clean: then they are put in lukewarm water, with the ſumac as before, and after twelve hours, rinſed in clear water, and ſcraped on the leg on both ſides, pounded in pails, and the water changed three times; then wrung and ſtretched on the leg, and paſſed after each other into water, with allum diſſolved in it. Thus allumed, they are left to drain till the morning, then wrung out, pulled on the leg, and folded from head to tail, the fleſh inwards.

In this ſtate they receive their firſt dye, by paſſing them after one another into a red liquor, prepared with lacca, and ſome other ingredients, kept ſecret among the *maroquineers*.— This they repeat again and again, till the ſkins have got their firſt colour. They are then rinſed in clear water, ſtretched on the leg, and left to drain twelve hours; thrown into water, into which white galls pulverized have been paſſed through a ſieve, and ſtirred inceſſantly for a day with long poles, taken out, hung on a bar a-croſs the water all night, white againſt red, and red againſt white, and in the morning the water ſtirred up, and the ſkins returned into it for twenty-four hours.

MORPHEW, MORPHÆA, a leprous ſort of freckle or ſcurf which breaks out ſometimes upon the ſkin; particularly about the forehead; called alſo *alphus*. See ALPHUS.

MORSELLI, or MORSULI, are denominations given to thoſe forms of medicines to be chewed in the mouth, as a *lozenge*; the word ſignifying a little mouthful. See LOZENGE.

MORSUS *diaboli*, *devil's bit*; a plant which ſeems to have a fringe around the bottom of its root: otherwiſe called *ſucciſa*. See SUCCISA.

It has its denomination from its roots, which appear as if bitten off at the bottom: which ſuperſtitious people attributed to the devil as done out of envy, leſt we ſhould have too much of ſo ſalutary a root. It was formerly looked on as a good alexipharmic; but is now much out of uſe.

From a likeneſs hereto, has the edge or ſelvedge of the tubæ Fallopianæ, obtained the ſame appellation. See FALLOPIAN.

MORSUS *canis rabidi*. See the article HYDROPHOBIA.

MORSUS *viperæ*. See the article VIPER.

MORT *d' anceſtre*, in law, ſee ASSISE *of mort d'anceſtre*.

MORTALITY, a term frequently uſed to ſignify a contagious diſeaſe, which deſtroys great numbers either of men, or beaſts. See DISEASE, PLAGUE, MURRAIN, *&c.*

Bills of MORTALITY, are weekly liſts compiled by the pariſh-clerks in, and about, London, containing the numbers of ſuch as die of each diſeaſe, as well as of thoſe that are born, every week. See BILL.

The bills of mortality comprehend not only the alleys, ſuburbs and liberties of London, and Weſtminſter, and borough of Southwark, but fifteen out-pariſhes next adjacent.—But then they are limited to the chriſtenings and burials in the pariſh-churches: For as to thoſe of the Diſſenters, Quakers, *&c.* they do not come under the cognizance of the pariſh-clerks.

The bills are of ſome ſtanding in England, in imitation whereof the like are now eſtabliſhed at Paris. They are very uſeful on ſeveral accounts, particularly in judging of the *mortality* of any diſeaſe, and whether an epidemic or infectious diſtemper increaſes or abates.

There are alſo *yearly bills*, collected out of the weekly ones.—By theſe it appears, that the annual number of burials at London is twenty-five or twenty-ſix thouſand: at Paris it is ſeventeen, or eighteen thouſand.

Mr. Graunt, who examined the London bills very accurately, has wrote an expreſs treatiſe of them.—Among other things, he calculates from them, that of 100 perſons who are born in the ſame week, there are but 64 left at the end of ſix years; but 40 at the end of ſixteen years; at the end of twenty-ſix years, but 25; and at the end of thirty-ſix years, but 16; at the end of forty-ſix years, but 10; at the end of fifty-ſix, no more than 6; at the end of ſixty-ſix years, but 3; at the end of ſeventy-ſix, but 1; and at the end of eighty years, they are reduced to none.

He likewiſe makes it appear, that in England in general, more are born than die; but in London, more die than are born: The proportion of births to burials, in the former, being as $1\frac{1}{12}$ to one; in the latter as $1\frac{1}{10}$ to one. Thus alſo cities and market towns are found to bury $1\frac{7}{100}$ to 1 birth. But in Paris they outdo London; their deaths being $1\frac{1}{2}$ to 1 birth. In the villages of England, fewer die than are born; there being but one death to $1\frac{17}{100}$ births. See MARRIAGE.

MORTAR, or MORTER, in architecture, a compoſition of lime, ſand, *&c.* mixed up with water; ſerving, as a cæment, to bind the ſtones, *&c.* of a building. See BUILDING, CÆMENT, *&c.*

The ancients had a kind of *mortar* ſo very hard and binding, that, after ſo long a duration, it is next to impoſſible to ſeparate the parts of ſome of their buildings; though there are ſome who aſcribe that exceſſive ſtrength to time, and the influence of certain properties in the air, which is found to harden ſome bodies very ſurprizingly. See AIR.

The lime uſed in the ancient *mortar* is ſaid to have been burnt from the hardeſt ſtones, and even fragments of marble. See LIME.

De Lorme obſerves, that the beſt *mortar* is that made of pozzolana for ſand; adding, that it penetrates black flints, and turns them white. See POZZOLANA.

Mr. Worledge obſerves, that fine ſand makes weak *mortar*; and the rounder the ſand, the ſtronger the *mortar*. He therefore adviſes the ſand to be waſhed ere mixed; and adds, that dirty water weakens the *mortar* conſiderably. See SAND.

Wolfius obſerves, that the ſand ſhould be dry and ſharp, ſo as to prick the hands when rubbed; yet not earthy, ſo as to foul the water it is waſhed in.

Vitruvius obſerves, that foſſil-ſands dry ſooner than thoſe taken out of rivers. Whence he adds, the latter is fitted for the inſides, the former for the outſides of a building. He ſubjoins, that foſſil-ſand lying long in the air, becomes earthy. Palladio takes notice, that of all ſands white ones are the worſt; the reaſon is owing to their want of aſperity.

The proportion of lime and ſand in our common *mortar* is extremely variable. Vitruvius preſcribes three parts of pit-ſand and two of river-ſand to one of lime; but the ſand here ſeems to be over-doſed. About London, the proportion of ſand to quick lime is as 36 to 25. In ſome parts they uſe equal quantities of each.

Mixing and blending of MORTAR.—M. Felibien obſerves that the ancient maſons were ſo very ſcrupulous herein, that the Greeks kept ten men conſtantly employed for a long ſpace of time, to each baſon, which rendered the mortar of ſuch prodigious hardneſs, that Vitruvius tells us the pieces of plaiſter falling off from old walls ſerved to make tables.—Felibien adds, it is a maxim among old maſons to their labourers, that they ſhould dilute with the ſweat of their brow, *i. e.* labour it a long time, inſtead of drowning it with water, to have done the ſooner.

Beſides the common *mortar* uſed in laying of ſtones, bricks, *&c.* there are ſeveral other kinds. As,

White MORTAR, uſed in plaiſtering the walls and ceilings; made of ox-hair mixed with lime and water, without any ſand. See PLAISTER.

MORTAR *uſed in making of water-courſes, ciſterns, &c.* is very hard and durable, made of lime and hog's greaſe, ſometimes mixed with the juice of figs, and ſometimes with liquid pitch: after application it is waſhed over with linſeed-oil. See CISTERN.

MORTAR *for furnaces*, &c. is made with red clay wrought in water, wherein horſe-dung and chimney-ſoot has been ſteeped. See FURNACE.

MORTAR *for ſun-dials* on walls may be made of lime and ſand tempered with linſeed oil; or, for want of that, with ſcummed milk. This will grow to the hardneſs of a ſtone.

For buildings, one part of waſhed ſoap-aſhes mixed with another of lime and ſand, make a very durable *mortar*. See CÆMENT, *&c.*

MORTAR-PIECE, a ſhort piece of ordnance, thick and wide, proper for throwing bombs, carcaſſes, ſhells, ſtones, *&c.* See ORDNANCE, BOMB, CARCASS, *&c.*

There are two kinds of *mortars*: the one hung, or mounted on a carriage with low wheels, after the manner of guns; called *pendent*, or *hanging mortars*. See MOUNTING.—The other fixed on an immoveable baſe, called *ſtanding mortars*.

At the head of the bore, or chaſe of the *mortar*, is the *chamber* for the charge of powder.—This is uſually made cylindrical, all but the baſe, which they make hemiſpherical: Though ſome of the latter engineers prefer ſpherical chambers; as the ſurface of thoſe being leſs, under equal capacities, make leſs reſiſtance to the gun-powder. See CHAMBER.

The thickneſs of the *mortar* about the chamber is to be much greater than about the chaſe; by reaſon the gun-powder makes a much greater effort about the chamber than elſewhere: The diameter of the chamber to be much leſs than that of the bore; by reaſon bombs, ſhells, *&c.* are much lighter than the bullets of equal diameters; and, conſequently, leſs powder ſuffices. See BULLET.

To charge, or *load a* MORTAR, the proper quantity of gun-powder is put into the chamber; and if there be any vacant ſpace, they fill it up with hay; ſome chuſe a wooden plug. Over this they lay a turf; ſome a wooden tampion fitted to the bore of the piece; and laſtly the bomb, taking care that the fuſee be in the axis thereof, and the orifice be turned from the muzzle of the piece. What remains, is to be filled up with hay, ſtraw, turf, *&c.* ſo as the load may not be exploded without the utmoſt violence. See CHARGE.

The quantity of gun-powder to be uſed, is found by dividing the weight of the bomb by 30. Though this rule is not always to be ſtrictly obſerved. See GUN-POWDER.

To elevate the MORTAR, ſo as its axis may make any given angle with the horizon; they apply the artillery-level, or gunner's quadrant; the uſe whereof ſee under the articles LEVEL and QUADRANT. See alſo ELEVATION.

An elevation of 70 or 80 degrees is what is commonly choſe for rendering *mortars* moſt ſerviceable in caſting ſhells into towns, forts, *&c.* though the greateſt range be at 45°. See RANGE.

If all *mortar-pieces* were, as they ought to be, exactly ſimilar, and their requiſites of powder as the cubes of the diameters of their ſeveral bores; and if their ſhells, bombs, carcaſſes, *&c.* were alſo ſimilar, then, comparing like with like, their ranges on the plane of the horizon, under the ſame degree of elevation, would be equal; and, conſequently, one piece being well proved, *i. e.* the range of the granado, bomb, carcaſs, *&c.* being found to any degree of elevation, the whole work of the *mortar-piece* would become very eaſy, and exact.

But ſince *mortars* are not thus ſimilar, it is required that the range of the piece at ſome known degree of elevation be accurately found by meaſuring; and from hence all the other ranges may be determined.

Thus, to find the range of the piece at any other elevation required; ſay, As the ſine of double the angle under which the experiment was made, is to the ſine of double the angle propoſed, ſo is the range known, to the range required.

Suppoſe, for inſtance, it be found that the range of a piece elevated to 30 degrees is 2000 yards; to find the range of the ſame piece with the ſame charge when elevated to 45 degrees: Take the ſine of 60°, the double of 30°, and make it the firſt term of the rule of three; the ſecond term muſt be the ſine of 90°, the double of 45°; and the third the given range 2000: The fourth term will be 2310, the range of the piece at 45°. If the elevation be greater than 45°, inſtead of doubling it, take the ſine of double its complement to 90°. As ſuppoſe the elevation of a piece be 50°, take the ſine of 80°, the double of 40°.

Again, if a determinate diſtance to which a ſhot is to be caſt, be given, and the angle of elevation to produce that effect be required; the range known muſt be the firſt term in the rule of three, which ſuppoſe 2000 yards, the range propoſed, which we ſuppoſe 1600 yards, the ſecond term; and the ſine of 60 double of the elevation for the range of 2000 yards, the third term. The fourth term will be found the ſine of 43°, 52′. whoſe half 21°, 56′, is the angle of elevation the piece muſt have, to produce the deſired effect. And if 21°, 56′, be taken from 90°, you will have 68°, 4′ for the other elevation of the piece, with which the ſame effect will likewiſe be produced.

Note, to avoid the trouble of finding ſines of double the angles of propoſed elevations, Galileo and Torricelli give us the following table, wherein the ſines of the angles ſought are had by inſpection.

Degrees.	Degrees.	Ranges.	Degrees.	Degrees.	Ranges.
90	0	0	0	0	0
89	1	349	66	24	7431
88	2	698	65	25	7660
87	3	1045	64	26	7880
86	4	1392	63	27	8090
85	5	1736	62	28	8290
84	6	2709	61	29	8480
83	7	2419	60	30	8660
82	8	2556	59	31	8829
81	9	3090	58	32	8988
80	10	3420	57	33	9135
79	11	3746	56	34	9272
78	12	4067	55	35	9397
77	13	4384	54	36	9511
76	14	4695	53	37	9613
75	15	5000	52	38	9703
74	16	5299	51	39	9781
73	17	5592	50	40	9841
72	18	5870	49	41	9903
71	19	6157	48	42	9945
70	20	6428	47	43	9976
69	21	6691	46	44	9994
68	22	6947	45	45	10000
67	23	7193			

The uſe of the table is obvious.—Suppoſe, for inſtance, it be known by experiment that a *mortar* elevated 15°, charged with three pounds of powder, throw a bomb to the diſtance of 350 fathom; and it be required, with the ſame charge, to throw a bomb 100 fathom farther: Seek in the table the number anſwering to 15 degrees, and you will find it 5000. Then as 350 is to 450, ſo is 5000 to a fourth number, which is 6428. Find this number, or that neareſt it, in the table, and againſt it you will find 20°, or 70°; the angles of elevation.

For the weight, dimenſions, *&c.* of the bombs, *&c.* to be caſt out of *mortars*, and the lines of the projection; ee BOMB, PROJECTILE, *&c.*

MORTGAGE*, in law, an obligation, whereby lands or tenements of the debtor, are pawned or bound over to the creditor for money, or other effects borrowed; peremptorily to be the creditor's for ever, if the money be not repaid at the day agreed on. See GAGE, *&c.*

> * Glanvil defines *mortgage, mortuum vadium*, to be that *cujus fructus vel reditus interim percepti in nullo ſe acquietant.* Thus it is called *mortgage*, i. e. *dead gage*, of *mort*, death; and *gage*, pledge; becauſe whatever profit it yields, yet it redeems not itſelf by yielding ſuch profit, except the whole ſum borrowed be likewiſe paid at the day; the *mortgager* being by covenant to receive the profits till default of payment. Others hold it called *mortgage*, becauſe if the money be not paid at the day, the land *moritur*, dies to the debtor, and is forfeited to the creditor.

In this ſenſe, *mortgage*, in common law, amounts to much the ſame with *hypotheca* in the civil law. See HYPOTHECA.

The creditor holding ſuch land, on ſuch agreement, is in the mean time called *tenant in mortgage*. See TENANT.—He who lays the pawn or gage, is called the *mortgager*, and he that takes it the *mortgagee*.—If a *mortgage* include exceſſive uſury, it is prohibited by a ſtatute 37 Hen. VIII.

The French ſometimes uſe the word *mortgage* in the ſame ſenſe in their language, where it ſtands in contradiſtinction to a ſimple contract, which does not carry with it the mean profits, and which they call *vif-gage*, live-pledge.

A *mortgage* is an engagement for the ſecurity of the creditor; for which purpoſe various means have been contrived: That of the pawn or pledge, ſeems to have been the moſt ancient, being in reality the ſame thing with the *mortgage*; all the difference conſiſting in this, that in a *mortgage* the pawn was put into the hands of the creditor; whereas in a ſimple engagement, the thing remained in the hands of the debtor.—But it was afterwards found much more commodious to engage lands by a ſimple convention, than by an actual delivery.

Accordingly, this was practiſed by the Greeks; and from them borrowed by the Romans; who, the better to prevent deceits, fixed up viſible marks to inform the public, that the eſtate was engaged by the proprietor: Though theſe marks were found ſo injurious to the debtors, that the uſe of them was at length prohibited.

The Romans had four kinds of *mortgages*, or *hypothecæ*. The *conventional*, which proceeds from the will and conſent of the contracters: The *legal*, which is introduced by the law, and which is therefore called *tacit*: The *mortgage of the prætor*, when by the flight or refuſal of the debtor, the creditor was put in poſſeſſion of his effects: And the *judiciary mortgage*, when the creditor was put in poſſeſſion, in conſequence of a decree or ſentence.

The civil lawyers diſtinguiſh twenty-ſix different kinds of *tacit mortgages*.

MORTIER, a badge, or enſign of dignity born by the chancellors, and great preſidents of the parliaments of Paris. That born by the chancellor is a piece of cloth of gold, lined and turned up with ermin: That of the firſt preſident is a piece of velvet edged with a gold lace; that of the other preſidents is only a piece of gold lace.

They formerly bore it on their head, but now in their hands, except in grand ceremonies, as at the entry of a king.—Hence the denomination, *preſidents a mortier*.

MORTIFICATION, *necroſis*, in medicine, a total extinction of the natural heat of the body, or a part thereof. See HEAT.

Some define *mortification* a diſeaſe, wherein the natural juices of any part quite loſe their proper motion; and by that means fall into a fermentative one, and corrupt, and deſtroy the texture of the part.

There are two ſpecies, or rather degrees of *mortification*: The one called a *gangrene*, which is a *mortification* in its firſt, or beginning ſtate: The other a *ſphacelus*, which is a perfect, or finiſhed *mortification*. See GANGRENE, and SPHACELUS.

MORTISE*, or MORTOISE, in carpentry, *&c.* a kind of joint, wherein a hole or inciſion, of a certain depth, is made in the thickneſs of a piece of wood, which is to receive another piece, called a *tenon*. See TENON.

> * The word is originally French, *mortoiſe*, which ſignifies the ſame; and which Borel derives further from *mordere*, to bite.

MORTMAIN*, in law, the alienation of lands and tenements to any guild, corporation, or fraternity, and their ſucceſſors; as biſhops, parſons, vicars, *&c.* which may not be done without the king's licence, and that of the lord of the manor; or of the king alone, if it be immediately holden of him.

> * The word literally denotes *dead-hand*; being a compound of *mort*, dead, and *main*, hand.—Accordingly Hottoman defines *mortmain* to be the poſſeſſion of thoſe who are, as it were, immortal, becauſe they never ceaſe to have heirs; ſo that the eſtate never reverts to its firſt lord; *main* hand, being uſed for poſſeſſion; and *mort*, dead, by antiphraſis, for immortal.—Others aſſign the reaſon of the name thus; that the ſervices and other profits due for ſuch lands, ſhould not, without ſuch licence come into a dead hand, (*mainmort*,) *i. e.* into a hand as it were dead, that is, ſo dedicated to God, or pious uſes, as to be different from other lands, tenements, or hereditaments, and never to revert to the donor, or any temporal or common uſe.

The preſidents and governors of hoſpitals may, without licence in *mortmain*, purchaſe land, *&c.* not exceeding the yearly value of 3000 *l.* Stat. 14 Car. 2.

MORTUARY, is a gift left by a man at his death to his pariſh-church, for a recompence of perſonal tithes and offerings, not duly paid in his life-time.

A *mortuary* is not properly and originally due to an incumbent from any but thoſe of his own pariſh: But, by cuſtom, in ſome places of the kingdom, it is paid to the parſons of other pariſhes, as the corpſe paſſes through them.

MORTUUM *caput*. See the article CAPUT.

MOSAIC*, MOSAIC *work*, or, as ſome chuſe to call it, MUSAIC, an aſſemblage of little pieces of glaſs, marble, ſhells, precious ſtones, woods, or the like, of various colours, cut ſquare and cemented on a ground of ſtucco, *&c.* imitating the natural colours and degradations of painting. See PAINTING. In which ſenſe *moſaic work* includes *marquetry*, or *inlaid work*, *vaneering*, &c.

> * The critics are divided as to the origin and reaſon of the name: Some derive it from *moſaicum*, a corruption of *muſaicum*, as that is of *muſivum*, as it was called among the Romans. Scaliger derives it from the Greek μοῦσα, and imagines the name was given to this ſort of works, as being very fine and ingenious. Nebricenſis is of opinion it was ſo called, becauſe *ex illis picturis ornabantur muſea.*

But in its more proper and reſtrained ſenſe *Moſaic* only takes in works of ſtone, metals, and glaſs; thoſe of wood being diſtinguiſhed by the name of *marquetry* or *inlaying*. See MARQUETRY.

Others diſtinguiſh otherwiſe between *moſaic* and *marquetry*. In that properly called *moſaic*, the ſeveral ſtones are all of the ſame colour; and the changes, and diminutions of colours, and ſhades, are made by applying different ſtones one on another, but all of the ſame colour. *Marquetry*, on the contrary, conſiſts of ſtones of different colours; and by theſe the ſeveral colours, ſhades, degradations, *&c.* are expreſſed.

Moſaic ſeems to have taken its origin from *paving:* The fine effect and uſe of pavements, compoſed of pieces of marble of different colours ſo well joined together, as that when dried they might be poliſhed, and the whole make a very beautiful and ſolid body, which continually trodden upon, and waſhed with water, was not at all damaged; gave the painter the hint; who ſoon carried the art to a much greater perfection: ſo as to repreſent foliages, maſques, and other groteſque pieces of various colours, on a ground of black or white marble. In fine, obſerving the good effect which this kind of work had in pavements, and finding that it reſiſted water, they proceeded to line walls therewith, and to make various figures for the ornament of their temples and public buildings.

But nature not producing variety of colours enough for them in marbles, to paint all kinds of objects, they bethought of counterfeiting them with glaſs and metal colours; which ſucceeded ſo well with them, that having given all manner of teints to an infinite number of little pieces of theſe two matters, to counterfeit ſtones of various colours, in order to get more colours; the workmen arranged them with ſo much art, that their *moſaic* ſeemed almoſt to diſpute with paintings. This way of repreſenting objects having this advantage, that it reſiſts the injuries of the air as well as marble it ſelf; and even grows more beautiful with time, which effaces all other kind of painting.

But the moderns have gone further, and ſetting aſide glaſs and metals, as too mean materials, have introduced, along with the fineſt marbles, the richeſt of precious ſtones, as lapis, agat, cornelians, emeralds, turquoiſes, *&c.*

Of theſe three kinds of *moſaic*-work, that of coloured glaſs and metals is now little in uſe, though of a ſurprizing luſtre and durableneſs: of the other two, that of marbles alone is in common uſe; the *moſaic* of precious ſtone being ſo very dear, that the few workmen who apply themſelves to it, make little elſe but petty-works, as ornaments for altar-pieces, tables for rich cabinets, *&c.* Though out of theſe muſt be excepted that ſumptuous chapel of the dukes of Tuſcany, which has been ſo long in hand, and which, if ever it be finiſhed, will be a noble monument of the magnificence and piety of thoſe princes, as well as of the patience and addreſs of the workmen employed therein.

We ſhall however enter into ſome detail of the manner of working in thoſe three kinds of *moſaic*; to which we ſhall add a fourth much newer, yet equally ingenious with any of the reſt, made with a kind of gypſum or talc, found in ſtone-quarries about Paris.

MOSAIC *work of glaſs.*—This kind they begin with little pieces of glaſs, which they provide of as many different colours as poſſible. To this end, the glaſſmens furnaces being diſpoſed, and their pots or crucibles full of the matter of which glaſs is made, or rather of glaſs already made, they put what colour or dye they think fit in each crucible, always beginning with the weakeſt, and augmenting the ſtrength of the colours from crucible to crucible, 'till they come to the deepeſt dye, as in mixing of colours on a palette to paint in oil. When the glaſs has had ſufficient coction, and all the colours are in their perfection, they take out the glaſs hot, as it is, and lay it on a ſmooth marble, flatting it down with another like marble, and then cutting it into ſlices of equal bigneſs, and about the thickneſs of an inch and half. They then with an inſtrument, which the Italians call *bocca di cane*, make other pieces ſquare, and others of different figures and ſizes, as occaſion requires; theſe they diſpoſe orderly in caſes; as in painting in freſco, 'tis uſual to range all the different teints in ſhells, according to their colour.

If it be deſired to have gold, either in the ground of the painting, or in the ornaments, or the draperies, they take ſome of the pieces of glaſs, formed and cut in the manner juſt mentioned. Theſe they moiſten on one ſide with gum-water, and afterwards lay them over with gold-leaf. They then put this piece, or ſeveral pieces at a time, on a fire-ſhovel, which they place in the mouth of the furnace, after having firſt covered them with another hollow piece of glaſs. Here they continue till ſuch time as they become red-hot; after which the ſhovel is drawn out, all at once, and the gold becomes ſo firmly bound to the glaſs, that it will never afterwards leave it.

Now, to apply theſe ſeveral pieces, and out of them to form a picture, they firſt make a cartoon, or deſign; this they transfer on the ground or plaiſter, by calquing, as in painting in freſco. See FRESCO.

As this plaiſter is to be laid thick on the wall, it will continue freſh and ſoft a conſiderable time, ſo that there may be enough prepared at once to ſerve three or four days. It is compoſed of lime made of hard ſtone, with brick-duſt very fine, gum-tragacanth, and whites of eggs; when it is thus prepared, and laid on the wall, and the deſign finiſhed of what is to be repreſented; with plyers they take out the little pieces of glaſs, ranging them one after another, and ſtill keeping ſtrictly to the light, ſhadow, different teints and colours repreſented in the deſign; preſſing or flatting them down with a ruler, which ſerves both to ſink them within the ground, and to render the ſurface even.

Thus, in a long time, and with an infinite deal of trouble, they finiſh the work, which is ſtill the more beautiful, as the pieces of glaſs are more uniform, and ranged at more equal heights. Some of theſe are executed with ſo much juſtneſs, that they appear as ſmooth as a table of marble, and as finiſhed and maſterly as a painting in freſco; with this advantage, that they have a fine luſtre, and will hold almoſt for ever.

The fineſt works of this kind, that have deſcended to us, and thoſe whereon the moderns have retrieved the art, almoſt loſt, are thoſe of the church of St. Agnes, formerly the temple of Bacchus at Rome; beſides ſome at Piſa, Florence, and other cities of Italy. The moſt eſteemed among the works of the moderns, are thoſe of Joſeph Pine, and the chevalier Lanfranc, in the church of St. Peter at Rome. There are very good ones likewiſe at Venice.

MOSAIC *work of marble, and precious ſtones.*—Theſe two kinds bear ſo near a relation to each other, as to the manner of working, that to avoid repetition, we ſhall give them both under one; obſerving, by the way, wherein the one differs from the other, either in the ſawing or the ranging of ſtones.

Moſaic of marble is uſed in large works, as in pavements of churches, baſilics, and palaces; and in the incruſtation and vaneering of the walls of the ſame edifices.—As to that of ſtones, eſpecially *precious ſtones*, it is only uſed in ſmall works, as before obſerved.

The ground of *moſaic* works wholly marble, is ordinarily a maſſive of marble, either white or black. On this ground the deſign is cut with a chiſſel, having been firſt calqued. When it is dug of a ſufficient depth, *i. e.* an inch or more, it is filled up with marble of a proper colour, firſt contourned, or faſhioned to the deſign, and reduced to the thickneſs of the cavities, with various inſtruments. To make the pieces, thus inſerted into the cavities, hold, whoſe ſeveral colours are to imitate thoſe of the deſign, they uſe a ſtucco, compoſed of lime and marble duſt; or a maſtic, which each workman prepares differently; after which, the work is half poliſhed with a ſoft kind of ſtone.

The figures thus marked out, the painter, or ſculptor himſelf draws, with a pencil, the colours of the figures not determined by the ground, and in the ſame manner makes ſtrokes or hatchings, in the places where ſhadows are to be; and when he has engraved with the chiſſel all the ſtrokes thus drawn, he fills them up with a black maſtick, compoſed partly of Burgundy pitch, poured on hot; taking off, afterwards, what is ſuperfluous, with a piece of ſoft ſtone or brick, which with water and beaten cement, takes away the maſtic, poliſhes the marble, and renders the whole ſo even, one would imagine it only conſiſted of a ſingle piece: It is this kind of *moſaic* we ſee in the pompous church of the invalids at Paris, and the fine chapel at Verſailles; and wherewith ſome intire apartments of that palace are incruſtated.

For moſaic work of precious ſtones; there are required other and more delicate inſtruments than thoſe uſed in marble; as wheels, drills, tin-plates, *&c.* uſed by lapidaries, and carvers in ſtone. As none but the richeſt marbles and ſtones enter this work, to make them go further, they are ſawn into the thinneſt leaves imaginable, ſcarce exceeding half a line in thickneſs; the block to be ſawed, is faſtened firmly with cords, on the bench, only raiſed a little on a piece of wood, one or two inches high. Two iron pins, which are on one ſide of the block, and which ſerve to faſten it, ſerve alſo to direct the ſaw. The pieces to be ſawed, are put into a vice contrived for the purpoſe; in which ſtate, with a kind of ſaw or bow made of fine braſs wire, bent on a piece of ſpringy wood, together with emery ſteeped in water, the leaf is gradually faſhioned, by following the ſtrokes of the deſign made on paper, and glued on the piece. See MARQUETRY.

When there are pieces enough faſhioned to form an entire flower, or ſome other part of the deſign, they are applied. The ground that ſuſtains this *moſaic*, is uſually of free ſtone. The matter wherewith the ſtones are joined together, is a maſtic, or ſtucco, laid very thin on the leaves as they are faſhioned; and the leaves in this ſtate, applied with plyers. If any contour, or ſide of a leaf, be not either rounded enough, or ſquared enough, to fit the place where it is to be uſed, when it is too large, it is brought down with a braſs file or raſp, and when too ſmall, is managed with a drill, and other lapidary inſtruments.

Manner of making MOSAIC *work of gypſum*, a kind of coarſe talc, or ſhining tranſparent ſtone, found in the quarries of Montmartre near Paris, among the ſtones thence dug to make the plaiſter of Paris.—It is different from the plaiſter, but retains the name which the Romans gave the plaiſter, *viz. gypſum.* See GYPSUM, and PLAISTER.

Of this ſtone, calcined in a kiln, beaten in a mortar, and paſſed through a ſieve, they make a kind of artificial marbles, imitating precious ſtones, and of theſe compoſe a kind of *moſaic* work, which comes little ſhort either of the durableneſs or vivacity of the natural ſtones; and which has this advantage, that it admits of continued pieces, or paintings of entire compartiments, without any joining viſible.

Some make the ground of plaiſter of Paris, others of free-ſtone: if the former, it is ſpread in a wooden frame, of the length and breadth of the intended work, and about an inch and half thick. This frame is ſo contrived, as, the tenons being only joined to the mortiſes by ſingle pins, they may be taken aſunder, and the frame be diſmounted when the plaiſter is dry. This frame they cover on one ſide with a ſtrong linnen cloth, nailed all round; and being placed horizontally, with the linnen at botton, it is filled with plaiſter, paſſed through a wide ſieve. The plaiſter being half dry, the frame is ſet perpendicular, and left till it be quite dry; then taken out, by diſmounting the frame. In this *moſaic*, the ground is the moſt important part. Now to prepare the ſifted gypſum to be applied on this ground, they diſſolve and boil it in the beſt Engliſh glue, and after mixing with it the colour it is to bear, the whole is worked up together into the ordinary conſiſtence of plaiſter; and then taken and ſpread on the ground, five or ſix inches thick. It muſt be obſerved, that if the work be ſuch, as that mouldings are required, they are formed with gouges and other inſtruments.

It is on this plaiſter, thus coloured like marble or precious ſtone, and which is to ſerve as a ground to a work either of lapis, agat, alabaſter, or the like, that the deſign to be repreſented is drawn; having been firſt pounced or calqued. To hollow or impreſs the deſign, they uſe the ſame inſtruments with the ſculptors; the ground whereon they are to work, not being much leſs hard than marble itſelf. The cavities thus made in the ground are filled up with the ſame gypſum boiled in glue, only differently coloured; and thus are the ſeveral colours of the original repreſented. To have the neceſſary colours and teints at hand, they temper quantities of the gypſum with the ſeveral colours in little pots. When the deſign is thus filled, and rendered viſible, by half poliſhing it with brick or ſoft ſtone; they go over it again, cutting ſuch places as are either to be weaker, or more ſhadowed, and filling them with gypſum; which is repeated till all the colours, added one after another, repreſent the original to the life. The work being finiſhed, is ſcowered with ſoft ſtone, ſand and water; then with pumice ſtone, and laſtly, poliſhed with a wooden rubber and emery. Laſtly, a luſtre is given it, by ſmeering it over with oil, and rubbing it a long time with the palm of the hand; which gives it a gloſs nothing inferiour to that of natural marble.

If it be only required to make a variegated table, or other work of ſeveral colours, without *moſaic* figures; the proceſs is ſomewhat different.—To this end, they only prepare ſeparately, in large bowls, as many different colours as nature ſhews in the marble to be imitated, and after incorporating them with the gypſum and glue-water, they take a truel-full of each, and diſpoſe them in a trough, without any order; then without mingling them, and only by cutting or croſſing the gypſum of each truel once or twice with each of the reſt, they give them that beautiful confuſion, for which natural marbles are ſo much valued: Of theſe they then make their tables, or lay a mold, according to the work to be done.

As to MOSAIC *work of wood*, more properly called *marquetry or inlaid work*, the ancients were well acquainted with it, and uſed it for the adorning of their beds, tables, and other moveables; employing for this purpoſe ivory, and the richeſt woods.—But friar John of Verona ſeems to have contributed the moſt to its perfection, by diſcovering the ſecret of dying woods of all colours and degrees, by which means he was enabled to imitate painting, and even to repreſent architecture in perſpective.

They begin with ſawing their woods into leaves, of the thickneſs of one or two tenths of an inch; then take pieces of the deſign they are to follow, and faſten them to thoſe leaves, and with a little ſteel ſaw faſhion theſe to the contour of the deſign. All that is neceſſary being taken off with the ſaw, they give the ſhadow to thoſe places that require it, by placing the piece in a hot ſand, or otherwiſe, with the direction neceſſary to ſhadow it more or leſs. This done, they lay each piece in its place, on a ground of another wood, as dry oak, and there faſten them with ſtrong glue.

There are two other branches of *moſaic* work; the one called *damaskeening*, or *damask-work*, conſiſting in an aſſemblage of gold or ſilver threads, of which are ſometimes formed flat works, and ſometimes baſſo-relievos. See DAMASKEENING. The other is called *ſhell-work*, conſiſting of ſhells, artificial congelations, petrifications, &c. uſed in grottos. See GROTTO.

MOSQUE*, or MOSK, among the Mahometans, is a temple ſet apart for the exerciſe of their religion. See TEMPLE, MAHOMETANISM, &c.

* The word comes from the Turkiſh *meſgid*, or *meſchit*, which properly ſignifies a temple built of wood, ſuch as the Turks firſt uſed. Hence the Spaniards derive their *meſcheta*, and the Italians *moſcheta*, and the French and Engliſh *moſque*, and *moſk*. Borel derives the word from the Greek *μοσχȣ calf*, becauſe of the frequent mention of a cow in the Alcoran. Others, and with the greateſt appearance of reaſon, derive it from the Arabic *maſgiad*, a place of worſhip.

There are royal *moſques* founded by the emperors, as the Solimania and Velidea at Conſtantinople; and private *moſques* founded by mufties, vizirs, baſſa's, &c.

Moſques are built like large halls, with iſles, galleries, and domes; and are adorned on the inſide with compartiments, and pieces of *arabeſque* work.—On one ſide is always found a pool with ſeveral cocks: and on the top is placed a creſcent.

The Turks have converted moſt of the Chriſtian churches into *moſques*. See CHURCH.

MOSS, MUSCUS, in natural hiſtory, a little plant of the paraſite kind, growing on the barks, &c. of ſeveral trees, as oak, poplar, aſh, cedar, &c. as well as on the ground. See PARASITE.

The moſt eſteemed, and odoriferous *bark*, is that of the cedar; it is of ſome medicinal uſe, being aſtringent, and proper to ſtop hæmorrhages and dyſenteries.

The ancients took the *moſs* of trees to be the effect of a diſorder or diſcompoſure of the texture of the bark; or at moſt a kind of little filaments ariſing from the bark. But the moderns find by ſeveral obſervations, that *moſſes* are all real, diſtinct plants, whoſe ſeed being extremely ſmall, is incloſed in little capſulæ, which burſting of themſelves, the ſeed is carried off by the winds, till falling on the inequalities of the bark of trees, it is there ſtopped, takes root, and feeds at the expence of the tree, as mouldineſs does on bread, &c. See MOULDINESS.

The different kinds of *moſſes* are very numerous; Monſ. Vaillant reckons 137 ſeveral ſpecies in the ſingle neighbourhood of Paris.

There is alſo a kind of greeniſh *moſs* growing on human ſkulls that have been long expoſed to the air, called *uſnea humana*, or *muſcus calvarius*. The ancients made a deal of uſe of it as an aſtringent, &c. See USNEA.

Moſſes make an article of commerce; there being ſeveral kinds uſed in medicine, in perfuming, &c. Among others, the *ſea-moſs*, called *coralline*, (ſee CORALLINE) and the *moſs* of cedar and fir, which enter the compoſition of cyprus powder.

The *moſs* of common trees, as oak, aſh, poplar, &c. is uſed for caulking of veſſels. It is alſo uſed by bird-merchants, to prepare cages for certain kinds of birds to hatch in.

The gardeners, &c. reckon *moſs* among the diſeaſes, or infirmities of plants. See DISEASE. Mr. Mortimer, &c. directs it to be rubbed, and ſcraped off with ſome proper inſtrument that will not hurt the bark of the tree, or with a piece of hair-cloth after a ſoaking rain; though the ſureſt cure is by removing the cauſe; which is effected by draining the land well of all ſuperfluous moiſture. Or, it may be prevented, in the firſt planting of trees, by not ſetting them too deep.

MOTE, MOTA, frequently occurs in our ancient cuſtoms for a meeting, court, or plea.

Of motes, by the Saxons alſo called *gemotes*, conſidered in the ſenſe of aſſemblies, or courts, there were divers kinds, as *wittenagemote*, *folkegemote*, *ſchiregemote*, *hundredgemote*, *burgemote*, *wardegemote*, *haligemote*, *ſwainegemote*, &c. See each under its proper article, WITTENAGEMOTE, FOLKEGEMOTE, &c.

MOTE, *mota*, was alſo uſed for a fortreſs, or caſtle; as *mota de Windſor*, &c.

MOTE, alſo denoted a ſtanding water to keep fiſh in; ſometimes a large ditch incompaſſing a caſtle, or dwelling-houſe. See MOAT.

MOTECTICO *ſtyle*. See the article STYLE.

MOTHER, *mater*, a female who ſtands in the relation of parent to another. See PARENT, &c.

Thus Eve is called our common *mother*: Cybele, among the ancients, was the *mother* of the gods. See GOD.

Queen mother, ſignifies the ſame with what we otherwiſe call *queen dowager*. See DOWAGER.

We meet with empreſſes on medals and inſcriptions with the title of *mother* of the camp, *mother* of the ſenate, *mother* of the country: *Mater ſenatus*, *mater caſtrorum*, *mater patriæ*, &c. See FATHER.

MOTHER *of God*, is an attribute commonly given to the bleſſed Virgin. See VIRGIN.—It had its origin from the Greeks, who firſt called her Θεοτοκος; in imitation of whom ſome Latins began to call her *Deipara*, and *Dei genetrix*. The council of Epheſus firſt gave a ſanction to the appellation; but the 5th of Conſtantinople decreed that the Virgin ſhould always be thus called. This gave riſe to terrible diſputes: Anaſtaſius a preſbyter of Neſtorius, patriarch of Conſtantinople, firſt aſſerted in a ſermon that the Virgin was by no means to be called Θεοτοκος; upon which words a great tumult ariſing, Neſtorius took his preſbyter's part, and taught the ſame doctrine. See NESTORIAN.

But though Θεοτοκος may be extended ſo as to ſignify as much as the *Mother of God*, becauſe τικτειν ſometimes denotes as much as γεννᾷν; whence accordingly it had been tranſlated in Latin *Dei genetrix* as well as *Deipara*; yet thoſe ancient Greeks who called the Virgin Θεοτοκος, did not call her μητηρ τȣ Θεȣ, the *mother of God*: Till the Latins tranſlating

Θεοτοκος by *Dei genetrix*, the Greeks came at length to retranſlate *Dei genetrix* by ϑεȣ μητηρ. And thus both were brought to call her *Mother of God*.

The firſt who is noted by the Greeks to have thus ſtyled her *Mother of God* is Leo Magnus: His reaſon, as repreſented by S. Cyril, was this, that taking *the Lord* and *God* to be ſynonymous, he apprehended that *Elizabeth* firſt ſtyled Mary *the Mother of God*, becauſe ſhe ſtyled her *the Mother of her Lord*.

MOTHER *tongue*, is properly an original language, from which others are formed. See LANGUAGE.

Of *mother tongues*, Scaliger reckons ten in Europe, *viz.* the *Greek*, *Latin*, *Teutonic* or *German*, *Sclavonic*, *Epirotic*, *Scythian* or *European Tartar*, *Hungarian*, *Cantabrian*, *Iriſh* and *Britiſh*. See GREEK, LATIN, TEUTONIC, &c.

MOTHER *churches*, are thoſe which have founded, or erected others. See CHURCH.

In beneficiary matters they ſay, it is not lawful for a man to enjoy at the ſame time both the *mother* and the daughter: Meaning that the canon law does not allow an abby, and the benefices depending thereon, to be held by the ſame perſon.

Fits of the MOTHER. See the article HYSTERIC *affection*.

MOTION, primarily ſo called, or *local* MOTION, is a continued, and ſucceſſive change of place; or that ſtate of a body whereby it correſponds ſucceſſively to ſeveral different places, or is preſent ſucceſſively in different parts of ſpace. See PLACE.

In which ſenſe, the doctrine and laws of *motion* make the ſubject of mechanics, or ſtatics. See MECHANICS, &c.

The ancient philoſophers conſidered *motion* in a more general and extenſive manner. They defined it, a paſſage out of one ſtate into another: and thus made ſix kinds of *motion*, viz. *creation*, *generation*, *corruption*, *augmentation*, *diminution*, and *lation* or *local motion*. See GENERATION, &c.

Some of the later ſchoolmen reduce theſe ſix kinds of *motion* to four: The firſt is general, including any paſſage from one ſtate to another; under which kind come *creation*, *production*, and *mutation*.—The ſecond is a paſſage of ſomething already exiſting from one ſtate to another: and thus *generation* is a *motion*.—The third, a ſucceſſive paſſage of ſomething already exiſting from one term to another; and thus *alteration*, and *accretion*, are ſpecies of *motion*.—The laſt, is *lation*, or *local motion*; and thus walking is *motion*.

But the lateſt philoſophers deny any other ſpecies beſide *local motion*; and reduce all the ſorts above-mentioned to this one.—So that we have here only to do with *lation* or *local motion*; whereof the reſt are only ſo many different determinations, or effects. See ACCRETION, ALTERATION, &c.

Phyſical writers, both ancient and modern, have ever been perplexed about the nature, and definition of *local motion*.—The Peripatetics define it by, *Actus entis in potentia, prout in potentia*, Ariſt. 3. Phyſ. c. 2. But the notion ſeems too abſtract and metaphyſical for our days; and is of no uſe in explaining the properties of *motion*.

The Epicureans explain *motion* by the migration of a body, or a part of a body, from one place to another. On which definition, the later Epicureans refine, and call it the migration or paſſage of a body from ſpace, to ſpace: Thus ſubſtituting the word *ſpace* for that of *place*.

The Carteſians define *motion* a paſſage, or removal of one part of matter out of the neighbourhood of thoſe parts immediately contiguous thereto, into the neighbourhood of others. Which definition agrees, in effect, with that of the Epicureans: all the difference between them conſiſting in this; that what the one calls *body* and *place*, the other calls *matter*, and *contiguous parts*.

Borelli, and other late writers after him, define *motion* more accurately and fully, the ſucceſſive paſſage of a body from one place to another, in a determinate time, by becoming ſucceſſively contiguous to all the parts of the intermediate ſpace.

Motion, then, is agreed to be the tranſlation of a body from place to place: But authors differ infinitely when they come to explain wherein this tranſlation conſiſts.—And hence the diviſions of motion become extremely precarious.

Ariſtotle, and the Peripatetics, divide all *motion* into *natural* and *violent*.

Natural MOTION, is that which has its principle, or moving force, within the moving body.—Such is that of a ſtone falling towards the centre of the earth.

Violent MOTION, is that whoſe principle is without, and againſt which the moving body makes a reſiſtance.—Such is that of a ſtone thrown upwards.

The moderns generally divide *motion* into *abſolute* and *relative*.

Abſolute MOTION, is the change of abſolute place, in any moving body: whoſe celerity, therefore, will be meaſured by the quantity of abſolute ſpace which the moveable body runs through. See PLACE.

Relative MOTION, is a mutation of the relative, or vulgar place of the moving body; and has its celerity eſtimated by the quantity of relative ſpace run through.

Others divide *motion* into *proper*, and *improper*, or *foreign*.

Proper MOTION, is a removal out of one proper place into another, which hereby becomes proper, as being poſſeſſed by the body alone, in excluſion of all others.—Such is the *motion* of a wheel in a clock.

Improper, *extraneous*, *foreign*, or *common* MOTION, is the paſſage of a body out of one common place into another common place.—Such is that of a clock when moving in a ſhip, &c.

The reaſon of all this diverſity ſeems to ariſe from the not attending to the different meanings of the words; but comprizing all in one definition and diviſion; which they ſhould rather have diſtinguiſhed into ſeveral parts.

Some, *e. gr.* in their definitions of *motion*, conſider the moving body, not as it regards the adjacent bodies, but as it regards immoveable and infinite ſpace. Others, again conſider the moving body, not as it regards infinite ſpace, but as it regards other bodies vaſtly remote.—And others, laſtly, conſider the moving body, not as it regards remote bodies, but that ſurface only to which it is contiguous.

But theſe various meanings once ſettled, the diſpute clears up; for as every thing that moves may be conſidered in theſe three ſeveral manners, there hence ariſe three ſeveral kinds of *motions*: whereof, that which regards the parts of infinite immoveable ſpace, without conſideration of the circumambient bodies, may be called *abſolutely and truly proper motion*.

That which regards circumambient bodies vaſtly remote, which may themſelves poſſibly be moved, we call *relatively common motion*.

The laſt, which regards the ſurfaces of the next contiguous bodies, in as much as it may want all, both abſolute and common *motion*, we call *relatively proper motion*.

Abſolutely and truly proper MOTION, then, is the application of a body to different parts of infinite and immoveable ſpace.

This alone is *proper and abſolute motion*, being always generated and changed by forces impreſſed on the moving body itſelf, and by thoſe only; and being that to which the real forces of all bodies, to put others in *motion* by impulſe, are owing; and to which thoſe *motions* are proportioned.—But this *motion* we cannot inveſtigate or determine accurately; nor can we diſtinguiſh, when two bodies are impelled on each other, in which of the two, (*v. gr.* that which appears to move the more ſwiftly, or the other which appears to move more ſlowly, and perhaps even to be at reſt,) the real *motion*, and conſequently, the real force whence the impulſe aroſe, is placed; not being able to determine whether the centre of gravity of the whole ſyſtem (which is but a point in infinite ſpace) is itſelf at reſt or in *motion*.

Relatively common MOTION, is a change of the ſituation of a body with reſpect to other remote circumambient bodies: and this is the *motion* we ſpeak of, when we ſay that men, cities, and the earth itſelf move round the ſun.

This is alſo the *motion* we mean, when we eſtimate the quantity of *motion*, and the force any body has to impel another.—For inſtance, if a wooden ſphere, filled with lead to make it the heavier, be dropped from the hand, we uſe to eſtimate the quantity of *motion*, and the force which the ſphere has to impel another, by the celerity of the ſphere and the weight of the included lead; and that truly with regard to the force itſelf, and the effect thereof, as it falls under our ſenſes.—But whether the real power or *motion* be in the ſphere which appears to ſtrike, or in the earth which appears to be ſtruck, that, as has been obſerved above, we cannot determine.

Relatively proper MOTION, is the ſucceſſive application of a body to the different parts of the contiguous bodies.

And this is the *motion* uſually underſtood in phyſical diſputes about the natures of particular things; as when we ſay, that heat, ſound, fluidity, &c. conſiſt in *motion*.

This muſt be added however, that by ſucceſſive application of a body, its whole ſurface, taken together, muſt be conceived ſucceſſively applied to different parts of the contiguous bodies.

From theſe ſeveral definitions of *motion* ariſe as many definitions of place: For when we ſpeak of *motion* (or reſt) *truly and abſolutely proper*, then place is that part of infinite and immoveable ſpace which the body fills.—When of *motion relatively common*, then place is a part of any ſpace or moveable dimenſion.—When of *motion relatively proper*, (which is really very improper) place is then the ſurface of the next adjacent bodies, or ſenſible ſpaces. See PLACE.

The definition of reſt is pretty well agreed on; but whether reſt be a mere privation of *motion*, or any thing poſitive, is hotly diſputed.—Malebranche, and others, maintain the former ſide of the queſtion: Cartes, and others, the latter.—Theſe laſt contend, that a body at reſt, has no power to perſevere in that reſt, nor to reſiſt any bodies that would deſtroy it; and that *motion* may as well be called a ceſſation of reſt, as reſt of *motion*. See REST.

The main argument urged by the former is this: Suppoſe a globe at reſt, and ſuppoſe God ceaſe to will its reſt; what will be the conſequence? It will reſt ſtill. Let it be in *motion*, and let God ceaſe to will its *motion*; what will be the conſequence? it will ceaſe to move; that is, be at reſt; becauſe the power whereby a body in *motion* perſeveres in that ſtate, is the poſitive will of God: that whereby the quieſcent body perſeveres, only his privative will.

But this is a *petitio principii*; for the force or conatus whereby bodies, whether moving or quieſcent, perſevere in thoſe ſtates, is the mere inactivity of matter; and therefore were it poſſible for God not to will any thing, a body already in *motion*, would move for ever; as a body at reſt, would reſt for ever.—To this inactivity of matter, it is owing that all bodies reſiſt according to their quantities of matter, and that any body ſtriking another with any given velocity, will move it in the ſame proportion which its denſity, or quantity of matter has, to the denſity or quantity of matter of the other. See VIS *inertiæ*.

Motion has ever been eſteemed a ſpecies of quantity; and its *quantum*, or greatneſs, which we otherwiſe call its *momentum*, is eſtimated partly from the length of the line which the moving body deſcribes; (as if a body paſs over a line of a hundred feet, the quantity of its *motion* is greater than if it paſſed over ten feet) and partly from the quantity of the matter moved together, or at the ſame time, *i. e.* not from the bulk or extenſion of the body, but from its maſs or weight; the air, and other ſubtile matters wherewith the pores are filled, not entering into the account: As if a body of two cubic feet run over a line of a hundred feet, the quantity of its *motion* is greater than that of a body of one cubic foot deſcribing the ſame line: For whatever *motion* one whole has, that is had in one half of the other; and the *motion* of the whole is the ſum of the *motion* of all its parts. See QUANTITY.

Hence it follows, that for two unequal bodies to have equal *motions*, or momentums, the lines which they paſs over muſt be in a reciprocal proportion of their maſſes or weights; *i. e.* if one body have three times the quantity of matter that another has, the line it runs over muſt be $\frac{1}{3}$ of the line run over by the other.—If two bodies, then, faſtened to the two extremities of a ballance or lever, have their maſſes in a reciprocal ratio of their diſtances from the fixed point, when theſe are moved, they muſt deſcribe lines in a reciprocal ratio of theſe maſſes.

For inſtance, if the body A (*Tab. Mechanic. fig.* 30.) have three times the maſs or weight of B, and each be faſtened to the extremes of the lever A B, whoſe fulcrum or fixed point is C, in ſuch manner as that the diſtance B C is thrice the diſtance C A; the lever cannot incline either way, but the ſpace which the leſs body moves, B E, will be thrice the ſpace A D, which the greater moves: ſo that their motions will be equal.—Nor is there are any reaſon why the body A tending downwards, *v. gr.* with four degrees of *motion*, ſhould raiſe the body B, rather than B tending downwards likewiſe with the ſame four degrees of *motion*, ſhould raiſe the body A: They will therefore be in equilibrio.—On which foundation depends the whole doctrine of mechanics. See BALLANCE, STEELYARD, *&c.*

Hence that great problem of Archimedes, With any given power, how ſmall ſoever, to raiſe any weight given, how great ſoever.—For by increaſing the diſtance C B infinitely, the power of the body A will be increaſed infinitely. See MECHANICS, and EQUILIBRIUM.

And it is allowed on all hands, that *motion* is no eſſential attribute of matter; hence ariſes a diſpute about its *production*, and to what cauſe its *continuation* is owing? See COMMUNICATION, *&c.*

Quantity of MOTION, *if always the ſame?*—The Carteſians maintain, that the Creator at the beginning impreſſed a certain quantity of *motion* on bodies; and that under ſuch laws, as that no part of it ſhould be loſt, but the ſame portion of *motion* be conſtantly preſerved in matter: And hence they conclude, that if any moving body ſtrike on any other body, the former loſes no more of its *motion* than it communicates to the latter. See CARTESIAN.

This principle Sir Iſaac Newton overturns in the following words:—'From the various compoſitions of two *motions*, it is manifeſt there is not always the ſame quantity of *motion* in the world; for if two balls joined together by a ſlender wire, revolve with an uniform *motion* about their common centre of gravity, and at the ſame time that centre be carried uniformly in a right line drawn in the plane of their circular *motion*; the ſum of the *motions* of the two balls, as often as they are in a right line drawn from their common centre of gravity, will be greater than the ſum of their *motions* when they are in a line perpendicular to that other. Whence it appears, that *motion* may both be generated and loſt. But by reaſon of the tenacity of fluid bodies, and the friction of their parts, with the weakneſs of the elaſtic power in ſolid bodies, nature ſeems to incline much rather to the deſtruction, than the production of *motion*; and in reality *motion* becomes continually leſs and leſs. For bodies which are either ſo perfectly hard, or ſo ſoft, as to have no elaſtic power, will not rebound from each other: Their impenetrability will only ſtop their *motion*. And if two ſuch bodies, equal to each other, be carried with equal but oppoſite *motions*, ſo as to meet in a void ſpace, by the laws of *motion* they muſt ſtop in the very place of concourſe, loſe all their *motion*, and be at reſt for ever: unleſs they have an elaſtic power to give them a new *motion*. If they have elaſticity enough to enable them to rebound with $\frac{1}{4}$, or $\frac{1}{2}$, or $\frac{3}{4}$, of the force wherewith they meet, they will loſe $\frac{3}{4}$, or $\frac{1}{2}$, or $\frac{1}{3}$, of their *motion*. And this is confirmed by experiments: For if two equal pendulums be let fall from equal heights, ſo as to ſtrike full on each other; if thoſe pendulums be of lead, or ſoft clay, they will loſe all, or almoſt all their *motion*; and if they be of any elaſtic matter, they will only retain ſo much *motion* as they receive from their elaſtic power.' If it be aſked, how it happens that *motion* being thus continually loſt, ſhould be continually renewed again: the ſame author adds, that it is renewed from ſome active principles, 'Such as the cauſe of gravity, whereby the planets and comets preſerve their *motions* in their orbits, and all bodies acquire a great degree of *motion* in falling; and the cauſe of fermentation, whereby the heart and blood of animals preſerve a perpetual warmth and *motion*; the inner parts of the earth are kept continually warmed; many bodies burn and ſhine; and the ſun himſelf burns and ſhines, and with his light warms and chears all things.' (as alſo from the cauſe of elaſticity, by which bodies reſtore themſelves into their former figures;) 'For we find but little *motion* in the world, except what plainly flows, either from theſe active principles, or from the command of the willer.' See GRAVITY, FERMENTATION, ELASTICITY, *&c.*

As to the continuation of MOTION, or the cauſe why a body once in *motion* comes to perſevere in it; this has been extremely controverted among phyſical writers, and yet follows very evidently from one of the grand laws of nature, *viz.* That all bodies perſevere in their preſent ſtate, whether of reſt or *motion*, unleſs diſturbed by ſome foreign powers. *Motion* therefore once begun, would be continued *in infinitum*, were it to meet with no interruption from external cauſes; as the power of gravity, the reſiſtance of the medium, *&c.* So that Ariſtotle's principle, every thing in *motion* affects reſt, is groundleſs. See NATURE.

Nor has the *communication of motion*, or the manner how a moving body comes to affect another at reſt; or how much of its *motion* is communicated by the firſt to the laſt, been leſs diſputed. See the laws thereof under the word PERCUSSION. See alſo COMMUNICATION.

MOTION, we have obſerved, is the ſubject of mechanics; and mechanics is the baſis of all natural philoſophy; which hence becomes denominated *mechanical.* See MECHANICAL, and PHILOSOPHY.

In effect, all the phænomena of nature; all the changes that happen in the ſyſtem of bodies, are owing to *motion*; and are directed according to the laws thereof.

Hence, the modern philoſophers have applied themſelves with peculiar ardour to conſider the doctrine of *motion*; to inveſtigate the properties, laws, *&c.* thereof; by obſervation, experiment, and the uſe of geometry.—And to this we owe the great advantages of the modern philoſophy above that of the ancients; who were extremely diſregardful of *motion*; notwithſtanding that they ſeemed ſo ſenſible of its importance, that they defined nature, by the firſt principle of *motion* and reſt of the ſubſtance wherein it is. See NATURE.

Among all the ancients, there is nothing extant on *motion*, excepting ſome things in Archimedes's books, *De æqui-ponderantibus.*—To Galileo, a great part of the doctrine of *motion* is owing: He firſt diſcovered the general laws of *motion*, and particularly of the deſcent of heavy bodies, both at liberty, and on inclined planes; the laws of the *motion* of projectiles; the vibrations of pendulums, and ſtretched chords; with the theory of reſiſtances, *&c.* which were things the ancients had little notion of. See DESCENT, PENDULUM, PROJECTILE, RESISTENCE, *&c.*

His diſciple, Torricelli, poliſhed, and improved the diſcoveries of his maſter; and added to them divers experiments concerning the force of percuſſion, and the equilibrium of fluids. See PERCUSSION, and FLUID.—M. Huygens improved very conſiderably on the doctrine of the pendulum; and both he and Borelli on the force of percuſſion.—Laſtly, Newton, Leibnitz, Varignon, Mariotte, *&c.* have brought the doctrine of *motion* ſtill nearer to perfection.

The general laws of *motion* were firſt brought into a ſyſtem, and analytically demonſtrated together, by Dr. Wallis, Sir Chriſtopher Wren, and M. Huygens, all much about the ſame time; the firſt in bodies not elaſtic, and the two laſt in elaſtic bodies.—Laſtly, the whole doctrine of *motion*, including all the diſcoveries both of the ancients and moderns on that head, was given by Dr. Wallis in his *Mechanica, ſive de motu*, publiſhed in 1670.

MOTION may be conſidered either as *equable*, and *uniform*; or as *accelerated*, and *retarded.*—*Equable motion* again may be conſidered either as *ſimple*, or as *compound:* And *compound motion* either as *rectilinear*, or *curvilinear.*

And all theſe again may be conſidered either with regard to themſelves, or with regard to the manner of their production, and communication, by percuſſion, *&c.*

Equable MOTION, is that wherein the moving body proceeds with the ſame unvaried velocity. See EQUABLE.

The laws of *equable motion* are as follow.—The reader being only to obſerve, by the way, that *maſs*, or quantity of matter is expreſſed by M; *momentum*, or the quantity of *motion* or impetus, by I; *time*, or the duration of *motion*, by T; *velocity*, or its ſwiftneſs, by V; and *ſpace*, or the line it deſcribes, by S. See MOMENT, MASS, VELOCITY, *&c.*

Thus, if the ſpace be $=ſ$, and the time $=t$; the velocity will be expreſſed by $ſ : t$. And if the velocity $=v$, and the maſs $=m$; the momentum will likewiſe be $=v\,m$.

Laws of uniform or equable Motion.—1°. The velocities V and v of two bodies moving equably, are in a ratio compounded of the direct ratio of the ſpaces S and $ſ$, and the reciprocal ratio of the times T and t.

$$\text{For, } V=S:T \text{ and } v=ſ:t$$
$$\text{therefore, } V:v::\frac{S:ſ}{T\ \ t}$$
$$V:v::St:ſT$$

Q. E. D.

This, and the following theorems, may be illuſtrated in numbers, thus:—Suppoſe a body A, whoſe maſs is as 7, that is, 7 pounds, in the time of 3 ſeconds paſſes over a ſpace of 12 feet; and another body B, whoſe maſs is as 5, in the time of 8 ſeconds paſſes over a ſpace of 16 feet. We ſhall then have $M=7$, $T=3$, $S=12$; $m=5$, $t=8$, $ſ=16$. And therefore $V=4$, $v=2$. The caſe then will ſtand thus:

$$V:v::St:ſT.$$
$$4:2::12.8:16.3::4:2.$$

Hence, if $V=v$, then will $St=ſT$; therefore $S:ſ::T:t$. That is, if two bodies move equably, and with the ſame velocities, their ſpaces are as the times.

The corollaries may be illuſtrated by numbers, in like manner as the theorems.—Thus ſuppoſe $S=12$, $T=6$, $ſ=8$, $t=4$. Then will the $V=12:6=2$, and $v=8:4=2$.

$$\text{Conſequently by reaſon } V=v$$
$$S:ſ=T:t$$
$$12:8=6:4.$$

If $V=v$, and alſo $t=T$; then will $S=ſ$, and ſo the bodies moving equably, will deſcribe equal ſpaces in equal times.

2°. The ſpaces S and $ſ$, over which two bodies paſs, are in a ratio compounded of the ratio of the times T and t, and of the velocities V and v.

$$\text{For } V:v::St:ſT$$
$$\text{Therefore } VſT=vSt$$
$$\text{And } S:ſ::VT:vt$$
$$\text{In numbers } 12:16::4.3:2.8::12:16.$$

Hence, If $S=ſ$, $VT=vt$, ſo that $V:v::t:T$. that is, if two bodies moving equably, deſcribe equal ſpaces; their velocities will be in a reciprocal ratio of their times.

In numbers, if we ſuppoſe $S=12$, and $ſ=12$. Becauſe $S=VT$ and $ſ=vt$; if $V=2$ and $v=3$, $T=6$ and $t=4$.

$$\text{So that we have } V:v=t:T$$
$$2:3=4:6.$$

Further, if $t=T$, then will $V=v$; and therefore bodies which move equably, deſcribe equal ſpaces in equal times, and have their velocities equal.

3°. The momenta, or quantities of *motion*, of two bodies moving equably, I and i, are in a ratio compounded of the velocities V and v, and the maſſes or quantities of matter M and m.

For $I=VM$, and $i=vm$; therefore $I:i::VM:vm$; that is, the ratio I to i is compounded of the ratio of V to v, and of M to m. Q. E. D.

If $I=i$, then will $VM=vm$; and therefore $V:v=m:M$. That is, if the momenta of two bodies moving equably, be equal; the velocities will be in a reciprocal ratio of their maſſes.

And therefore if $M=m$, $V=v$; that is, if the momenta and maſſes of two moving bodies be equal, their velocities are alſo equal.

4°. The velocities V and v of two bodies moving equably, are in a ratio compounded of the direct ratio of their momenta I and i, and the reciprocal one of their maſſes M and m.

$$\text{Since } I:i::VM:vm$$
$$Ivm=iVM$$
$$V:v=Im:iM$$

Q. E. D.

In numbers $4:2::28.5:10.7::4.1:2.1::4:2$

Hence, If $V=v$, then $Im=iM$; and therefore $I:i=M:m$; that is, if two bodies move equably, and with the ſame velocity, their momenta will be in the ſame ratio with their maſſes.

If $M=m$, $I=i$; and therefore if two bodies, that have the ſame maſſes, move equably, and with equal velocity, their momenta are equal.

5°. In an equable *motion*, the maſſes of the bodies M and m are in a ratio compounded of the direct ratio of their momenta, and the reciprocal ratio of their velocities V and v.

$$\text{For, ſince } I:i::VM:vm$$
$$\text{Therefore } Ivm=iVM$$
$$M:m=Iv:iV.$$

In numbers $7:5::28.2:10.4::7.1:5.1::7:5$.

If $M=m$, then will $Iv=iV$; and therefore $I:i=V:v$. That is, if two bodies moving equably, have their maſſes equal, their momenta will be as their velocities.

In numbers, ſuppoſe $I=12$, $i=8$, $M=4$, $m=4$; then will

$V=12:4=3$, and $v=8:4=2$.

$$\text{Therefore } I:i=V:v.$$
$$12:8=3:2$$

6°. In an equable *motion*, the momenta I and i are in a ratio compounded of the direct ratio's of the maſſes M and m, and the ſpaces S and $ſ$, and the reciprocal ratio of the times T and t.

$$\text{For becauſe } V:v::St:ſT$$
$$\text{And } I:i::VM:vm$$
$$\text{Therefore } VI:vi::VMSt:vmſT$$
$$I:i::MSt:mſT$$

Q. E. D.

Hence, if $I=i$, then will $MSt=mſT$; and therefore $M:m=ſT:St$, $S:ſ=mT:Mt$, and $T:t=MS:mſ$; that is, if two bodies moving equably, have their momenta equal, 1°. Their maſſes are in a ratio compounded of the direct ratio of their time, and the reciprocal one of their ſpaces. 2°. Their ſpaces are in a ratio compounded of the direct ratio of the times, and the reciprocal one of their maſſes. 3°. Their times are in a ratio, compounded of their maſſes and their ſpaces.

Further, if $M=m$; then will $ſT=St$; and therefore $S:ſ=T:t$; that is, if two bodies moving equably, have their momenta, and their maſſes equal, their ſpaces are as their times.

Again, if $T=t$, then will $S=ſ$. Two moving bodies therefore, whoſe maſſes and momenta are equal, deſcribe equal ſpaces in equal times.

If beſides $I=i$, $S=ſ$; then will $mT=Mt$; and therefore $M:m::T:t$; that is, if two moving bodies, whoſe momenta are equal, paſs over equal ſpaces, their maſſes are proportionable to their times.

Further, if $T=t$, then will $M=m$; and therefore bodies, whoſe momenta are equal, and which moving equably, deſcribe equal ſpaces in equal times, have their maſſes equal.

If beſides $I=i$, $T=t$; then will $MS=mſ$; and therefore $S:ſ::m:M$; that is, the ſpaces paſſed over in the ſame time, by two moving bodies, whoſe momenta are equal, are in a reciprocal ratio of their maſſes.

7°. In an equable *motion*, the ſpaces S and $ſ$ are in a ratio compounded of the direct ratio's of the momenta I and i, and the times T and t; and the reciprocal one of the maſſes M and m.

$$\text{For becauſe } I:i::MSt:mſT,$$
$$ImſT=iMSt$$
$$\text{Wherefore } S:ſ::ITm:itM.$$

Q. E. D.

In numb. $12:16::3.28.5:8.10.7::3.4.1:8.2.1::12:16$.

Hence if $S=ſ$, $Itm=itM$; and therefore $I:i::tM:Tm$, $M:m::IT:it$, $T:t::iM:Im$. If two bodies therefore move equably over equal ſpaces, 1°. Their momenta will be in a ratio compounded of the direct ratio of the maſſes, and the reciprocal one of the times. 2°. Their maſſes will be in a ratio compounded of the momenta and the times. 3. The times will be in a ratio compounded of the direct ratio of the maſſes, and the reciprocal one of the momenta.

If beſide $S=ſ$, $M=m$; then will $IT=it$; and therefore $I:i::t:T$. That is, bodies whoſe maſſes are equal, have their momenta reciprocally proportionable to the times in which they move over equal ſpaces.

If beſide $S=ſ$, $T=t$; then will $iM=Im$; and therefore two bodies moving equably, and through equal ſpaces in equal times, have their momenta proportionable to their maſſes.

8°. Two bodies moving equably, have their maſſes M and m, in a ratio compounded of the direct ratio's of the momenta I and i, and the times T and t, and the reciprocal one of the ſpaces $ſ$ and S.

$$\text{For becauſe } I:i::MSt:mſT,\ ImſT=iMSt.$$
$$\text{Wherefore } M:m::ITſ:itS.$$

Q. E. D.

In numbers $7:5::3.28.16:8.10.12::3.7.2:1.10.3::7:5$.

Again $I:i::MSt:mſT$.

In numbers $28:10::7.12.8:5.16.3::7.4.1:5.2.1::28:10$.

Hence if $M=m$, then will $ITſ=itS$; and therefore $I:i::tS:Tſ$, $S:ſ::IT:it$, and $I:t::iS:Iſ$. That is, in two moving bodies, whoſe maſſes are equal; 1°. The momenta are in a ratio compounded of the direct ratio of the ſpaces, and the reciprocal one of the times. 2°. The ſpaces are in a ratio compounded of the momenta and the times. 3°. The times are in a ratio compounded of the direct ratio of the ſpaces, and the reciprocal one of the momenta.

If beſide $M=m$, $T=t$, then will $iS=Iſ$; and therefore $I:i::S:ſ$. That is, the momenta of two bodies, whoſe maſſes are equal, are proportional to the ſpaces paſſed over in equal times.

9°. In equable *motions*, the times T and t are in a ratio compounded of the direct ratio's of the maſſes M and m, and the ſpaces S and $ſ$, and the reciprocal one of the momenta I and i.

For becauſe $I : i :: MSt : m\text{ſ}T$, $Im\text{ſ}T = iMSt$.
Wherefore $T : t :: iMS : Im\text{ſ}$.

Q. E. D.

Hence, if $T = t$, $iMS = Im\text{ſ}$; and therefore $I : i :: MS : m\text{ſ}$, $M : m :: I\text{ſ} : iS$; and $S : \text{ſ} :: Im : iM$. That is, if two bodies, moving equably, deſcribe equal ſpaces in equal times; 1°. Their momenta will be in a ratio compounded of the maſſes and the ſpaces. 2°. Their maſſes will be in a ratio compounded of the direct ratio of the momenta, and the reciprocal one of the ſpaces. 3°. The ſpaces will be in a ratio compounded of the direct ratio of the momenta, and the reciprocal one of the maſſes.

Accelerated MOTION, is that which continually receives freſh acceſſions of velocity:—It is ſaid to be *uniformly accelerated*, when in equal times its acceſſions of velocity are equal. See ACCELERATION, and ACCELERATED.

Retarded MOTION, is that whoſe velocity continually decreaſes:—It is ſaid to be *uniformly retarded*, when its decreaſe is continually proportional to the time. See RETARDATION.

Laws of MOTIONS *uniformly accelerated and retarded.*—It is an axiom that a body once at reſt, will never move, unleſs ſome other body put it in *motion*; and when once in *motion*, it will continue for ever to move, with the ſame velocity, and in the ſame direction, unleſs it be forced from its ſtate by ſome other cauſe.—This is evident from that fundamental axiom in philoſophy, That nothing happens without a ſufficient cauſe.

It follows, that a body moved by one only impulſe, muſt proceed in a right line.—If then it be carried in a curve, it muſt be acted on by a double power; one, whereby it would proceed in a right line; another, whereby it is continually drawn out of it.

If the action and re-action of two (*unelaſtic*) bodies be equal, there will no *motion* enſue; but the bodies after colliſion, will remain at reſt, by each other.

If a moving body be impelled in the direction of its *motion*, it will be accelerated; if by a reſiſting force, it will be retarded. Heavy bodies deſcend with an accelerated *motion*.

10°. If a body move with an uniform accelerated velocity; the ſpaces will be in a duplicate ratio of the times.

For, let the velocity acquired in the time t be $= v$, then will the velocity acquired in the time $2t = 2v$, in the time $3t = 3v$, *&c.* and the ſpaces correſponding to thoſe times, t, $2t$, $3t$, *&c.* will be as tv, $4vt$, $9vt$, *&c.* (by *Law* 2.) The ſpaces therefore are as 1. 4. 9, *&c.* And the times as 1. 2. 3. *&c.* that is, the ſpaces are in a duplicate ratio of the times. Q.E.D.

Hence, in a *motion* uniformly accelerated, the times are in a ſubduplicate ratio of the ſpaces.

11°. The ſpaces paſſed over by a body uniformly accelerated, increaſe, in equal times, according to the unequal numbers 1. 3. 5. 7, *&c.*

For, if the times, wherein a moving body equably accelerated, proceeds, be as 1. 2. 3. 4. 5, *&c.* the ſpace paſſed over in one moment, will be as 1, in 2 moments as 4, in 3 as 9, in 4 as 16, in 5 as 25, *&c.* (*Law* 10.) If therefore you ſubtract the ſpace paſſed over in one moment, *viz.* 1. from that paſſed over in two moments, 4. there will remain the ſpace correſponding to the ſecond minute, *viz.* 3. In the ſame manner may be found the ſpace paſſed over in the third minute, $9 - 4 = 5$. The ſpace correſponding to the fourth minute, $16 - 9 = 7$; and ſo of the reſt. The ſpace of the firſt minute therefore is as 1, that of the ſecond as 3, that of the third as 5, of the fourth as 7, of the fifth as 9, *&c.* Therefore the ſpaces paſſed over by a body, moving with an uniformly accelerated *motion*, in equal times, increaſe according to the unequal numbers, 1, 3, 5, 7, 9, *&c.* Q. E. D.

12°. The ſpaces paſſed over by a body equably accelerated, are in a duplicate ratio of the velocities.

For, ſuppoſing the velocities to be V and v, the times T and t, the ſpaces S and s; then will $V : v :: T : t$. Wherefore, ſince $S : s :: T^2 : t^2$, (*Law* 10.) $S : s :: V^2 : v^2$.

Wherefore, in a *motion* uniformly accelerated, the velocities are in a ſubduplicate ratio of the ſpaces.

13°. Heavy bodies deſcend with an uniformly accelerated *motion*, in a medium void of reſiſtance, if the ſpaces be not very great.

For, ſince heavy bodies deſcend with an accelerated velocity, the power of gravity muſt continually impel them. But the power of gravity is found the ſame at all diſtances from the earth where the experiment can be made. Therefore heavy bodies muſt be driven downwards in the ſame manner in equal times. If then, in the firſt moment of time, they be impelled with the velocity v, they will be impelled with the ſame velocity v in the ſecond moment, and with the ſame in the third, fourth, *&c.* moments. Now the medium being ſuppoſed void of all reſiſtance, (by *Hypoth.*) they will ſtill retain the velocity they acquire; and by reaſon of their equal freſh acquiſitions every minute, they will deſcend with a *motion* uniformly accelerated. Q. E. D. See GRAVITY.

Hence, the ſpaces of deſcent are in a duplicate ratio of their times, and alſo of their velocities, and increaſe according to the uneven numbers 1, 3, 5, 7, 9, *&c.*

The times, and likewiſe the velocities, are in a ſubduplicate ratio of the ſpaces.

In ſuppoſing heavy bodies to move through a medium void of reſiſtance, we exclude, at once, all manner of impediments, under what name ſoever they be called, or from whatſoever cauſe they proceed; and among the reſt, that motion wherewith the earth revolving on its axis, carries with it heavy bodies during the time of their fall; though this is not ſenſible at any moderate diſtance.

It was Galileo who firſt diſcovered the law of the deſcent of heavy bodies; and that too by reaſoning; though he afterwards confirmed it by experiments. Theſe he repeated again and again, and ſtill found the ſpaces paſſed over as the ſquares of the time: But it muſt be obſerved, that the ſpaces are not to be taken in the length, but the height of the plane, as will be ſhewn elſewhere. See DESCENT.

The ſame experiments were tried, though in a different manner, by Ricciolus and Grimaldus, who let fall ſeveral ſtone balls of the ſame bulk and weight, eight ounces each, from various altitudes; meaſuring the times of deſcent by the vibrations of a pendulum. The reſult of their experiments is ſeen in the following table.

Vibrations.	Time.		Space at the end of the time.	Space paſſed over in each time.
	″	‴	Rom. feet.	Rom. feet.
5	0	50	10	10
10	1	40	40	30
15	2	30	90	50
20	3	20	160	70
25	4	10	250	90
6	1	0	15	15
12	2	0	60	45
18	3	0	135	75
24	4	0	240	105

14°. If a heavy body fall through a medium void of reſiſtance, and from a height not very great; the ſpace it paſſes over is ſubduple of that which it would paſs over by an uniform *motion* in the ſame time, with the velocity it has acquired at the end of its fall.

For, let the right line AB (*Tab. Mechanics, fig.* 31.) repreſent the whole time of a heavy body's deſcent; and let this be divided into any number of equal parts; to the abſciſſes AP, AQ, AS, AB, draw the right lines PM, QI, SH, BC, which may be as the velocities acquired, in thoſe times, in the deſcent. Since then $AP : AQ :: PM : QI$, $AP : AS :: PM : SH$, *&c.* (*Eucl.* VI. 2.) If then the altitude of the triangle ABC be conceived to be divided into equal parts infinitely ſmall; the *motion* being uniform in a moment of time infinitely ſmall; the little area $PpMm = Pp$. PM as the ſpace paſſed over in the little moment of time Pp. Therefore the ſpace paſſed over in the time AB, will be as the ſum of all the little areas, *i. e.* as the triangle ABC. But the ſpace that would be deſcribed in the ſame time AB with the uniform velocity BC, being as the rectangle $ABCD$, it will be to the other ſpace as 1 to 2. (*Eucl.* I. 41.)

Hence, the ſpace paſſed over in half the time AB, with the velocity BC, is equal to the ſpace which the heavy body paſſes over from a ſtate of reſt in the whole time AB.

Hence alſo, the time wherein a heavy body falls from any given altitude being given; to determine the ſpaces it paſſes over in each part of that time.

Let the given altitude $= a$, the time $= t$, the ſpace paſſed over in one part of that time x. Then

$$\begin{array}{c} 1 : x :: t^2 : a \\ \hline t^2 x = a \\ x = a : t^2. \end{array}$$

The ſpace therefore paſſed over in the firſt part of time is $a : t^2$, and therefore that paſſed over in the ſecond part of time $= 3a : t^2$; that paſſed over in the third part $= 5a : t^2$, *&c.*

E. gr. In the above-mentioned experiments of Ricciolus, the ball deſcended 240 feet in four ſeconds. The ſpace therefore paſſed in the firſt ſecond $= 240 : 16 = 15$; that in the next ſecond $= 15 \cdot 3 = 45$: that in the third $= 15 \cdot 5 = 75$, *&c.*

The time of a heavy body's deſcent in a medium void of reſiſtance through any given ſpace, being given, to determine the time wherein it will paſs over another given ſpace, in the ſame medium.

Since the ſpaces are as the ſquares of the time, to the ſpace the heavy body moves in the given time, the ſpace required in the queſtion, and the ſquare of the given time, ſeek a fourth proportional; this will be the ſquare of the time required: Its ſquare root therefore being extracted, will yield the time required.—*E. gr.* In Ricciolus's experiments the ball fell 240 feet in four ſeconds; it is demanded then how much time it will take up in falling 135 feet? This time will be found $= \surd(135 \cdot 16 : 240) = \surd(135 : 15)\ \surd 9 = 3$.

The ſpace a body falls in any given time in a medium void of reſiſtance being given, to determine the ſpace it will fall, in any other given interval of time.

Since the ſpaces are as the ſquares of the times, find a fourth proportional to the ſquare of the time wherein the body falls through the given ſpace, the ſquare of the time wherein it is to fall through the ſpace required, and the ſpace given; this fourth proportional will be the ſpace required.

Thus, by Ricciolus's experiments a ball falling 60 feet in two ſeconds, to find the ſpace it falls through in four ſeconds? The anſwer will be found 16.60 : 4=4.60=240.

15°. If a body proceed with a *motion* uniformly retarded, it will paſs over half the ſpace which it would deſcribe in the ſame time by an equable *motion*.

For, ſuppoſe the given time divided into any number of equal parts; and draw the right lines B C, S H, Q I, P M thereto, which are to be as the velocities correſponding to the parts of time *o*, B S, B Q, B P, B A; ſo as letting fall the perpendiculars H E, I F, M G, the right lines C E, C F, C G, C B may be as the velocities loſt in the times H E, F I, G M, A B; that is, B S, B Q, B F, B A. Since C E : C F :: E H : F I, C G : C B :: G M : B A, A B C will be a triangle, (*Eucl.* III. 17.) If B *b*, therefore, be a moment of time infinitely ſmall, its *motion* will be uniform; and, therefore, the ſpace deſcribed by the moving body will be as the little Area B *b c* C. The ſpace therefore deſcribed in the time A B is as the triangle A B C, *viz.* as the ſum of all the little areas B *b c* C. Now the ſpace deſcribed by the body moving uniformly with the velocity B C in the time A B, is as the rectangle ABCD, therefore the former is half of this. (*Eucl.* I. 41.)

16°. The ſpaces deſcribed by a *motion* uniformly retarded, in equal times, decreaſe according to the unequal numbers 7, 5, 3, 1.

For, ſuppoſe the moving body in the firſt inſtant of time to paſs over ſeven feet; I ſay, that in the ſecond, if it be equally retarded, it will paſs over 5; in the third 3; and in the fourth 1. For let the equal parts of the axis of the triangle BS, SQ, QP, P A be as the times; the ſemi-ordinates B C, S H, QI, P M as the velocities at the beginning of any time; the trapezia BSHC, SQIH, QPMI, and the triangle P A M as the ſpaces deſcribed in thoſe times. Let then B C =4 and B S=S Q=QP. =P A=1. Then will S H =3, Q I=2, P M=1, (*Law* 13.) B S H C=(4+3) 1 : 2=$\frac{7}{2}$. S Q I H=(3+2) 1 : 2=$\frac{5}{2}$. Q P M I= (2+1) 1 : 2=$\frac{3}{2}$ P A M=$\frac{1}{2}$. Conſequently the ſpaces deſcribed in equal times are as $\frac{7}{2}$, $\frac{5}{2}$, $\frac{3}{2}$, $\frac{1}{2}$, that is as 7, 5, 3, 1.

For the cauſe, &c. *of the acceleration of* MOTION, ſee GRAVITY, and ACCELERATION.

For the cauſe, &c. *of retardation*, ſee RESISTENCE, and RETARDATION.

The laws wherein MOTION *is communicated* by the colliſion and percuſſion of bodies, are very different, as the bodies are either *elaſtic* or *unelaſtic*, and as the direction of the ſtroke is *oblique* or *direct*.

What relates to the colliſion of bodies *not elaſtic*, when the ſtroke or ſhock is direct, will come under the following heads.

17°. A moving body ſtriking againſt a body at reſt, will communicate *motion* thereto, and both will proceed in the direction of the firſt; and the momentum, or quantity of *motion*, in the two, will be the ſame after the ſtroke, as in the ſingle one before it.

For, it is the action of the firſt that gives the latter all the *motion* it has; and it is the re-action of the latter that takes off any part of the *motion* of the firſt. Now, as action and reaction are always equal, the momentum acquired by the one muſt be juſt equal to that loſt by the other; ſo that there is neither loſs nor gain from the ſtroke.

Hence, the velocity after the ſtroke, is found by multiplying the maſs of the firſt body by its velocity before the ſtroke, and dividing the product by the maſs of the ſecond body.

Hence if a body in *motion* ſtrike on another moving in the ſame direction, but more ſlowly, both will continue their *motion* in their firſt direction; and the momenta, or ſum of *motion* will be the ſame after as before the ſtroke.

If two equal bodies move againſt each other with equal velocities, after the ſtroke they will both remain at reſt.

Simple MOTION is that produced by ſome one power.

Compound MOTION is that produced by ſeveral conſpiring powers. See COMPOUND and COMPOSITION.

Powers are ſaid *to conſpire*, when the direction of the one is not oppoſite to that of the other; as when the radius of a circle is imagined to whirl round on its centre, and a point in the ſame radius is at the ſame time ſuppoſed impelled ſtrait along it.

All *curvilinear motion* is compound; as all ſimple *motion* is rectilinear.

18°. If a moving body A (*fig.* 26.) be acted on by a double power; the one according to the direction A B, the other according to A C; with the *motion* compounded thereof, it will deſcribe the diagonal of a parallelogram A D; whoſe ſides A B and A C it would have deſcribed in the ſame time with each of the reſpective powers apart.

For, if the body A were only acted on by the force impreſſed along A B; in the firſt inſtant of time it would be in ſome point of the right line A B, as in H, and ſo in the line H L, parallel to A C; if it were only acted on by the power impreſſed in the direction A C, it would in the ſame inſtant of time be in ſome point of the line A C, as in I, and ſo in the line I L parallel to A B.—But ſince the directions of the powers are not oppoſite to each other, neither of them can impede the other; and therefore the body in the ſame inſtant of time will arrive both at the point H L and at I L; and will conſequently be in the point L, where the two meet.—In the ſame manner it appears that if K M and M G be drawn parallel to A B and A C, the body in the ſecond inſtant of time will be in M, and at length in D. *Q. E. D.*

Hence, ſince about every right line as A D, a parallelogram as A B D C, may be conſtructed, by making two equal triangles A C D and A B D, on one common baſe A D; every *rectilinear motion*, when it may be of ſervice for the demonſtration, may be conſidered as a *compound* one.

But as the proportion of the ſides A C and C D may be various, ſo alſo may the right line A D be deſcribed by a *motion* compounded various ways; and therefore the ſame rectilinear *motion* may be reduced to various compound *motions*.

Hence, if a moveable body be drawn by three ſeveral powers according to the directions B A, A D, and A C, (*fig.* 33.) two of which taken together are equivalent to the third; they will be to each other as the right lines B D, D A, D C, parallel to their directions; that is, reciprocally as the ſines of the angles included between the lines of their directions, and the line of direction of the third: D B being to A D as the ſine of the angle B A D to the ſine of the angle A B D.

19°. In an equable compound *motion*, the velocity produced by the conſpiring powers, is to the velocity of each of the two apart, as the diagonal A D (*fig.* 26.) of the parallelogram A B D C, in the direction of whoſe ſides they act, to either of thoſe ſides A B or A C.

For in the ſame time that one of the powers would carry it over the ſide of the parallelogram A B, and the other over A C ſeparately, joined together they carry it over the diagonal A D. The diagonal A D therefore is the ſpace deſcribed by the conſpiring powers in the ſame time: but in an equable *motion* the velocities in the ſame time are as the ſpaces; the velocities therefore ariſing from the conſpiring forces are to the velocity ariſing from either force, as A D to A B or A C.

Hence the conſpiring forces therefore being given; *i. e.* the ratio of the velocities being given, by the lines A B and A C given in magnitude, and the direction through thoſe lines being given in poſition, or by the angle of direction; the celerity and direction of the oblique *motion* is given: becauſe the diagonal is given both in magnitude and poſition.

The oblique *motion* however being given, the ſimple ones are not, *vice verſa*, given; becauſe the ſame oblique *motion* may be compounded of various ſimple ones.

20°. In a compound *motion* produced by the ſame forces, the velocity is greater if the angle of direction be leſs; and leſs, if this be greater.

For, let the greater angle of direction be B A C, (*fig.* 34.) the leſs F A C; ſince the powers are ſuppoſed the ſame, A C will be common to each parallelogram A F C E and B A C D, and beſides A B=A F. Now it is evident that in the caſe of the greater angle, the diagonal A D is deſcribed; and in the caſe of the leſs angle, A E; and both in the ſame time, by reaſon A B=A F. The velocities therefore are as A D to A E: Wherefore ſince A D is leſs than A E, the velocity in the caſe of the greater angle is leſs than in that of the leſs angle.

Hence, ſince the legs A C and C E, with the included angle being given, the angle C E A, and thence, alſo, A E is found; the velocity of the conſpiring powers, and the angle of direction, in any particular caſe, being given, the velocity of the compound *motion*, and conſequently the ratio of the velocities produced by the ſame powers under different angles of directions, may be determined.

For the particular laws of MOTION *ariſing from the colliſion of bodies both* elaſtic *and* unelaſtic, *and that where the directions are both* perpendicular *and* oblique, ſee PERCUSSION.

For circular MOTION, *and the laws of* projectile, ſee CENTRAL *forces*, and PROJECTILE.

For the MOTION *of pendulums*, *and the laws of* oſcillation, ſee PENDULUM, and OSCILLATION.

Altitude of MOTION. See the article ALTITUDE.

Longitude of MOTION. See the article LONGITUDE.

Undulatory MOTION. See the article UNDULATORY.

Perpetual MOTION. See PERPETUAL *motion*.

The celebrated problem of a *perpetual motion*, conſiſts in the inventing a machine, which has the principle of its *motion* within itſelf.—M. de la Hire has demonſtrated the impoſſibility of any ſuch machine, and finds that it amounts to this, *viz.* to find a body which is both heavier and lighter at the ſame time; or a body which is heavier than itſelf. See MACHINE.

Animal MOTION, is that whereby the ſituation, figure, magnitude, *&c.* of the parts, members, *&c.* of animals are changed. See ANIMAL.

Under theſe *motions* come all the animal functions, as *reſpiration*, *circulation* of the blood, *excretion*, *walking*, &c. See Function.

Animal motions are uſually divided into two ſpecies, *viz. ſpontaneous*, and *natural*.

Spontaneous, or *muſcular* Motion, is that performed by means of the muſcles, at the command of the will; hence alſo called *voluntary motion*. See Muscular *motion*.

Natural, or *involuntary* Motion, is that effected without ſuch command of the will; by the mere mechaniſm of the parts.

Such is the *motion* of the heart, and pulſe; the periſtaltic *motion* of the inteſtines, *&c.* See Heart, Peristaltic, *&c.*

Inteſtine Motion, denotes an agitation of the particles, whereof a body conſiſts. See Intestine, Fermentation, Effervescence, *&c.*

Some philoſophers will have every body, and every particle of a body, in continual *motion*. For fluids, it is the definition they give of them, that their parts are in continual *motion*. See Fluidity.

And as to ſolids, they infer the like *motion* from the effluvia continually emitted through their pores. See Effluvia.

Hence *inteſtine motion* is repreſented to be a *motion* of the internal and ſmaller parts of matter, continually excited by ſome external, latent agent, which of itſelf is inſenſible, and only diſcovers itſelf by its effects; appointed by nature to be the great inſtrument of the changes in bodies.

Motion, in aſtronomy, is peculiarly applied to the orderly courſes of the heavenly bodies. See Sun, Planet, Comet, *&c.*

The *motion* of the earth, from weſt to eaſt, is now generally granted among aſtronomers: See it proved under the article Earth.

The *motions* of the celeſtial luminaries are of two kinds, *diurnal* or *common*; and *ſecondary* or *proper*.

Diurnal or *primary* Motion, is that wherewith all the heavenly bodies, and the whole mundane ſphere, appears to revolve every day round the earth, from eaſt to weſt. See Diurnal, and Star.

This is alſo called the *motion of the primum mobile*, and the *common motion*; to diſtinguiſh it from that rotation which is peculiar to each planet, *&c.*—It is about the various phænomena reſulting from this *motion*, that aſtronomy is chiefly employed. See Astronomy.

Secondary or *proper* Motion, is that wherewith a ſtar, planet, or the like, advances a certain ſpace every day from weſt towards eaſt. See Mobile.

See the ſeveral *motions* of each luminary, with the irregularities, *&c.* thereof, under the proper articles; Earth, Moon, Star, *&c.*

Angular Motion. See the article Angular.

Horary Motion *of the earth*. See the article Horary.

Paracentric Motion *of impetus*. See Paracentric.

Motion *of trepidation*, &c. See Trepidation, and Libration.

Motion, in muſic, denotes the manner of beating the meaſure, to haſten or ſlacken the time of the words, or notes. See Measure, and Time.

The *motion*, in ſongs compoſed in double time, differs from thoſe in triple time. It is the *motion* that diſtinguiſhes courants and ſarabands, from gavots, borees, chacones, *&c.*

Motion is alſo uſed among mechanics, for the inſide of a watch, *&c.* more commonly called *movement*. See Movement.

Motions, in war, denote the marches, counter-marches, *&c.* an army makes in changing its poſt. See March.

The great ſkill of a general conſiſts in diſcovering the enemies *motions*, and concealing his own. Nothing is more dangerous, than to make great *motions* before a powerful enemy, ready to come to blows.

Motion, or *emotion*, in rhetoric, *&c.* See Passion.

MOTORII, Motory *nerves*, the third part of nerves; ſerving for the motion of the Eye. See Nerve.

This pair is united into one near their inſertion into the brain; by which means, when one eye is moved towards any object, the other is directed towards the ſame. See Eye.

MOTOS, Μοτος, a piece of lint, or linen cloth, teazed like wool, to be put into ulcers, to ſtop the flux of blood, *&c.*

MOTRIX, ſomething that has the power or faculty of *moving*. See Faculty, Motion, *&c.*

MOTTO, an Italian term, literally ſignifying *word*, or *ſaying*; uſed in arms, deviſes, *&c.* See Arms, and Devise.

Motto *of an armoury*, is a ſhort ſentence or phraſe carried in a ſcroll generally over, ſometimes under the arms; ſometimes alluding to the name of the bearer, ſometimes to the bearing, and ſometimes to neither. See Arms.

The *motto*, or word, ſays Guillim, is an external ornament annexed to coat-armour; being the invention or conceit of the bearer, ſuccinctly and ſignificantly expreſſed, uſually in three, or four words, which are ſet in ſome ſcroll or compartiment, placed at the foot of the eſcutcheon.

As the *motto* holds the loweſt place in arms; ſo it is the laſt in blazoning. In ſtrictneſs, it ſhould expreſs ſomething intended in the atchievement; but cuſtom has now received whatſoever fancy of the deviſer. See Blazon.

The uſe of *motto's* is very ancient; hiſtory, both ſacred and profane, furniſhing inſtances thereof. Our anceſtors made choice of *motto's* to expreſs their predominant paſſions, as of piety, love, war, *&c.* or ſome extraordinary adventure befallen them: Moſt of which, from ſome ſuch original, have become hereditary in divers families.

The *motto* of the royal family of England, is, *Dieu & mon droit*, God and my right; of the royal family of Bourbon, *Eſperance*, hope; of the order of the garter, *Honi ſoit qui mal y penſe*, ſhame be to him that evil thinks; of the duke of Norfolk, *Sola virtus invicta*; of the duke of Bedford, *Che ſara ſara*; of the duke of Devonſhire, *Cavendo tutus*, alluding to the family's name, Cavendiſh; of the duke of Kingſton, *Pie repone te*, alluding to the name Pierepoint; of the earl of Radnor, *Quæ ſupra*, alluding to the three ſtars in his arms; of the earl of Abingdon, *Virtus ariete fortior*, alluding to the three battering rams bore in the arms; of Forteſcue Lord Clinton, *Forte ſcutum ſalus ducum*.

The *motto of a deviſe*, is alſo called the *ſoul of the deviſe*. See Devise.

MOTU.—*Ex mero* Motu. See the article Ex.

MOVE *in arreſt of judgment*. See the article Arrest.

MOVEABLE, ſomething ſuſceptible of motion; or that is diſpoſed to be moved. See Motion.

A ſphere is the moſt *moveable* of all bodies, *i. e.* the eaſieſt to move: A door is *moveable* on its hinges, the magnetical needle on a pin, or pivot, *&c.*

Moveable is frequently uſed in contradiſtinction to *fixt*. See Fixt.

Moveable *feaſts*, are ſuch as are not always held on the ſame day of the year or month; though they be on the ſame day of the week. See Feast.

Thus, Eaſter is a *moveable* feaſt; being always held on the ſunday which falls upon or next after the firſt full moon following the 21ſt of March. Vid. *Philoſ. Tranſ.* Nº 240. p. 185.

All the other *moveable* feaſts follow Eaſter, *i. e.* keep their diſtance from it; ſo that they are fixed with reſpect thereto.

Such are *Septuageſima*, *Sexageſima*, *Aſh-Wedneſday*, *Aſcenſion-Day*, *Pentecoſt*, *Trinity-Sunday*, &c. Which ſee under their proper articles, Septuagesima, *&c.*

MOVEABLES, or Moveable *goods*, by civilians called *bona mobilia*, are thoſe which are capable of being removed from one place to another; or which may be concealed or perverted, as not being fixed to the ground, *&c.* See Goods.

In England, we have two kinds of effects, *moveable* and *immoveable*: the *moveable* are ready money, merchandizes, bonds, book-debts, cattle, and houſhold furniture, not faſtened either with iron or nail, nor ſealed in the plaiſter, but which may be tranſported without either fraction, or deterioration. See Chattel.

In the cuſtomary laws, they ſay, *moveables* follow the perſon, and his proper habitation; *moveables* follow the body, *&c.* which words have different meanings in different countries.

Sometimes they ſignify, that *moveables* go according to the cuſtom of the place where is the habitation of the deceaſed, though he die in another place; and ſometimes they ſignify, that *moveables* follow the cuſtom of the place where the defunct died.

MOVEMENT, *motion*, a term frequently uſed in the ſame ſenſe with *automaton*. See Automaton.

The moſt uſual *movements* for keeping time, are *watches* and *clocks*: The firſt are ſuch as ſhew the parts of time; the ſecond ſuch as publiſh it. See Watch, and Clock.

Movement, in its popular uſe among us, ſignifies all the inner work of a watch, clock, or other engine, which *move*, and, by that *motion*, carry on the deſign of the inſtrument.

The *movement* of a clock, or watch, is the inſide; or that part which meaſures the time, ſtrikes, *&c.* excluſive of the frame, caſe, dial-plate, *&c.*

The parts common to both of theſe *movements* are, the *main-ſpring*, with its appurtenances; lying in the ſpring-box, and in the middle thereof lapping about the ſpring-arbor, to which one end of it is faſtened.—A-top of the ſpring-arbor is the *endleſs ſcrew*, and its wheel; but in ſpring-clocks, this is a ratchet-wheel with its click, that ſtops it.—That which the main ſpring draws, and round which the chain or ſtring is wrapped, is called the *fuſy*: This is ordinarily taper; in large works going with weights, it is cylindrical, and called the *barrel*.—The ſmall teeth at the bottom of the fuſy or barrel, which ſtop it in winding up, is called the *ratchet*; and that which ſtops it when wound up, and is for that end driven up by the ſpring, the *garde-gut*.—The *wheels* are various: the parts of a wheel, are the *hoop* or *rim*; the *teeth*, the *croſs*, and the *collet*, or piece of braſs ſoldered on the arbor or ſpindle, whereon the wheel is riveted.—The little wheels playing in the teeth of the larger, are called *pinions*; and their teeth, which are 4, 5, 6, 8, *&c.* are called *leves*; the ends of the ſpindle are called *pivots*; and the guttered wheel, with iron ſpikes at bottom, wherein the line of ordinary clocks runs, the *pully*.—We need not ſay any thing of the *hand*, *ſcrews*, *wedges*, *ſtops*, &c. See WHEEL, FUSY, *&c.*

Theory of calculating the numbers for MOVEMENTS.—1°. It is to be obſerved, that a wheel divided by its pinion, ſhews how many turns the pinion has to one turn of the wheel.

2°. That from the fuſy to the balance, the wheels drive the pinions; conſequently the pinions run faſter, or make more revolutions than the wheels; but it is the contrary from the great wheel to the dial-wheel.

3°. That the wheels and pinions we write down either as vulgar fractions, or in the way of diviſion in common arithmetic; *v. gr.* a wheel of 60 moving a pinion of 5, is wrote either $\frac{60}{5}$, or better 5)60. And the number of turns the pinion has in one turn of the wheel, as a quotient, thus, 5)60(12. A whole *movement* may be wrote, as in the adjoining ſcheme; where the uppermoſt number expreſſes the pinion of report 4, the dial-wheel 36, and the turns of the pin 9; the ſecond, the pinion, and great wheel; the third, the ſecond wheel, *&c.* the fourth, the contrat wheel; and the laſt, 17, the crown-wheel.

4)36(9
———
5)55(11
5)45(9
5)40(8
———
17

Hence, 4°. From the number of turns any pinion makes in one turn of the wheel it works in, may be determined the number of turns a wheel or pinion has at any greater diſtance, *viz.* by multiplying together the quotients; the produce whereof is the number of turns. Thus,

Suppoſe the wheels and pinions as in the caſe adjoining; 11 multiplied by 9, gives 99, the number of turns of the ſecond pinion 5, in one turn of the wheel 55, which runs concentrical, or on the ſame ſpindle with the pinion 5. Again, 99 multiplied by 8, gives 792, the number of turns the laſt pinion has in one turn of the firſt wheel 5.

5)55(11
5)45(9
5)40(8

Hence we proceed to find, not only the turns, but the number of beats of the balance in the time of thoſe turns. For having found the number of turns the crown-wheel has in one turn of the wheel ſought, thoſe turns multiplied by its notches, give half the number of beats, in that one turn of the wheel, Suppoſe, *v. gr.* the crown-wheel to have 720 turns, to one of the firſt wheel; this number multiplied by 15, the notches in the crown-wheel, produces 10800; half the number of ſtrokes of the balance in one turn of the firſt wheel of 80 teeth. See CALCULATION.

The general diviſion of a *movement*, is into the clock, and watch parts. See CLOCK-*work*, and WATCH-*work*.

MOVER, or *firſt* MOVER. See MOBILE.

Perpetual MOVER. See PERPETUAL *motion.*

MOULD, or MOLD, in the mechanic arts, *&c.* a cavity artfully cut, with deſign to give its form, or impreſſion to ſome ſofter matter applied therein.

Moulds are implements of great uſe in ſculpture, foundery, *&c.* See SCULPTURE, FOUNDERY, *&c.*

The workmen employed in melting the mineral or metallic glebe dug out of mines, have each their ſeveral *mould*, to receive the melted metal as it comes out of the furnace; but different according to the diverſity of metals and works.—In gold mines, they have *moulds* for ingots: In ſilver-mines for bars: In copper or lead-mines for pigs or ſalmons: In tin-mines for pigs and ingots: And in iron-mines for ſows, chimney-backs, anvils, caldrons, pots, and other large utenſils and merchandizes of iron, which are here caſt, as it were, at firſt hand. See GOLD, SILVER, LEAD, TIN, IRON, *&c.*

The MOULDS *of founders of large works*, as ſtatues, bells, guns, and other brazen works, are of wax, ſupported within-ſide by what they call a *core*, and covered without-ſide with a cap or caſe.—It is in the ſpace which the wax took up, which is now melted to leave it free, that the liquid metal runs, and the work is formed; being carried thither through a great number of little canals which cover the whole *mould*. See FOUNDERY.

The MOULDS *of moneyers*, are frames full of ſand, wherein the plates of metal are caſt that are to ſerve for the ſtriking of ſpecies of gold or ſilver. See COINAGE.

MOULDS *of founders of ſmall works*, are like the frames of coiners. It is in theſe frames, which are likewiſe filled with ſand, that their ſeveral works are faſhioned; into which, when the two frames whereof the *mould* is compoſed, are rejoined, the melted braſs is run. See FOUNDERY.

MOULDS *of letter-founders*, are partly of ſteel, and partly wood: The wood, properly ſpeaking, ſerves only to cover the real *mould* which is within, and to prevent the workman who holds it in his hand, from being incommoded by the heat of the melted metal. Only one letter or type can be formed at once in each *mould*. See *Letter*-FOUNDERY.

MOULDS *in the manufacture of paper*, are little frames compoſed of ſeveral braſs or iron-wires faſtened together by another wire ſtill finer. Each *mould* is of the bigneſs of the ſheet of paper to be made, and has a rim or ledge of wood to which the wires are faſtened. Theſe *moulds* are more uſually called *frames* or *forms*. See PAPER.

Furnace, and crucible maker's MOULDS, are made of wood, of the ſame form with the crucibles; that is, in form of a truncated cone. They have handles of wood to hold, and turn them with, when being covered with the earth, the workman has a mind to round or flatten his veſſel. See FURNACE, *&c.*

MOULDS *for leaden bullets*, are little iron pinchers, each of whoſe branches terminates in a hemiſpherical concave, which when ſhut, form an entire ſphere. In the lips or ſides where the branches meet, is a little jet or hole, through which the melted lead is conveyed.

Glaziers MOULDS.—The glaziers have two kinds of *moulds*, both ſerving to caſt their lead. In the one they caſt the lead into long rods or canes fit to be drawn through the vice, and the grooves formed therein. This they ſometimes call *ingot-mould*. In the other they *mould* thoſe little pieces of lead a line thick, and two lines broad, faſtened to the iron-bars. Theſe may be alſo caſt in the vice. See VICE, and GLASIERY.

Goldſmiths MOULDS.—The goldſmiths uſe the bones of the cuttle-fiſh to make *moulds* for their ſmall works; which they do by preſſing the pattern between two bones, and leaving a jet or hole to convey the ſilver through after the pattern has been taken out.

MOULD, among maſons, is a piece of hard wood or iron, hollowed within-ſide, anſwerable to the contours of the mouldings or corniſhes, *&c.* to be formed. This is otherwiſe called *caliber*.

MOULDS, among plumbers, are the tables whereon they caſt their ſheets of lead.—Theſe they ſometimes call ſimply *tables*.—Beſides which, they have other real *moulds* wherewith they caſt pipes without ſoldering. See each deſcribed under the article PLUMBERY.

MOULDS, among glaſs-grinders, are wooden frames whereon they make the tubes wherewith they fit their perſpectives, teleſcopes, and other optic machines. See GLASS, and GRINDING. Theſe *moulds* are cylinders, of a length and diameter according to the uſe they are to be applied to, but always thicker at one end than the other, to facilitate the ſliding.

The tubes made on theſe *moulds* are of two kinds; the one ſimply paſte-board and paper; the other of thin leaves of wood joined to the paſte-board.—To make theſe tubes to draw out, only the laſt or innermoſt is formed on the *mould*; each tube made afterwards ſerving as a *mould* to that which is to go over it; but without taking out the *mould* from the firſt. See TUBE.

MOULDS uſed in baſket-making are very ſimple, conſiſting ordinarily of a willow, or oſier turned or bent into an oval, circle, ſquare, or other figure, according to the baſkets, panniers, hampers, hots, and other utenſils intended.—On theſe *moulds* they make, or more properly meaſure all their work; and accordingly have them of all ſizes, ſhapes, *&c.*

MOULDS, among tallow-chandlers, are of two kinds: The firſt for the common dipped candles, being the veſſel wherein the melted tallow is diſpoſed, and the wiek dipped.

This is of wood, of a triangular form, and ſupported on one of its angles, ſo that it has an opening of near a foot a-top. The other, uſed in the fabrick of *mould*-candles, is of braſs, pewter, or tin.—Here each candle has its ſeveral *mould*. See each under the article CANDLE.

MOULD, among gold-beaters, a certain number of leaves of velom, or pieces of guts, cut ſquare, of a certain ſize, and laid over one another, between which they put the leaves of gold and ſilver which they beat on the marble with the hammer.

They have four kinds of *moulds*; two whereof are of velom, and two of gut. The ſmalleſt of thoſe of velom conſiſts of forty or fifty leaves, the largeſt contains an hundred. For the others, each contains five hundred leaves.

The *moulds* have all their ſeveral caſes, conſiſting of two pieces of parchment ſerving to keep the leaves of the *mould* in their place, and prevent their being diſordered in beating. See GOLD-*beating*.

MOULD, or MOLD, in agriculture, denotes a black kind of earth, every where obvious on the ſurface of the ground: called alſo *natural* or *mother earth:* and by ſome alſo *loam*. See EARTH, SOIL, *&c.*

The beſt *mould* for the gardener's purpoſes, according to Mr. Evelyn, is that of a blackiſh grey colour; according to Mr. Switzer, that of a lively cheſnut, or hazle colour, which cuts like butter, and does not ſtick obſtinately, but is ſhort, tolerably light, breaking into ſmall clods, may be tempered without cruſting or chapping in dry weather, or turning to mortar in wet.

Next to cheſnut, are the dark greys, and ruſſet. The light and dark aſh-colours are naught, being thoſe commonly found in heathy ground. The yellowiſh red is worſt of all.

Hip-MOULD. See the article HIP-*mould*.

Iron-MOULD. See the article IRON-*mould*.

MOULDINESS, a term applied to bodies which corrupt in the air, from ſome hidden principle of humidity therein; and whoſe corruption ſhews itſelf by a certain white down, or lanugo on their ſurface.

This *mouldineſs*, when viewed with a microſcope, affords a curious ſpectacle; being a kind of meadow out of which ariſe herbs and flowers, ſome only in the bud, others full blown, and others decayed; each having its little root, ſtalk, and other parts: the figure whereof may be ſeen in Hook's *Micrographia*.—The ſame may be obſerved of the *mouldineſs* which gathers on the ſurface of liquid bodies.

Mr. Bradley obſerved this *mouldineſs* in a melon very accurately; and found the vegetation of theſe little plants exceedingly quick.—Each plant had its ſeeds in great abundance, which did not ſeem to be three hours ere they began to ſhoot up, and in ſix hours more the plant was compleat and mature, and the ſeed ready to fall.—When the fruit had been covered with a *mould* for ſix days, its vegetative quality began to abate, and was intirely gone in two days more; then came on a putrefaction, and the fleſhy parts of the melon yielded nothing but a ſtinking water, which began to have a gentle motion in its ſurface, and in two days time maggots appeared, which in ſix more laid themſelves up in their bags, where they continued four days, and then came out flies. See MUSHROOM.

MOULDING, any thing caſt in a mould, or that ſeems to have been ſo, though in reality it were cut with a chiſſel, or the ax.

MOULDINGS, in architecture, are jettings, or projectures beyond the naked of a wall, column, wainſcot, *&c.* the aſſemblage whereof forms corniches, door-caſes, and other decorations of architecture.—See *Tab. Architect. fig.* 1. to 12. See alſo ORNAMENT.

Some *mouldings* are ſquare, others round, ſome ſtrait, others curved, *&c.*—Some are plain, others carved, or adorned with ſculpture, either hollowed, or in relievo.

Some *mouldings* again are crowned with a fillet; others are without, as the doucine, talon, ovolo, torus, plinth, ſcotia, aſtragal, gula, corona, and cavetto. See each under its proper article, DOUCINE, TALON, OVOLO, *&c.*

Mouldings are in architecture what letters are in writing.—By the various diſpoſitions and combinations of *mouldings* may be made an infinite number of different profiles for all ſorts of orders, and compoſitions, regular and irregular; and yet all the kinds of *mouldings* may be reduced to three; *viz.* ſquare, round and mixt, *i. e.* compoſed of the other two.

For this reaſon, thoſe who invented the Gothic architecture, reſolving to recede from theſe perfect figures, and affecting to uſe others leſs perfect, to diſtinguiſh their architecture from the antique, introduced a new ſet of whimſical *mouldings* and ornaments. See GOTHIC, GROTESQUE, *&c.*

Regular *mouldings* are either *large*; as, doucines, ovolos, gulas, talons, torus's, ſcotias, *&c.* or *ſmall*, as fillets, aſtragals, conges, *&c.* which ſee in their places, DOUCINE, OVOLO, ASTRAGAL, FILLET, *&c.*

Bed-MOULDING. See the article BED-*moulding*.

Plane MOULDING. See the article PLANE.

MOULIN.—*Fer de* MOULIN. See FER.

MOULINET, a French term properly ſignifying a little mill; being a diminutive of *moulin*, mill.

It is uſed in mechanics to ſignify a roller, which being croſſed with two levers, is uſually applied to cranes, capſtans, and other ſorts of engines of the like nature, to draw ropes, and heave up ſtones, timber, *&c.* See CAPSTAN, *&c.*

MOULINET is alſo a kind of turn-ſtile, or wooden croſs, which turns horizontally upon a ſtake fixed in the ground; uſually placed in the paſſages to keep out horſes, and to oblige paſſengers to go and come one by one.

Theſe *moulinets* are often ſet near the out-works of fortified places, at the ſides of the barriers, through which people paſs on foot.

MOULTING, in natural hiſtory. See MOLTING.

MOUND, a term uſed for a bank, rampart, or other fence, particularly of earth. See WALL, *&c.*

MOUND, or MOND, in heraldry, is a ball or globe with a croſs upon it; ſuch as our kings are uſually drawn with, holding it in their left hand, as they do the ſcepter in the right. See GLOBE.

MOUNT, an elevation of earth, called alſo *mountain*. See MOUNTAIN.

The words *mount* and *mountain* are ſynonymous; but the former is ſcarce ever uſed in proſe, unleſs when accompanied with ſome proper name, as *mount* Ætna, *mount* Gibel, *mount* Libanon, *mount* Sinai, *mount* Atlas, *mount* Parnaſſus, *&c.*

St. Catherine of MOUNT *Sinai*. See the article CATHERINE.

Knight of MOUNT *Carmel*. See the article CARMEL.

MOUNTS *of piety*, are certain funds, or eſtabliſhments in Italy, where money is lent out on ſome ſmall ſecurity.—We had alſo *mounts of piety* in England, raiſed by contribution for the benefit of people ruined by the extortions of the Jews.

MOUNTAIN, MONS, a part of the earth riſing to a conſiderable height above the level of the ſurface thereof. See EARTH.

The origin of *mountains* is variouſly aſſigned by philoſophers: Some will have them co-eval with the world, and created along with it.

Others, among whom Dr. Burnet, will have them to take their riſe from the deluge; urging, that the extreme irregularity and diſorder viſible in them, plainly ſhews they do not come immediately out of the hand of God, but are the wrecks of the old world broken into the abyſs. See ABYSS.

Others again, alledge from hiſtory, that the roots of many hills being eaten away, the hills themſelves have ſubſided, and ſunk into plains: Whence they conclude, that where the corruption is natural, the generation is ſo too.

This, indeed, appears pretty evident, that ſome *mountains* muſt have been generated gradually, and have grown up in proceſs of time, from the ſea-ſhells, *&c.* found in many of them; which may be accounted for from a violent wind blowing the ſand, *&c.* into huge heaps, which are afterwards made into a maſs by the rain, *&c.*—Some among the divines tell us, that the earth was created perfectly even; and that when God ſeparated the water from the land, he dug channels in the earth; and the earth ſcooped out, he threw up in *mountains*: but whether the *mountains* be ſufficient to fill all the channels of the ocean, let them look to it.

The uſes of *mountains* are numerous: We ſhall only mention two, or three. 1°. They ſerve as ſkreens to keep off the cold and nipping blaſts of the northern and eaſtern winds. 2°. They ſerve for the production of a great number of vegetables and minerals, which are not found in any other ſoil. 3°. The long ridges and chains of lofty and topping *mountains* being generally found to run from eaſt to weſt, ſerve to ſtop the evagation of the vapours towards the poles, without which they would all run from the hot countries, and leave them deſtitute of rain.

Mr. Ray adds, that they condenſe thoſe vapours, like alembic-heads, into clouds, and ſo by a kind of external diſtillation, give original to ſprings and rivers; and by amaſſing, cooling, and conſtipating them, turn them into rain; and by that means render the fervid regions of the torrid zone habitable. See SPRING, *&c.*

In hiſtory, we have inſtances of *mountains* travelling a conſiderable diſtance; particularly Huſket-Marvel-Hill, if I miſremember not, in Herefordſhire, which is ſaid to have made a conſiderable journey. See Speed's *Theat.*

To meaſure the height of a *mountain*, ſee ALTITUDE, *&c.*—Though there is another way uſed by Dr. Halley in the meaſure of Snowdon-Hill in Wales, by means of a barometer, the different heights of whoſe mercury at the top and bottom of the *mountain*, give its perpendicular altitude; accounting 82 feet perpendicular aſcent, for every inch varied in the height of the mercury. See BAROMETER, and LEVELLING.

MOUNTAIN-*green*	See the article	GREEN.
Burning-MOUNTAINS.		VOLCANO.
MOUNTAINS *in the moon*.		MOON.

MOUNTING *the guard, trenches, breach*, &c. denotes the going upon duty, being upon guard, in the trenches, running to the breach, *&c.* See GUARD, TRENCH, *&c.*

MOUNTING *a cannon, mortar*, &c. is the ſetting it on its carriage; or the raiſing its mouth. See CANNON, MORTAR, CARRIAGE, *&c.*

MOUNTING, in the manufactories, ſomething that ſerves to raiſe or ſet off a work.—Thus the frame or border, and its dependencies, make the *mounting* of a looking-glaſs: The fuſt, or but, the *mounting* of a muſquet, carabine, *&c.* The hilt, *&c.* the *mounting* of a ſword.

MOUNTING *of a fan*, the ſticks which ſerve to open and ſhut it, whether they be of wood, ivory, tortoiſe-ſhell, whalebone, Indian-cane, or the like. See FAN.

MOURNING, a particular dreſs or habit, wore to ſignify grief, on ſome melancholy occaſion. See FUNERAL, *&c.*

The modes of *mourning* are various in various countries; as are alſo the colours that obtain for that end.—In Europe, the ordinary colour for *mourning* is black; in China, white; in Turkey, blue, or violet; in Egypt, yellow; in Æthiopia, brown. The ancient Spartan and Roman ladies *mourned* in white; and the ſame colour obtained formerly in Caſtile on the death of their princes. Herrera obſerves, that the laſt time it was uſed, was in 1498, at the death of prince John.—Kings and cardinals mourn in purple.

Each people have their reaſons for the particular colour of their *mourning*: White is ſuppoſed to denote purity; yellow, that death is the end of human hopes, in regard leaves when they fall, and flowers when they fade, become yellow. Brown denotes the earth, whither the dead return. Black, the privation of life, as being the privation of light. Blue expreſſes the happineſs which it is hoped the deceaſed does enjoy; and purple, or violet, ſorrow on the one ſide, and hope on the other; as being a mixture of black and blue.

MOUTH, in anatomy, a part of the human face, conſiſting of the lips, the gums, the inſide of the cheeks, and the palate. See FACE, LIPS, *&c.*

All theſe parts are lined with a glandulous coat, which is continued over the whole inner ſurface of the *mouth*, and all its parts, the teeth excepted.

From the glands of this coat, through innumerable little excretory ducts, is ſeparated a kind of ſalival juice, which ſerves to keep the *mouth* and all its parts, moiſt, ſmooth and ſlippery. See SALIVA.

On the hind part of the palate, perpendicularly over the rima of the larynx, hangs a round, ſoft, ſmooth body, like the end of a child's finger, formed by the duplicature of the membrane of the palate, and called the *uvula*, which is moved by two muſcles, called *ſphenoſtaphylinus* and *pterygoſtaphylinus*; and ſuſpended by as many ligaments. See Uvula.

Under the membrane of the palate, are a great number of glands, pretty conſpicuous in the fore-part, like grains of millet; whoſe excretory ducts piercing the membrane, open into the *mouth*: but towards the hind-part they lie much thicker, and about the root of the uvula are gathered ſo cloſe to one another, that they ſeem to form one large conglomerate gland; which is therefore by Verheyen called *glandula conglomerata palatina*. See Palate.—The gums are, as it were, the ſockets and ligaments of the teeth. See Tooth.

Beſides the proper parts of the *mouth*, there are in and about it others highly ſerviceable and neceſſary thereto: Among which are the glands; the moſt conſiderable whereof are the parotides, the glandulæ maxillares, the ſublinguales, and the tonſils or amygdalæ; which ſee in their reſpective places, Parotides, *&c.*

Theſe are the ſalival organs, whence ſprings all that liquor we call the *ſpittle*, which flows into the *mouth* by the reſpective ducts, after its ſeparation from the blood in the bodies of the glands: As the demand of ſpittle is greater in actions of the lower jaw, *i. e.* in maſtication, deglutition, much talking, *&c.* ſo does the diſpoſition of theſe ſalival ducts favour that diſcharge on thoſe occaſions.

Mr. Derham obſerves that the *mouth*, in the ſeveral ſpecies, is nicely adapted to the uſes of ſuch a part; well ſized and ſhaped for the catching of prey, for the gathering and receiving food, the formation of ſpeech, *&c.*

In ſome creatures it is wide and large, in others little and narrow; in ſome with a deep inciſure up into the head, for the better catching and holding of prey, and more eaſy comminution of hard, large and troubleſome food; in others with a ſhorter inciſure, for the gathering and holding of herbaceous food.

In inſects it is very notable: in ſome forcipated, to catch, hold, and tear the prey; in others aculeated, to pierce and wound animals, and ſuck their blood; in others ſtrongly ridged with jaws and teeth, to gnaw and ſcrape out their food, carry burdens, perforate the earth, nay the hardeſt wood, and even ſtones themſelves, for houſes and neſts for their young.

Nor is the *mouth* leſs remarkable in birds, being neatly ſhaped for piercing the air, hard and horny to ſupply the want of teeth; hooked in the rapacious kind, to catch and hold their prey; long and ſlender in thoſe who have their food to grope for in mooriſh places; and broad and long in thoſe that ſearch it in muddy places.

Mouth is alſo uſed in the courts of princes, for what relates to their eating and drinking.—Hence, *officers of the mouth*, *yeomen of the mouth*, &c.

Daviler defines *mouth*, an apartment compoſed of ſeveral rooms, as offices, kitchens, *&c.* where the meat intended for the firſt tables, is dreſſed by itſelf.—At court, this is called the *king's mouth*.

Mouth, in the manage, denotes a horſe's feeling or ſenſibility in that part where the bits are applied. See Bit, *&c.*

Ridges of a horſe's **Mouth**. See the article Ridge.

Opening, or *ſhutting the* **Mouth**, of a cardinal, is a ceremony uſed in the conſiſtory at Rome; wherein the pope ſhuts a new-elected cardinal's *mouth*, ſo as he may not ſpeak at all, even though the pope ſhould ſpeak to him; and remains in the mean time deprived of all voice, both active and paſſive, 'till the calling of another conſiſtory, when the pope *opens his mouth* again, making a little harangue, to teach him how to ſpeak, and comport himſelf in the conſiſtory. See Cardinal.

MOXA, a ſort of cotton, or downy ſubſtance, brought from China, and by ſome ſaid to grow on the lower part of the mugwort-leaf.

It is not known among us for any medicinal efficacy, however celebrated in the Indies for curing the gout, by being burnt upon the part: People here have not faith enough to try it this way; and ſome think if they had, in all likelihood, any other cauſtic would do as well. Quincy.

MUCILAGE, Mucilago, in pharmacy, *&c.* a thick, viſcous juice; ſo called, as reſembling the *mucus* of the noſe. See the article Mucus.

Mucilages are prepared chiefly from roots, and ſeeds pounded in a mortar, and infuſed in hot water, and ſtrained through a cloth. The ſeeds principally uſed for this purpoſe, are thoſe of althæa, mallows, ſymphytum, *&c.*

Mucilages enter the compoſition of ſeveral plaiſters.—They are ſometimes alſo made of gums and fruits, as figs, quinces, iſing-glaſs, tragacanth, &c. See Gum, *&c.*

Mucilage alſo denotes a thick, pituitous matter, evacuated with the urine, in the gravel, and dyſuria.

MUCILAGINOUS *glands*, a very numerous ſet of glands in the joints, firſt deſcribed by Dr. Havers.—There are two ſorts of *mucilaginous glands*, ſome ſmall, next a-kin to miliary glands, being glandules placed all along the ſurface of the membranes, which lie over the articulations. See Mucus, and Articulation.

The other ſort are conglomerated, or many glandules collected, and planted one upon another, ſo as to make a bulk, and appear conſpicuouſly. In ſome of the joints, there are ſeveral of them; in others, there is a ſingle one.

As to the ſtructure of theſe large glands; they conſiſt of ſmall veſicles, which are not gathered together into ſeveral lobes, or bags of glandules, but are diſpoſed upon ſeveral membranes lying over one another; of which membranes there are ſeveral in every one of theſe glands, which appear evidently in thoſe who are hydropical. They have their blood-veſſels, as other glands: but their veins have a particular texture, in their courſe, for retarding the return of the blood from the glands, that the *mucilaginous* liquor, which is not ſeparated with the greateſt expedition, may have time for ſeparation; which is a contrivance, obſerved wherever a thick fluid is to be ſecerned. See Animal *ſecretion*.

The large *mucilaginous glands* are variouſly ſituated; ſome in a ſinus formed in the joint; others ſtand near, or over-againſt the interſtice between the articulated bones: but in general, they are ſo placed, as to be ſqueezed gently, and lightly preſſed in the inflection or extenſion of the joint, in order to yield a quantity of mucilage proportionate to the motion of the part, and the preſent occaſion, without any injury.

The deſign of all theſe glands is to ſeparate a *mucilaginous* kind of liquor, which ſerves principally to lubricate the joints, or to make them ſlippery. It ſerves likewiſe to preſerve the ends of the articulated bones from attrition and heating: But all this it does in conjunction with the medullary oil; with which, together, is made a compoſition admirably well fitted for thoſe ends; for the mucilage adds to the lubricity of the oil, and the oil preſerves the mucilage from growing too thick and viſcous.

Dr. Havers obſerves the ſame glands to lie between the muſcles and tendons; and ſuppoſes that there is the ſame mixture there of an oily and *mucilaginous* ſubſtance; the one being that fat, which is found between the muſcles, and is ſupplied by the glandulæ adipoſæ; and the other ſeparated by the *mucilaginous* glandules, of which the common membrane of the muſcles is every where full. This mixture in the interſtices of the muſcles, lubricates them and their tendons, and preſerves them from ſhrinking, and growing rigid and dry. See Muscle.

MUCOUS *glands*, are three glands which empty themſelves into the urethra; ſo called by the firſt diſcoverer, Mr. Cowper, from the tenacity of the liquor which they ſeparate.—See *Tab. Anat.* (*Splanch.*) *fig.* 8. *lit. w.* See alſo Mucus.

The two firſt diſcovered of theſe, are about the bigneſs of a French bean, of a depreſſed oval figure, and a yellowiſh colour, like the proſtates; being on each ſide the bulb of the cavernous body of the urethra, a little above it.

Their excretory ducts ſpring from the internal ſurface next the inner membrane of the urethra; into which they open a little lower, by two diſtinct orifices, juſt below its bending under the oſſa pubis, in perinæo, where they diſcharge a tranſparent viſcous liquor.

The third *mucous* gland, is a ſmall, conglobate, yellowiſh gland, like the former, but ſomewhat leſs, ſituate above the angle of flexure of the urethra, under the oſſa pubis, in the perinæum, near the anus.—It has two excretory ducts, which enter the urethra obliquely, a quarter of an inch below the two former; and diſcharge a liquor like the former, both in colour and conſiſtence. See Urethra.

MUCRO *cordis*, in anatomy, the lower pointed end of the heart. See Heart.

The word is Latin, *mucro*, where it properly ſignifies the point of a ſpear, *&c.*

Hence, Mucronated is applied to whatever tends to, or terminates in a point, like that of a ſpear; as *mucronata cartilago*, *&c.* See Xiphoides.

MUCUS, *of the joints*, is a *mucilaginous* liquor, ſeparated by its proper glands, conveniently placed in the interſtices of the bones, where thoſe glands are gently preſſed by the motion of the parts: it ſerves to make the extremities of the bones, or joints, ſlip more eaſily. See Bone, and Mucilaginous.

Mucus, *of the urethra*, a viſcous tranſparent liquor, ſerving to line, and lubricate the part; that the ſeed and the urine may ſlip more freely, without either adhering to or lacerating the part. See Urethra.

It comes from glands lately diſcovered by Mr. Cowper, about the penis; and is that, which in women is often miſtaken for ſemen. See Mucous *gland*, Penis, Seed, *&c.*

Mucus, *of the noſtrils*, is a viſcid excrementitious humour ſeparated by its proper glands, placed in the internal membrane of thoſe parts.—It ſerves to moiſten, lubricate, and defend the olfactory nerves; which being extremely ſoft and naked, would, without ſuch proviſion, be ſoon ſpoiled. See Nose, *&c.*

MUD-*walls*. See the article Wall.

MUFTI. See the article Muphti.

MUGGLETONIANS, a religious ſect, which aroſe in England, about the year 1657; denominated from their leader Lodowick Muggleton, a journeyman taylor.

Muggleton, with his aſſociate Reeves, ſet up for great prophets; and it is ſaid, pretended to an abſolute power of ſaving and damning whom they pleaſed: giving out, that they were the two laſt witneſſes of God, that ſhould appear before the end of the world.

MUID, a large meaſure, in uſe among the French, for dry commodities; as corn, pulſe, ſalt, lime, coals, &c. See MEASURE.

The *muid* is no real veſſel uſed as a meaſure; but an eſtimation of ſeveral other meaſures, as the ſeptier, mine, minot, buſhel, &c.

At Paris, the *muid* of wheat, pulſe, and the like, is compoſed of twelve ſeptiers, each ſeptier making two mines, the mine two minots, the minot three buſhels, the buſhel four quarts, or ſixteen litrons, each litron 36 cubic inches, exceeding our pint by $1\frac{1}{12}$ cubic inch.—The *muid* of oats is double that of wheat, though compoſed, like that, of 12 ſeptiers; but each ſeptier contains 24 buſhels.—The *muid* of charcoal contains 20 mines, ſacks, or loads, each mine two minots, each minot eight buſhels, each buſhel four quarts, &c.

MUID is alſo one of the nine caſks, or regular veſſels uſed in France, to put wine and other liquors in.—The *muid* of wine divided into two *demi-muids*, four *quarter-muids*, and eight *half quarter-muids*, contains 36 ſeptiers, each ſeptier 8 pints, Paris meaſure; ſo that the *muid* contains 288 pints. See MEASURE.

MULATTO*, a name given, in the Indies, to thoſe who are begotten by a negro man on an Indian woman; or by an Indian man on a negro woman.

* The word is originally Spaniſh, *mulata*, formed of *mula*, a mule, as being begotten of two different ſpecies.

Thoſe begotten of a Spaniſh woman and an Indian man, are called *metis*; and thoſe begotten of a ſavage by a *metis*, are called *jambos*.—Theſe are all very different in colour, and in their hair.

MULCT, MULCTA, a penalty, or fine of money, impoſed for a fault or miſdemeanour. See FINE, AMERCEMENT, &c.

MULE, in natural hiſtory, a mongrel kind of quadruped uſually generated betwen an aſs and a mare; ſometimes alſo between a horſe and a ſhe-aſs.

Mules are a ſort of monſters; and, therefore, do not propagate their kind. See MONSTER.

And yet the ancients mention a ſort of *mules* that were prolific, in Phrygia, Syria, Cappadocia, and Africa. Witneſs Ariſtotle, *Hiſt. Animal. l.* 6. *c.* 36. Varro *de Re Ruſtica*, *l.* 2. *c.* 1. Columella, *l.* 7. *c.* 36. Theophraſtus, and, after him, Pliny, *l.* 8. *c.* 44. Steno, examining the teſticles of a *mule*, found *ova* therein, with a ſort of placenta about them; which perſuaded him that *mules* might engender without any miracle. But the obſervation is fanciful, and the concluſion unworthy ſo able a naturaliſt!

The Roman ladies had equipages drawn by *mules*; as appears from the medals of Julia and Agrippina. And at this day, in Spain, the coaches of the nobility, and even princes, are uſually drawn by no other than *mules*. We are aſſured that M. de Thou, firſt preſident of the parliament, had the fourth coach in France, in 1585; till which time every body rid to court, parliament, &c. on *mules*. See COACH.

MULES, among gardeners, denote a ſort of vegetable monſters produced by putting the farina fœcundans of one ſpecies of plant into the piſtil, or utricle of another. See GENERATION *of plants*.

The carnation and ſweet-william being ſomewhat alike in their parts, particularly their flowers; the *farina* of the one will impregnate the other: and the ſeed ſo enlivened will produce a plant different from either.—An inſtance of this we have in Mr. Fairchild's garden at Hoxton; where a plant is ſeen neither ſweet-william, nor carnation, but reſembling both equally, which was raiſed from the ſeed of a carnation that had been impregnated by the farina of the ſweet-william.—Theſe couplings being not unlike thoſe of the mare with the aſs, which produce the *mule*; the ſame name is given them; and they are, like the others, incapable of multiplying their ſpecies.

This gives us a hint for altering the property and taſte of any fruit, by impregnating one tree with the *farina* of another of the ſame claſs; *e. gr.* a codling with a pearmain, which will occaſion the codling ſo impregnated to laſt a longer time than uſual, and be of a ſharper taſte. Or if the winter-fruits be fecundated with the duſt of the ſummer ſeeds, they will decay before their uſual time. And from this accidental coupling of the *farina* of one with another, it may poſſibly be that in an orchard where there is variety of apples, even the fruit gathered from the ſame tree differ in their flavour, and in the ſeaſon of maturity. It is from the ſame accidental coupling that proceeds the numberleſs varieties of fruits and flowers raiſed every day from ſeed. See FARINA and SEED.

MULIEBRIA, a term ſometimes uſed to ſignify the privities of women; or ſo much as is otherwiſe called *cunnus*.—See *Tab. Anat.* (*Splanch.*) *fig.* 9. See alſo GENITAL, and GENERATION.

MULIER, in law, ſignifies lawful iſſue born in wedlock, but begot before. See BASTARD.

If a man have a ſon by a woman before marriage, which is a baſtard and illegitimate; and he after marries the mother of the baſtard, and they have another ſon: this ſecond ſon is called *mulier* *, and is lawful, and ſhall be heir to his father. Theſe we ſometimes alſo find with the additions, *baſtard eigne*, and *mulier puiſne*.

* Some derive the word from the Latin *melior*, or French *meilleur*, better; in regard the condition of a ſon born thus is better than that of an elder brother born before wedlock. Though, according to Glanvil, the lawful iſſue is rather called *mulier* than *melior*, becauſe begotten on *mulieres*, and not on *concubinæ*: For he calls ſuch iſſue *filios mulieratos*; oppoſing them to baſtards.—Agreeable to which, Briton has *frere mulier*, i. e. the brother begotten of the wife; in oppoſition to *frere* baſtard.

The like ſeems to obtain in Scotland, where, according to Skene, *mulieratus filius* is a lawful ſon begot of a lawful wife.

MULIER was alſo anciently uſed as an addition for a wife; ſometimes alſo for a widow.—According to Coke, virgin is alſo included under the name *mulier*. See ADDITION, &c.

MULLER, or MULLAR, denotes a ſtone flat and even at bottom, but round a-top; uſed for grinding of matters on a marble. The apothecaries uſe *mullers* to prepare many of their ingredients; and painters for their colours, either dry or in oil.

MULLER is alſo an inſtrument uſed by the glaſs-grinders; being a piece of wood, to one end whereof is cemented the glaſs to be ground, whether convex, in a baſon, or concave, in a ſphere or bowl. See GLASS, and GRINDING.

The *muller* is ordinarily about ſix inches long, turned round; the cement they uſe is compoſed of aſhes and pitch.

MULLET, or MOLLET, in heraldry, a bearing in form of a flat, or rather of the rowel of a ſpur, which it originally repreſented.

The *mullet* has but five points; when there are ſix it is called a *ſtar*.—Though others make this difference, that the *mullet* is, or ought to be, always pierced, which a ſtar is not.—*Vid. Tab. Heraldry*, *fig.* 71.

The *mullet* is uſually the difference, or diſtinguiſhing mark for the fourth ſon, or third brother, or houſe. See DIFFERENCE.

Though it is often alſo borne alone, as coat-armour: Thus, Ruby on a chief pearl, two *mullets* diamond, was the coat of the famous lord Verulam, firſt Sir Francis Bacon.

MULSUM, MULSE, a liquor made of wine and honey; or even of honey and water. See HYDROMEL, HONEY, &c.

MULTA, or MULTURA *epiſcopi*, a fine, or final ſatisfaction anciently given the king by the biſhops, that they might have power to make their laſt wills: and that they might have the probate of other men's, and the granting of adminiſtrations.

MULTANGULAR, a figure, or body which has many angles. See ANGLE, and POLYGON.

MULTILATERAL, in geometry, is applied to thoſe figures which have more than four ſides or angles, more uſually called *polygons*. See POLYGON.

MULTINOMIAL, or MULTINOMINAL *roots*, in mathematics, are ſuch as are compoſed of many names, parts, or members; as, $a+b+c+d$, &c. See ROOT, MONOMIAL, BINOMIAL, &c.

For the method of raiſing an infinite *multinomial* to any given power, or of extracting any given root out of ſuch a power; ſee a method of M. de Moivre in *Philoſ. Tranſact.* N° 230.

MULTIPLE, MULTIPLEX, in arithmetic, a number which comprehends ſome other number ſeveral times. See NUMBER, EQUIMULTIPLE, and SUBMULTIPLE.

Thus 6 is a *multiple* of 2; or, which is the ſame, 2 is a quota part of 6; 2 being contained in 6 three times. And thus 12 is a *multiple* of 6, 4, 3; and comprehends the 1ſt twice, the 2d thrice, the 3d four times, &c.

MULTIPLE *ratio*, or *proportion*, is that which is between *multiple* numbers. See RATIO.

If the leſſer term of a ratio be an aliquot part of the greater, the ratio of the greater to the leſs is called *multiple*: And that of the leſs to the greater *ſub-multiple*.

A *ſub-multiple* number is that contained in the *multiple*. Thus the numbers 1, 2, and 3 are *ſub-multiples* of 6 and 9.

Duple, triple, &c. ratio's; as alſo ſub-duples, ſub-triples, &c. are ſo many ſpecies of *multiple* and *ſub-multiple* ratio's. See DUPLE, TRIPLE, &c.

MULTIPLE *echo*. See the article ECHO.

MULTIPLICAND, in arithmetic, is one of the factors in the rule of multiplication; being that number which is given to be multiplied by another called the *multiplicator*, or *multiplier*. See MULTIPLICATOR.

MULTIPLICATOR, in arithmetic, a number multiplied by another called the *multiplicand*. See MULTIPLICAND.

The largeſt number is ordinarily made the multiplicand, and placed above the ſmaller, or *multiplicator*; but the reſult is the ſame which ſoever of the numbers be made multiplicand, or *multiplicator*; 4 times 5, and 5 times 4 making the ſame ſum. See MULTIPLICATION.

MULTIPLICATION, the act of *multiplication*, or increaſing the number of any thing. See MULTIPLYING.

The *multiplication* of the loaves in the wilderneſs was one of our Saviour's greateſt miracles. The Romaniſts hold a real *multiplication* of the body of Chriſt in the euchariſt; ſo that every communicant has a whole body, &c.

It is ordained and eſtabliſhed, that none from henceforth ſhall uſe to *multiply* gold, or ſilver, nor uſe the craft of *multiplication*; and if any the ſame do, he ſhall incur the pain of felony. *Stat.* 5 *Hen.* IV. c. 4. See PHILOSOPHER'*s-ſtone.*

This ſtatute was made on preſumption that ſome perſons ſkilful in chymiſtry, could *multiply* or augment thoſe metals by elixirs, or other ingredients; and change other metals into very gold and ſilver.—Under Henry VI. letters patent were granted to certain perſons (who undertook to perform the ſame, and to find the philoſopher's ſtone) to free them from the penalty in the ſaid ſtatute.—But the ſtatute has been ſince repealed, 1 *Will. &* *Mar. c.* 30.

MULTIPLICATION, in arithmetic, the act, or art of *multiplying* one number by another, to find the product. See PRODUCT.

Multiplication, which is the third rule in arithmetic, conſiſts in finding ſome third number, out of two others given; wherein, one of the given numbers is contained as often as unity is contained in the other.

Or, *Multiplication* is the finding what will be the ſum of any number added to itſelf, or repeated, as often as there are units in another.—So that *multiplication* of numbers is a compendious kind of addition. See ADDITION.

Thus the *multiplication* of 4 by 5 makes 20, *i. e.* four times five amount to twenty; which algebraiſts expreſs thus, 4 × 5 = 20. See CHARACTER.

In *multiplication*, the firſt factor, *i. e.* the number to be multiplied, or the multiplicand, is placed over that whereby it is to be multiplied; (See MULTIPLICAND) and the factum or product under both.

An example or two will make the proceſs of *multiplication* eaſy.—Suppoſe I would know the ſum 269 multiplied by 8, or 8 times 269.

Multiplicand ——— ———	269
Multiplier ——— ——— ———	8
Factum, or Product ——— ———	2152

The factors being thus diſpoſed, and a line drawn underneath, (as in the example) I begin with the multiplicator thus: 8 times 9 makes 72, ſet down 2, and carry 7 tens, as in addition; then 8 times 6 make 48, and 7 I carried, 55; ſet down 5, and carry 5; laſtly, 8 times 2 make 16, and with 5 I carried 21, which I put down: ſo as coming to number the ſeveral figures placed in order, 2, 1, 5, 2, I find the product to be 2152. See NUMERATION.

Now ſuppoſing the factors to expreſs things of different ſpecies, *viz.* the multiplicand men, or yards, and the multiplier pounds; the product will be of the ſame ſpecies with the multiplicator. Thus the product of 269 men or yards multiplied by 8 pounds or pence, is 2152 pounds or pence; ſo many of theſe going to the 269 at the rate of 8 a-piece. Hence the vaſt uſe of *multiplication* in commerce, &c.

If the multiplicator conſiſt of more than one figure, the whole multiplicand is to be added to itſelf, firſt, as often as the right-hand figure of the multiplicator ſhews, then as often as the next figure of the multiplicator ſhews, and ſo on.—Thus 421 × 23 is equal to 421 × 3 and alſo 421 × 20. The product ariſing from each figure of the multiplicator, multiplied into the whole multiplicand, is to be placed by itſelf in ſuch a manner, that the firſt or right-hand figure thereof may ſtand under that figure of the multiplicator from which the ſaid product ariſes. For inſtance;

Multiplicand ——— ——— ———	421
Multiplicator ——— ——— ———	23
Particular product of 421 × 3 ———	1263
Particular product of 421 × 20 ———	842
The total product ——— ———	9683

This diſpoſition of the right-hand figure of each product, follows from the firſt general rule; the right-hand figure of each product being always of the ſame denomination with that figure of the multiplicator from which it ariſes.

Thus in the example, the figure 2 in the product 842, is of the denominations of tens, as well as the figure 2 in the multiplicator. For 1 × 20 (that is the 2 of 23) = 20, or 2 put in the place of tens, or ſecond place.

Hence if either of the factors have one or more ciphers on the right-hand, the *multiplication* may be performed without regarding the ciphers, till the product of the other figures be found: To which they are to be then affixed on the right. And if the multiplicator have ciphers intermixed, they need not to be regarded at all.—Inſtances of each follow.

12|	358|	1|0	24|00	8013
1|0	6|000	1|0	3|0	5006
120	214 8000	10 0	72 000	48078
				40065
				40113078

Thus much for an idea of *multiplication*, where the multiplicator conſiſts wholly of integers; in the praxis whereof, it is ſuppoſed, the learner is apprized of the product of any of the nine digits multiplied by one another, eaſily learnt from the common table, (ſee TABLE) or otherwiſe.

There are alſo ſome abbreviations of this art.—Thus to multiply a number by 5, you need only add a cipher to it, and then halve it.—To multiply by 15, do the ſame, then add both together. The ſum is the product.

Expedients for the more eaſy and expeditious multiplying large ſums are ſliding rules and Neper's bones.—The want of which may be ſupplied by tabulating the multiplicand.

Where the multiplicator is not compoſed wholly of integers; as it frequently happens in buſineſs, where pounds are accompanied with ſhillings and pence; yards with feet and inches: the method of procedure, if you multiply by a ſingle digit, is the ſame as in ſimple numbers, only carrying from one denomination to another, as the nature of each ſpecies requires. *E. gr.* to multiply 123 *l.* 14 *s.* 9 *d.* 3 *q.* by five: Say, 5 × 3 *q.* = 15 *q.* that is, 3 *d.* 3 *q.* write down the 3 *q.* and proceed, ſaying, 5 × 9 = 45 *d.* that is 3 *s.* 9 *d.* ſet down the 9 *d.* and proceed in the ſame manner through the reſt.

If you multiply by two or more digits, the methods of procedure are as follow.—Suppoſe I have bought 37 ells of cloth at 13 *l.* 16 *s.* 6 *d.* *per* ell, and would know the amount of the whole.—I firſt multiply 37 ells by the 13 *l.* in the common method of *multiplication* by integers, leaving the two products without adding them up; then multiply the ſame 37 ells by 16 *s.* leaving, in like manner, the two products without adding them. Laſtly, I multiply the ſame 37 by the 6 *d.* the product whereof is 222 *d.* which divided by 12, (ſee DIVISION) gives 18 *s.* 6 *d.* and this added to the products of the 16 *s.* the ſum will be 610 *s.* 6 *d.* the amount of 37 ells at 16 *s.* 6 *d.* the ell. Laſtly, the 610 *s.* 6 *d.* are reduced into pounds by dividing them by 20: (ſee REDUCTION) upon adding the whole, the amount of 37 ells at 13 *l.* 16 *s.* 6 *d.* will be found as in the following.

37 ells At 13 pounds.	37 ells At 16 ſhillings.	37 ells. At 6 pence.
111	222	222
37	37	
30 10 6	18 6	
Product 511 10 6	610 6	

Or thus: Suppoſe the ſame queſtion; reduce the 13 *l.* 16 *s.* into ſhillings, the amount will be 276 *s.* reduce 276 *s.* into pence, adding 6, the amount will be 3318 *d.* Multiply the 37 ells by 3318, the amount will be 122766 *d.* which divided by 12; and the quotient 10230 *s.* 6 *d.* reduced into pounds by cutting off the laſt figure on the right, and taking half of thoſe on the left, yields 511 *l.* 10 *s.* 6 *d.* the price of the 37 ells, as before.

Though by theſe two methods any *multiplications* of this kind may be effected, yet the operations being long, we ſhall add a third much ſhorter.—Suppoſe the ſame queſtion: Multiply the price by the factors of the multiplicator, if reſolvable into factors: if not, by thoſe that come neareſt it; adding the price for the odd one, or multiplying it by what the factors want of the multiplier. So, the work will ſtand thus: 37 ells at 16 *s.* 6 *d.*: 6 × 6 = 36 × 1 = 37:

Therefore ———			6
	82	19	0
	497	14	0
	13	16	6
	511	10	6

The price of the 37 ells.

But the moſt commodious is the fourth method, which is performed by aliquot and aliquant parts—where you are to obſerve by the way, that *aliquot parts* of any thing are thoſe contained ſeveral times therein, and which divide without any remainder; and that *aliquant* parts are other parts of the ſame thing compoſed of ſeveral aliquot parts. See ALIQUOT, and ALIQUANT.

To MULTIPLY *by aliquot* parts, is in effect only to divide a number by 3, 4, 5, &c. which is done by taking a 3d, 4th, 5th, &c. from the number to be multiplied. Example. To multiply, *v. g.* by 6 *s.* 8 *d.* Suppoſe I have 347 ells of ribbon at 6 *s.* 8 *d.* *per* ell.

Multiplicand ——— ———	347 ells.
Multiplicator ——— ———	6 *s.* 8 *d.*
Product ——— ———	115 *l.* 13 *s.* 4 *d.*

The queſtion being ſtated, take the multiplicator, which according to the table of aliquot parts is the third; and ſay, the third of three is 1, ſet down 1; the third of 4 is 1, ſet down 1, remains 1, that is, 1 ten, which added to 7, makes 17; then the third of 17 is 5; remains 2 units, *i. e.* two thirds, or 13 *s.* 4 *d.* which place after the pounds. Upon numbering the figures 1, 1, and 5, integers, and 13 *s.* 4 *d.* the aliquot part remaining, I find the ſum 115 *l.* 13 *s.* 4 *d.*

For MULTIPLICATION *by aliquant parts:* Suppoſe I would multiply by the aliquant part 19 *s.* I firſt take for 10 *s.* half the multiplicand; then for 5, which is the fourth, and, laſtly, for 4, which is the 5th. The products of the three aliquot parts that compoſe the aliquant part, being added together, the ſum will be the total product of the *multiplication*, as in the following example; which may ſerve as a model for *multiplication* by any aliquant part that may occur.

Multiplicand	———	356 ells.
Multiplier	—— ——	19 *s.*
		178 *l.* for 10 *s.*
		89 *l.* for 5 *s.*
		71 *l.* 4 *s.* for 4 *s.*
Product	—— ——	338 *l.* 4 *s.*

For the proof of MULTIPLICATION.—The operation is right when the product divided by the multiplier quotes the multiplicand; or divided by the multiplicand quotes the multiplier. —A readier way, though not abſolutely to be depended on (ſee ADDITION) is thus: Add up the figures of the factors, caſting out the nines; and ſetting down the remainders of each. Theſe multiplied together, out of the factum, caſt away the nines, and ſet down the remainder. If this remainder agree with the remainder of the factum of the ſum, after the nines are caſt out; the work is right.

Croſs MULTIPLICATION, or otherwiſe called *duodecimal arithmetic*, is an expeditious method of multiplying things of ſeveral ſpecies, or denominations, by others likewiſe of different ſpecies, *&c.* *E. gr.* Shillings and pence by ſhillings and pence; feet and inches by feet and inches; much uſed in meaſuring, *&c.*—The method is thus.

Suppoſe 5 feet 3 inches to be multiplied by 2 feet 4 inches; ſay, 2 times 5 feet is 10 feet, and 2 times 3 is 6 inches: Again, 4 times 5 is 20 inches, or 1 foot 8 inches; and 4 times 3 is 12 parts, or one inch; the whole ſum makes 12 feet 3 inches.—In the ſame manner you may manage ſhillings and pence, *&c.*

F.	I.
5	3
2	4
10	6
1	8
	1
12	3

MULTIPLICATION, in geometry, or in lines, is effected by ſuppoſing a line *a b*, (*Tab. Geomet. fig.* 9.) called the *deſcribent*, moving perpendicularly along another *b c*, called the *dirigent*. See DESCRIBENT, *&c.*

For by this means the deſcribent forms the rectangle *a d c b*; and if it be divided together with the dirigent into any number of equal parts, will by its motion deſcribe as many little rectangles as the units in the deſcribent and dirigent will produce when multiplied into one another; *viz.* 21. See DIRIGENT.

For when the line *a b* hath moved over one part of *a d*, it will by its three parts have deſcribed the three little rectangles in the firſt column; when it comes to 2, it will have deſcribed three more. And this is the reaſon why *multiplication* in the Latin tongue is uſually expreſſed by the word *ducta*, drawn: (and from hence alſo comes *product*.) As if *a b* were multiplied by *b c*, they ſay, *a b ducta* in *b c*, becauſe the deſcribent is led, as it were, or carried along in an exact poſture upon the dirigent, and by that means deſcribes the rectangle; ſo that the rectangle and product are all one in geometry.

Now, as in all *multiplication* unity is to one factor as the other is to the product, *multiplication* in lines may be performed thus.

Let *a b* (*fig.* 10.) be to be multiplied by *a d*.—Make any angle at pleaſure; on one of the legs ſet off $a\,u =$ to unity; and on the ſame leg ſet off *u d*, the multiplicator (3); then ſet the multiplicand *a b* (2) from *a* on the other leg of the angle; draw *u b*, and parallel to it through *d*, draw *d c*, (6). I ſay, *d c* or 6, is the product: for $a\,u : a\,d :: a\,b : b\,c$.

MULTIPLICATION *of plants*. See FECUNDITY *of plants*.

MULTIPLICATIVES. See NUMERALS.

MULTIPLYING, in the animal œconomy, the producing of one's like. See GENERATION.

Mankind *multiplied* at a prodigious rate before the flood; rabbits, fiſh, and moſt inſects, *multiply* incredibly: The ſingle milt of a cod, examined with M. Leewenhoeck's microſcope, was found to contain more ova than there are animals on the face of the earth. See INSECT, ANIMALCULE, *&c.*

M. Dodart has ſeveral diſcourſes on the multiplication of plants in the *Memoirs of the royal academy of ſciences*. He has examined the beech-tree particularly with this view, and found its increaſe to ſurpaſs all imagination. See FECUNDITY.

MULTIPLYING, in arithmetic, is the finding a number which contains the multiplicand as often as there are units in the multiplier. See MULTIPLICAND, *&c.*

The rule of three conſiſts in *multiplying* the third term by the ſecond, and dividing the product by the firſt. See RULE *of three*.

MULTIPLYING-*glaſs*, a lens, or glaſs in which objects appear increaſed in number. See LENS.

A *multiplying-glaſs*, called alſo *polyhedron*, is a glaſs formed or ground into ſeveral planes, or faces, making angles with one another; through which the rays of light iſſuing from the ſame point undergo different refractions, ſo as to enter the eye from every ſurface in a different direction; as if they came from ſeveral points.

And thus the ſame point is ſeen in ſeveral imaginary foci; and therefore appears *multiplied*. See REFRACTION.—For the phænomena and laws of *multiplying-glaſſes*, ſee POLYHEDRON.

MULTISILIQUOUS *plants*, are the ſame with *corniculate plants*, *viz.* thoſe which, after each flower, have divers diſtinct, ſlender, and frequently crooked, ſiliquæ, or pods, wherein their ſeed is contained: and which when they ripen, open of themſelves, and let the ſeeds drop. See CORNICULATE, and SEMINATION. See alſo PLANT.

MULTITUDE, MULTITUDO, an aſſemblage, or collection, of a great number of things, or perſons.

Multitude is properly the abſtract whereby things are ſaid to be *many*. See MULTUM.

In which ſenſe *multitude* may be conſidered as *number*; (ſee NUMBER) and ſtands oppoſed to *unity*. See UNITY.

In law, ſome will have *multitude* to imply at leaſt ten perſons; but Sir Edward Coke ſays, he could never find it reſtrained by the common law to any certain number, but always left to the diſcretion of the judges.

A MULTO *fortiori*, or *à minore ad majus*, is a way of argumentation often uſed by Littleton; whoſe force is thus: If it be ſo in a feoffment paſſing a new right; much more is it for the reſtitution of an ancient right.

MULTUM, in arithmetic.—If A be one, B one, C one, D one, *&c.* And B, C, and D be not the ſame with A; A, B, C, and D are *multa*, or *plura*, many. Wolfius.

MULTURA *epiſcopi*. See the article MULTA.

MUM, a wholeſome kind of malt liquor, chiefly prepared in Germany. See MALT-LIQUOR.

The proceſs of making *mum*, as recorded in the town-houſe of Brunſwick, the place of moſt note for this liquor, is as follows:

Take 63 gallons of water that has been boiled to the conſumption of a third part; brew it with ſeven buſhels of wheaten-malt, one buſhel of oat-malt, and one buſhel of ground beans; when it is tunned, let not the hogſhead be too full at firſt, and as ſoon as it begins to work, put into it of the inner rind of fir three pounds, tops of fir and birch one pound, carduus benedictus three handfuls, flower of roſa ſolis, one handful or two, burnet, betony, marjoram, avens, penny-royal, wild thyme, of each a handful and a half; of elder-flowers, two handfuls or more; ſeeds of cardamum bruiſed 30 ounces, barberries bruiſed one ounce: put the herbs and ſeeds into the veſſel when the liquor has wrought a while, and after they are added, let the liquor work over the veſſel as little as may be, then fill it up: at laſt, when it is ſtopt, put into the hogſhead ten new-laid eggs unbroken or cracked, ſtop it up cloſe, and drink it at two years end.

Our Engliſh brewers uſe cardamum, ginger, and ſaſſafras inſtead of the inner rind of fir; and add walnut-rinds, madder, red ſanders, and elecampane.

MUMMY*, MUMIA, a carcaſs, or body embalmed or dried in the manner of the ancient Egyptians. See EMBALMING.

> * Menage, after Bochart, derives the word *mummy* from the Arabic *mumia*; of *mum*, wax. Salmaſius, from *amomum*, a kind of perſume. (See AMOMUM.) Though others hold, that in the Arabic tongue, the word *mumia* ſignifies a body embalmed, or aromatized.

Properly ſpeaking, *mummy* is not the fleſh of the deceaſed, but the compoſition wherewith it is embalmed; but in common uſe *mummy* is alſo uſed for the body.

The preparation of *mummy* is of ſo old a ſtanding, that it was in uſe in Egypt before the time of Moſes. The coffin in which the *mummy* is contained is of ſycamore-wood, which is found to keep ſound for the ſpace of 3000 years; but it is very different from our ſycamore.

Mummy is ſaid to have been firſt brought into uſe in medicine by the malice of a Jewiſh phyſician, who wrote that fleſh thus embalmed was good for the cure of divers diſeaſes, and particularly bruiſes, to prevent the blood's gathering and coagulating. The Turks prevent the export of *mummy* in Europe as much as poſſible.

There are two kinds of bodies denominated *mummies*.—The firſt are only carcaſſes, dried by the heat of the ſun, and by that means kept from putrefaction; frequently found in the dry ſands of Lybia.—Some ſay, they are the bodies of deceaſed people buried there on purpoſe to keep them entire without embalming; others, that they are the carcaſſes of travellers, *&c.* over-whelmed with clouds of ſand raiſed by the hurricanes frequent in thoſe deſarts. Be that as it will, theſe *mummies* are of no uſe in medicine, and are only preſerved as curioſities.

The ſecond kind of *mummies* are bodies taken out of the pits, or catacombs near Cairo, wherein the Egyptians depoſited their dead after embalming.—It is theſe make the *mummy* ſo much valued, and to which ſuch extraordinary virtues are aſcribed.

It is ſaid, that all the *mummy* ſold in ſhops, whether brought from Venice or Lyons, or even directly from the Levant by Alexandria, is factitious, and the work of certain Jews, who knowing the value the Europeans ſet on the Egyptian *mummy*, counterfeit it by drying carcaſſes in ovens, after having prepared them with powder of myrrh, caballin aloes, Jewiſh pitch, black pitch, and other coarſe or unwholeſome drugs.

The French Charletans, it ſeems, have likewiſe got the art of preparing *mummies*. Their method is ſimple enough: Out of the carcaſs of a perſon hanged, they take the brain and entrails, dry the reſt in an oven, ſteeping it in pitch, and other drugs. And this they ſell for right Egyptian *mummy*.

Paræus has a very curious treatiſe of *mummies*, wherein he ſhews the abuſes thereof; and makes it appear that they can never be of any real medicinal uſe.

Matthiolus is of the ſame opinion, after Serapion. Both theſe authors take even the Egyptian *mummies* to be no more than bodies embalmed with piſſaſphaltum.

MUMMY, *mumia*, is more particularly uſed for the liquor, or juice oozing from human bodies aromatized and embalmed; gathered in the ſepulchres.—This is the *mummy* chiefly ſpoke of among the ancient writers.

MUMMY alſo denotes a medicinal drug, or a viſcous compoſition partaking of bitumen and pitch, found in the mountains and foreſts of Arabia, and other hot countries of the eaſt; much uſed in embalming of dead bodies.

Dioſcorides ſpeaks of a *mummy* found on the ſea-coaſt near Epidaurus, brought thither by the torrents from the Ceraunian mountains, and there dried by the ſun into huge heaps. It ſmells like bitumen mixt with pitch. The people thereabouts call it *mineral wax*.—In Latin, or rather Greek, it is called *piſſaſphaltus*. See PISSASPHALTUS.

MUMMY, *mumia*, is alſo uſed by ſome phyſicians for I know not what implanted ſpirit, found chiefly in carcaſſes, when the infuſed ſpirit is fled.

The infuſed ſpirit is ſometimes alſo called *mummy* in living ſubjects; and both the one and the other are ſuppoſed to ſerve in tranſplantation. See TRANSPLANTATION.

A plant, for inſtance, bringing this *mumia* from one ſubject to another, the *mumia* joins and unites itſelf immediately, with the *mumia* or ſpirit of the new ſubject; and from this union ariſes a natural and common inclination between the two ſubjects.—And on this principle they account for ſympathetic or magnetic cures. See SYMPATHETIC, *&c.*

MUMMY is alſo uſed among gardeners for a ſort of wax uſed in the planting and grafting of trees. See WAX.

Agricola directs the preparation thereof as follows: Take one pound of common black pitch, and a quarter of a pound of common turpentine; put them together in an earthen pot, and ſet them on the fire in the open air, having ſomething in your hand to cover and quench it in time; the matter to be thus alternately lighted and quenched till all the nitrous and volatile parts be evaporated. To this a little common wax to be added; and the compoſition to be ſet by for uſe.

To apply it in the dreſſing of the roots of trees, melt it, and dip in the two ends of the pieces of root one after another; then put them in water, and plant them in the earth, the ſmall end downward, ſo that the larger may appear a little way out of the earth, and ſo have the benefit of the air; then preſs the earth hard down upon them that they may not receive too much wet. See PLANTING.

MUNDANDIS *vicis & venellis*. See the article VICIS.

MUNDIBURDUS. See ADVOCATE.

MUNDICK, a ſort of marcaſite, or mineral glebe, found in the tin-mines, ſometimes white, yellow, or green, but generally of a dark brown colour.

It is frequently called *maxy*; and appears to be nothing elſe but a kind of ſulphur; fire alone being found to ſeparate it from the tin, in which caſe it evaporates into ſmoke. See TIN.

The *mundick ore* is eaſily diſtinguiſhed by its brown, ſad-coloured glittering, and by its diſcolouring the fingers.—Some ſay it feeds the tin, and yet allow that where there is much *mundick*, there is little or no tin. Vid. *Gibſ. Addit. to Camd. Brit. in Cornwall.*

The tinners ſeparated it with great care from the tin, becauſe it made it thick and curdy.—But of late it has been tried, and wrought ſingly, and is found to turn to very good advantage by affording copper.

The ſteams of the *mundic* are very troubleſome to the miners; yet it is found a good vulnerary; and the miners uſe no other remedy for wounds but waſhing them in water that runs from the *mundick ore*.

MUNDIFICATIVES, or MUNDIFYERS, in medicine, denote *cleanſers*, *purifyers*, or *detergents*. See DETERGENT.

Mundificative plaiſters, or unguents, are ſuch as deterge, and dry, and thus cleanſe ulcers of two kinds of matter, *viz. pus* and *ſanies*. See ULCER.

The chief ingredients in *mundificative* unguents, are gentian, ariſtolochia, enula campana, and vulnerary herbs. See DETERGENT.

MUNDUS, *world*. See the article WORLD.

Anima MUNDI. See the article ANIMA.

MUNERARIUS. See DESIGNATOR.

MUNICIPAL*, MUNICIPALIS, or MUNICEPS, an appellation given to the inhabitants of the municipia, or municipal cities.

* The word is compounded of *munus*, office, employ; and *capio*, I take or hold.

In the Roman law, *municipal* denotes a perſon veſted with the rights and privileges of a Roman citizen.

This title the Romans frequently beſtowed on foreign cities and people; and in effect, it was little more than a title.

MUNICIPAL *cities*, *municipia*, were thoſe whoſe inhabitants were capable of civil offices in the city of Rome.

Theſe, according to Mariana, came ſomewhat ſhort of the privileges of the colonies. See COLONY.

They had no ſuffrages or votes at Rome; but were left to be governed by their own laws, and magiſtrates.—It is true, ſome few *municipal* cities, by particular merit, *&c.* obtained the liberty of votes, which occaſioned that received diſtinction of *municipium ſine ſuffragio, & municipium cum ſuffragio.*

They were ſo called, becauſe *muneris hujus honorarii participes*; but by *munus honorarium*, was meant no more than the bare appellation of a Roman, whereby they were privileged to fight in a legion, as denizens; and not in auxiliary bands, as aſſociates. See CITIZEN.—The firſt who had the honour, were the Cærites.

MUNICIPAL, among us, is now applied to the cuſtomary laws that obtain in any particular city, or province; and which have no authority in the neighbouring places. See CUSTOM, and LAW.

MUNICIPAL *officers*, are thoſe elected to defend the intereſts of cities, their rights and privileges, and to mantain order and good policy; as mayors, and ſheriffs, conſuls, bailiffs, *&c.* See OFFICE.

In Spain, the *municipal* offices are bought. In England, they are obtained by election. See OFFICE, VENAL, *&c.*

MUNIMENTS, or MINIMENTS, the evidences or writings, whereby a man is enabled to defend the title of his eſtate. See MUNIMENT-*houſe*, WRITING, DOCUMENT, *&c.*

Wrangford ſays, the word *muniment* includes all manner of evidence, deeds, charters, *&c.* See EVIDENCE, *&c.*

MUNIMENT-*houſe*, a little, ſtrong apartment in cathedral and collegiate churches, caſtles, colleges, or the like, deſtined for keeping the ſeal, evidences, charters, *&c.* of ſuch church, college, *&c.* called *muniments*, or *miniments*. See ARCHIVE.

MUNIMINA, the grants, or charters of kings, and princes to churches*, ſo called, becauſe *cum eis muniuntur* againſt all thoſe who would deprive them of thoſe privileges.

* The word is formed of the Latin *munio*, I defend, ſtrengthen.

MUNIONS, in architecture, the ſhort upright poſts or bars which divide the ſeveral lights in a window frame. See WINDOW.

MUNITION, or AMMUNITION, the proviſions wherewith any place is furniſhed in order for defence; or wherewith a veſſel is ſtocked for a voyage; or that follow a camp for its ſubſiſtence. See AMMUNITION.

MUNITION-*bread* is the proportion of bread diſtributed every day to the ſoldiers of a garriſon or army.—Each officer is allowed ſo many rations of *munition-bread*. See RATION.

MUPHTI, or MUFTI, the chief, or patriarch of the Mahometan religion, reſiding at Conſtantinople. See MAHOMETANISM.

The *muphti* is the ſovereign interpreter of the Alcoran, and decides all queſtions of the law. See ALCORAN, *&c.*

He takes place of the baſhaws; and his authority is often terrible to the grand ſignior himſelf.—It is he girds on the ſword to the grand ſignior's ſide; which ceremony anſwers to the coronation of our kings.

MURAGE, MURAGIUM, in our cuſtoms, a reaſonable toll to be taken of every cart or horſe coming laden into a city or town, for the building or repairing the walls thereof.

MURAL, ſomething belonging to a *wall*; which the Latins call *murus*. See WALL.

MURAL *crown*, among the ancient Romans, was a kind of crown indented a-top, like the battlements of a wall. See CROWN.

The *mural crown* was the reward of thoſe who firſt mounted the walls of the enemy: whence it was alſo called *corona obſidionalis*.

MURAL *arch*, is a wall, or walled arch placed exactly in the plane of the meridian, *i. e.* upon the meridian-line; for the fixing of a large quadrant, ſextant, or other inſtrument, to obſerve the meridian altitudes, *&c.* of the heavenly bodies. See MERIDIAN-*line*, and MERIDIAN-*altitude*.

Tycho Brahe was the firſt who uſed a *mural-arch* in his obſervations; after him Mr. Flamſteed, de la Hire, *&c.* uſed the ſame means. See COELESTIAL, *&c.*

MURDER. See the article MURTHER.

MURDERING *battery*. See the article BATTERY.

MURE.—*Counter*-MURE. See the article COUNTER-*mure*.

MURENGERS, two officers of great antiquity in the city of Cheſter, being two of the principal aldermen choſe yearly to ſee the walls kept in good repair, and to receive certain toll and cuſtom for the maintenance thereof.

MURING, the walling, or raiſing the walls of a building. See WALL.

MURORUM *domeſticus*. See the article DOMESTICUS.

MURRAIN, *gargle*, a mortality, or contagious diſeaſe among cattle. See MORTALITY.

Murrains are occaſioned various ways, but principally by a hot, dry ſeaſon; or rather by a general putrefaction of the air, which begets an inflammation in the blood, and a ſwelling in the throat, which ſoon proves mortal, and is communicated from one to another.

The ſymptoms are generally a hanging down and ſwelling of the head, rattling in the throat, ſhort breath, palpitation of the heart, ſtaggering, abundance of gum in the eyes, &c. breath hot, and tongue ſhining.

The moſt remarkable *murrain* we hear of, is that mentioned in the *Philoſophical Tranſactions*, which ſpread itſelf through Switzerland, Germany, into Poland, &c.

The contagion ſeemed to propagate itſelf in form of a blue miſt, which fell on the graſs where the cattle grazed, inſomuch that whole herds returned home ſick, and being very dull, and forbearing their food, moſt of them died away in twenty-four hours time. On diſſection were found large corrupted ſpleens, ſphacelous and corroded tongues, &c. Thoſe people who managed them, without a due regard to their own health, were infected by them, and died like the beaſts.

Some imagine it had its riſe from noxious vapours thrown out of the earth in three diſtinct earthquakes perceived in the neighbourhood of the place where it began: Though Dr. Slare rather thinks it owing to ſwarms of volatile inſects. The antidote for the ſound, and the medicine for the ſick, were the ſame, *viz.* equal parts of ſoot, gun-powder, brimſtone, and ſalt, with as much water as would waſh it down, a ſpoonful in a doſe.

MURREY, in heraldry, a kind of purple colour, called alſo *ſanguine*. See Sanguine, and Purpure.

MURRHINE, Murrhinus, ΜΟΡ'ΡΙΝΟΣ, in antiquity, an appellation given to a delicate ſort of earthen or ſtone ware, brought from the eaſt, whereof cups and vaſes were made, which added not a little to the ſplendor of a Roman banquet. Critics are divided concerning the matter of the *pocula* or *vaſa murrhina*, *murrina*, or *murrea*. Some will have them to have been the ſame with our porcelane, or china-ware. See Porcelane.

The generality hold them to have been made of ſome precious kind of ſtone, which was found chiefly, as Pliny tells us, in Parthia, but more eſpecially in Carmania.—Some conjecture them to have been of agate, others of onyx, others of coralline: Baronius doubtleſs was fartheſt out of the way, when he took them to be made of myrrh congealed and hardened.

Pompey is recorded as the firſt who brought theſe *murrhine* veſſels out of the eaſt, which he exhibited in his triumph, and dedicated to Jupiter Capitolinus.—But private perſons were not long without them. So fond, in effect, did the Roman gentry grow of them, that a cup which held three ſextaries was ſold for ſeventy talents. T. Petronius, before his death, to ſpite Nero, (or as Pliny expreſſes it, *ut menſam ejus exhæredaret*, to diſinherit his beaufet) broke a baſon, *trulla murrhina*, valued at three hundred talents, on which that emperor had ſet his heart.

MURTHER *, or Murder, the act of killing another with violence, injuſtice, and effuſion of blood. See Homicide.

* The word comes from the Saxon *morth*, death; which ſome will have to ſignify a violent death; whence the barbarous Latin, *murdrum*, and *mordrum*.

Among the number of popular errors, is the notion which has obtained, that the dead body would bleed in the preſence, or upon the touch of the *murtherer*.

The crime of *murther* is puniſhed with death in almoſt all nations. See Puniſhment.

Murther, in our law, denotes a wilful, and felonious killing another upon prepenſed malice, whether ſecretly or openly, and whether Engliſhman or foreigner, living under the king's protection.

This prepenſed malice, which makes the eſſence of *murther*, is twofold: 1°, *Expreſs*, where it may be evidently proved that there was ill will. 2°, When one kills another ſuddenly, he having nothing to defend himſelf withal; as in going over a ſtile, or the like: For in ſuch a caſe, or when a man kills a mere ſtranger, the law preſumes he had malice, or that he would not have done it without any manner of provocation.

Formerly, *murther* was reſtrained to a clandeſtine, and treacherous killing.—Thus, *Murdritus homo antiquitus dicebatur, cujus interfector neſciebatur ubicumque vel quomodocumque eſſet inventus. Nunc adjunctum eſt, licet ſciatur quis murdrum fecerit, homicidium per proditionem.* Leges Hen. I.—*Arthurem nepotem propriis manibus per proditionem interfecit, peſſimo mortis genere quod Angli* murdrum *appellant.* Matt. Paris, an 1216.

Self-Murther, is otherwiſe called *ſuicide*. See Felo *de ſe*.

MURTHERERS, or Murthering *pieces*, are ſmall pieces of ordinance, either of braſs or iron, having chambers, (that is, charges made of braſs or iron) put in at their breeches. See Chamber, and Ordinance.

They are moſtly uſed at ſea, at the bulk-heads of the forecaſtle, half-deck, &c. in order to clear the decks when an enemy boards the ſhip.

MUSCADINE *, a rich wine, of the growth of Provence, Languedoc, Cividad, &c. See Wine.

* The word, as well as the liquor, is French: Some fetch its original from *muſk*; the wine being ſuppoſed to have a little of the ſmell of that perfume: others from *muſca*, a fly, becauſe the flies are extremely fond of its grapes; as the Latins had their *vinum apianum*, ſo called *ab apibus*, from the bees which fed on it.

The way of making *muſcadine* at Frontignac is as follows: They let the *muſcadine* grapes grow half dry on the vine; as ſoon as they are gathered, they tread and preſs them immediately, and tun up the liquor, without letting it ſtand, and work in the fat; the lee occaſioning its goodneſs.

MUSCLE *, Musculus, in anatomy, a fleſhy, fibrous part of the body of an animal, deſtined to be the organ or inſtrument of motion. See Motion.

* The word is derived from the Greek μυς, or the Latin *mus*, a mouſe; on account of the reſemblance it is ſuppoſed to bear to a skinned mouſe.—Dr. Douglas will have it from μυειν, to ſhut or contract; that being the proper office of a *muſcle*.

The *muſcle* is a bundle of thin, parallel plates; and is divided into a great number of faſciculi, or little *muſcles*, each incloſed in its proper membrane, from the internal ſurface whereof, paſs an infinite number of tranſverſe filaments, which interſect the *muſcle* into ſeveral diſtinct areas, filled with their reſpective faſciculi of fibres.—See *Tab. Anat.* (*Myol.*) *fig.* 1, 2, 3, 5, 7, &c. See alſo the article Fibre.

A *muſcle* is uſually divided into three parts, the *head*, the *tail*, and the *belly*.—The *head* and *tail*, which are alſo called *tendons*, are the two extremes of the *muſcle*; whereof the firſt is fixed to the ſtable part, and the latter to the part intended to be moved. See Tendon.

The *venter* or *belly* is the body of the *muſcle*, being a thick, fleſhy part, into which are inſerted arteries and nerves, and out of which iſſue veins and lymphæducts.

All theſe parts of a *muſcle*, the belly, and the tendons, are compoſed of the ſame fibres: Their only difference conſiſts in this, that the fibres of the tendons are more cloſely and firmly bound together than thoſe of the belly, which are more looſe. Hence in the belly there is room for a ſufficient quantity of blood to give them an appearance of redneſs; and the whiteneſs of the tendons only proceeds from the blood's being in ſome meaſure excluded by the tightneſs of their contexture.—The difference then between the belly and the tendons ſeem to be the ſame as between a ſkein of thread, and a cord made of the ſame thread.

All the *muſcles* act by having their bellies inflated or ſwelled: for by that means they are ſhortened, ſo as to draw, or preſs the ſolid bodies to which they are faſtened, according to the direction of their fibres.—All the difficulty then in *muſcular* motion, is, to aſſign their fabric, and the cauſe of their ſwelling.

Every ſimple *muſcle*, then, conſiſts of one fleſhy belly, and two tendons; but may be again divided into others ſimilar, though leſs; and thoſe again into others ſtill leſs, yet ſtill ſimilar to the great one: Which diviſion may be carried on to a degree of ſubtility that exceeds all imagination; though it is reaſonable to think it muſt have an end.—That laſt, therefore, being ſimilar to the firſt, muſt, in like manner, have its *belly* and *tendons*; and this is what we ordinarily call a *muſcular fibre*, in an aſſemblage or union of ſeveral whereof, a *muſcle*, properly ſo called, conſiſts. See Fibre.

Some take the *muſcular fibres* to be productions of the arteries and veins, or the capillaries of thoſe veſſels inoſculated with, and continued to each other; by the intumeſcence of whoſe contents, the extremities are drawn nearer each other, and by conſequence, the bone to which the moveable part is fixed, approximated to the other.—But that they are, in truth, neither venous, nor arterious, nor lymphatic veſſels, is evident from the laſt obſervation. Whether they are veſicular; or whether they only conſiſt of ſingle threads, may be ſtill a queſtion!

Dr. Boerhaave, from a conſideration that the nerves enter every *muſcle* along with its veins and arteries, and that there laying aſide their outer integument, they are ſo diſtributed through the whole body of the *muſcle*, as that no one point can be aſſigned wherein a part of them is not found; that thoſe nerves terminated here; and that in other parts of the body the extremities of the nerves are expanded, as it were, into membranes; concludes, that the *muſcular fibres* are nothing elſe but extremely ſlender expanſions of the nerves ſtript of their integument, hollow within, and of the figure of a *muſcle*, and full of a ſpirit communicated by the nerve from its origin in the brain or cerebellum, by the continual action of the heart. See Nerve.

Of theſe fibres united, are formed faſciculi or bundles; which, again, have each their ſeveral membrane, wherein they are involved, and kept diſtinct from others. This membrane is extremely ſlender and porous within, full of oil, which is accumulated in time of reſt, and ſpent in motion, furniſhed by the arteries; and this oil, in conjunction with a ſmooth mucous juice ſecreted by ſmall mucilaginous glands, interſperſed among theſe faſciculi, ſerves to lubricate the parts, and preſerve the faſciculi from fretting on each other.

Now, beſides the nerves, there are arteries alſo carried into the *muſcles*, and thoſe in ſuch abundance, and of ſuch contexture, that a man might be inclined to think the whole body of the *muſcle* compoſed of them. — Theſe are principally diſtributed among the faſciculi, and the membranes that ſeparate them, and perhaps alſo in the external ſurface of each fibrilla, where they terminate in reticular plexus's, in little oily ſecretories, ſmall lymphatics, and perhaps in hollow fibrillæ like nerves; which fibrillæ may again either terminate in the cavity of the nervous muſcular fibres, or make others like them. — This, at leaſt, is clear, that every branch of an artery in the *muſcles* has its correſponding little vein, which united to the other, increaſes its bulk; whence the blood-veſſels of the *muſcles* are alſo lymphatics.

Of two ſuch *muſcles* as have been deſcribed, faſtened in oppoſite ſituations to each other, moſt of the *muſcles*, or pairs of *muſcles* we know of, conſiſt.

It has been already obſerved, that the tendon of a *muſcle* conſiſts of the ſame number of fibres with the *muſcle* itſelf; with this difference, that the cavities of the muſcular fibres diminiſhing, and loſing of their former diameter, form one compact, hard, rough, dry, narrow body, which is but little vaſcular. — From what has been ſaid then it appears, that the redneſs of a *muſcle* is owing to the blood; and its bulk to the fulneſs of the arteries, veins, oily cells, and lymphatics.—Hence we ſee, why in old age, leanneſs, conſumptions, atrophies, conſtant heat, and hard labour, their redneſs as well as bulk are ſo diminiſhed; and yet in old age, leanneſs, *&c.* the motion remains. This may be effected, when the *muſcles* have no redneſs left; as appears in inſects, whoſe fleſh is not perceivable.

The fibres, faſciculi, arteries, and nerves, may be ſeparated from each other in a live or a dead body, without breaking: They are always in a degree of tenſion, and endued with a contractive force; ſo that when cut aſunder, the ends fly back from each other; and then they become ſhorter, their bulk is leſſened, and they contract themſelves into an undular kind of ſurface, and throw off their proper juices. Hence it appears that they are always in a ſtate of violence, are ever oppoſing their elongation, ever endeavouring to ſhorten themſelves, but more in a live body than in a dead one; and therefore require antagoniſts.

If the brain be ſtrongly compreſſed, or have any violent contuſion; if it be ſuppurated, obſtructed, or torn, the voluntary action of all the *muſcles* immediately ceaſes; as well as all ſenſe and memory: however the ſpontaneous action of the *muſcles* in the heart, lungs, the viſcera, and vital parts, remains. — Theſe ſame alterations being made in the cerebellum, the action of the heart, lungs, and life itſelf, ceaſes; when yet the vermicular motion continues a long time after in the ſtomach and inteſtines.

The nerve of any *muſcle* being compreſſed, tied up, corrupted, or cut, all the motion of that *muſcle*, both vital and voluntary, immediately ceaſes; and if a nervous trunk ſending branches to ſeveral *muſcles*, be thus bound up, cut, *&c.* they are all affected in the ſame manner. — The ſame things being done in any part of the ſpinal marrow, the action of all the *muſcles* whoſe nerves ariſe from the part affected, is deſtroyed: And, the ſame thing being done to the artery which carries blood to one or more *muſcles*, the effect is the ſame.

The tendon of a *muſcle* in action, does not undergo any ſenſible alteration, but the belly ſhortens, becomes hard, pale, ſwoln, protuberant; the tendons are approached nearer, and the more moveable part faſtened to the tendon, is drawn towards the other leſs moveable: which action of a *muſcle* is called its *contraction*, which is much greater and ſtronger than that inherent contraction obſerved under the firſt phænomenon; and therefore is not natural, but ſuperadded.—The tendon of a *muſcle* not in action, is ſtill the ſame; but the belly ſofter, redder, laxer, longer, and flatter: and this ſtate of a *muſcle* is called its *reſtitution*, though it is uſually owing to the contrary action of its antagoniſt; for that being fruſtrated, the contraction of the other continues, as not being balanced by the action of an antagoniſt.

If one antagoniſt remain at reſt while the other is in action, the member in that caſe will be bent; if both act at the ſame time, it will be fixed and immoveable; if neither act, it will be indifferent, and ready to be moved whither the leaſt exceſs ſhall carry it.

All which changes are performed in the ſmalleſt moment of time, and in the whole *muſcle* at once; ſo that they can paſs and repaſs reciprocally without leaving any trace in the body behind them.

By injecting warm water into the artery of a quieſcent *muſcle*, even that of a dead carcaſs, its contraction is reſtored; and that long after death.—The bulk of a *muſcle* is increaſed rather than diminiſhed by every experiment of its contraction.

A limb being bent, by ſome external force, againſt the will, the flexor *muſcle* of that member aſſumes a ſtate of contraction, as if acted by its proper motion; though not altogether ſo ſtrenuouſly.—The will remaining indifferent, all the voluntary *muſcles*, and all their veſſels, are equally full, and moved by the blood and ſpirits equably conveyed to them, and that throughout the whole body at once.

For the application of this ſtructure of the *muſcles*, in accounting for the great phænomenon of muſcular motion, ſee MUSCULAR *Motion*.

As to the muſcular fibres, or, which comes to the ſame, the faſciculi of muſcular fibres, they have not always the ſame ſituation with regard to each other, nor run in the ſame direction, but ſometimes run parallel to themſelves and their tendons; and are ſometimes diſpoſed obliquely both to their tendons and to each other. Hence there ariſe two different kinds of *muſcles*: the one direct, and parallel; which ſome call *ſimple* MUSCLES. The other inclined, or oblique; called *compound* MUSCLES.

Under the firſt of theſe kinds are included ſeveral other ſpecies: for, firſt, either the fleſhy fibres run ſtrait from one extreme to the other, as in the *ſartorius*, &c. or are turned into a circle, as in the *ſphincters* of the bladder, and anus; or twiſted into a ſpiral, as in the *œſophagus*: And hence they come to be called *recti*, *orbiculares*, and *ſpirales*. See RECTI, SPHINCTER, ORBICULARES, *&c.*

The ſecond kind alſo includes various ſpecies, according to the various angles which the oblique fibres make with the tendons; ſome inclining equally to each tendon, ſo as to form a rhombus, or acute angled parallelogram with them, whence the *muſcles* are called *rhomboidales*; others ariſing from two parallel tendons, are inſerted obliquely into one common tendon, as in the biceps of the hand; laſtly, others ariſing from the periphery of the circle, concur in a centre, and form *muſcles* called *radiæi*. See RHOMBOIDES, RADIÆUS, *&c.*

There are divers other ſpecies, and diviſions of *muſcles*.—Some authors diſtinguiſh them into *muſcles* of *voluntary*, and of *involuntary*, or *neceſſary motion*.

MUSCLES *of involuntary*, or *neceſſary motion*, have their contracting and extending powers within themſelves, and have no antagoniſt: ſuch are the heart and lungs ſuppoſed to be. See HEART, and LUNGS.

MUSCLES *of voluntary motion*, which we more peculiarly denominate *muſcles*, and which are thoſe we have here chiefly regard to, have each of them their antagoniſt *muſcles*, which act alternately in a contrary direction; the one being ſtretched and extended, while the other is contracted at the inſtance of the will. See MOTION.

The *muſcles* have alſo different names from their different actions, ſituations, forms, *&c.* Thoſe which ſerve to move the ſame members contrary ways, are called *antagoniſts*; and thoſe that concur to the ſame action, *fellows*, or *pairs*.

Digaſtric MUSCLES, are thoſe which have two bellies.—*Trigaſtrics*, thoſe with three. See DIGASTRIC, and BIVENTER.

Sphincter MUSCLES, are thoſe deſtined to ſhut ſeveral apertures and paſſages in the body; as the *muſcle* at the neck of the bladder, and that of the anus, which have the ſame effect with the ſtring of a purſe to cloſe thoſe parts. See SPHINCTER.

Some *muſcles* have two or three heads, called *bicepes* and *tricepes*. See BICEPS, TRICEPS, *&c.*

We call *elevators*, thoſe which lift up or raiſe the parts; *depreſſors*, thoſe which move them downwards. See ELEVATOR, *&c.*

Flexors, thoſe which bend them; *extenſors*, thoſe which ſtretch them out; *adductors*, thoſe which move the parts inwards; *abductors*, thoſe which move them outwards; *rotators*, thoſe which move them round. See FLEXOR, EXTENSOR, ABDUCTOR, ADDUCTOR, ROTATOR, *&c.*

Muſcles have alſo different names from their different figure; ſome reſembling a bat; ſome a lizard; and ſome a turbet: Some are triangular, others ſquare, others ſcalenous, others pentagonal, others pyramidal, round, *&c.* Whence the names of *deltoides*, *rhomboides*, *ſcalenus*, *trapezius*, &c. See DELTOIDES, SCALENUS, TRAPEZIUS, *&c.*

Anatomiſts are not agreed on the number of *muſcles* in the human body; ſome reckon five hundred and twenty-nine; ſome four hundred and forty-ſix; and others only four hundred and thirty-five.—The calculus, according to theſe laſt, is as follows. Two of the forehead; two of the occiput; ſix of the eyelids; twelve of the eyes; ſeven of the noſe; eight of the external ear; four of the internal ear; thirteen of the lips; eight of the tongue; four of the palate; fourteen of the larynx; ſeven of the pharynx; ten of the os hyoides; twelve of the under jaw; fourteen of the head; eight of the neck; eight of the omoplates; eighteen of the arms; twelve of the elbows; eight of the radii; twelve of the carpi; forty-eight of the fingers; fifty-ſeven of uſe in reſpiration; ſix of the loins; ten of the abdomen; two of the teſticles; one of the bladder; four of the penis; four of the anus; thirty of the thighs; twenty-two of the legs; eighteen of the feet; forty-four of the toes.

The following table of the names and offices of the ſeveral *muſcles* in the body is taken from Dr. Keil.

Frontales, ſerve to pull the ſkin of the forehead upwards.

Occipitales, pull the ſkin of the hind-head upwards.

Attollens
Deprimens } *auricularum*.

Internus malleoli, diſtends the tympanum.

Externus malleoli, relaxes the tympanum.

Obliquus malleoli.

Muſculus ſtapedis, moves the ſtirrup.

Corrugator ſupercilii.
Rectus palpebræ ſuperioris, lifts up the upper eye-lid.
Orbicularis palpebrarum, ſhuts both eye-lids.
Attollens
Deprimens
Abductor } *oculorum.*
Adductor
Obliquus major, pulls the eye forwards, and obliquely downwards.
Obliquus minor, pulls the eye forwards, and obliquely upwards.
Attollens
Dilatans } *nares.*
Deprimens
Inciſivus, pulls the upper lip upwards.
Triangularis, pulls it downwards.
Caninus
Elevator labii inferioris } pull the lower lip upwards.
Quadratus, pulls it downwards.
Zygomaticus, draws both lips obliquely to either ſide.
Orbicularis, draws both lips together.
Buccinator, thruſts the meat between our teeth.
Temporalis
Maſſeter } pull the jaw upwards.
Pterygoidæus internus, draws the jaw to either ſide.
Pterygoidæus externus, draws the jaw forwards.
Quadratus, pulls the jaw and the cheeks downwards.
Digaſtricus, pulls the jaw downwards.
Periſtaphylinus internus, pulls the uvula forwards.
Periſtaphylinus externus, pulls the uvula backwards.
Stylogloſſus, draws the tongue upwards.
Geniogloſſus, pulls it out of the mouth.
Ceratogloſſus, pulls it into the mouth.
Geniohyoidæus, pulls the os hyoides and tongue upwards and forwards.
Sternohyoidæus, pulls the os hyoides downwards.
Milohyoidæus, pulls it obliquely upwards.
Coracohyoidæus, pulls it obliquely downwards.
Stylohyoidæus, pulls it to either ſide, and ſomewhat upwards.
Stylopharingæus, pulleth up and dilateth the pharynx.
Oeſophagæus, ſtreightens the pharynx.
Sternothyroidæus, pulls the thyroides downwards.
Hyothyroidæus, pulls the thyroides upwards.
Cricothyroidæus.
Cricoarytænoidæus poſticus.
Cricorytænoidæus lateralis.
Thyroarytænoidæus, dilates the glottis.
Arytænoidæus, contracts the glottis.
Splenius } move the head backwards.
Complexus
Rectus major } nod the head backwards.
Rectus minor
Obliquus inferior
Obliquus ſuperior } perform the ſemicircular motion of the head.
Maſtoidæus
Rectus internus major } nod the head forwards.
Rectus internus minor
Rectus lateralis, nods the head to one ſide.
Intercoſtales interni & externi
Subclavius } pull the ribs upwards in inſpiration.
Serratus anticus major
Serratus poſticus ſuperior
Triangularis
Serratus poſticus inferior } make the motion of the ribs downward in expiration the ſwifter.
Sacrolumbaris
Diaphragma, uſed in inſpiration and expiration.
Obliquus externus
Obliquus internus } compreſs the parts contained in the lower belly; aſſiſt the motion of the ribs downwards in expiration; and help to bend the vertebræ of the loins forwards.
Tranſverſalis
Rectus
Pyramidalis
Longiſſimus dorſi, keep the body erect.
Tranſverſalis dorſi, move the body obliquely backwards.
Interſpinalis, draws the acute proceſſes near one another.
Quadratus lumbrorum, draws the vertebræ of the loins to one ſide.
Longus } bend the vertebræ of the neck.
Scalenus
Pſoas parvus, helps to bend the vertebræ of the loins.
Cremaſter, draws up the teſticles in the act of generation.
Erectores penis.
Tranſverſales penis.
Acceleratores urinæ.
Erectores clitoridis.
Sphincter veſicæ, contracts the neck of the bladder, that the urine may not run continually.
Levatores ani, draw up the anus.
Sphincter ani, ſhuts the anus.
Serratus anticus minor, draws the ſhoulder-blade forwards.
Trapezius, moves it upwards, backwards, and downwards.
Rhomboides, pulls it backwards.
Levator ſcapulæ, pulls the ſhoulder-blade upwards.

Deltoides
Supra ſpinatus } lift the arm upwards.
Coracobrachialis
Teres major
Latiſſimus dorſi } pull the arm downwards.
Pectoralis, moves the arm forwards.
Infra ſpinatus
Tranſverſalis } draw the arm backwards.
Subſcapularis
Biceps
Brachiæus internus } bend the fore-arm.
Longus
Brevis
Brachiæus externus } extend the fore-arm.
Anconæus
Rotundus } perform the motion of pronation, or turn the
Quadratus palm of the hand downwards.
Longus } perform the motion of ſupination, or turn the
Brevis palm of the hand upwards.
Cubitæus internus } bend the wriſt.
Radiæus internus
Cubitæus externus } extend the wriſt.
Radiæus externus
Palmaris, helps the hand to graſp any thing cloſely.
Palmaris brevis, makes the palm of the hand concave.
Sublimis } bend the fingers.
Profundus
Extenſor digitorum communis.
Lumbricales, aſſiſt in bending the firſt joint of the fingers.
Interoſſei interni, draw the fingers to the thumb.
Interoſſei externi, draw the fingers from the thumb.
Flexor pollicis longus.
Flexor pollicis brevis.
Extenſor primi.
——*ſecundi.*
——*tertii internodii pollicis.*
Thenar, draws the thumb from the fingers.
Antithenar, draws the thumb to the fingers.
Abductor indicis.
Extenſor indicis.
Hypothenar, draws the little finger from the reſt.
Extenſor auricularis.
Pſoas
Iliacus } bend the thigh.
Pectinæus
Glutæus major
Glutæus medius } extend the thigh.
Glutæus minor
Triceps, pulls the thigh inwards.
Pyriformis
Gemini } move the thigh outwards.
Quadratus
Obturator internus } help to move the thigh obliquely and
Obturator externus circularly.
Seminervoſus
Semimembranoſus } bend the leg.
Biceps
Gracilis
Rectus
Vaſtus externus } extend the leg.
Vaſtus internus
Cruræus
Sartorius, makes the legs croſs one another.
Poplitæus, turns the leg ſomewhat inwards.
Membranoſus, turns it a little outwards.
Tibialis anticus } bend the foot.
Peronæus anticus
Gaſtrocnemii
Solæus } extend the foot.
Plantaris
Tibialis poſticus, moves the foot inwards.
Peronæus poſticus, moves the foot outwards.
Profundus
Sublimis } bend the four leſſer toes.
Lumbricalis
Longus } extend the four leſſer toes.
Brevis
Flexor pollicis.
Extenſor pollicis.
Thenar, draws the great toe from the reſt.
Antithenar, draws it to the reſt.
Flexor pollicis longus.
—— *brevis.*
Abductor minimi digiti } draw the toes toward the great toe.
Interoſſei interni
Interoſſei externi, draw them from the great toe.
Tranſverſalis, brings all the toes cloſe to one another.

MUSCOVITE *bible.* See the article BIBLE.

MUSCOVITE *coinage.* See the article COINAGE.

MUSCOVITE *coins.* See the article COINS.

MUSCOVITE *meaſures.* See the article MEASURE.

Muscovite *moneys.* See the article Money.

MUSCULAR, or Musculous, ſomething that relates to the muſcles; or that partakes of the nature thereof. See Muscle.

In which ſenſe we ſay, *muſcular fibre, muſcular coat, muſcular fleſh, muſcular veins, muſcular arteries,* &c.

Muscular *arteries,* two arteries proceeding from the ſubclavians, and diſtributed among the hind-muſcles of the neck.

The ſame denomination is alſo given by ſome to certain arteries of the loins: Theſe are divided into *upper* and *under.* — *Muſculares ſuperiores,* the *upper-muſculars,* proceed from the large artery, and loſe themſelves in the fleſh.

The *under-muſculars, muſculares inferiores,* are branches of the inner iliac arteries. See Artery.

Muscular, *muſcularis,* is alſo a name given to two arteries of the thigh, the one called the *internal muſcular,* as being diſtributed among the inner muſcles of the thigh; the other the *external muſcular,* becauſe it proceeds to the outer part.

Muscular *fibres,* are fine threads, or fibres, already deſcribed, whereof the body of muſcles is compoſed. See Muscle.

Anatomiſts are exceedingly divided as to the nature of theſe fibres. Some will have them blood-veſſels, *viz.* veins and arteries; others, nerves, *&c.* See Artery, Nerve, *&c.*

Some reſtrain *muſcular* fibres to the longitudinal and red, called alſo *fleſhy fibres:* The tranſverſe, and ſpiral ramifications wherewith the former are bound about, they call *nervous fibres.* See Fibre.

Dr. Morgan endeavours to prove, that all the fibres which enter the ſtructure and compoſition of a muſcle, are endued with an intrinſic elaſticity, ſpring, or power of contracting or reſtoring themſelves, as a given weight or force, by which they may be ſtretched; and that this elaſticity, or contractive reſtitutive power, being a natural inherent property of the fibres themſelves, does not depend on the mixture, rarefaction, or effervеſcence of any fluids, or humours whatſoever. See Muscular *motion.*

Muscular *fleſh.* See the article *Muſcular* Flesh.

Muscular *membrane, membrana* Musculosa, is a membrane ſuppoſed to inveſt the whole body, immediately under the adipoſe membrane; called alſo *panniculus carnoſus,* and *membrana muſculorum communis.* See Panniculus *carnoſus,* and Membrana *communis.*

Muscular *motion,* is the ſame with voluntary or ſpontaneous motion; thus called, becauſe effected by means of the contraction and dilatation of the muſcles. See Motion, Muscle, *&c.*

The mechaniſm of a *muſcle* we have delivered at large; but how this mechaniſm is employed to produce motion in animals, is matter of endleſs doubt.—The generality of writers ſuppoſe the belly of the *muſcle* to be ſwelled, and thus its extremes brought nearer; and conſequently the part it is fixed to, moved.

The ſtructure of a *muſcle* we have ſhewn to be ſuch as renders it capable of being ſwelled and contracted, and by that means of having its extremities brought nearer each other, which is its proper action: But how the contraction is effected, is the point in diſpute!

The generality account for it from the influx of ſome fluid into the muſcular fibres.—Others ſolve it from the natural elaſticity of thoſe fibres.—And the retainers to a fluid, are ſubdivided as to the particular fluid employed for this purpoſe.

From the ſtructure and phænomena of the *muſcles* above laid down, we may gather the properties of the hidden cauſe that moves the *muſcles*; *viz.* *1ſt,* That it may either be preſent or abſent in a *muſcle*; and therefore, *2dly,* May enter into it, and go out again: *i. e.* *3dly,* It is derived to it from ſome other place, and paſſes from it elſewhere: And, *4thly,* All this, by an inſtantaneous direction of the will: *5thly,* And in the ſame moment of time, wherein the *muſcle* is contracted, muſt paſs from within outwards to every point of the ſurface of the *muſcle*; that is, *6thly,* It muſt be at once equally diſtributed throughout the whole belly of the *muſcle:* And therefore, *7thly,* fill and dilate the membranes of the fibres, change them from an oblong into a more ſpherical figure, lengthen their leſs diameter, and diminiſh their longer, and ſo draw the tendons nearer each other: *Laſtly,* That it muſt have its riſe from the cerebrum and cerebellum, the origin of the nerves, and be powerful enough to overcome thoſe obſtacles which here ſtrongly reſiſt it.—On the whole then, it muſt be a moſt fluid, ſubtile, active body, and be applied with ſome energy within the *muſcle.*

Now all the fluids in the body that have any pretenſions to theſe properties, that are any way qualified to produce the phænomena above, or that have been alledged as the cauſe of *muſcular motion,* are the *animal ſpirits,* (or, as our later writers call it, the *nervous juice*) and the *blood:* but as each of theſe ſingly ſcarce appears adequate to the effect, our authors have ſuppoſed them to mix in the *muſcles,* and each to contribute to the action of the other.—But the animal ſpirits ſeem to have the greateſt number of advocates, though their exiſtence was never yet fully proved; beſides that the manner of their action, as aſſigned by authors, ſeems to be arbitrary and precarious.

Some, with the learned Dr. Willis, make the tendons a receptacle for the ſpirits, which are raiſed at the inſtigation of the will, and ſent thence into the belly of the *muſcle*; where meeting with the active particles of the blood, they ferment, and cauſe an intumeſcence, and ſo contract the *muſcle.*

Others, among whom Des Cartes and his followers, allow no receptacle for them but the brain, and ſend them thence through the nerves like lightening at every ſummons of the will; becauſe they cannot allow the tendons to be a proper lodgment, on account of the cloſeneſs of their contexture, nor can believe that the animal ſpirits ſhould remain there unactive.

Others, among whom M. du Verney, imagine this intumeſcence may be without fermentation, by the animal ſpirits, and a juice from the arteries running into the tendons and fleſhy fibres, and extending them; as ropes, *&c.* ſwell in moiſt weather.

Dr. Chirac, and others, maintain, that every muſcular fibre, beſides its vein, artery, and nerve, has alſo from ſpace to ſpace, ſeveral little cavities, or pores of an oblong figure, when the *muſcle* is ſlack or flaccid; and that the blood circulating thro' the *muſcle,* is continually depoſiting into thoſe pores a ſulphurous recrement, abounding with alkaline ſalts; which meeting with the ſpirits that flow by the nerves into thoſe ſame oval pores, their nitro-aerial particles ferment with the ſaline ones of the ſulphurous recrement, and, by a kind of exploſion, ſo diſtend the pores, as to change the long oval figure into a round one: and thus the *muſcle* is contracted.

Borelli takes the fibres of a *muſcle* to conſiſt of a chain of rhombus's or lozenges, whoſe areas are enlarged or contracted as the nervous juice, with the lympha and blood, are let into, or forced out of them, at the inſtance of the ſoul.

Dr. Croon ſuppoſes every fleſhy fibre to conſiſt of a chain of little bladders, or globules, communicating with each other; into which the nutritious juice, and one or two more liquors entering, do, by means of the natural heat, make an efferveſcence; by which the body of the *muſcle* is extended, *&c.*

Dr. Cheyne takes the ſmall fibrillæ of the *muſcles* to be ſo many ſlender elaſtic canals, bound about by ſmall tranſverſe parallel threads, which divide the hollow fibrillæ into ſo many elaſtic cyſtes or veſiculæ, which are orbicular, being formed of two concave ſegments of a ſphere; into every one of which veſiculæ, an artery, vein, and nerve, enter; the two firſt to carry and bring back the blood, the laſt to carry thither the liquidum nervoſum, or nervous juice, which mingling in the veſiculæ with the blood, does, by its acid pointed particles, prick and break the globules of the blood, ſo as to let out the impriſoned elaſtic air (contained in the globules) into thoſe little veſiculæ; whereby the elaſtic cells of the fibres will be blown up, and thereby their longitudinal diameters from cell to cell ſtraitned: and this muſt contract the length of the whole fibre, and ſo move that organ to which one of the tendons is fixed.

Dr. Keil, not contented with this theory, ſets up another, wherein the ſame ſtructure of the *muſcle* is ſuppoſed, and the ſame fluid; *viz.* the blood and nervous juice, the agents or inſtruments of contraction: but inſtead of the pungent particles of the nervous juice piercing the globules of blood, and ſetting at liberty the impriſoned elaſtic aura, he reſolves the whole into the power of attraction. See Attraction.

According to this author, the diſtenſion of the veſicles of the fibres is not owing to their being filled with a greater quantity of blood and animal ſpirits than before their contraction; but to a rarefaction ariſing from the mixture of thoſe two fluids, by means whereof they come to poſſeſs a greater ſpace.

To account for this rarefaction of the blood and ſpirits in the veſicles of the muſcular fibres, he ſuppoſes a ſmall globule of air between the particles of a fluid, which particles have a ſtrong attractive force, whereby they endeavour to come together: By preſſing every way equally on the globule of air, they will hinder its eſcape from between them. But the force whereby they endeavour to come together being vaſtly greater than that of gravity, the globule of air muſt be conſiderably condenſed; but the force of elaſticity being proportional to that of its condenſation, the force wherewith the airy globule endeavours to expand itſelf, will likewiſe be vaſtly great: ſo that if the niſus of the particles of the fluid to come together ſhould be taken off, the air between them would expand itſelf with a conſiderable force. Now, if upon the mixing of another fluid, the particles of the firſt fluid be more ſtrongly attracted to the particles of this other fluid, than they were before to one another, their niſus to one another will then ceaſe, and give the incloſed globule of air liberty to expand itſelf; ſo that the whole fluid will take up a greater ſpace than it did before: But when the particles of the two globules come to be united together, they will again incloſe the globule of air that lies between them, and, by their mutual attraction, ſoon bring it to its former ſtate of condenſation.

Now, that the blood contains a great number of globules of air, is evident from the great quantity it yields in the air-pump; and that the particles of the blood have a ſtrong attractive force, cannot well be denied.—Upon the meeting, then, of theſe two fluids in the veſicles of the fibres, the nervous juice, conſiſting of ſmaller particles than the blood, muſt, from what Sir I. Newton has proved of the rays of light, attract the particles whereof they are compoſed more ſtrongly than thoſe do one another; and conſequently the niſus of thoſe particles to one another ceaſing, the condenſed globule of air will expand itſelf with a conſiderable force; whereby each veſſel of the fibre will be diſtended, and conſequently, therefore, ſhortened; *i. e.* the whole muſcle will be contracted: but when the particles of the blood are well mixed with the nervous fluid, they will both together incloſe the globule of air again, and compreſs it into as ſmall a ſpace as it was before: And the contraction of the muſcle muſt immediately ceaſe, till freſh blood and ſpirits, ſtill ſucceeding one another, continue the inflation of the veſicles. But when a muſcle has been ſtrongly attracted for ſome time, the quantity of ſpirits ſpent being more than can be prepared in the ſpace of time by the glands which ſupply its nerves, the inflation of the veſicles muſt fall, and the muſcle grow feeble and weak.—And thus that ingenious author conceives the veſicles to be diſtended without any ebullition or efferveſcence; and their diſtenſion to ceaſe without any precipitation, or flying-off, of the aerial globules through the pores of the muſcles.

He proceeds to ſhew how artfully the mechaniſm of the fibres is contrived for contraction.—It is a known experiment, that a bladder blown up and diſtended as to its capacity, but contracted as to length, will raiſe a weight to ſome determined height. Two bladders, therefore, thus blown up, and communicating with each other, he argues, will raiſe the weight double the height, and three bladders thrice the height, &c. So that if there were a ſtring of bladders joined together, of equal bulk, and like figures, the ſpace through which the weight would riſe, would be proportionable to the number of bladders, *i. e.* to the length of the ſtring.—Now each fibre of a muſcle conſiſting of an infinite number of ſmall veſicles, reſembles a chain or ſtring of bladders; ſo that the contraction of the muſcle is always proportionable to the length of its fibres. Farther, the veſicles whereof the fibres conſiſt being very ſmall, though one large bladder might raiſe a weight as high as ſeveral ſmall ones, yet the quantity of elaſtic fluid uſed in the inflation would in that caſe be much greater than where the weight is raiſed by a ſtring of ſmall ones.

For, ſuppoſing two bladders of ſimilar figures, but the diameter of the one triple that of the other; then will the one require twenty-ſeven times the quantity of elaſtic fluid to expand it that the other does, and will alſo expand to twenty-ſeven times the ſpace; and yet three of the leſs bladders joined together, (he goes on) will raiſe the weight to the ſame height that the bigger one does; but with nine times leſs expence of elaſtic fluid, and take up but a ninth part of the ſpace. — By diminiſhing, therefore, the bigneſs of the veſicles, and increaſing their number, the force required to diſtend them, and the diſtenſion itſelf, may be diminiſhed in any given proportion, and come at laſt to be inſenſible. Suppoſe a bladder, *v. gr.* of a determinate bigneſs, can raiſe a weight a foot; a hundred bladders, whoſe diameters are each a hundredth part of the former, being blown up, will raiſe the weight to the ſame height; but the force required to inflate them, and the ſwelling of all put together, will be ten thouſand times leſs than of the large one.

Again, if a weight of a determined bigneſs can be raiſed to a certain height by a bladder, or one ſtring of bladders, to which the weight is tied; twice that weight may be raiſed by two ſuch bladders, or ſtrings; thrice by three, &c. and, conſequently, the weight a muſcle can raiſe, will be always as the number of its fibres, *i. e.* as its thickneſs, ſuppoſing the diſtenſion of the veſicles equal, and the abſolute ſtrength of one muſcle to that of another, as their bulks.—Thus much for the once flouriſhing ſyſtem of the chain of bladders; which being liable to very great difficulties as to the geometricity of it, has of late given way to others.

Dr. Boerhaave finding all the requiſites before laid down, for the action of the muſcles in the nervous juice, or animal ſpirits, and in no other fluid in the body, thinks it needleſs to have recourſe to a mixture of ſeveral liquors where one will do; and therefore makes no ſcruple to attribute the whole buſineſs to it alone.—The manner of action he conceives thus:

Suppoſe the ſpirit, from any cauſe, to be moved more ſwiftly from the origin of ſome one nerve, than through the reſt; the influx will here be greater into the *muſcular* fibre open to this nerve than into another: This will therefore be more dilated; and the other phænomena mentioned above will ſucceed. The ſame cauſe continuing, the effect will be increaſed, ſo that in a moment of time, the whole will be ſwelled up; and while the ſame determination laſts, will remain contracted. And this obtaining in an infinite number of fibrillæ at once, the whole muſcle will be inflated.

Hence it neceſſarily follows, that as the celerity is increaſed in one nerve, the motion will be leſs in another; this therefore being relaxed, the effort in contraction will be the ſtronger. For which reaſon, all the turgid fibres of a muſcle will compreſs the intermediate ſpaces and blood with a great force; whence the veins will be emptied, and the arteries being compreſſed, will repel the groſſer, that is, the red parts of the blood, but will drive the more ſubtile parts by the force of the heart and their own, into the moſt minute canals; and thus the cruor being expelled, the whole body of the muſcle will be found to act by a ſubtile humour concurring from the nerves and arteries.

Thus are all the phænomena accounted for; without any other aſſumption, than an accelerating force in the origin of the nerves; which is common to all hypotheſes, and which cannot be traced any further.

All other ſyſtems, therefore, Boerhaave abſolutely rejects; nor makes the leaſt account of Galen's incorporeal power inflating the muſcles; the nitrous ſpirit of the nerves mixing with the oil of the blood, and ſo rarefying it; the acid parts of the nervous juice mixing with the alcalious ones of the blood, the ebullition of the air, and the arterious juice; and the increaſe or diminution of attractive force of the minute corpuſcles of the humours, as repugnant to ſenſe, experience, the laws of matter, and of mixture, and to the phænomena of the muſcles.

Dr. Aſtruc has gone a good way towards proving the nervous juice alone concerned in *muſcular motion*; and that the blood has no ſhare in it; by the following experiment, which he tried ſeveral times with the ſame ſucceſs.

Cutting open the abdomen of a live dog, and removing the inteſtines out of the way, he bound up the aorta where it divaricates into the iliac arteries, with a thread, ſo as to conſtringe each iliac and the hypogaſtric artery very cloſely; then ſewing up the epigaſtric muſcles, he found the ſenſation and motion ſtill as briſk and vivid in the dog's poſteriors, as before. So that when once ſet at liberty, he ſtood on all four, and walked with his uſual eaſe and firmneſs; though it is certain there could not be one drop of blood conveyed to thoſe hind parts.

Aſtruc, however, differs from Boerhaave in the manner wherein this nervous juice acts; nor will allow that celerity, wherewith the muſcles act at the command of the will, to be owing to the velocity of the juice ſent through the nerve, but to an impreſſion given to one extremity of the thread, and communicated through all the intermediate parts to the other extremity; ſuppoſing the nerves in their natural ſtate to be turgid, and full of ſpirits: ſo that if the extremity in the ſenſory be ever ſo little preſſed by the acceſſion of any new ſpirit, as much will be inſtantly expelled at the other extreme; and, vice verſa, a ſmall impreſſion given to the outer extremity of the nerve, will immediately move the other extreme open to the ſenſory, ſo that part of it will drop out: Which accounts for ſenſation as well as *muſcular motion.* See SENSATION.

Laſtly, Dr. Lower, and Mr. Cowper, and after them Dr. Morgan, and other of the lateſt writers on that ſubject, ſetting aſide all adventitious fluids, account for *muſcular motion* from the intrinſic elaſticity of the nervous fibrillæ contracting and reſtoring themſelves againſt the ſtretching force of the circulating blood.

This ſyſtem, Morgan endeavours to evince from the following conſiderations. — 1°, All the veſſels in an animal, conſiſting of flexible, diſtractile fibres, are in a ſtate of tenſion; *i. e.* are both ſtretched tranſverſly and longitudinally by their contained fluids: Thus, *e. gr.* let a vein, or artery be cut, and the oppoſite ſides of the veſſel will contract, and come nearly to a contact about the axis; while the two ends receding both ways leave a chaſm: which ſhews that the veſſel, while in its natural ſtate, was diſtended both ways; and, conſequently, that contraction, in all their dimenſions, is the natural intrinſic action of the veſſels, or fibres.

And the ſame might be deduced, à priori, from the growth of animals; for by the increaſed quantity of the accumulated blood, the veſſels muſt neceſſarily be enlarged every way. Now, againſt this diſtending power of the fluids, the ſolid *muſcular* fibrillæ continually exert a contractive, or reſtitutive force, by which they are kept in their proper ſtate of tenſion.

2°, That this contractive power of the *muſcular* fibres is a natural intrinſic property of the fibres themſelves, and does not depend on any mixture, or mutual action of fluids, is evident from hence, that theſe fibres retain the ſame property, after they are taken out of the body and dried; as we ſee in thongs, catgut, and other ſuch like cords or ſtrings, cut out of the *muſcular* coats and ſkins of animals, which may be ſtretched out to a conſiderable length beyond their natural ſtate; and when the ſtretching force or weight is taken off, they will immediately contract again by their native ſpring.

3°, While a muſcle contracts, the blood is ſqueezed out, and during its ſtate of contraction, it is more hard and ſolid than before; that is, contains leſs blood when contracted, than when ſtretched; which ſhews, that the contraction cannot be by the addition of another fluid from the nerves mixing with the blood in the muſcles.

4°, No ſuch fluid in the nerves could ever be found, as being mixed with the blood, would occaſion ſuch fermentation, or expanſion. But ſuppoſing the *muſcular* cells thus inflated, no ſuch effect could follow, as ſhortening the muſcle in length, and ſwelling it in thickneſs: But the conſequence muſt be, that the muſcle would be lengthened as well as thickened; that is, it muſt increaſe its dimenſions proportionably every way, which is the proper action of fluids on the ſolids.

If then it be ſaid, that theſe bladders, when the muſcle is ſtretched, are drawn into oblong ſpheroids; and when inflated, by the mixture of the nervous fluid, reduced to a ſpherical figure, by which means their axes are ſhortened, and their conjugate diameters enlarged: It is anſwered, that thoſe ſmall veſicles are ſoft, flexible, diſtractile, and equally yielding every way; and ſince an included expanſive fluid muſt preſs its containing veſſels equally yielding every way, and equally expanſive; a veſſel, notwithſtanding ſuch diſtenſion, muſt retain its natural figure, and be equally ſtretched in all directions.

Again, ſince the blood circulates freely through theſe *muſcular* cells, it is plain, that as ſoon as they begin to inflate, it muſt be immediately puſhed forward with an increaſed velocity in the courſe of its circulation, which muſt prevent any ſuch inflation in the muſcles. Before theſe veſicles, therefore, can be diſtended in the manner ſuppoſed, the exit of the fluid muſt be hindered; that is, the circulation muſt be ſtopped. If any one doubt of this, let him try whether he can blow up a bladder, or other veſſel, that is open at both ends, and where the expanſive fluid has as free an egreſs as ingreſs.

Thus much premiſed, the natural action of a muſcle will be eaſily explained. From its ſtructure, it follows, that on the contraction of its tranſverſe and ſpiral fibres, which are the ramifications of the nerves, the longitudinal, red, and fleſhy fibres, or blood-veſſels, which conſtitute the body of the muſcle, muſt be ſqueezed and drawn together, as being compelled to follow the motion of theſe elaſtic cords; by which means the blood being compreſſed, muſt be forced, with ſome impetuoſity, through the muſcle, and propelled forward in the courſe of its circulation.

Now if the blood ſhould hereupon ſtop, and return no more to the muſcle, it is plain the muſcle muſt for ever remain in this contracted ſtate, as its proper and natural ſtate of quieſcence to which it tends, and where it would reſt: But the blood having received a freſh impetus by the contraction, and returning upon the muſcle in the courſe of its circulation, again ruſhes into the blood-veſſels, which being inlarged in all their dimenſions by the force of the returning blood, the tranſverſe and ſpiral nervous fibres muſt be hereby ſtretched, and the muſcle extended: till by this means the blood-veſſels being brought to their natural extent, and conſequently the diſtending force of the blood ceaſing, the contractive power of the nerves begins to act again, and reſtore them with the ſame force by which they were extended; till the returning blood re-enters the muſcle, and ſtretches it again.

Muscular *conſumption.* See the article Consumption.

Muscular, is alſo an appellation given to ſeveral veins; two whereof come from the ſkin and the hind-muſcles of the thigh, and terminate in the ſubclavians. See Vein.

There are three others in the loins alſo called *muſculares*, and diſtinguiſhed into *upper*, *middle*, and *under*; the firſt terminates in the trunk of the vena cava, and the two others open into the external iliac vein.

Musculi *aliformes.*	See	Aliformes.
Musculi *amatorii.*		Amatorii.
Musculi *annuentes.*		Annuentes.
Musculi *vermiformes, &c.*		Vermiformes, &c.

MUSCULOUS. See the article Muscular.

MUSEUM, ΜΟΥΣΕΙΟΝ, was originally uſed to ſignify a place in the palace of Alexandria, which took up at leaſt a fourth part of the city; ſo called, as being deſtined and ſet apart to the *muſes*, and the ſciences. See Muse.

Here were lodged and entertained a great number of learned men, who were divided into companies or colleges, according to the ſciences or ſects whereof they were profeſſors.—And to each houſe or college was allotted a handſome revenue—This eſtabliſhment is attributed to Ptolemy Philadelphus, who here fixed his library. See Library.

Museum has hence paſſed into a general denomination; and is now applied to any place ſet apart as a repoſitory for things that have ſome immediate relation to the arts, or the muſes. See Repository, Cabinet, &c.

The Museum *at Oxford*, called the *Aſhmolean muſeum*, is a noble pile, erected at the expence of the univerſity, for the promoting and carrying on ſeveral parts of curious and uſeful learning.—It was begun in 1679, and finiſhed in 1683; at which time a valuable collection of curioſities was preſented to the univerſity by Elias Aſhmole, Eſq; and the ſame day there repoſited, and afterwards digeſted and put in a juſt order by Dr. Plott, who was conſtituted firſt keeper of the *muſeum*.

Divers conſiderable acceſſions have been ſince made to the *muſeum*; as of hieroglyphics, and other Egyptian antiquities, by Dr. Huntingdon; and of an entire mummy by Mr. Goodyear; of a cabinet of natural rarities by Dr. Liſter; alſo of divers Roman antiquities, altars, medals, lamps, &c.

Over the entrance of the *muſeum* is this inſcription; MUSEUM ASHMOLEANUM, SCHOLA NATURALIS HISTORIÆ, OFFICINA CHYMICA.

MUSES*, Musæ, ΜΟΥΣΑΙ, fabulous divinities of the antient heathens, who were ſuppoſed to preſide over the arts, and ſciences. See God, &c.

The antients admitted nine *muſes*, and made them the daughters of Jupiter and Mnemoſyne, or Memory. At firſt, indeed, their number was but three; *viz.* Melete, Mneme, and Aæde; Greek words ſignifying memory, ſinging, and meditation. But a certain ſculptor of Sicyon having orders to make three ſtatues of the three *muſes* for the temple of Apollo, and miſtaking his inſtructions, made three ſeveral ſtatues of each *muſe*; theſe however were found ſo beautiful, that they were all ſet up in the temple, and from that time they began to reckon nine *muſes*: To whom Heſiod afterwards gave names; viz. *Calliope*, *Clio*, *Erato*, *Thalia*, *Melpomene*, *Terpſichore*, *Euterpe*, *Polyhymnia*, and *Urania*.

Each of theſe were ſuppoſed to preſide over their reſpective art; Calliope over heroic poetry; Clio over hiſtory; Melpomene over tragedy; Thalia over comedy; Euterpe over wind-muſic; Urania over aſtronomy; Terpſichore over the harp; Erato, the lute; Polyhymnia, rhetoric.

They are painted young, handſome, and modeſt, agreeably dreſſed, and crowned with flowers. Their uſual abodes were about mount Helicon in Bœotia, and mount Parnaſſus in Phocis. Their buſineſs was to celebrate the victories of the gods, and to inſpire and aſſiſt the poets; and hence the cuſtom of invoking their aid at the beginning of a poem. See Invocation.

It muſt not, however, be imagined, that the deities thus invoked, are conſidered even by the antient poets themſelves as divine perſons, from whom they expect any real help. Under the name of *muſe*, they pray for the genius of poetry; and all the talents and circumſtances neceſſary for a happy execution of their undertaking.

Their addreſſes to the *muſes* are mere allegories, and manners of expreſſing themſelves poetically; as when they make gods of ſleep, of fame, of revenge, and other natural and moral things. See God.

Accordingly, the *muſes* are of all ages, countries, and even of all religions. There are chriſtian as well as heathen *muſes*; Latin, Greek, Engliſh, and French *muſes*. There are alſo *new muſes*, which appear every day in favour of thoſe who, diſdaining things too trite and common, chuſe to ſtrike out of the road.

When Virgil wrote his Eclogues, he invoked the Sicilian *muſes*, becauſe he imitated Theocritus; and the Sicilian poet having ſucceeded, the Roman begged for a genius as happy as that of this iſlander.

The *muſes* of the poet Lucretius had never inſpired any perſon before him. It is plain, from the doctrine of his book, what kind of divinity it was he invoked. He addreſſes himſelf to Venus, but at the ſame time tells us, that none of the deities trouble themſelves with human affairs. His *muſes*, therefore, muſt of neceſſity be mere allegories.

MUSHROOM, or Mushrom, in natural hiſtory, a plant, of a form and ſtructure very different from that of all other plants; having neither ſeeds nor flowers, that have ever yet been diſcovered. See Plant, Seed, &c.

There are various kinds of *muſhrooms*; and the vulgar call by this name all that come under the general head of fungus's; by the Greeks called μυκητες.

They are all uſed with ſome ſuſpicion, though ſome are more harmleſs, as well as more delicious, than others. Thoſe uſed among us, are *muſhrooms of the wood*, called *morilles*; and *of the meadows*, called *champignons*; which are gathered in autumn, and eſteemed for their whiteneſs above, their carnation underneath, and the ſweetneſs of their ſmell.

Mr. Bradley mentions a hundred kinds of *muſhrooms*, which he has ſeen in England; beſides thoſe very numerous ſmall ones, which conſtitute the mouldineſs of liquors, fruits, &c. which laſt are ſuch quick growers, that they arrive at perfection in leſs than twelve hours. See Mouldiness.

The fungoides only differs from a *muſhroom* in its external form; the coralloides are of the ſame ſpecies, though of a different name, as being branched like coral; and truffles come under the ſame kind. See Truffles, &c.

Matthiolus mentions *muſhrooms* which weighed thirty pounds each, and were as yellow as gold. Fer. Imperatus tells us, he ſaw ſome which weighed above a hundred pounds; and, to add no more, the *Journal des Scavans* furniſhes us with an account of ſome growing on the frontiers of Hungary, which made a full cart load.

The origin and production of *muſhrooms*, has extremely puzzled the botaniſts. How a plant ſhould be produced without a ſeed, is a myſtery; and yet the beſt microſcopes are not able to diſcover any appearance of a ſeed; and the manner of cultivating this plant, ſeems to make it ſtill more probable that it has not any. See Seed.

M. Tournefort gives a very curious account of their culture, in

* The word, according to Phornutus, is derived from the Greek, μωσθαι, which ſignifies the ſame with ζητειν, to ſearch: Others derive it from ὁμοιεσιος, ſimilar, or alike; all the ſciences being bound and united together: Euſebius derives it from μυειν, to initiate, to inſtruct: Plato and Scaliger from μαιωσθαι, *obſtetricare*, becauſe to them are attributed the invention of arts; and it is they who produced them. Laſtly, Heinſius and Voſſius derive it from the Hebrew, מוסר muſar, ſcience, *diſciplina.*—The *muſes* are called by various names; *Camenæ*, *Heleconiades*, *Parnaſſides*, *Aonides*, *Pierides*, *Pegaſides*, *Aganippides*, *Theſpiades*, *Libetbrides*, and *Caſtalides.*

in the *Memoirs of the Royal Academy*, with the ſubſtance of which we ſhall here preſent the reader.—All the ſecret of bringing up *muſhrooms* ſpeedily and in abundance, conſiſts in ranging balls of horſe-dung about the bigneſs of the fiſt, in lines, at the diſtance of about three feet from each other, and at the depth of one foot under ground, and covering theſe over with mould, and that again with horſe-dung.

If this be done in April, in the beginning of Auguſt the pieces of dung will begin to whiten, and grow mouldy, being covered all over with little hairs, or fine white threads, branched, and woven about the ſtraws whereof the dung is compoſed. The dung now loſes its former excrementitious ſmell, and ſpreads an admirable odour of *muſhrooms*.

According to all appearance, theſe white threads are no other than the opened ſeeds or buds of *muſhrooms*, which ſeeds were before incloſed in the dung, but in ſo ſmall a compaſs, that they could not be perceived till after they had ſhot themſelves into little hairs. By degrees the extremity of theſe hairs grows round into a kind of button, which ſwelling by little and little, at length opens itſelf into a *muſhroom*, whereof the lower part is a kind of pedicle, bearded in the place where it enters the ground, and at the other end loaden with a roundiſh capital or head, in the manner of a calotte, which expands itſelf without producing either ſeeds or flowers, that are ſenſible; the bottom is ſpread with laminæ, which proceeding from the centre to the circumference, may be called the *leaves of the muſhrooms*.

At the foot of each *muſhroom* are found an infinite number of little ones, not bigger than the head of a pin, when the others are at their growth. The buds of the *muſhrooms*, or the white hairs of the dung, preſerve themſelves a long time without rotting, if kept dry; and if laid again on the ground, will produce new *muſhrooms*.

Muſhrooms, then, are nothing elſe but the produce of what we call the *mouldineſs of horſe-dung*: But what analogy is there between theſe two things? Or how ſhould ſo artful and delicate a ſtructure as this of a plant, reſult from the mere fortuitous concourſe of a few juices, differently agitated?

It ſeems paſt doubt then, that *muſhrooms*, like all other plants, have their origin in ſeeds: Now we know that the ſeeds of plants cannot vegetate every where; there are firſt required certain juices proper to penetrate their coats, to excite a fermentation, and to join themſelves to the little parts thereof, and increaſe them. Hence ariſes that infinite diverſity of places, wherein different ſpecies of this plant are produced. There are ſome which will only grow on ſome other particular plants, whoſe trunk, bark, or roots, alone, have the juices proper for them.

What M. Tournefort mentions from Meſſ. Lemery and Mery, is ſtill more ſurprizing: There is a ſpecies of *muſhrooms*, which grow on the fillets and bandages applied to the fractures, *&c.* of the patients in the Hotel-Dieu. After which, it will not be at all ſurprizing that horſe-dung, prepared in the manner M. Tournefort mentions, ſhould be a ſoil, or matrix, capable of making common *muſhrooms* grow.

Hence it ſeems to follow, that the ſeeds of *muſhrooms* ſhould be ſpread in an infinite number of places where they do not vegetate; and in a word, throughout the whole earth; and the ſame may be ſaid of a great number of other plants. See Seed, and Semination.

It muſt be owned, the imagination is ſhocked, at ſuch a prodigious multitude of different ſeeds thrown every where at random, and in many places to no purpoſe; but a little reaſoning will put the matter of fact paſt doubt.

Dioſcorides tells us, he was aſſured that pieces of the bark of the poplar tree being laid in the ground over horſedung, there would grow out of them very good *muſhrooms*. Ruel ſays, that by boring the trunk of a white poplar tree near the root, and waſhing it with leven ſteeped in water, *muſhrooms* ſpring out of it, as it were, inſtantly. He adds, that the hillocks produce ſeveral kinds of *muſhrooms*, if the ſtubble be burnt on them in the rainy ſeaſon.

M. Tournefort tells us, on his own knowledge, that where the ſtubble is burnt, as in Provence, Languedoc, and the iſlands of the Archipelago, there ariſe great quantities of black poppies in the firſt autumnal rains, which diſappear the year following; ſo that they are never found but on burnt lands. And we know that after the burning of London, the ground as far as the fire reached, ſhot up with vaſt quantities of eryſimum latifolium majus glabrum. One of the chief reaſons, if not the only one, why mountains produce plants different from the plains or valleys, and places become fenny, from the ſame places when they were dry; is the difference in the nutricious juices found in thoſe places. Without this, how ſhall we account for the origin of miſletoe or hypocyſtus, which are never known to grow in the earth, at leaſt without adhering to ſome other plant; but the one grows on trees, and the other to the root of the cyſtus? Why do the ivy, and vine of Canada, pellitory, polypody, the ſpecies of capillaries, grow only on the trunks of trees, on walls, and in the clefts of rocks, unleſs it be, that the juices of thoſe places are the beſt adapted to them.

Theſe, and other inconteſtable facts, prove plainly both the vaſt multitude of ſeeds diſperſed every where; and the neceſſity of certain circumſtances to make them vegetate.

If to this ſpeculation on the inviſible ſeeds of plants, we join that of the inviſible eggs of inſects, which muſt be allowed equal thereto, the earth will be found full of an inconceivable infinity of animals and vegetables, perfectly formed, and deſigned, as it were, in miniature; and only waiting for certain favourable circumſtances to enable them to make their appearance in large. How rich then muſt the hand be that has ſown with ſo much profuſion! See Insect, Animalcule, *&c.*

We have been the more particular on this head, on account of the oddneſs of the phænomena; and becauſe what is here ſaid of *muſhrooms* will give light into the generation of all other vegetables, *&c.* whoſe ſeeds are yet undiſcovered. See Plant, and Vegetation.

Dr. Liſter, indeed, thinks he has found out the ſeeds of *muſhrooms*. He inſtances, particularly, in the fungus poroſus craſſus magnus J. B. the texture of whoſe gills is like a paper pricked full of pin-holes. Theſe gills, he makes no doubt, are the very flower and ſeed of this plant; when it is ripe, the gills are eaſily ſeparable from the reſt of the head, each ſeed being diſtinct from other, and having its impreſſion in the head of the *muſhrooms*; juſt as the ſeed of an artichoke hath in the bottom of it: the bigger end of the ſeeds is full and round, and they are diſpoſed in a ſpiral order, like thoſe of the artichoke: And the ſame he thinks will hold of all other *muſhrooms*, however differently figured. If it happen that theſe, when ſown, prove ſterile, and do not produce their kind, it is no wonder; there being whole genus's of plants that come up, and flower, and ſeed, yet their ſeed was never known to produce plants of their kind, being no more than a barren volatile duſt; as that of all the orchides, or bee-flowers, is ſaid to be.

MUSIC, ΜΟΥΣΙΚΗ, the ſcience of ſound, conſidered as capable of producing melody, or harmony: or, the art of diſpoſing and conducting ſounds, conſidered as grave and acute; and of proportioning them among themſelves, and ſeparating them by juſt intervals, pleaſing to the ſenſe. See Sound.

* The word is ſuppoſed originally formed from *muſa*, muſe; the muſes being ſuppoſed to be the inventors thereof. Kircher, however, will have it take its name from an Egyptian word, as ſuppoſing its reſtoration after the flood to have begun there, by reaſon of the reeds, *&c.* on the banks of the Nile.—Heſychius tells us, the Athenians gave the name *muſic*, μȣσκη, to every art.

Mr. Malcolm defines *muſic*, a ſcience that teaches how ſounds under certain meaſures of tune, and time, may be produced, and ſo ordered or diſpoſed, as either in conſonance, or ſucceſſion, or both, they may raiſe agreeable ſenſations.

Muſic naturally divides itſelf into *ſpeculative* and *practical.*

Speculative Music, is the knowledge of the materia muſica, or how to produce ſounds in ſuch relations of tune, and time, as ſhall be agreeable in conſonance, or ſucceſſion, or both.

By which, we do not mean the actual production of theſe ſounds by an inſtrument or voice, which is merely the mechanical or effective part; but the knowledge of the various relations of tune and time, which are the principles, out of which the pleaſure ſought derives. See Tune.

Practical Music, is that which ſhews how theſe principles are to be applied; or how ſounds, in the relations they bear to *muſic* (as thoſe are determined in the ſpeculative part) may be ordered, variouſly put together in ſucceſſion and conſonance, ſo as to anſwer the end.

And this we call the art of *compoſition*, which is properly the practical part of *muſic*. See Composition.

Some add a third branch, *viz. inſtrumental muſic*, or the knowledge of inſtruments; but as this depends altogether on the firſt, and is only an application or expreſſion of it, it cannot come regularly under the definition, and conſequently is no part of the diviſion of the ſcience.

The firſt branch, which is the contemplative part, divides itſelf into theſe two, *viz.* the knowledge of the *relations and meaſures of tune*, and the *doctrine of time*.

The former is properly what the antients call *harmonica*, or the doctrine of harmony in ſounds, as containing an explication of the grounds, with the various meaſures and degrees of the agreement of ſounds, in reſpect of their tune. See Harmonica.

The latter is what they call *rhythmica*, becauſe it treats of the numbers of ſounds or notes with reſpect to time; containing an explication of the meaſures of long and ſhort, or ſwift and ſlow, in the ſucceſſion of ſounds. See Rhythmica.

The *ſecond* branch, or the practical part of *muſic*, as naturally divides into two parts, anſwering to the parts of the firſt.

That correſponding to the harmonica, the antients called *melopœia*; becauſe it contains the rules of making ſongs, with reſpect to tune, and harmony of ſounds; though we have no reaſon to think the antients had any thing like compoſition in parts.

That which anſwers to the rhythmica, they call *rhythmopœia*; containing rules for the application of the numbers and time. See Rhythmopoeia.

We find a ſtrange diverſity in the antient writers, as to the nature, office, extent, diviſion, &c. of *muſic*.

Hermes Triſmegiſtus defines *muſic* to be the knowledge of the order of all things; which is alſo the doctrine of the Pythagorean ſchool, and of the Platoniſts, who teach, that every thing in the univerſe is *muſic*. — Agreeable to which wide ſenſe, ſome divide *muſic* into *divine* and *mundane*.

Divine Music, is that reſpecting the order and harmony which obtains among the celeſtial minds.

Mundane Music, is that which reſpects the relations and order of every thing elſe in the univerſe.

Though Plato, by *divine muſic* underſtands that which exiſts in the divine mind, *viz.* thoſe archetypal ideas of order and ſymmetry, according to which God formed all things.— And as this order exiſts in the mundane creatures, he calls it *mundane muſic*.

This laſt ſpecies the antients again ſubdivided into four, *viz.*

Elementary Music, or the harmony of the elements of things.

Celeſtial Music, or the *muſic of the ſpheres*; comprehending the order and proportions in the magnitudes, diſtances and motions of the heavenly bodies, and the harmony of the ſounds reſulting from thoſe motions.

Human Music, which conſiſts chiefly in the harmony of the faculties of the human ſoul, and its various paſſions; and is alſo conſidered in the proportion, temperament, and mutual dependance of the parts of the body.—Laſtly,

Music, properly ſo called, which has for its object motion, conſidered as under certain regular meaſures and proportions, by which it affects the ſenſes in an agreeable manner. See Motion.

Now as motion belongs to bodies, and as ſound is the effect of motion, and cannot be without it, but all motion does not produce ſound; hence this laſt branch of *muſic* became farther ſubdivided.

Where the motion is without ſound, or as it is only the object of ſight, it was either called *muſica orcheſtrica*, or *ſaltatoria*, which contains the rules for the regular motions of dancing.— Or *muſica hypocritica*, which reſpects the motion and geſtures of the pantomimes. See Dance, and Pantomime.

When the motion is perceived only by the ear, *i. e.* when ſound is the object of *muſic*, there were three ſpecies; *viz.* *Harmonica*, which conſiders the differences and proportions with reſpect to grave and acute.—*Rhythmica*, which reſpects the proportion of the ſounds as to time, or the ſwiftneſs and ſlowneſs of their ſucceſſions. — And *Metrica*, which belongs properly to the poets, and reſpects the art of making verſes. See Harmonica, &c.

Ariſtides, Quintilianus, Bacchius, and ſome other antient writers, define *muſic* the knowledge of ſinging, and of the things belonging thereto; which they explain by the motions of the voice and body: as if the ſinging conſiſted only in the different tones of the voice. See Singing.

The ſame Ariſtides, conſidering *muſic* in the largeſt ſenſe of the word, divides it into *contemplative* and *active*. The firſt, he ſays, is either *natural*, or *artificial*.—The natural is either *arithmetical*, which conſiders the proportion of numbers; or *phyſical*, which examines the order of the things of nature.

The artificial he divides as above, into *harmonica*, *rhythmica*, and *metrica*.

The *active*, which is the application of the artificial, is either *enuntiative*, as in oratory; *organical*, or inſtrumental performance; *odical*, for voice and ſinging; *hypocritical*, in the motions of the pantomimes.—To which ſome add *hydraulical*, though in reality no more than a ſpecies of the organical; in which, water is uſed, for the producing or modifying of ſound. See Hydraulics.

Porphyry makes another diviſion of *muſic*, taking it in the limited ſenſe, as having motion both dumb and ſonorous for its object; and without diſtinguiſhing the ſpeculative and practical, he makes its parts theſe ſix, viz. *rhythmica*, for the motions of dancing; *metrica*, for the cadence and recitation; *organica*, for the practice of inſtruments; *poetica*, for the numbers and feet of verſes; *hypocritica*, for the geſtures of the pantomimes; and *harmonica*, for ſinging.

The *muſical faculties*, as they call them, are *melopœia*, which gives rules for the tones of the voice or inſtrument; *rhythmopœia*, for motions; and *poeſis*, for making verſes. See Poetry.

Muſic appears to have been one of the moſt antient of arts: and of all others, *vocal muſic* muſt undoubtedly have been the firſt kind.—For man had not only the various tones of his own voice to make his obſervations on, before any other art or inſtrument was found out, but had the various natural ſtrains of birds, to give him occaſion to improve his own voice, and the modulations of ſounds it was capable of. See Vocal.

Of many antient authors who agree in this conjecture, we ſhall only mention Lucretius, who ſays,

> *At liquidas avium voces imitarier ore,*
> *Ante fuit multò quam levia carmina cantu,*
> *Concelebrare homines poſſent, aureiſque juvare.*

The firſt invention of ſtringed inſtruments, the ſame poet aſcribes to the obſervation of the winds whiſtling in the hollow reeds.

As for other kinds of inſtruments, there were ſo many occaſions for cords or ſtrings, that men could not be long in obſerving their various ſounds, which might give riſe to ſtringed inſtruments. See Chord.

And for the pulſatile inſtruments, as drums and cymbals, they might ariſe from the obſervation of the hollow noiſe of concave bodies. See Drum, Cymbal, &c.

Plutarch, in one place, aſcribes the firſt invention of *muſic* to the god Apollo, and in another to Amphion, the ſon of Jupiter and Antiope. This laſt, however, is pretty generally allowed to have been the firſt who brought *muſic* into Greece, and to have been the inventor of the lyre.—The time he lived in, is not agreed upon. See Lyre.

To him ſucceeded Chiron, the demi-god; Demodocus; Hermes Triſmegiſtus; Olympus; Orpheus, whom ſome make the firſt introducer of *muſic* into Greece, and the inventor of the lyra; to whom add Phemius, and Terpander, who was contemporary with Lycurgus, and ſet his laws to *muſic*. To him ſome attribute the firſt inſtitution of muſical modes, and the invention of the lyre: Laſtly, Thales; and Thamyris, who is ſaid to have been the firſt inventor of inſtrumental *muſic* without ſinging.

Theſe were the eminent muſicians before Homer's time. Others of a later date, were Laſus Hermionenſis, Melnippides, Philoxenus, Timotheus, Phrynnis, Epigonius, Lyſander, Simmicus, and Diodorus; who were all conſiderable improvers of *muſic*.—Laſus is ſaid to have been the firſt author who wrote on *muſic*, in the time of Darius Hyſtaſpes; Epigonius invented an inſtrument of forty ſtrings, called the *epigonium*: Simmicus alſo invented an inſtrument, called *ſimmicium*, of thirty-five ſtrings: Diodorus improved the *tibia*, by adding new holes; and Timotheus the *lyre*, by adding a new ſtring; for which he was fined by the Lacedemonians.

As the accounts we have of the inventors of muſical inſtruments among the antients are very obſcure; ſo are alſo the accounts what thoſe inſtruments were; we ſcarce knowing any thing of them beſides the bare name.

The general diviſion of inſtruments, is into *ſtringed inſtruments*, *wind inſtruments*, and the *pulſatile* kind.—Of *ſtringed inſtruments*, we hear of the *lyra* or *cithara*, the *pſalterium*, *trigonum*, *ſambuca*, *pectis*, *magas*, *barbiton*, *teſtudo*, *epigonium*, *ſimmicium*, and *pandoron*; which were all ſtruck with the hand, or a plectrum; and which ſee in their places, Lyre, Cithara, &c.

Of *wind inſtruments*, we hear of the *tibia*, *fiſtula*, *hydraulic organs*, *tubæ*, *cornua*, and *lituus*. See Fistula, Flute, &c.

The *pulſatile inſtruments*, were the *tympanum*, *cymbalum*, *crepitaculum*, *tintinnabulum*, *crotalum*, and *ſiſtrum*. See Tympanum, Cymbalum, &c.

Muſic has ever been in the higheſt eſteem, in all ages, and among all people. Nor could authors expreſs their opinion of it ſtrongly enough, but by inculcating, that it was uſed in heaven, and was one of the principal entertainments of the gods, and the ſouls of the bleſſed.

The effects aſcribed to it by the antients, are almoſt miraculous; by means hereof, diſeaſes are ſaid to have been cured, unchaſtity corrected, ſeditions quelled, paſſions raiſed and calmed, and even madneſs occaſioned.—Athenæus aſſures us, that antiently all laws, divine and civil, exhortations to virtue, the knowledge of divine and human things, lives and actions of illuſtrious men, were written in verſe, and publickly ſung by a chorus to the ſound of inſtruments; which was found the moſt effectual means to impreſs morality, and a right ſenſe of duty on the mind.

Muſic made a great part of the diſcipline of the antient Pythagoreans, and was uſed by them to draw over the mind to laudable actions, and ſettle in it a paſſionate love of virtue: It was their doctrine, that the ſoul itſelf conſiſts of harmony; and therefore by *muſic*, they pretended to revive the primitive harmony of its faculties. — By this primitive harmony, they meant that which, according to their dogma, was in the ſoul, in its preexiſtent ſtate in heaven. See Pythagorean, and Preexistence.

Dr. Wallis has endeavoured to account for the ſurpriſing effects aſcribed to the antient *muſic*; and charges them principally on the novelty of the art, and the hyperbola's of the antient writers: nor does he doubt but the modern *muſic*, cæteris paribus, would produce effects at leaſt as conſiderable as the antient.—The truth is, we can match moſt of the antient ſtories of this kind in the modern hiſtories. If Timotheus could excite Alexander's fury with the Phrygian mode, and ſooth him into indolence with the Lydian; a more modern muſician is ſaid to have driven Eric king of Denmark into ſuch a rage, as to kill his beſt ſervants. Dr. Niewentiit tells us of an Italian, who by varying his *muſic* from briſk to ſolemn, and ſo vice verſa, could move the ſoul, ſo as to cauſe diſtraction and madneſs. And Dr. South has founded his poem, called *Muſica Incantans*, on an inſtance he knew of the ſame thing.

Muſic, however, is not only found to exert its force on the affections, but on the parts of the body alſo; witneſs the Gaſcon knight, mentioned by Mr. Boyle, who could not contain his water at the playing of a bagpipe; the woman, mentioned by the ſame author, who would burſt out in tears at the hearing

ing of a certain tune, with which other people were but little affected.—To ſay nothing of the trite ſtory of the tarantula: We have an inſtance in the hiſtory of the academy of ſciences, of a muſician's being cured of a violent fever, by a little concert occaſionally played in his room. See Tarantula.

Nor are our minds and bodies alone affected with ſounds, but even inanimate bodies.—Kircher tells us of a large ſtone, that would tremble at the ſound of one particular organ-pipe; and Morhoff mentions one Petter, a Dutchman, who could break rummer-glaſſes with the tone of his voice. Merſenne alſo tells us of a particular part of a pavement, that would ſhake and tremble, as if the earth would open, when the organs played. Mr. Boyle adds, that ſeats will tremble at the ſound of organs; that he has felt his hat do ſo under his hand, at certain notes both of organs and diſcourſe; and that he was well informed, every well-built vault would anſwer ſome determinate note.

There is a great diſpute among the learned, whether the antients, or moderns, beſt underſtood and practiſed *muſic?* Some maintain that the antient art of *muſic*, by which ſuch wonderful effects were performed, is quite loſt; and others, that the true ſcience of harmony is now arrived to much greater perfection, than was known or practiſed among the antients.

This point ſeems no other way to be determinable, but by comparing the principles and practice of the one with thoſe of the other.—As to the theory or principles of harmonics, it is certain we underſtand it better than the antients; becauſe we know all that they knew, and have improved conſiderably on their foundations.—The great diſpute then lies on the practice.

With regard to which it may be obſerved, that among the antients, *muſic*, in the moſt limited ſenſe of the word, included *harmony*, *rhythmus*, and *verſe*; and conſiſted of verſes ſung by one or more voices alternately, or in choirs, ſometimes with the ſound of inſtruments, and ſometimes by voices only. Their muſical faculties, we have already obſerved, were *melopœia*, *rhythmopœia*, and *poeſis*. The firſt whereof may be conſidered under two heads, *viz. melody* and *ſymphony*. As to the latter, it ſeems to contain nothing but what relates to the conduct of a ſingle voice, or making what we call *melody*: The antients do not appear to have ever thought of the concert, or harmony of parts; which is a modern invention, for which we are beholden to Guido Aretine, a Benedictine friar.

We would not, however, be underſtood to mean, that the antients never joined more voices or inſtruments than one together in the ſame ſymphony; but, that they never joined ſeveral voices ſo as that each had a diſtinct and proper melody, which made among them a ſucceſſion of various concords, and were not in every note uniſons, or at the ſame diſtance from each other as octaves.—This laſt indeed agrees to the general definition of the word *ſymphonia*; yet it is plain that in ſuch caſes, there is but one ſong, and all the voices perform the ſame individual melody.—But when the parts differ, not by the tenſion of the whole, but by the different relations of the ſucceſſive notes, this is the modern art, which requires ſo peculiar a genius, and on which account the modern *muſic* ſeems to have much the advantage of the antient. For further ſatisfaction on the ſubject, ſee Kircher, Perrault, Dr. Wallis, Mr. Malcolm, the jeſuit Cerceau, and others; who unanimouſly agree, that after all the pains they have taken to know the true ſtate of the antient *muſic*, they could not find the leaſt reaſon to think there was any ſuch thing in their days as *muſic* in parts. See Symphony, Synaulia, Harmony, *&c.*

The antient muſical notes are very myſterious and perplexed: Boethius and Gregory the Great firſt put them into a more eaſy and obvious method.—In the year 1204, Guido Aretine, a Benedictine of Arezzo in Tuſcany, firſt introduced the uſe of a ſtaff with five lines, on which, with the ſpaces, he marked his notes by ſetting a point up and down upon them, to denote the riſe and fall of the voice; though Kircher mentions this artifice to have been in uſe before Guido's time. See Note, Staff, *&c.*

Another contrivance of Guido's was to apply the ſix muſical ſyllables *ut*, *re*, *mi*, *fa*, *ſol*, *la*, which he took out of the Latin hymn,

UT*queant laxis* RE*ſonare fibris*
MI*ra geſtorum* FA*muli tuorum*
SOL*ve polluti* LA*bii reatum.*
O Pater Alme.

Beſides his notes of *muſic*, by which, according to Kircher, he diſtinguiſhed the tones, or modes, and the ſeats of the ſemitones, he alſo invented the ſcale, and ſeveral muſical inſtruments, called *polyplectra*, as ſpinets and harpſicords. See Note, Gamut, *&c.*

The next conſiderable improvement was in 1330, when Joannes Muria, or de Muris, doctor at Paris, (or as Bale and Geſner make him, an Engliſhman) invented the different figures of notes, which expreſs the times, or length of every note, at leaſt their true relative proportions to one another, now called *longs*, *breves*, *ſemi-breves*, *crotchets*, *quavers*, &c. See Character.

The moſt antient writer of *muſic*, we have already obſerved, was Laſus Hermionenſis; but his work, as well as thoſe of many others, both Greek and Roman, are loſt. Ariſtoxenus, diſciple of Ariſtotle, is the eldeſt author extant on the ſubject; after him came Euclid, author of the Elements: Ariſtides Quintilianus wrote after Cicero's time. Alypius ſtands next; after him Gaudentius the philoſopher, and Nicomachus the Pythagorean, and Bacchius.—Of which ſeven Greek authors, we have a fair copy, with a tranſlation and notes, by Meibomius.

Ptolemy, the celebrated mathematician, wrote in Greek of the principles of harmonics, about the time of the emperor Antoninus Pius. This author keeps a medium between the Pythagoreans and Ariſtoxenians. He was ſucceeded at a good diſtance by Manuel Bryennius.

Of the Latins, we have Boethius, who wrote in the time of Theodoric the Goth; and one Caſſiodorus, about the ſame time: Martianus, and S. Auguſtin not far remote.

Of the moderns, are Zarlin, Salinas, Vincenzo Galileo, Doni, Kircher, Merſenne, Paran, De Caux, Perrault, Wallis, Des Cartes, Holder, Malcolm, *&c.*

MUSK *, Moschus, a kind of perfume, of a very ſtrong ſcent; only agreeable when moderated by the mixture of ſome other perfume. See Perfume.

* The word comes from the Arabic, *moſcha*, muſk: whence was formed the common Greek, μοσχος, muſk.

Muſk is found in a kind of bag, or tumour growing about the bigneſs of a hen's egg, under the belly, towards the genital parts of a wild beaſt of the ſame name; and appears to be nothing elſe but a kind of bilious blood there congealed, and almoſt corrupted.

The animal is pretty common in the kingdoms of Boutan, Tonquin, and ſome others, as Cochin-China, *&c.* But the moſt eſteemed are thoſe in the kingdom of Tibet.

They inhabit the woods and foreſts, where the natives hunt them down: when the beaſt is killed, they cut out the bladder under the belly, ſeparate the coagulated blood, and dry it in the ſun, where it is reduced into a little friable ſubſtance almoſt of the nature of a powder, of a duſky reddiſh colour; and acquires a very ſtrong and diſagreeable ſmell. It is then tied up again in bladders, and exported to other countries; and this is the *muſk* which we uſe.

What the antients have wrote of it, is fabulous, *viz.* that it comes from the teſticles of a caſtor, which, to ſtop the purſuit of the hunter, caſtrates itſelf. The occaſion of their error may be owing to this, that among the Indians the *muſk* animal goes by the name of *caſtor*. See Castoreum.

Muſk is in conſiderable uſe among the perfumers and confectioners; though much leſs now than formerly. It is ſuppoſed to fortify the heart and brain; and is good againſt deafneſs; but is little uſed in medicine, as being apt to occaſion the vapours.

MUSKET, or Musquet, a fire-arm borne on the ſhoulder, and uſed in war; to be fired by the application of a lighted match. See Fire-*arm*.

The length of the *muſket* is fixed to three feet eight inches from the muzzle to the touch-pan, and its bore is to be ſuch as may receive a ball of ſixteen in a pound.

Muſkets were antiently borne in the field by the infantry: at preſent they are little uſed ſave in the defence of places; fuſees, or fire-locks, having taken their place.

MUSKETOON, a *muſket* ſhorter, though thicker, than the ordinary muſket.—It is fired by the colliſion of a ſteel and flint in the lock; whereas the muſket is fired by a match. Its bore is a thirty-eighth part of its length; and carries five ounces of iron, or ſeven and a half of lead, with an equal quantity of powder.

MUSLIN, or Musslin, a fine ſort of cloth, wholly cotton; ſo called, as not being bare, but having a downy nap on its ſurface, reſembling moſs, which the French call *mouſſe*.

There are various kinds of *muſlins* brought from the Eaſt-Indies; chiefly Bengall; betelles, tarnatans, mulmuls, tanjeebs, terrindams, doreas, *&c.*

MUSSA *mora*. See the article Moor.

MUSSLIN. See the article Muslin.

MUSSULMAN *, or Musulman, a title by which the Mahometans diſtinguiſh themſelves; ſignifying, in the Turkiſh language, *true believer*, or *orthodox*. See Mahometanism.

* In Arabic, the word is written *Moſlem*, *Moſleman*, or *Moſolman*.

The appellation was firſt given to the Saracens; as is obſerved by Leunclavius.—There are to kinds of *Muſſulmans*, very averſe to each other; the one called *Sonnites*, and the other *Shiites*.—The Sonnites follow the interpretation of the Alcoran given by Omer; the Shiites are the followers of Ali. The ſubjects of the king of Perſia are Shiites; and thoſe of the grand ſignior, Sonnites. See SONNA, and ALCORAN.

Some authors will have it, that the word *Muſſulman* ſignifies *ſaved*, that is, predeſtinated; and that the Mahometans give themſelves the appellation, as believing they are all predeſtinated to ſalvation.—Martinius is more particular as to the origin of the name; which he derives from the Arabic מסלם *muſalam*, ſaved, ſnatched out of danger: the Mahometans, he obſerves, eſtabliſhing their religion by fire and ſword, maſſacred all thoſe who would not embrace it, and granted life to all that did, calling them *Muſſulmans*; q. d. *erepti è periculo*, whence the word, in courſe of time, became the diſtinguiſhing title of all thoſe of that ſect, who have affixed to it the ſignification of *true believer*.

MUST, MUSTUM, ſweet wine newly preſſed from the grape; or the new liquor preſſed from the fruit before it has worked or fermented. See WINE.

MUSTARD, a preparation of a ſeed of that name, ground or beaten up with vinegar, or the *muſt* of wine; whence its name.

MUSTARD-*ſeed*, in Latin *ſinapi*, a warm biting ſeed, which gives the denomination to a ſpecies of topical medicines called *ſinapiſms*. See SINAPISM.

Muſtard-ſeed is alſo uſed in preparing ſhagreen. See SHAGREEN.

MUSTER *, a review of a body of military forces under arms, in order to take account of their numbers, condition, accoutrements, arms, &c.

* The word is formed of the French, *mouſtre*, ſpecimen. See REVIEW.

Falſe-MUSTER. See the article FALSE.

MUSTER-*maſter general*, or *commiſſary general of* MUSTERS, is an officer in the army, who takes account of every regiment, their number, horſes, arms, &c. See COMMISSARY.

MUSTER-*rolls*, are liſts of the ſoldiers in every troop, company, regiment, &c. delivered by the captains to the commiſſary: by which they are paid, and the ſtrength of the regiment known. See ROLL.

MUSTERED *of record*, (Stat. 18. Hen. VI.) denotes a being enrolled in the number of the king's ſoldiers. See ROLL.

MUTABILITY. See the article IMMUTABILITY.

MUTARE *arma*. See the article ARMA.

MUTATION, the act of changing: or, ſometimes, the change itſelf. See CHANGE, PERMUTATION, and TRANSMUTATION.

It is one of the laws of nature, that the *mutation* of motion is ever proportional to the moving force impreſſed. See NATURE, and MOTION.

MUTATION, in the antient muſic, is applied to the changes, or alterations that happen in the order of the ſounds which compoſe the melody. See MUSIC.

Ariſtoxenus repreſents *mutation* as a kind of paſſion in the order of the melody. See MELODY.

The changes are, 1°, in the genera; when the ſong begins in one, as the chromatic, and paſſes into another, as the diatonic. 2°, In the ſyſtem; as when the ſong paſſes out of one tetrachord, as meſon, into another, as diazeugmenon; or more generally, when it paſſes from a high place of the ſcale to a lower, or contrarily; *i. e.* part of it is ſung high, and part low. 3°, In the mode or tone, as when the ſong begins in one, as the Doric; and paſſes into another, as the Lydian. 4°, In the melopœia, that is, when the ſong changes the very air, ſo as from gay and ſprightly, to become ſoft and languiſhing; or from a manner that expreſſes one paſſion or ſubject, to the expreſſion of ſome other.

MUTE, *dumb*, denotes a perſon that cannot ſpeak, or has not the uſe of ſpeech. See DUMBNESS.

Mutes and dwarfs make their fortune in the grand ſignior's ſeraglio. The *mutes* ſerve as executioners to take off perſons of the firſt rank.

MUTE, in law, is he that ſtands dumb, or ſpeechleſs; when he ought to anſwer, or plead.

A priſoner may ſtand *mute* two ways: 1°, When he ſpeaks not at all: In which caſe it is enquired, whether he ſtand *mute* of malice, or by the act of God: If by the latter, then the judge, ex officio, ought to enquire whether he be the ſame perſon; and of all other pleas, which he might have pleaded if he had not ſtood *mute*. 2°, When he pleads not directly, or will not put himſelf upon the inqueſt to be tried.—The puniſhment of ſtanding *mute*, is preſſing, even to death. See PAINE *fort & dure*.

MUTE, in grammar, a letter which is not ſounded, or heard in the pronunciation: or, a letter which yields no ſound of itſelf and without a vowel. See LETTER.

The conſonants are ordinarily diſtinguiſhed into *mutes*, and *liquids* or ſemi-vowels. See CONSONANT, LIQUID, &c.

The *mutes* in the Engliſh alphabet are eleven, *viz.* B, C, D, F, G, J, K, P, Q, T, V. They are called *mutes*, becauſe a liquid cannot be ſounded in the ſame ſyllable before them, as *rpo*; but a *mute* may be pronounced in the ſame ſyllable before a liquid, as *pro*.

MUTILATED *corniche*. See the article CORNICHE.

MUTILATED *medals*. See the article MEDAL.

MUTILATED *roof*. See the article ROOF.

MUTILATION, the retrenching, or cutting away any member of the body. See MEMBER, &c.

The uſe of the word is alſo extended to ſtatues, and buildings, where any part is wanting, or the projecture of any member, as a corniche, or an impoſt is broke off. See STATUE, &c.

MULITATION is ſometimes alſo uſed in a more immediate manner for *caſtration*. See CASTRATION.

MUTUAL, a relative term, denoting ſomething that is reciprocal between two or more perſons. See RECIPROCAL.

Thus we ſay, *mutual* aſſiſtance, *mutual* averſion, &c.—There are *mutual*, or reciprocal duties, offices, &c. between ſuperiors, and inferiors; the king and his ſubjects; the maſter and his ſervants, &c.

Vaugelas makes a diſtinction between *mutual* and *reciprocal*: *Mutual*, according to him, is underſtood of what is between two only; and reciprocal of what is between more than two: But this deciſion is little regarded in common uſe.

MUTUAL *teſtament*, is that made by two perſons who leave their effects reciprocally to the ſurvivor.

MUTULE, MUTULUS, in architecture, a kind of ſquare modillion in the Doric frieze. See MODILLION.

The chief difference between *mutule* and modillion conſiſts in this, that the former is uſed in ſpeaking of the Doric order, and the latter in the Corinthian, &c. See DORIC, &c.

The *mutules* in the Doric anſwer to the triglyphs, which are under them; whence ſome make *guttæ*, or drops to hang. See GUTTÆ.

MUTUUM, in the civil law, is a loan ſimply ſo called; or a contract introduced by the law of nations, whereby a thing conſiſting in weight, as ſuppoſe bullion; in number, as money; or in meaſure, as corn, timber, wine, &c. is given to another, upon condition that he ſhall return another thing of the ſame quantity, nature, and value, on demand.

This, therefore, is a contract without reward: So that where uſe or intereſt ariſes, there muſt be ſome particular article in the contract whereon it is founded. See INTEREST.

MUZZLE-*ring*, of a gun, the moulding, or circle, which incompaſſes, and ſtrengthens the mouth of it. See CANNON, &c.

MY—*Per* MY *& per tout*. See the article PER *my*.

MYLOGLOSSUM, in anatomy, a pair of muſcles, thus called becauſe ariſing about the backſide of the molares, or grinding-teeth, and inſerted into the ligament of the tongue; helping to pull it upwards. See TONGUE.

Theſe are the ſame with what Mr. Cowper calls *ſtyloglosſum*. See STYLOGLOSSUS.

MYLOHYOIDEUM, in anatomy, a broad, but ſhort muſcle, lying immediately under the biventer muſcle of the jaw, and which ſpringing from the lower margin on each ſide the under jaw, is inſerted into the baſis of the os hyoides. See HYOIDES.

Beſides the common uſe aſcribed to this muſcle, which is to move the hyoides, the tongue, and the larynx both upwards, inwards, and ſide-ways; its ſeries of tranſverſe fibres have a further uſe when it is at reſt; and that is to compreſs the glands under the tongue, and by this means promote the diſcharge of ſaliva into the mouth from the lower ſalival ducts. Whence it is we uſe this muſcle when we want ſaliva in the mouth.

MYOCEPHALON *, in medicine, a little part of the tunica uvea, protended over the ſight of the eye; occaſioned by an ulceration of the part: ſo called, as reſembling the head of a fly. See UVEA.

* The word is Greek μυοκεφαλον, formed of μυια, fly, and κεφαλη, head.

MYOLOGY *, in anatomy, a deſcription of the muſcles; or the knowledge of what relates to the muſcles of the human body.—See *Tab. Anat.* (*Myol.*) See alſo MUSCLE.

* The word is formed of μυς, μυος, a muſcle, and λογος, diſcourſe.

MYOMANCY, a kind of divination, or method of foretelling future events by means of mice. See DIVINATION.

Some authors hold *myomancy* one of the moſt antient kinds of divination; and think it is on this account that Iſaiah, lxvi. 17. reckons mice among the abominable things of the idolaters. But beſide that it is not certain that the Hebrew word עכבר uſed by the prophet, ſignifies a *mouſe*; it is evident it is not divination by that animal, be it what it will, is here ſpoke of; but eating it.

MYOPS *, MYOPIS, a perſon who is ſhort-ſighted; or, as we popularly call it, *purblind*. See SIGHT.

* The word is Greek, μυωψ, compounded of μυς, mouſe; and ωψ, eye; by reaſon, we ſuppoſe, the ſame conformation of the eye is obſerved in mice.

Myopes are properly ſuch as ſee remote objects confuſedly, and near ones diſtinctly. See MYOPIA.—Thoſe who labour under the oppoſite defect, are called *presbytæ*. See PRESBYTA.

The defect of *myopes* is not in the optic nerve, the pupil, or the like; but in the form of the cryſtalline, or the diſtance of the retina from the ſame. The cryſtalline being rounder, or more convex than ordinary, the rays will be rendered more convergent than ordinary in paſſing through the ſame. See REFRACTION.—By this means they will be brought to meet, or concur, at the leſs diſtance from the cryſtalline; ſo that if the retina be at its uſual diſtance, they will concur ere they reach it. It is the too great nearneſs, then, of the retina to the cryſtalline, that conſtitutes the *myopia*. See CHRISTALLINE, RETINA, *&c.*

MYOPIA, or MYOPIAS, *ſhortſightedneſs*, a confuſion, or obſcurity of ſight, when directed to remote objects. See MYOPS, VISION, SIGHT, *&c.*

The *myopia* is owing to the too great convexity of the ball of the eye, and particularly of the cryſtalline; whence it happens, that the viſual rays concur before they reach the retina. For this reaſon, to ſee an object diſtinctly, they muſt either apply it cloſe to the eye, or uſe a concave glaſs. See CONCAVE.

The *myopia* wears off by time, the eye growing flatter and flatter as perſons draw towards old age. See EYE.

MYOTOMY, MYOTOMIA, an anatomical diſſection, or demonſtration of the muſcles. See MUSCLE.

MYRIAD, the number of ten thouſand.—Whence *myriarcha*, a captain, or commander of ten thouſand men.

MYRMECIA, in medicine, a kind of wart, by Latin writers called *formica*. See FORMICA.

MYRMIDONS, MYRMIDONES, in antiquity, a people of Theſſaly, fabled to have aroſe from ants, or piſmires, upon a prayer put up for that purpoſe by king Æacus to Jupiter, after his kingdom had been diſpeopled by a ſevere peſtilence. — In Homer, and Virgil, the *Myrmidons* are Achilles's ſoldiers.

MYRMILLONES*, a kind of gladiators in antient Rome; called alſo *murmuliones*. See GLADIATOR.

* Turnebius derives the name from the *Myrmidons*.

MYROBALANS*, MYROBALANI, a kind of medicinal fruit, brought from the Indies; much more uſed in the Arabic than the Greek pharmacy; and more among the antients than the moderns; and ſtill more abroad than in England.

* The word comes from the Greek μυρον, unguent; and βαλανος, acorn; as being in form of acorns, and uſed in medicine.

There are five kinds of *myrobalans*, or purging Indian plumbs: the firſt called *citrini*, of a yellowiſh red, hard, oblong, and the ſize of an olive.—The ſecond called *black* or *Indian myrobalans*, the bigneſs of an acorn, wrinkled, without ſtone.—The third, *chebuli myrobalans*, the ſize of a date, of a yellowiſh brown, pointed at the end.—The fourth *emblici*, round, rough, the ſize of a gall, of a dark brown. — The laſt called *bellerici*, hard, yellow, round, the ſize of an ordinary prune, leſs angular than the reſt.—*Myrobalans* of each kind are ſlightly purgative, and aſtringent.

MYRRH*, MYRRHA, a kind of gum, or reſin, iſſuing, by inciſion, and ſometimes ſpontaneouſly, from the trunk, and larger branches of a tree growing in Arabia, Egypt, and eſpecially Abyſſinia. See GUM.

* The word comes from μυῤῥα, of μυρα, I run, or trickle.

Authors are not agreed about the tree which produces this gum: It is true, they all make it ſmall and thorny; but diſagree about the form of its leaves.

The inciſions are made twice a year, and the *myrrh* oozing out is received on ruſh mats, diſpoſed underneath.

The druggiſts ſell two kinds of *myrrh*, viz. *myrrh in tears*, which they call *ſtacte*; the other *ungulata*, or in nails. See STACTE, *&c.*

Of the firſt kind, the beſt is in bright, yellow, tranſparent drops, friable, light, of a ſtrong diſagreeable ſmell: But this is very rare; and moſt of that in uſe is the naild myrrh, ſo called from little white ſpots obſerved thereon, much like thoſe on the nails of the fingers.

The beſt is in little maſſes, or tears, red, and tranſparent; which, when broke, contain a kind of unctuous liquor, the moſt precious part of the *myrrh*, and the real *ſtacte* of the antients.

This gum enters a great number of medicinal compoſitions. Its bitterneſs renders it good for the ſtomach, and againſt worms; it is chewed to prevent infection from contagious diſeaſes. Dr. Quincy ſays it is excellent to cleanſe and ſtrengthen the womb, and againſt tickling rheums; a good detergent; and as ſuch much uſed externally in unguents for the healing of wounds; and makes the principal ingredient in embalming. The chymiſts draw from it oils, ſpirits, tinctures, *&c.* to which they attribute extraordinary virtues.

MYRRHINE *veſſels, vaſa* MYRRHINA. See MURRHINE.

MYRTIFORM *glands*. See the article GLAND.

MYRTIFORMIS *carunculæ*, in anatomy, little caruncles, or fleſhy knots adjoining to, or rather in the place of the hymen in women.—*See Tab. Anat. (Splanch.) fig.* 9. *lit. ſ. ſ.* See alſo CARUNCLE.

They are about the bigneſs of myrtle-berries, whence they take their name; and are ſuppoſed by ſome to be largeſt in maids, and by degrees to grow leſs through the uſe of venery. Others, and with more probability, derive them from the broken membrane of the hymen, whoſe fragments ſhrunk up, they take them to be. See HYMEN.

MYRTLE-*berries*, the fruit of a ſhrub well known under the name of *myrtle*, *myrtus*, growing common in Spain, eſpecially in the mountains of Sierra Morena, *&c.*

There are two kinds of *myrtle*, *male* and *female*; the latter whereof produces the beſt berries, and in the greateſt quantity. The fruit is at firſt green, but becomes black gradually within; it is a white ſeed in form of a creſcent, ſolid, hard, and of an aſtringent taſte; while the fruit continues on the trees, it is ſucculent and ſmooth, and only becomes hard and wrinkled, becauſe dried in the ſun for the convenience of carriage.

Myrtle-berries are rough and aſtringent, and are chiefly uſed in the way of ſyrup, as a ſtrengthner againſt fluxes and abortion. They are alſo an ingredient in ſeveral of the ſtrengthning plaiſters.

The perfumers likewiſe uſe them in their perfumes, and draw an eſſence from them. The German dyers make a blue colour from them. In England the leaves and branches are alſo uſed in the tanning of leather.

MYSTERY*, MYSTERIUM, ſomething ſecret, or hidden; impoſſible, or difficult to be comprehended. See ACATALEPSY.

* The word comes from the Greek μυϛηριον; and that, according to ſome etymologiſts, from μυω, *claudo*, *taceo*, I ſhut, I am ſilent; and ϛομα, mouth; but then whence comes the *r*? Muſt the *m* of *ſtoma* be converted into an *r*? The word ſeems derived with more propriety from the Hebrew סתר *ſator*, to hide; whence is formed מסתר *miſtar*, a hidden thing.

Myſtery is primarily uſed in ſpeaking of certain truths revealed in ſcripture; into the full underſtanding whereof human reaſon cannot penetrate.—Such are the doctrines of the trinity, the incarnation, *&c.* See TRINITY, *&c.*

We have an epitome of the *myſteries of faith*, or the *myſteries of Chriſtianity*, in the ſymbols, or creeds, compiled by the apoſtles, the council of Nice, and S. Athanaſius. See CREED.

In all theſe, mention is made of the *myſtery* of the trinity; the *myſteries* of the incarnation of the Son of God, his death and paſſion, and his deſcent into hell for the redemption of mankind: of his reſurrection the third day, his aſcenſion to heaven, his ſitting at the right hand of God, and his coming again to judge the world: of the divinity, and co-equality of the holy Ghoſt with the Father and the Son: of the unity of the church: of the community of ſaints; the participation of the ſacraments; and the general reſurrection.—Such are the principal *myſteries* of faith; which the church declares neceſſary to be known and believed, in order to ſalvation.

From the earlieſt ages there have been particular feſtivals inſtituted in honour of theſe *myſteries*; to return thanks to God for having revealed them, and to oblige the miniſters and paſtors to inſtruct the people therein. See FEAST.

Such are the feaſt of the *myſtery* of the incarnation, called alſo *Chriſtmas*; thoſe of the circumciſion, paſſion, reſurrection, *&c.* See INCARNATION, CIRCUMCISION, EASTER, EPIPHANY, *&c.*

The heathens too had their *myſteries*, particularly thoſe of Ceres, the bona dea, *&c.* See ELEUSINIA. — The Egyptian prieſts concealed the *myſteries* of their religion and philoſophy under hieroglyphics. See HIEROGLYPHIC.—Thoſe who revealed the *myſteries* of the bona dea were ſeverely puniſhed; and none were truſted with them but thoſe ſolemnly initiated, and ſworn to ſecrecy.

But theſe were not called *myſteries*, as being incomprehenſible, or raiſed above the ken of reaſon; but becauſe they were covered, and diſguiſed under types, and figures, to raiſe the greater veneration in the people.—The *myſteries* of paganiſm were celebrated in caves and grotto's, fitter to conceal crimes than to celebrate religious *myſteries* in. See INITIATED, ORACLE, *&c.*

MYSTERY, in ſcripture-language, is uſed with ſome latitude.—Sometimes it denotes any thing not to be known without divine revelation. See REVELATION.

In this ſenſe we are to underſtand thoſe texts: "He that reveals ſecrets, (or *myſteries*) makes known to thee what ſhall come to paſs; *Dan.* ii. 29. "There is a God in heaven that reveals *myſteries*," *ib.* v. 28.

MYSTERY is alſo uſed to denote the ſecret things, which God has diſcovered by his miniſters the prophets, Jeſus Chriſt, and the apoſtles.

In which ſenſe it is S. Paul ſays,—"We ſpeak the wiſdom of God in a *myſtery*, which God had reſolved before all ages to reveal for our glory, 1 *Cor.* ii. 7. We are to be accounted as miniſters of Chriſt, and diſpenſers of the *myſteries* of God, 1 *Cor.* iv. 1. Though I underſtand all *myſteries*, and have the knowledge of all things, if I have not charity, I am nothing, 1 *Cor.* xiii. 2. Behold I ſhew you a *myſtery*, 1 Cor. xv. 51. By reading my epiſtle, you may underſtand my knowledge in the *myſtery* of Chriſt, *Epheſ.* iii. 4." And in the following verſes he adds, that this *myſtery* is, that the Gentiles are fellow-heirs, and make but one body with the Jews, being ſharers with them in the promiſes of God in the goſpel. "Holding the *myſtery* of the faith in a pure conſcience, 1 *Tim.* iii. 9. "When the ſeventh angel begins to ſound his trumpet, the *myſtery* of God ſhall be finiſhed, as he has declared to his ſervants the prophets, *Revel.* x. 7."

Additions of MYSTERY. See the article ADDITION.

MYSTES. See the article HYDROMYSTES.

MYSTICAL, ΜΥΣΤΙΧΩΣ, MYSTIC, ſomething *myſterious*, or allegorical. See MYSTERY, ALLEGORY, *&c.*

The commentators on the ſcripture, beſides a literal, find alſo a *myſtical*, and a moral meaning.—The Bible, they contend, is a book written both within-ſide, and without-ſide.—Within-ſide, in reſpect to the *myſtical*, internal, ſublime, and hidden ſenſe; and without-ſide, in reſpect to the literal and grammatical ſenſe, immediately expreſſed by the words.

In effect, ſeveral of the antient fathers, and doctors of the church, underſtand the books mentioned in Ezek. ii. 10. and in the Apocalypſe, v. 1. " which were wrote both within-ſide and without," of the ſcriptures: and take the literal and *myſtical* ſenſe to be here fairly intimated. See ALLEGORICAL, TYPE, *&c.*

The ſenſe of ſcripture, ſay they, is either that immediately ſignified by the words and expreſſions in the common uſe of language: or it is mediate, ſublime, typical, and *myſtical*; wherein the things themſelves ſignified, are made to ſignify ſtill other and further things, according to the particular deſign, and intention of God, and of the prophets and apoſtles inſpired by him. See TYPICAL.

The literal ſenſe they again divide into *proper* literal, which is contained in the words taken ſimply and properly:

And *metaphorical* literal, where the words are to be underſtood in a figurative and metaphorical ſenſe; as where the right eye is commanded to be plucked out, *&c.*

Whereever the proper literal ſenſe contains any thing abſurd, or indecent, there recourſe muſt be had to the metaphorical literal ſenſe.

All ſcripture has a true literal ſenſe, but not always a *myſtical* one. We muſt ever underſtand it in the literal ſenſe, when it ſpeaks immediately of any of the laws of nature; of charity, of doing good; when it gives us inſtructions for the conduct of life, for regulating our manners; and when it relates any matter of fact, or point of hiſtory.

The ſame paſſage of ſcripture has ſometimes ſeveral ſenſes, expreſſed and ſignified immediately by the words taken in their proper, and their figurative ſenſe, and which appear to have been all intended by the inſpired perſon who ſpoke them, as having been ſo underſtood by others likewiſe inſpired.—As thoſe words in Pſalm ii. " Thou art my ſon, this day have I begotten thee;" which S. Paul underſtands according to the ſtrict letter in Heb. i. of the generation of Jeſus Chriſt in time: and in Acts xiii. 33. he takes them in a metaphorical ſenſe, and applies them to our Saviour's reſurrection.—Thus in Hoſea xi. 1. the words of the prophecy, " I have called my ſon out of Egypt," are underſtood literally of the children of Iſrael, whom God brought out of Egypt under the conduct of Moſes; and yet in Matth. ii. 15. they are underſtood metaphorically of Jeſus Chriſt. See PROPHECY.

The *myſtical* ſenſe of ſcripture, is that which the things expreſſed by the words do further ſignify; or it is a ſecond ſignification, held forth or ſignified by the firſt: this ſecond being expreſſed immediately by the firſt, and mediately by the words themſelves.

Writers allow of three kinds of *myſtical* ſenſes in the word of God: The firſt correſponding to faith, and called *allegorical*; the ſecond to hope, called *anagogical*; and the third to charity, called the *tropological ſenſe*. See ANAGOGICAL, *&c.*

The four ſenſes, and their applications, are included in the Latin diſtich,

> *Litera geſta docet, quid credas allegoria,*
> *Moralis quid agas, quo tendas anagogia.*

Sometimes the ſame word in ſcripture is to be taken in all the four ſenſes.—Thus the word *Jeruſalem* literally ſignifies the capital of Judæa; allegorically, the church militant; tropologically and morally, a believer; and anagogically, heaven.

So, that paſſage in Geneſis, " Let there be light, and there was light;" ſignifies, according to the letter, corporeal light; by allegory, the Meſſiah; in the tropological ſenſe, grace; and anagogically, beatitude, or the light of glory.

MYSTIC *theology*, denotes a refined and ſublime kind of divinity, profeſſed by the *myſtics*. See MYSTICS, and THEOLOGY.

It conſiſts in a knowledge of God, and divine things, not acquired in the common way, but infuſed immediately by God, and which has the power to move the ſoul in an eaſy, calm, devout, affective manner; to unite it intimately to God; to illumine the underſtanding, and warm and enliven the will in an extraordinary manner.

Among the writings attributed to Dionyſius the areopagite, is a diſcourſe of *myſtic theology*. Several others have wrote on the ſame ſubject, both antients and moderns.

MYSTICS, MYSTICI, a kind of religious ſect, diſtinguiſhed by their profeſſing pure, ſublime, and perfect devotion, with an intire diſintereſted love of God, free from all ſelfiſh conſiderations. See QUIETISM, *&c.*

The *Myſtics*, to excuſe their fanatic extaſies, and amorous extravagancies, alledge that paſſage of S. Paul; " The ſpirit " prays in us by ſighs and groans that are unutterable." Now, if the ſpirit, ſay they, pray in us; we muſt reſign ourſelves to its motions, and be ſwayed, and guided by its impulſe, by remaining in a ſtate of mere inaction.

Paſſive contemplation is that ſtate of perfection to which the *Myſtics* all aſpire. See CONTEMPLATION.

MYTHOLOGY*, ΜΥΘΟΛΟΓΙΑ, the hiſtory of the fabulous gods, and heroes of antiquity; with the explanation of the myſteries or allegories couched therein. See GOD, HERO, FABLE, THEOGONY, *&c.*

* The word is Greek, and ſignifies a diſcourſe or deſcription of fables; from μυθος, *fabula*; and λογος, *ſermo*, diſcourſe.

MYURUS*, ΜΥΟΥΡΟΣ, in medicine, a pulſe which is continually weakening by inſenſible degrees; ſo that the ſecond beat is fainter than the firſt; the third than the ſecond, *&c.* See PULSE.

* The word is compounded of μυς, mouſe, and ουρα, tail; the diminution of the pulſe being ſuppoſed like that of the thickneſs of the tail of that animal, which grows leſs from the root to the tip.

N.

N, A liquid conſonant, and the thirteenth letter of the Greek, Latin, Engliſh, &c. alphabets. See LETTER, and ALPHABET.

The *n* is a naſal conſonant: Its ſound is that of a *d*, paſſed through the noſe; ſo that when the noſe is ſtopped by a cold, or the like, it is uſual to pronounce *d* for *n*. M. l'Abbe de Dangeau obſerves, that in the French, the *n* is frequently a meer naſal vowel, without any thing of the ſound of a conſonant in it.—He calls it the Sclavonic vowel. The Hebrews call their *n*, *nun*, which ſignifies child, as being ſuppoſed the offspring of *m*; partly on account of the reſemblance of ſound, and partly on that of the figure.—Thus from the *m*, by omitting the laſt column, is formed *n*: and thus from the capital *N*, by omitting the firſt column, is formed the Greek minuſcule ν.—Hence for *biennius*, &c. the Latins frequently uſe *bimus*, &c. And the ſame people convert the Greek ν at the end of a word into an *m*; as, φαρμαχον, pharmacum, &c. See M.

N before *p*, *b*, and *m*, the Latins change into *m*, and frequently into *l* and *r*, as *in-ludo*, *illudo*; *in-rigo*, *irrigo*, &c. in which they agree with the Hebrews, who in lieu of nun, frequently double the following conſonant; and the Greeks do the ſame, as when for Manlius, they write Μαλλιος; &c. The Greeks, alſo, before κ, γ, χ, ν, changed the ν into γ: in which they were followed by the antient Romans, who for *Angulus* wrote *Aggulus*; for *anceps*, *agceps*, &c.

The Latins retrench the *n* from Greek nouns ending in ων; as Λεων, Leo; Δρακών, Draco.—On the contrary, the Greeks add it to the Latin ones ending in *o*; as Κατων, Νερων, for Cato, Nero.

N, among the antients, was a numeral letter, ſignifying 900; according to the verſe in Baronius,

> N, *quoque nongentos numero deſignat habendos.*

And when a line was ſtruck over it, N̄, nine thouſand.

Among the antient lawyers, *N. L.* ſtood for non liquet, *i. e.* the cauſe is not clear enough to paſs ſentence upon.

N. or **N°**, in commerce, &c. is uſed as an abbreviation of numero, number.—Thus alſo in medicine, caryophyllorum, N° vi. ſignifies ſix cloves.

NAAM, NAMIUM, in law, the taking or diſtraining another man's moveable goods. See DISTRESS.

This is either *lawful*, or *unlawful*, and *prohibited*.

Lawful **NAAM**, is a reaſonable diſtreſs, proportionable to the value of the thing diſtrained for; and was antiently called either *vif* or *mort*, as it was made of quick, or dead chattel. *Lawful naam*, is ſo either by the common law; as when a man takes another's beaſts doing damage in his ground; or by a man's particular fact, as on account of ſome contract, &c.

Unlawful **NAAM**, *Vetitum Namium*. See NAMIUM, and VETITUM.

NABONASSAR.—The æra of NABONASSAR is famous: We know but little of the hiſtory of the man; only that he was king of Babylon, and was alſo called Beleſus; though ſome will have him the Baladan mentioned in Iſaiah xxxix. 1. and 2 Kings xx. 12. Some even conjecture that he was a Mede; and that he was ſet on the throne by the Babylonians, upon their riſing and ſhaking off the ſubjection of the Medes.

The beginning of this prince's reign is of great importance in chronology; by reaſon Ptolemy aſſures us, there were aſtronomical obſervations made by the Chaldeans from *Nabonaſſar* to his time: and Ptolemy, and the other aſtronomers, account their years from that epocha. See ASTRONOMY.

From the obſervations quoted by Ptolemy, it follows, that the firſt year of this æra is the 747th year before Jeſus Chriſt; and the 3967th of the Julian period. See EPOCHA.

The years of this epocha are Egyptian years, of 365 days each; commencing on the 29th of February, and reckoned, according to the computation of aſtronomers, from noon. See YEAR.

NADIR*, in aſtronomy, a point in the heavens diametrically oppoſite to the zenith. See ZENITH.

* The word is pure Arabic, where it ſignifies the ſame.

The *nadir* is that point directly under our feet; or a point in a right line drawn from our feet through the center of the earth, and terminating in the under hemiſphere.

The zenith and *nadir* are the two poles of the horizon, each 90° diſtant from it, conſequently each in the meridian. See HORIZON.

Sun's **NADIR**, is the axis of the cone projected by the ſhadow of the earth; thus called, in regard that axis being prolonged, gives a point in the ecliptic diametrically oppoſite to the ſun.

NÆVI, or NEVI, in the animal œconomy, marks made on the fœtus, by the imagination of the pregnant mother, in longing for any thing. See theſe accounted for under the article MONSTER. See alſo FOETUS, and IMAGINATION.

NAIADS*, or NAIDS, NAIADES, a ſort of nymphs, or heathen divinities, ſuppoſed to preſide over fountains, and rivers. See NYMPH, and GOD.

* The word comes from the Greek, ναω, fluo, I flow; or from ναιω, I inhabit, abide.

Strabo ſays, the *naiades* were prieſteſſes of Bacchus.

NAIANT, or NATANT, *q. d.* ſwimming; a term in heraldry, uſed in the blazoning of fiſhes, when drawn in an horizontal poſture, feſs-wiſe, or tranſverſely, a-croſs the eſcutcheon; that being their ſwimming poſture. See FISH.

NAILING *of cannon*, the driving of a *nail*, or iron ſpike, by force, into the touch-hole of a piece of artillery; ſo as to render it for ſome time uſeleſs to the enemy. See CANNON.

NAILS, in the animal body, a kind of horny excreſcences, growing over the ends of the fingers, and toes of men, and ſeveral other animals; much of the ſame nature with the hoofs of others. See FINGER, and TOE.

Hoofs being nothing elſe but a number of ſmall husks, anſwering to ſo many papillæ of the skin; it may be concluded, that *nails* are no more but the covers, or ſheaths of the papillæ pyramidales of the skin, on the extremities of the fingers and toes, which dry, harden, and lie upon one another. See PAPILLÆ.

Their uſe is to ſtrengthen and defend the ends of the fingers in handling any hard, and rugged bodies; that part being exceedingly ſenſible, by reaſon of the great number of nerves which terminate here for the ſenſation of feeling. See FEELING.

The *nails* are formed, and grow after the ſame manner as the reſt of the body; their nouriſhment they receive from their roots, as is eaſily obſervable from the white ſpecks ſometimes ſeen on them, and which conſtantly recede from the root.

The Romans were very curious in the cutting their *nails*, and had it done by artiſts, who made an employment of it.

The Chineſe doctors and literati pique themſelves on the exceſſive length of their *nails*. F. le Compte ſays, ſome of them wear *nails* near as long as their fingers. See CIRCUMCISION.

NAILS, in building, &c. are little metalline members, ſerving to bind, or faſten the parts together, &c. See IRON, &c.

The ſeveral kinds of *nails* are very numerous.—As *back* and *bottom nails*; made with flat ſhanks to hold faſt, and not open the wood.—*Clamp nails*, thoſe proper to faſten the clamps in buildings, &c.—*Claſp nails*, whoſe heads claſping and ſticking into the wood, render the work ſmooth, ſo as to admit a plane over it: They are of two kinds, *viz.* *long*, proper for fine buildings of fir, &c. and *ſtrong*, fit for oak, and other hard wood.—*Clench nails*, thoſe uſed by boat, barge, &c. builders; proper for boarded buildings, that are to be taken down, becauſe they will drive without ſplitting, and draw without breaking.—*Clout nails*, thoſe ordinarily uſed for nailing on of clouts to axle-trees.—*Deck nails*, thoſe proper for faſtening of decks in ſhips, doubling of ſhipping, and floors laid with planks.---*Dog nails*, proper for faſtening of hinges to doors, &c.—*Flat points*, are of two kinds, *viz.* *longs*, much uſed in ſhipping, and proper where there is occaſion to draw, and hold faſt, yet no neceſſity of clenching.—*Jobent nails*, thoſe commonly uſed to nail thin plates of iron to wood.—*Lead nails*, uſed to nail lead, leather, and canvas to hard wood.—*Port nails*, commonly uſed to nail hinges to the ports of ſhips.—*Pound nails*, are four-ſquare in the ſhank; much uſed in Norfolk, Suffolk and Eſſex, though ſcarce elſewhere, except for paling.—*Ribbing nails*, uſed to faſten the ribbing, to keep the ribs of ſhips in their place in building.—*Roſe nails*, are drawn four-ſquare in the ſhank, and commonly in a round tool.—*Rother nails*, chiefly uſed to faſten rother-irons to ſhips.—*Round-head nails*, proper to faſten on hinges, or other uſes, where a neat head is required.—*Scupper nails*, much uſed to faſten leather and canvas to wood.—*Sharp nails*, much uſed, eſpecially in the Weſt-Indies, made with ſharp points, and flat ſhanks.---*Sheathing nails*, uſed to faſten ſheathing-boards to ſhips: the rule for their length, is to have them full three times as long as the board is thick.—*Square nails*, of the ſame ſhape as *ſharp nails*; chiefly uſed for hard woods.—To which may be added *tacks*; the ſmalleſt, ſerving to faſten paper to wood; middling, for wool-cards and oars; larger, for upholſterers, and pumps.

In lathing, 500 *nails* are ordinarily allowed to a bundle of five-foot laths.—In flooring, 200, i. e. 240, are allowed for a ſquare of flooring.

Nails are ſaid to be toughned, when too brittle, by heating them in a fire-ſhovel, and putting ſome tallow or greaſe among them. See TEMPERING.

NAIL is alſo a ſort of long meaſure chiefly uſed in the commerce of cloths; containing the ſixteenth part of a yard. See YARD, and MEASURE.

NAIRANGIA *, a kind of divination in uſe among the Arabs, drawn from ſeveral phænomena of the ſun and moon. See DIVINATION.

* The word is formed from the Arabic *nairan*, the plural of *nair*, light.

NAISSANT, in heraldry, is applied to a lion, or other animal, ſhewing only the head, ſhoulders, fore-feet, and legs, with the tip of the tail; the reſt of the body lying hid under the ſhield, or ſome charge, or ordinary thereon; from which it appears to be iſſuing or ariſing.—See *Tab. Herald. fig.* 28.

Naiſſant differs from iſſuant, in that the animal in the former caſe iſſues out at the middle, and in the latter, at the bottom, of the ſhield, or charge. See ISSUANT.

F. Meneſtrier ſays, *naiſſant* is only uſed for animals, which ſhew the bare head as ariſing out of the extremity of the chief, or from above the feſſe.

NAKED, in architecture.—NAKED of a wall, *&c.* is the ſurface, or plain, from whence the projectures ariſe; or which ſerves as a ground to the projectures. See *Tab. Archit. fig.* 24. lit. *r.* See alſo PROJECTURE.

Thus, we ſay, a pilaſter ought to exceed the *naked* of the wall by ſo many inches; and that the foliages of a capital ought to anſwer to the *naked* of the column. See COLUMN, *&c.*

NAKED *Fire*, is a term uſed by chymiſts for an open fire; or one where the containing veſſel is immediately expoſed to the fire. See FIRE, and HEAT.

NAKED *Seeds*, in botany, are ſuch ſeeds of plants as are not incloſed in any pod, or caſe. See PLANT, and SEED.

NAMATION, NAMATIO, in law, the act of diſtraining, or taking a diſtreſs. See DISTRESS, and NAAM.

In Scotland, the word is particularly uſed for impounding. See POUND.

NAME, denotes a word, whereby men have agreed to expreſs ſome idea; or which ſerves to denote, or ſignify a thing, or ſubject ſpoken of. See WORD.

This the grammarians uſually call a *noun*, *nomen*, though their *noun* is not of quite ſo much extent as our *name*. See NOUN.

Seneca, Lib. II. *de Beneficiis*, obſerves, that there are a great number of things which have no *name*; and which, therefore, we are forced to call by other borrowed *names*. *Ingens eſt*, ſays he, *rerum copia ſine nomine, quas cum propriis appellationibus ſignare non poſſumus, alienis accommodatis utimur:* Which may ſhew why, in the courſe of this dictionary, we frequently give divers ſenſes to the ſame word.

It was Adam that firſt gave things their names, Gen. ii. 19. *Formatis, igitur, Dominus Deus, de humo cunctis animantibus terræ, & univerſis volatilibus cœli, & omnibus beſtiis terræ, adduxit ea ad Adam, ut videret quid vocaret ea; omne enim quod vocavit Adam animæ viventis ipſum eſt nomen ejus.* Ver. 20. *Appellavitq; Adam nominibus ſuis cuncta animantia, & univerſa volatilia cœli, & omnes beſtias terræ.*

Names are diſtinguiſhed into *proper* and *appellative*.

Proper NAMES, are thoſe which repreſent ſome individual thing, or perſon; ſo as to diſtinguiſh it from all other things of the ſame ſpecies; as, Socrates, which repreſents a certain philoſopher. See PROPER.

Appellative, or *General* NAMES, are thoſe which ſignify common ideas; or which are common to ſeveral individuals of the ſame ſpecies; as, horſe, animal, man, oak, *&c.*

Proper names are either called *chriſtian*, as being given at baptiſm; or *ſurnames:* the firſt, impoſed for diſtinction of perſons; anſwering to the Roman *prenomen*. See PRENOMEN.

The ſecond, for the diſtinction of families, anſwering to the *nomen* of the Romans, and the *patronymicum* of the Greeks. See SURNAME.

Originally every perſon had but one *name*; as among the Jews, Adam, *&c.* among the Egyptians, Buſiris; among the Chaldees, Ninus; the Medes, Aſtyages; the Greeks, Diomedes; the Romans, Romulus; the Gauls, Divitiacus; the Germans, Arioviſtus; the Britains, Caſſibelan; the Engliſh, Hengiſt, *&c.* And thus of other nations, except the ſavages of mount Atlas, whom Pliny and Marcellinus repreſent as anonymi, nameleſs.

The Jews gave the *name* at the circumciſion, *viz.* eight days after the birth: The Romans, to females the ſame day, to males the ninth; at which time they held a feaſt, called *nominalia*. See LUSTRAL, and LUSTRATION.

Since chriſtianity has obtained, moſt nations have followed the Jews, baptizing, and giving the *name* on the eighth day after the birth; except our Engliſh anceſtors, who, till of late, baptized, and gave the *name*, on the birth-day. See BAPTISM.

The firſt impoſition of *names* was founded on different views, among different people; the moſt common was to mark the good wiſhes of the parents, or to intitle the children to the good fortune a happy *name* ſeemed to promiſe.—Hence, Victor, Caſtor, Fauſtus, Statorius, Probus, *&c.*

Accordingly, we find ſuch *names*, by Cicero called *bona nomina*, and by Tacitus, *fauſta nomina*, were ſtill firſt enrolled, and ranged in the Roman muſters; firſt called to ſerve at the ſacrifices, in the foundation of colonies, *&c.* —And, on the contrary, Livy calls Atrius Umber, *abominandi ominis nomen:* And Plautus, on occaſion of a perſon named Lyco, *i. e.* greedy wolf, ſays;

> *Voſmet nunc facite conjecturam cæterum*
> *Quid id ſit hominis, cui* Lyco *nomen ſiet.*

Hence, Plato recommends it to men to be careful in giving happy *names*; and the Pythagoreans taught expreſsly, that the minds, actions, and ſucceſſes of men, were according to their *names*, genius, and fate.—Thus Panormitan, *ex bono nomine oritur bona præſumptio*; and the common proverb, *Bonum nomen bonum omen:* And hence the foundation of the onomomantia. See ONOMOMANTIA.

Hence Camden takes it for granted, that the *names*, in all nations and languages, are ſignificative, and not ſimple ſounds, for meer diſtinction ſake.—This holds not only among the Jews, Greeks, Latins, *&c.* but even the Turks; among whom, Abdalla ſignifies God's ſervant; Soliman, peaceable; Mahomet, glorified, *&c.* And the ſavages of Hiſpaniola, and throughout America, who, in their languages, *name* their children, Gliſtering Light, Sun Bright, Fine Gold, *&c.* And they of Congo, by the *names* of precious ſtones, flowers, *&c.*

To ſuppoſe *names* given without any meaning, however by the alteration of languages their ſignification may be loſt, that learned author thinks, is to reproach our Anceſtors; and that contrary to the ſenſe of all antient writers. —Porphyry notes, that the barbarous *names*, as he calls them, were very emphatical, and very conciſe: And accordingly, it was eſteemed a duty to be φερωνυμοι, or *ſui nominis homines:* as Severus, Probus, and Aurelius, are called *ſui nominis imperatores*.

And it was the uſual way of giving *names*, to wiſh the children might diſcharge their *names*.—Thus when Gunthram, king of France, named Clotharius at the font, he ſaid, *Creſcat puer, & hujus ſit nominis executor*.

The antient Britains, Camden adds, generally took their *names* from colours, becauſe they painted themſelves; which names are now loſt, or remain hid among the Welch.—When they were ſubdued by the Romans, they took Roman *names*; ſome of which ſtill remain, corrupted; though the greateſt part are become extinct, upon the admiſſion of the Engliſh Saxons, who introduced the German *names*, as Cridda, Penda, Oſwald, Edward, *&c.*—The Danes, too, brought with them their *names*; as Suayne, Harrold, Knute, *&c.*

The Normans, at the conqueſt, brought in other German *names*, as originally uſing the German tongue; ſuch as Robert, William, Richard, Henry, Hugh, *&c.* after the ſame manner as the Greek *names*; Aſpaſius, Boethius, Symmachus, *&c.* were introduced into Italy, upon the diviſion of the empire.—After the conqueſt, our nation, which had ever been averſe to foreign *names*, as deeming them unlucky, began to take Hebrew *names*; as Matthew, David, Sampſon, *&c.*

The various *names* antiently, or at preſent obtaining among us, from what language or people ſoever borrowed, are explained by Camden in his Remains.—As to the period when *names* began to be multiplied, and *ſurnames* introduced, *&c.* See SURNAME.

Of late years it has obtained among us to give *ſurnames* for *chriſtian names*; which ſome diſlike, on account of the confuſion it may introduce.—Camden relates it as an opinion, that the practice firſt began in the time of Edward VI. by ſuch as would be godfathers, when they were more than half fathers. Upon which, ſome were perſuaded to change their *names* at confirmation; which, it ſeems, is uſual in other countries.---Thus, two ſons of Henry II. of France, chriſtened Alexander and Hercules, changed them at confirmation into Henry, and Francis.

In monaſteries, the religious aſſume new *names* at their admittance; to ſhew they are about to lead a new life, and have renounced the world, their family, and even their *name:* *v. g.* ſiſter Mary of the incarnation, brother Henry of the holy ſacrament, *&c.*

The popes alſo change their *name* at their exaltation to the pontificate; a cuſtom firſt introduced by pope Sergius, whoſe *name*, till then, as Platina informs us, was Swine-ſnout. But Baronius refers it to pope Sergius I. and Onuphrius to John XII. or XIII. and at the ſame time, adds a different reaſon for it from that of Platina, *viz.* that it was done in imitation of S. Peter and S. Paul, who were firſt called Simon and Saul.—Indeed pope Marcellus, of late, refuſed to change his *name*.

In Italy, it is frequent to join the *name* of ſome ſaint, in a kind of devotion, to the chriſtian *name*; as Joannes Baptiſta Spinoſa, *&c.*

Among the antients, thoſe deified by the heathen conſecrations, had new *names* given them; as Romulus was called Quirinus; Melicertes, Portunus, or Portumnus, *&c.* See Consecration.

New *names* were alſo given in adoptions, and ſometimes by teſtament; thus L. Æmilius, adopted by Scipio, took the *name* of Scipio Africanus; and thus Auguſtus, who at firſt was called C. Octavius Thurinus, being adopted by the teſtament of Julius Cæſar into his *name* and family, took the *name* of Caius Julius Cæſar Octavianus. See Adoption.

Names were alſo changed at enfranchiſements into new cities.—Thus Lucumo, at his firſt being made free of Rome, took the *name*, Lucius Tarquinius Priſcus, *&c.* and ſlaves, when made free, uſually aſſumed their maſters *names*. See Freedom, Slave, *&c.*

Thoſe called to the equeſtrian order, if they had baſe *names*, were always new named, *Nomine ingenuorum veterumque Romanorum*. — And among the primitive Chriſtians, it was the practice to change the *names* of the catechumens: Thus the renegado Lucianus, till his baptiſm, was called Lucius.

Of the **Name**, is a phraſe, frequent among hiſtorians, and genealogiſts, to denote perſons of the ſame quality and *name*.—It is near nine hundred years ſince the emperors of the weſt firſt began to diſtinguiſh themſelves in this manner by their number; and in the *Italia Sacra* of Ughellus, we meet with a charter of the emperor Louis le Debonnaire, anno 818. wherein he ſtyles himſelf the firſt *of the name*. Le Blanc mentions a charter of the year 1084. wherein the emperor Henry III. ſtyles himſelf king of Italy, the fourth *of the name*; and emperor, the third *of the name*.

Some French writers obſerve, that in a manuſcript preſerved in the king's library, their Louis XI. is only ſtyled the ninth *of the name*; Louis the Debonnaire, and Louis the Stammerer, not being then reckoned in the number, by reaſon they were emperors, as well as kings of France: On which footing, the preſent king, inſtead of the fifteenth, ſhould only be the thirteenth *of the name*.

NAMIUM, Naam, in law. See the article Naam.

Namium *Vetitum*, or *Prohibited* **Naam**, is an unjuſt taking the cattle of another, or driving them to an unlawful place, pretending damages done by them. See Naam.

In ſuch caſe, the owner of the cattle may demand ſatisfaction for the injury, which is called *placitum de namio vetito*. See Vetitum.

NAPE, is uſed for the hind-part of the neck; by reaſon, perhaps, of the ſoft ſhort hair growing therein, like the nap of a cloth. See Neck, and Nucha.

NAPELLUS. See the article Aconite.

NAPHTHA *, ΝΑΦΘΑ, a kind of liquid bitumen, very oily, and inflammable; exuding out of the earth in ſeveral places in Chaldæa; particularly the place where ſtood the antient Babylon: and found alſo in ſome provinces of Italy and France, particularly Auvergne, and near Raguſa. See Sulphur, and Bitumen.

* The word, in the original Chaldee, ſignifies *ſtillare*, to ooze, or drop; *naphtha*, according to Pliny, running like a kind of bitumen.

Naphtha is found ſwimming on the ſurface of the water of ſome ſprings. It is uſually of a black colour, though that found in certain ſprings about Babylon is ſaid to be whitiſh.

That of France is ſoft and black, like liquid pitch, and of a fetid ſmell; that of Italy is a kind of petrol, or a clear oil, of various colours, oozing out of a rock, ſituate on a mountain in the dutchy of Modena. See Petrol.

Naphtha is eſteemed penetrating, reſolutive, and vulnerary; but its virtues are little known in medicine: its chief uſe is in lamps, *&c.* on account of its inflammability.

The Turks call the *naphtha*, *cara ſakiz*, black maſtic, to diſtinguiſh it from pitch. Voſſius has an expreſs treatiſe on *naphtha*, antient and modern: He ſays, it is a flower of bitumen, of more virtue than any other bitumen.

NAPIERS, or Nepers *Bones*. See Nepers *Bones*.

NARCOTICS *, in medicine, opiates, or medicines that excite drowſineſs, and ſleep. See Opiates.

* The word comes from the Greek ναρκωτικος, of ναρκωσις, drowſineſs.

Narcotics, called alſo *hypnotics*, and *ſoporifics*, act by calming, and diminiſhing the motion of the blood, and ſpirits. See Hypnotics, and Soporific.

Authors are of various opinions, as to the manner wherein *narcotics* operate: the antients tell us, it is by their being cold in nature, whereby the ſtupify and deaden the ſenſe. Etmuller, after Willis, takes the animal ſpirits to be compoſed of a fluid, volatile ſalt; and thinks they are diſſolved by the mixture of ſulphurs and oils, wherewith *narcotics* abound. — M. Andry's opinion is, that the ſalt of *narcotics* diſſolves in any liquor whatever; and that their ramous branches becoming thus diſengaged from the ſalts, are embarraſſed among one another, and thus ſtop the courſe of the blood and ſpirits. — Others think, that *narcotics* cloſe the orifices of the nerves, and thus block up the paſſage of the ſpirits. — Laſtly, Linden, in his treatiſe *de Venenis*, thinks, that the operation of *narcotics* is not the ſame in all; drowſineſs being producible from a great variety of different cauſes. See Sleep.

NARRATION, in oratory and hiſtory, a recital, or rehearſal of a fact as it happened, or as it is ſuppoſed to have happened.

This is of two kinds: either *ſimple*, and *hiſtorical*; as where the auditor or reader is ſuppoſed to hear or read of a tranſaction at ſecond hand: or *artificial*, and *fabulous*, as where their imaginations are raiſed, and the action, as it were, reacted before them.

The *narration*, according to the writers of rhetoric, makes the ſecond part of a juſt ſpeech, or harangue; *viz.* that immediately following the exordium. See Oration.

It makes the whole of a hiſtory; abating for the occaſional reflections, epiſodes, and digreſſions. See History.

Cicero requires four virtues in a *narration*, *viz.* perſpicuity, probability, brevity, and ſweetneſs.

The *narration* is rendered perſpicuous, by obſerving the order of time, by uſing none but proper and known terms, and by reciting the action uninterruptedly. See Obscurity.

It is rendered probable, by the credibility of the narrator, by the ſimplicity and openneſs of the *narration*, by avoiding every thing far remote from the common ſenſe and opinion of mankind, and by a preciſe detail of circumſtances. See Probability.

It is rendered brief, by taking it up no higher than is juſt neceſſary; nor fetching it back, as that impertinent author in Horace, *Qui gemino bellum Trojanum orditur ab ovo:* And by avoiding trivial circumſtances.

Laſtly, it is rendered ſweet, by uſing ſmooth, numerous, and well-ſounding words; by arranging them, ſo as to avoid any hiatus, or claſhing. By the greatneſs, novelty, and unexpectedneſs of the things related; and by enriching it with tropes and figures: as frequent admirations, exclamations, interrogations, expectations, ſuſpences, ſurprizing events; by grief, joy, fear, *&c.* See Numbers, Cadence, and Trope.

Narration, in poetry, is uſed more particularly for the action, or event, that makes the ſubject of an epic poem. See Action.

F. Boſſu obſerves, that the actions in poetry are equally ſuſceptible of the two kinds of oratorial *narration*; and that each conſtitutes a particular ſpecies of poetry.

Thoſe under the artificial, or active form, are now called *dramatic*. See Drama.

And thoſe only related by the poet, who here perſonates an hiſtorian, are called *epic*. See Epopea.

In the drama, the *narration* is the whole of the piece; in the epopea, it is only a part, though in effect it is the principal part, and the body of the poem. — It is preceded by the propoſition, and invocation, which Boſſu calls the preludes; and is frequently interrupted by the poet's ſpeaking in perſon, demanding pardon, favour, *&c.* See Invocation, *&c.*

The *narration* includes the whole action, epiſodified, with all its circumſtances and its ornaments. See Episode.

It is in this part that the action is to be begun, carried on, and ended. It is this, is to ſhew the cauſes of all that is related; in this the difficulties are to be propoſed and reſolved; and the perſons, both human and divine, are here to ſhew their intereſts, their manners, and their qualities, by their actions and their diſcourſe: and all this is to be deſcribed with the beauty, the majeſty, and force of verſe, ſtyle, ſentiments, compariſon, and other ornaments proper to the ſubject in general, and to each thing in particular. See Style.

The qualities of the epic *narration* are, that it be agreeable, probable, moving, ſurprizing, and active.

Horace ſpeaks of the utile and dulce as on the ſame footing. Boſſu looks on the utile as an eſſential property; and the dulce as no more than an additional quality.

NASAL, ſomething belonging to the noſe, *naſus*; as the noſe-piece of a helmet, antiently called *naſale*.

Nasal, in grammar, *&c.* is applied to thoſe ſounds, or letters, in whoſe formation the noſe is the principal organ; and particularly where the ſound formed is paſſed through the noſe. See Letter.

In moſt Engliſh words, the ſounds expreſſed by the characters an, en, in, on, un, are ſimple ſounds, and proper *naſal* vowels. See M, N, *&c.*

NASALIA, in medicine, a ſort of remedies to be taken by the noſe; called alſo *errhines*. See Errhines.

NASI *Os*, in anatomy, a thin bone, making the upper part of the noſe. See Nose.

NATALIS, Natalis *Dies*, or Natalitium, properly ſignify a man's *birth-day*. See Nativity.

The word was firſt uſed among the Heathens, to ſignify the feaſt held on the anniverſary of the birth of an emperor; whence it came, in time, to ſignify any ſort of feaſt. And, accordingly, in the Faſti, we meet with *natalis ſolis*, *natalis invicti*, &c. See FEAST.

The primitive Chriſtians, finding the word thus eſtabliſhed, uſed it in the ſame manner; and hence we meet in the antient martyrologiſts with *natalis calycis*, for the feaſt of the ſupper, or Maunday-Thurſday: *natalis cathedræ*, for the pontificate of S. Peter: *natalis*, or *natalitium*, of ſuch a church, for the feaſt of the dedication. See DEDICATION.

The word *genethlion* is uſed by the Greeks in the ſame ſenſe as *natalis*, or *natalitium*, among the Latins.

Ludi **NATALITII**, **NATAL** *games*, were games introduced on the anniverſaries of the birth-days of great men. See GAME.

NATAL *Ring*, *Annulus* **NATALITIUS**, was a ring only wore on the birth-day. See RING.

NATES, in anatomy, a term expreſſing thoſe two fleſhy poſterior parts of the body, popularly called the *buttocks*: by the Latins *clunes*, or *nates*.

NATES *Cerebri*, are two circular protuberances of the brain, ſituate on the back-ſide of the medulla oblongata near the cerebellum. See BRAIN, and MEDULLA.

NATION, a collective term, uſed for a conſiderable people, inhabiting a certain extent of ground, encloſed within fixed limits, and under the ſame government.

Each *nation* has its particular character: It is proverbially ſaid, light as a Frenchman, waggiſh as an Italian, grave as a Spaniard, wicked as an Engliſhman, fierce as a Scotchman, drunken as a German, idle as an Iriſhman, deceitful as a Greek, *&c.* See CHARACTER.

NATION is alſo uſed in ſome univerſities, for a diſtinction of the ſcholars, and profeſſors of colleges. See UNIVERSITY.

The faculty of Paris conſiſts of four *nations*; *viz.* that of France, that of Normandy, that of Picardy, and that of Germany; which are again, excepting that of Normandy, diſtinguiſhed into tribes; each tribe has its deacon.

The German *nation* comprehends all foreign *nations*, Engliſh, Italian, *&c.*

When the procureur of the French *nation* ſpeaks in publick, his ſtyle is, *Honoranda Gallorum natio:* He of Picardy ſays, *Fideliſſima Picardorum natio:* He of Normandy, *Veneranda Normannorum natio:* He of the *nation* of Germany, *Conſtantiſſima Germanorum natio.*

NATIONAL *Synod*. See the articles SYNOD, and COUNCIL.

NATIVE, is applied to a perſon conſidered as born in a certain place; or deriving his origin therefrom.

The more accurate writers diſtinguiſh between a *native* of a place, and being *born* there. Born ſignifies no more than the having been there produced, or brought into the world, whether that were the proper country, or habitation of the parents, or whether they were there only by accident, as ſtrangers, *&c.*—Whereas *native* refers to the proper manſion, or reſidence of the parents and the family; and where the perſon has his education.

And hence a perſon may be a *native* of one place, and born at another: Thus Jeſus Chriſt is called a Nazarite, and Galilean, as a *native*; though he were born at Bethlehem in Juda.

NATIVE, **NATIVUS**, in our antient law-books, ſignified a perſon who was born a ſlave or villain. See SLAVE, *&c.*

By which he differed from one who had ſold himſelf, or became a ſlave by his own deed, who was called *bondman*. See VILLAIN.

NATIVE *Tenentes*, in our old law-books, are freemen, who hold *native* land; *i. e.* land ſubject to the ſervices of *natives*. Spelm.

NATIVI *de Stipite*, were villains or bondmen by birth or family.—There were alſo *nativi conventionarii*, who were villains by contract or covenant. *Servi enim alii natura, alii facti, alii emptione, alii redemptione, alii ſua vel alterius datione.* LL. Hen. I. cap. 76.

In Cornwall it was a cuſtom, that if a freeman married *nativam* (that is, a neif) and brought her *ad liberum tenementum & liberum thorum*, and had two daughters, one of them was free, and the other a villain. Bract. l. 4. c. 21. See NEIF.

NATIVITY, **NATIVITAS**, or *Natal-Day*; the day of one's birth. See NATALIS.

The term is chiefly uſed in ſpeaking of ſaints, *&c.* The *nativity* of S. John Baptiſt, *&c.*---When we ſay abſolutely *the nativity*, it is underſtood of that of Jeſus Chriſt, or the feaſt of Chriſtmas. See FEAST, CHRISTMAS, *&c.*

It is commonly held, that pope Teleſphorus was the firſt who decreed the feaſt of the *nativity* to be held on the 25th of December. John, archbiſhop of Nice, in an epiſtle upon the *nativity* of Jeſus Chriſt, relates, that at the inſtance of S. Cyril of Jeruſalem, pope Julius procured a ſtrict inquiry to be made into the day of our Saviour's *nativity*; which being found to be on the 25th of December, they began thenceforth to celebrate the feaſt on that day. See INCARNATION.

NATIVITY, *Nativitas*, in antient law-books, ſignifies bondage, or ſervitude. See VILLENAGE.

NATIVITY, in aſtrology, the theme, or figure of the heavens and particularly of the twelve houſes, at the moment when a perſon was born: called alſo *horoſcope*. See HOROSCOPE.

Caſting the *nativity*, or by calculation ſeeking to know how long the queen ſhould live, *&c.* was made felony, anno 23. Eliz. c. 2.

NATRON, or **ANATRON**, in natural hiſtory, a browniſh kind of ſalt, taken out of a lake of ſtagnant water, in the deſert of Nitria, in Egypt. See SALT.

It is much of the nature of nitre, whence it is called Egyptian nitre, and is even ſuppoſed to be the proper nitre of the antients. See NITRE.

It is a popular error, that all bones or ſtones thrown into this lake, are by degrees converted into *natron*.---It makes a great ebullition, when mixed with acids; whence it is ranked as of the alkali kind. See ACID, and ALKALI.

It is uſed in the whitening of linens, but burns them, if not corrected by a mixture of aſhes. See BLEACHING.

The *natron* of Egypt, as deſcribed by Pliny, Matthiolus, and Agricola, is an alkali ſalt perforated in manner of a ſponge, and of a lixivial taſte.

Its principles, Dr. Leigh takes to be chiefly two; *viz.* a ſea-ſalt, and an urinous ſalt. The firſt, he takes it for granted, it receives from the earth; the ſecond, from the air.

Dr. Huntington, who was on the ſpot, ſays, the *natron* is thought to riſe from the bottom of the lake; where, by the heat of the ſun, it is condenſed, and hardened into the form we ſee it in: But his opinion is, that it is rather ſeparated by the ſun from the water.

M. de la Chambre adds, that three or four days before the Nile begins to overflow, there falls a certain dew, of a fermentative virtue, inſomuch as to leaven a paſte expoſed to it; and that at the ſame time the *natron* riſes.

Hippocrates, Galen, Matthiolus, Dioſcorides, *&c.* mention it as of uſe in phyſic; and M. de Cloſs is even of opinion, that all the mineral waters of France are impregnated with this kind of nitre; and that it is hence they derive their medicinal virtues.

It is of ſingular efficacy in fertilizing of ground; which Dr. Leigh accounts for, by ſuppoſing its volatile particles heated by ſome ſubterraneous fire, or by the warmth of the ſun; and thus readily made to aſcend up the minute tubes of plants, and carry with them the juices of the earth.

Pliny derives the invention of glaſs from ſome of this *natron* accidentally melted down into the ſand, where it ran into ſtreams of glaſs. See GLASS.

This nitre is diſtinguiſhed from the modern nitre, or ſaltpetre, by its fermenting with acids, which ſaltpetre will not do; by its volatile ſpirit, its lixivial ſmell, the clammy inſipid ſubſtance it yields, *&c.*--- It agrees with ſaltpetre, in that, by dropping ſpirit of ſulphur upon it, it ſhoots into pyramidal cryſtals. Dr. Leigh thinks it comes nearer ſal armoniac than ſaltpetre. See SALTPETRE.

Dr. Liſter conjectures, that moſt of the ſalt water of the lakes of Egypt, having paſſed through the bodies of thoſe vaſt animals wherewith they are ſtocked, as crocodiles, hippopotami, *&c.* muſt of conſequence be rendered urinous, or ſalino-urinous; which is a part of the compoſition of ſal armoniac. See ARMONIAC.

NATTA *, or **NATA**, in medicine, a large fleſhy excreſcence, or tumor, ariſing in ſeveral parts of the body.

* The word is alſo written *naſa*, *naſda*, and *napta*.

Blancard defines it, a large, ſoft, painleſs, colourleſs tumor, ariſing uſually on the back, ſometimes on the ſhoulders, and other parts.---Its root is very ſmall; yet it grows ſo prodigiouſly, that it ſometimes equals a melon, or gourd.

Nattæ ofteneſt appear on the neck, much after the manner of talpæ. See TALPA.

They are of the œdematous kind, and are to be extirpated by inciſion, and their return prevented by red precipitate, vitriol, or burnt allom ſtrewed on the place.

Bartholine mentions a lady, who cured herſelf of a *natta*, by biting it off.

NATURAL, ſomething that relates to nature; that ariſes from a principle of nature; or is conformable to the ordinary courſe and order of nature. See NATURE.

When a ſtone falls downwards, we vulgarly ſay it does it by a *natural* motion; but if it be thrown upwards, its motion is ſaid to be violent. See MOTION.

Water ſuſpended in a ſucking pump, is ſaid to be out of its *natural* place: cures wrought by medicines, are *natural* operations; but the miraculous ones wrought by Chriſt, ſupernatural. See MIRACLE, &c.

NATURAL *Children*, are thoſe born out of lawful wedlock. See BASTARD.

NATURAL *Horizon*, is the ſenſible or phyſical horizon. See HORIZON.

NATURAL *Law*. See the article *Law of* NATURE.

N° VIII

NATURAL *Day.* } See the article { DAY.
NATURAL *Year.* } See the article { YEAR.
NATURAL *Faculty.* } See the article { FACULTY.

Quincy defines *natural faculty*, to be that power ariſing from the blood's circulation, which is conſpicuous in all the ſecretions performed within the body; that ſecretion alone excepted, which is made at the origin of the nerves. See SECRETION, SPIRIT, NERVE, &c.

NATURAL *Functions*, in the animal œconomy, are thoſe actions whereby things taken into the body are changed, and aſſimilated, ſo as to become parts of our body. See FUNCTION.

Theſe are the actions of the viſcera, the veſſels that receive, retain, move, change, mix, ſecern, apply, excern, and ſpend the humours of the body. See DIGESTION, NUTRITION, &c.

NATURAL *Inclinations*, are thoſe tendencies, or motions of the mind, towards things ſeemingly good, which are common, in a greater or leſs degree, to all mankind.

Natural inclination, according to F. Malebranche, is the ſame thing with regard to minds, that motion is with regard to bodies: and as all the varieties in the material world ariſe from the ſeveral motions of bodies, ſo do all thoſe of the intellectual world from inclinations: and as all motions are the reſults of impreſſions immediately communicated by the finger of the Creator, ſo all inclinations are certainly nothing elſe but continual impreſſions of the will of the Creator on that of the creature; and muſt therefore of neceſſity be agreeable to his; and therefore can naturally have no principal end but his glory; nor any ſecondary one, but their own preſervation, and that of others: both ſtill with regard to his will who gave them being.

Now as, properly ſpeaking, there is but one love in God, *viz.* that of himſelf; ſo he only impreſſes one love or deſire in us, which is that of good in the general. It is this general love, or deſire, is the principle of all our particular ones; as, in effect, it is the will itſelf: the will being defined to be a continual impreſſion of the author of nature, which carries the mind of man to good in general. See WILL.

But the impreſſion towards good in the general, doth not only proceed from God, but alſo all our inclinations to particular goods; as, *v. g.* ſelf-preſervation, &c. See PASSION.

NATURAL *Hiſtory*, a deſcription of the natural products of the earth, water, or air; *v. g.* beaſts, birds, fiſhes, metals, minerals, and foſſils; together with ſuch extraordinary phænomena, as at any time appear in the material world; as meteors, monſters, &c. See HISTORY.

Beſides *general natural hiſtories*, as thoſe of Pliny, &c. there are *particular* ones; and that of two kinds. — The firſt, thoſe which only conſider one kind of things; ſuch as the hiſtory of ſhells, by Dr. Liſter; of fiſhes, by Willughby; that of birds, by the ſame; that of plants, by Ray; thoſe of inſects, by Swammerdam, and Mouffet; that of animals, by Geſner; that of foſſils, by Agricola, Mercatus, &c.

The ſecond, thoſe which conſider the ſeveral kinds of *natural* things found in particular countries, or provinces; as the *natural hiſtory* of Dauphiné, by Chorier; the *natural hiſtory* of the Antilles, by F. du Tertre, and M. Lonvillers de Poincy; thoſe of Oxfordſhire and Staffordſhire, by Dr. Plott; that of Lancaſhire, by Leigh; of Northamptonſhire, by Morton; and that of the ſame county, expected from Mr. Bridges; that of the weſtern iſlands, by Martin, &c.

NATURAL *Philoſophy*, that ſcience which conſiders the powers of nature, the properties of *natural* bodies, and their mutual action on one another, otherwiſe called *phyſics*. See PHYSICS, and NATURE.

NATURAL *Magic*, is that which only makes uſe of *natural* cauſes. See MAGIC.

NATURAL *Cauſe*. See the article CAUSE.

NATURAL, in heraldry, is uſed where animals, fruits, flowers, &c. are blazoned with the colours they naturally have, though different from the common colours of heraldry: and this is to prevent the armories being accuſed of falſity, when blazoned with the names of colours unknown in heraldry. See COLOUR, and BLAZON.

NATURAL, in muſic, is ſometimes uſed for *diatonic*. See DIATONIC.

NATURAL is alſo ſometimes put for *phyſical*. — In which latter ſenſe, *natural muſic* is that performed by *natural* organs, *i. e.* vocal muſic; in contradiſtinction to *artificial*, or inſtrumental. See MUSIC.

NATURAL *Harmony*, is that produced by the *natural*, and eſſential chords of the mode. See HARMONY.

NATURAL *Note*, is uſed in oppoſition to *flat* and *ſharp* notes, which are called *artificial* notes. See NOTE, SCALE, &c.

NATURAL is alſo uſed for ſomething coming immediately out of the hands of nature. — In which ſenſe it ſtands oppoſed to *factitious*, or artificial, which ſignifies ſomething wrought by art. See ARTIFICIAL.

Biſhop Wilkins obſerves, that there appears a world of difference between *natural* and artificial things, when viewed with microſcopes; the firſt ever appear adorned with all imaginable elegance and beauty; the latter, though the moſt curious in their kind, infinitely rude and unhewn: the fineſt needle appears a rough bar of iron; and the moſt accurate engraving, or emboſſment, as if done with a mattock or trowel.

NATURALIST, a perſon who has ſtudied nature, and is well verſed in natural bodies, eſpecially what relates to metals, minerals, ſtones, vegetables, and animals. See ANIMAL, PLANT, MINERAL, &c.

Ariſtotle, Ælian, Pliny, Solinus, and Theophraſtus, were the greateſt *naturaliſts* among the antients; but they fell into abundance of errors, which have been corrected by the happy induſtry of the moderns.—Aldrovandus is the moſt copious and complete of the modern *naturaliſts*; his work is in thirteen volumes in folio.

NATURALIZATION, in law, the act of naturalizing an alien, or putting him into the condition of a natural-born ſubject, and entitling him to the rights and privileges thereof. See ALIEN, and DENIZEN.

In France, *naturalization* is the king's prerogative; in England it is only done by act of parliament.

In France, Swiſs, Savoyards, and Scots, need not any *naturalization*, being reputed regnicoles, or natives.

NATURALS, *Res* NATURALES, in medicine.—In every animal, howſoever ſick and diſeaſed, there is ſtill remaining ſome degree of life, and ſtrength; and the cauſes and effects of each.—Theſe are called *naturals*, natural things, or things according to nature; and ſometimes barely nature; in contradiſtinction to *non-naturals*. See NON-NATURAL.

NATURE, NATURA, is a term variouſly uſed. Ariſtotle has a whole chapter wrote expreſsly to enumerate the various acceptations of the Greek word, φυσις, rendered into Engliſh, *nature:* and among Latin writers, the different acceptations are ſo many, that a certain author reckons up fourteen or fifteen. Mr. Boyle, in a preciſe treatiſe of the vulgarly received notion of *nature*, gives us eight principal ones.

NATURE, then, is ſometimes uſed for the ſyſtem of the world; the machine of the univerſe; or the aſſemblage of all created beings. See UNIVERSE, and SYSTEM.

In which ſenſe we ſay, the author of *nature*. The ſun is called the eye of *nature*, becauſe he illumines the univerſe, and the father of *nature*, becauſe he warms the earth, and makes it fruitful. And thus we ſay of the phœnix, or a chimæra, that there is no ſuch thing in *nature*.

Inſtead of the word *nature*, in this ſenſe, Mr. Boyle, to avoid ambiguity, and abuſe of the word, wiſhes to have *world*, or *univerſe*, ſubſtituted. See WORLD.

NATURE, in a more confined ſenſe, is applied to each of the ſeveral kinds of beings, created and increated; ſpiritual and corporeal. See ENS.

In which ſenſe we ſay, human *nature*, meaning all men together, who poſſeſs the ſame ſpiritual, reaſonable ſoul. Angelical *nature*; the divine *nature*, &c.

In this ſenſe, the ſchool divines ſay, *natura naturans*, and *natura naturata*; ſpeaking of God, who is the *natura naturans*, as giving being and *nature* to all others: in oppoſition to the creatures, who are the *natura naturata*, as receiving their *nature* from the hands of another.

NATURE, in a ſtill more reſtrained ſenſe, is uſed for the eſſence of a thing; or that which the ſchoolmen call the *quiddity* thereof, that is, the attribute which makes it what it is. See QUIDDITY.

In which ſenſe, the Carteſians ſay, it is the *nature* of the ſoul to think; and that the *nature* of matter conſiſts in extenſion. See SOUL, MATTER, EXTENSION, &c.

And here the word *eſſence*, Mr. Boyle would have obtain, in lieu of *nature*. See ESSENCE.

NATURE is more particularly uſed for the eſtabliſhed order, and courſe of material things; the ſeries of ſecond cauſes; or the laws which God has impoſed on the motions impreſſed by him. See CAUSE, LAW, and MOTION.

In which ſenſe it is we ſay, phyſics is the ſtudy of *nature*; *nature* makes the night ſucceed the day; *nature* has rendered reſpiration neceſſary to life, &c.

Thus S. Thomas defines *nature* a kind of divine art, communicated to beings, which carries them to the end they are determined for. — In which ſenſe, *nature* is nothing elſe but that concatenation of cauſes and effects, or that order and œconomy which God has eſtabliſhed in the parts of his creation. See CONCATENATION, &c.

In this ſenſe too we ſay, miracles are effects above the powers of *nature:* art is ſaid to force, or ſurpaſs *nature*, by means of machines; in regard theſe produce effects which exceed what we find in the common courſe of things. See ART, MIRACLE, &c.

NATURE, again, is taken for an aggregate of powers belonging to any body, eſpecially a living one.

In which ſenſe phyſicians ſay, *nature* is ſtrong, weak, or ſpent; or, that in ſuch a diſeaſe, *nature* left to herſelf, will perform the cure.

NATURE, is ſtill more ſtrictly uſed for the action of providence, the principle of all things; or, that ſpiritual power, or being, which is diffuſed throughout the creation, and moves and acts in all bodies, and gives them certain properties, and produces certain effects. See PROVIDENCE.

In this, which Mr. Boyle conſiders as the moſt uſual ſenſe, *nature* is nothing elſe but God, acting himſelf, and according to certain laws he himſelf has fixed. See GOD.

This ſeems pretty agreeable to the opinion of many of the antients, who made *nature* the God of the univerſe, the το πᾶν, who preſides over, and governs all: Thou others owned this an imaginary being, and by *nature* meant no more than the qualities, or virtues, which God has given his creatures, and which their poets and orators took occaſion of perſonifying.

F. Malebranche ſays, the *nature* ſo much talked of in the ſchools, is fit for nothing but to lead us back to idolatry; the antient heathens hereby underſtanding ſomething, which, without being God, acts continually throughout the univerſe. Thus the idol *nature* muſt be an actual principle, which, in concurrence with God, is the next and immediate cauſe of all the changes which befal matter. Which ſeems to fall in with the opinion of the anima mundi; as if *nature* were a ſubſtitute of God, or a collateral cauſe with God, or a middle being between God and created things. See ANIMA MUNDI.

Ariſtotle defines *nature*, *principium & cauſa motus & ejus in quo eſt primo per ſe & non per accidens*: A definition ſo obſcure, that none of his commentators, with all their gloſſes, have been able to render it intelligible.

This principle, which the Peripatetics called *nature*, they ſuppoſed to act neceſſarily; and was therefore deſtitute of knowledge, or liberty. See NECESSITY.

Thus alſo the Stoics conceived *nature* as a certain ſpirit, or virtue, diffuſed throughout the univerſe, which gave every thing its motion; ſo that all muſt be dragged away by the invariable order of a blind *nature*, and an inevitable neceſſity. See FATE.

In ſpeaking of the action of *nature*, no more is to be underſtood, but that bodies act on one another, in a manner agreeable to the general laws of motion, which the Creator has eſtabliſhed.

In this lies the myſtery of that great word, which is only a compendious way of expreſſing the action of all bodies: but the mechaniſm of bodies would, perhaps, better expreſs what is here meant by *nature*. See MECHANISM.

Some, Mr. Boyle obſerves, will have the *nature* of a thing to be only the law that it receives from the Creator, and according to which it acts on all occaſions.—But this is an improper, and figurative expreſſion.

The ſame author propoſes a notion of *nature* as more fit than any yet given, to paſs for the principal one of *nature*; with regard to which, many axioms and expreſſions relating to that word may be conveniently underſtood. In order to this, he diſtinguiſhes between *general* and *particular nature*.

General **NATURE**, he defines the aggregate of the bodies which make up the world in its preſent ſtate, conſidered as a principle, by virtue whereof they act and ſuffer, according to the laws of motion preſcribed by the author of things.

Particular **NATURE** of any ſubordinate, or individual, conſiſts in the general *nature* applied to a diſtinct portion of the univerſe.—Or it is a convention of the mechanical properties (as magnitude, figure, order, ſituation, and local motion) of parts convenient and ſufficient to conſtitute or entitle to, its particular ſpecies or denomination, the particular body they make up; the concourſe of all theſe being conſidered as the principle of motion, reſt, &c.

Laws of **NATURE**, are axioms, or general rules of motion, and reſt, obſerved by natural bodies in their actions on one another; and in all the changes which befal them in their natural ſtate. See LAW.

The *laws of nature*, and of *motion*, are, in effect, the ſame; cuſtom, indeed, has made ſome difference, and we find authors call the particular caſes of motion, laws of motion; which ſee under MOTION.—The more general, or catholic ones, and thoſe from which, as from axioms, the others are deduced, they call *laws of nature*.

Of theſe, Sir Iſaac Newton has eſtabliſhed three:

1°, That every body perſeveres in the ſame ſtate, either of reſt, or uniform rectilinear motion; except ſo far as it is forced to change that ſtate by ſome foreign force.

Thus projectiles perſevere in their motions, except ſo far as they are retarded by the reſiſtance of the air, and the cauſe of gravity; and thus a top, whoſe parts, by their coheſion, are continually drawing one another out of their rectilinear motion, only ceaſes to run round becauſe reſiſted by the air, and the friction of the plane whereon it moves. And thus the larger bodies of the planets and comets, preſerve their progreſſive and circular motions a long time undiminiſhed, in regions void of all ſenſible reſiſtance. See VIS *Inertiæ*, RESISTANCE, and MEDIUM.

2°, The change of motion is ever proportional to the moving force whereby it is effected, and in the direction of the right line wherein that force is impreſſed.

If a certain force produce a certain motion; a double force will produce double the motion; a triple force triple the motion; whether it be impreſſed all at once, or ſucceſſively, and by degrees. And this motion, (ſince it is ever directed to the ſame point with the generating force) if the body were in motion before, is either to be added to it, as if the motions conſpire; or ſubtracted from it, as where contrary; or added obliquely, as where oblique; and is compounded with it, according to the determinations of each. See COMPOSITION.

3°, Reaction is always contrary, and equal to action; or the actions of two bodies upon one another, are always mutually equal, and directed contrary ways.

Whatever preſſes, or pulls another, is equally preſſed or pulled thereby. Thus, if I preſs a ſtone with my finger, the finger is equally preſſed by the ſtone. If a horſe draw a weight by a rope, the horſe is equally drawn back towards the weight; for the rope being equally ſtretched each way, will, with an equal endeavour to relax itſelf, drive the horſe toward the ſtone, and the ſtone toward the horſe; and will hinder the progreſs of the one, as much as it promotes that of the other.

Again, if any body, by ſtriking on another, do in any manner change its motion, it will, itſelf, by means of the other, undergo an equal change in its own motion, by reaſon of the equality of the preſſure.

In theſe actions the changes are equal; not thoſe, we mean, of the velocities, but thoſe of the motions, the bodies being ſuppoſed free from any other impediments. For the changes of velocities, which are likewiſe made contrary ways, inaſmuch as the motions are equally changed, are reciprocally proportional to the bodies. See REACTION.

This law alſo obtains in attractions. See ATTRACTION.

NATURE, in proſody.—A ſyllable is ſaid to be long or ſhort by *nature*, to ſignify that it is ſo originally, and independently of any rule of grammar, which might render it ſo by poſition, or otherwiſe. See QUANTITY, and PROSODY.

NAVAL, ſomething relating to ſhips, or navigation. See SHIP, and NAVIGATION.

In this ſenſe we ſometimes ſay, *naval* ſtrength, a *naval* combat, &c.

NAVAL *Crown*, *Corona* **NAVALIS**, among the antient Romans, a crown adorned with figures of prows of ſhips, conferred on perſons who in ſea engagements firſt boarded the enemy's veſſel. See CROWN.

Though A. Gellius ſeems to ſpeak in the general, where he ſays, the *naval* crown was adorned with prows of ſhips; Lipſius diſtinguiſhes two kinds of *naval* crowns; the one he calls *ſimple*, the other *roſtrated*.

The firſt he ſuppoſes plain, and given to the common ſoldiers, &c.—The latter much more glorious, adorned with prows of ſhips, and only given to generals, or admirals, who had gained ſome important victory at ſea.

NAVE*, in architecture—**NAVIS** *Eccleſiæ*, denotes the body of a church; or the place where the people are placed; reaching from the rail, or balluſter of the choir, to the chief door. See CHURCH.

> * Baldus derives the word from the Greek ναὸς, temple; which Salmaſius brings farther, from ναυς, ſhip; by reaſon the vault or roof of a church bears reſemblance to a ſhip.

The antient Greeks called the *nave*, *pronaos*; the Latins frequently *cella*. See PRONAOS.

The *nave* of the church belongs to the pariſhioners; it is they are to repair it, &c. See REPARATION.

NAVEL, a part in the middle of the belly, by anatomiſts called *umbilicus*.—See *Tab. Anat. (Splanch.) fig.* 3. *lit. c. fig.* 16. *lit. e*; ſee alſo UMBILICUS.

NAVEL-*String*, by anatomiſts is called *funiculus umbilicalis*. See UMBILICAL.

NAVICULARE *Os**, in anatomy, the third bone in the foot, between the aſtragalus, and the oſſa cuneiformia.

> * It is thus called from *navis*, a ſhip; to which it bears ſome reſemblance: for which reaſon likewiſe it is ſometimes called *cymbiforme*, from *cymba*, a boat; and *ſcaphoides*, from a Greek word of the like import. See FOOT.

The *os naviculare* has behind it a large ſinus, which receives the anterior convex head of the firſt bone; and before it is convex. It is divided into three heads, which are received into the ſinus's of the oſſa cuneiformia.

NAVIGATION, the art, or act of ſailing, or of conducting a veſſel from one place to another, the ſafeſt, ſhorteſt, and moſt commodious way. See SHIP, and SAILING.

This art, in the full latitude of the word, comprehends three parts: 1°, The art of conſtructing and building ſhips. 2°, The loading of ſhips. And, 3°, the conducting and guiding of ſhips through the ſea; which is in a peculiar ſenſe called *navigation*, or ſailing. See SAILING.

In this reſtrained ſenſe of the word, *navigation* is either *common*, or *proper*.

Common NAVIGATION, uſually called *coaſting*, is where the ports are on the ſame, or very neighbouring coaſts; and where the veſſel is ſeldom out of ſight of land, or out of reach of ſounding. See COASTING.

In this, little elſe is required, but an acquaintance with the lands, the compaſs, and ſounding-line; each of which ſee in its place, COMPASS, and SOUNDING.

Proper NAVIGATION, is where the voyage is long, and out in the main ocean.

In this, beſides the requiſites in the former, are likewiſe required the uſe of Mercator's chart, azimuth and amplitude compaſſes, log-line, and other inſtruments for celeſtial obſervations, as quadrants, foreſtaffs, &c. See each inſtrument, &c. in its place. See CHART, QUADRANT, &c.

Navigation turns principally on four things; two whereof being known, the reſt are eaſily found from them by the tables, ſcales, and charts.

Theſe four things are, the *difference of latitude*, *difference of longitude*, the *reckoning*, or diſtance run, and the *courſe*, or rhumb ſailed on.

The latitudes are eaſily found, and with ſufficient accuracy. See LATITUDE.

The courſe and diſtance, are had by the log-line, or dead reckoning, and the compaſs. See LOG, COMPASS, COURSE, and DISTANCE.

Nor is there any thing wanting to the perfection of *navigation*, but to determine the longitude.—The mathematicians of many ages have applied themſelves with the utmoſt aſſiduity to ſupply this grand deſideratum, but hitherto in vain; notwithſtanding the magnificent rewards of ſeveral princes and ſtates to the diſcoverer.—For the various methods that now occaſionally obtain at ſea for this purpoſe. See LONGITUDE.

The poets refer the invention of the art of *navigation* to Neptune, ſome to Bacchus, others to Hercules, others to Jaſon, others to Janus, who is ſaid to have made the firſt ſhip. See SHIP.

Hiſtorians aſcribe it to the Æginetes, the Phœnicians, Tyrians, and the antient inhabitants of Britain. Some will have it, the firſt hint was taken from the flight of the kite; others, as Oppian, *de Piſcibus*, Lib. I. from the fiſh called Nautilus: Others aſcribe it to accident.—Scripture refers the origin of ſo uſeful an invention to God himſelf, who gave the firſt ſpecimen thereof in the ark built by Noah, under his direction. For the raillery the good man underwent on account of his enterprize, ſhews evidently enough, the world was then ignorant of any thing like *navigation*, and that they even thought it impoſſible. See ARK.

However, hiſtory repreſents the Phœnicians, eſpecially thoſe of their capital Tyre, as the firſt navigators; being urged to ſeek a foreign commerce by the narrowneſs and poverty of a ſlip of ground they poſſeſſed along the coaſts; as well as by the conveniency of two or three good ports; and by their natural genius to traffic.

Accordingly, Lebanon, and the other neighbouring mountains, furniſhing them with excellent wood for ſhip-building, in a ſhort time they were maſters of a numerous fleet, which conſtantly hazarding new *navigations*, and ſettling new trades, they ſoon arrived at an incredible pitch of opulency and populouſneſs: inſomuch as to be in a condition to ſend out colonies; the principal of which was that of Carthage: which keeping up their Phœnician ſpirit of commerce, in time not only equalled Tyre itſelf, but vaſtly ſurpaſſed it; ſending its merchant-fleets through Hercules's pillars, now the ſtraights of Gibraltar, along the weſtern coaſts of Africa and Europe; and even, if we believe ſome authors, to America itſelf; the diſcovery whereof, ſo many ages afterwards, has been ſo glorious to the Spaniards. See COMMERCE.

Tyre, whoſe immenſe riches and power are repreſented in ſuch lofty terms both in ſacred and profane authors, being deſtroyed by Alexander the great; its *navigation* and commerce were transferred by the conqueror to Alexandria, a new city, admirably ſituated for thoſe purpoſes; propoſed for the capital of the empire of Aſia, which Alexander then meditated---And thus aroſe the *navigation* of the Egyptians, which was afterwards ſo cultivated by the Ptolemys, that Tyre and Carthage (which laſt, after having a long time diſputed empire with the Romans, was at length ſubdued) were quite forgot.

Egypt being reduced into a Roman province after the battle of Actium, its trade and *navigation* fell into the hands of Auguſtus; in whoſe time Alexandria was only inferior to Rome: and the magazines of the capital of the world, were wholly ſupplied with merchandizes from the capital of Egypt.

At length, Alexandria itſelf underwent the fate of Tyre and Carthage; being ſurprized by the Saracens, who, in ſpite of the emperor Heraclius, overſpread the northern coaſts of Africa, &c. whence the merchants being driven, Alexandria has ever ſince been in a languiſhing ſtate, though ſtill it has a conſiderable part of the commerce of the Chriſtian merchants, trading to the Levant.

The fall of Rome, and its empire, drew along with it, not only that of learning, and the polite arts, but that of *navigation*; the barbarians, into whoſe hands it fell, contenting themſelves with the ſpoils of the induſtry of their predeceſſors.

But no ſooner were the more brave among thoſe nations well ſettled in their new provinces, ſome in Gaul, as the Franks; others in Spain, as the Goths; and others in Italy, as the Lombards; but they began to learn the advantages of *navigation* and commerce, and the methods of managing them, from the people they ſubdued; and this with ſo much ſucceſs, that in a little time ſome of them became able to give new leſſons, and ſet on foot new inſtitutions for its advantage.

Thus it is to the Lombards we uſually aſcribe the invention and uſe of banks, book-keeping, exchanges, rechanges, &c. See BANK, EXCHANGE, &c.

It does not appear which of the European people, after the ſettlement of their new maſters, firſt betook themſelves to *navigation* and commerce.—Some think it began with the French; though the Italians ſeem to have the juſteſt title to it, and are accordingly ordinarily looked on as the reſtorers hereof, as well as of the polite arts, which had been baniſhed together, from the time the empire was torn aſunder.

It is the people of Italy then, and particularly thoſe of Venice and Genoa, who have the glory of this reſtoration; and it is to their advantageous ſituation for *navigation*, they in great meaſure owe their glory.

In the bottom of the Adriatic were a great number of marſhy iſlands, only ſeparated by narrow channels, but thoſe well ſcreened, and almoſt inacceſſible, the reſidence of ſome fiſhermen, who here ſupported themſelves by a little trade of fiſh and ſalt, which they found in ſome of theſe iſlands.---Thither, then, the Veneti, a people inhabiting that part of Italy along the coaſts of the Gulph, retired, when Alaric, king of the Goths, and afterwards Attila, king of the Huns, ravaged Italy.

Theſe new iſlanders, little imagining that this was to be their fixed reſidence, did not think of compoſing any body politic; but each of the ſeventy-two iſlands of this little Archipelago, continued a long time under its ſeveral maſters, and each made a diſtinct commonwealth.---When their commerce was become conſiderable enough to give jealouſy to their neighbours, they began to think of uniting into a body: And it was this union, firſt begun in the ſixth century, but not completed till the eighth, that laid the ſure foundation of the future grandeur of the ſtate of Venice.

From the time of this union, their fleets of merchantmen were ſent to all the parts of the Mediterranean; and at laſt to thoſe of Egypt, particularly Cairo, a new city, built by the Saracen princes on the eaſtern banks of the Nile, where they traded for their ſpices, and other products of the Indies.

Thus they flouriſhed, increaſed their commerce, their *navigation*, and their conqueſts on the terra firma, till the famous league of Cambray, in 1508, when a number of jealous princes conſpired to their ruin; which was the more eaſily effected by the diminution of their Eaſt-India commerce, of which the Portugueſe had got one part, and the French another.

Genoa, which had applied itſelf to *navigation* at the ſame time with Venice, and that with equal ſucceſs, was a long time its dangerous rival, diſputed with it the empire of the ſea, and ſhared with it the trade of Egypt, and other parts both of the eaſt and weſt.

Jealouſy ſoon began to break out, and the two republics coming to blows, it was three centuries almoſt continual war, ere the ſuperiority was aſcertained; when towards the end of the fourteenth century, the fatal battle of Chioza ended the noble ſtrife: The Genoeſe, who till then had uſually the advantage, having now loſt all; and the Venetians, almoſt become deſperate, at one happy blow, beyond all expectation, ſecured to themſelves the empire of the ſea, and ſuperiority in commerce.

About the ſame time that *navigation* was retrieved in the ſouthern parts of Europe, a new ſociety of merchants was formed in the north, which not only carried commerce to the greateſt perfection it was capable of till the diſcovery of the Eaſt and Weſt Indies, but alſo formed a new ſcheme of laws for the regulation thereof, which ſtill obtain under the names of *Uſes and Cuſtoms of the Sea.* See USES.

This ſociety is that famous league of the Hanſe-towns, commonly ſuppoſed to have begun about the year 1164. See HANSE *Towns*.

For the modern ſtate of *navigation* in England, Holland, France, Spain, Portugal, &c. See COMMERCE, COMPANY, &c.

We ſhall only add, that in examining the reaſons of commerce's paſſing ſucceſſively from the Venetians, Genoeſe, and Hanſe-towns, to the Portugueſe and Spaniards; and from thoſe again to the Engliſh and Dutch; it may be eſtabliſhed as a maxim, that the relation between commerce and *navigation*, or, if we may be allowed to ſay it, their union, is ſo intimate, that the fall of the one, inevitably draws after it the other; and that they will always either flouriſh or dwindle together.

Hence ſo many laws, ordinances, ſtatutes, &c. for its regulation; and hence particularly that celebrated act of *navigation*, which an eminent foreign author calls the palladium, or tutelar deity of the commerce of England; which is too important not to be here mentioned; as it is the ſtanding rule, not only of the Engliſh among themſelves, but alſo of other nations with whom they traffic.

Act of Engliſh NAVIGATION, is a ſtatute whereby the parliament of England have ſettled divers matters relating to the *navigation* and commerce of the kingdom.

Till this act, all nations were at liberty to import into England all kinds of merchandizes, whether of their own growth, or laden elſewhere, and that on their own veſſels.

Cromwell firſt perceiving the prejudice this liberty did to the Engliſh commerce, which was now almoſt wholly in the hands of foreigners, chiefly the Dutch, whom he hated, animated the Engliſh, by ſeveral acts of parliament, to reſume their trade into their own hands; and particularly paſſed an act prohibiting the Dutch from importing any merchandizes, except thoſe of their own growth or manufacture, which were very few.

Upon the reſtoration, the firſt parliament Charles II. called, diſtinguiſhing, in Cromwell, the politician from the parricide, condemned the memory of the one, and followed the plan of the other with regard to *navigation* and commerce; by paſſing that celebrated bill or act for the encouraging and increaſing of ſhipping, and of *navigation*, which ſtill ſubſiſts in its full latitude, and its antient vigour. Its date is from the firſt of December, 1660. 12 Car. II. c. 18.—Its chief articles follow.
